Re: ***Petition of Tennessee American Water Company To Change And Increase Certain Rates And Charge So As To Permit It To Earn A Fair And Adequate Rate Of Return On Its Property Used And Useful In Furnishing Water Service To Its Customers Docket No. 08-00039***

Dear Chairman Roberson:

Enclosed please find an original and seven (7) sets of copies of Tennessee American Water Company's Responses to the Discovery Requests filed by the Consumer Advocate and Protection Division, dated May 12, 2008. In addition, two compact disks have been provided. The first disk contains all of the Company's responses in Word or Excel to data requests filed May 12, 2008. The second disk contains all such responses in pdf format.

Please return three (3) copies of these Responses to me, which I would appreciate your stamping as "filed," by way of our courier.

Should you have any questions concerning any of the enclosed, please do not hesitate to contact me.

With kindest regards, I remain

Very truly yours,

R. Dale Grimes

IN RE:

PETITION OF TENNESSEE AMERICAN WATER COMPANY TO CHANGE AND INCREASE CERTAIN RATES AND CHARGES SO AS PERMIT IT TO EARN A FAIR AND ADEQUATE RATE OF RETURN ON ITS PROPERTY USED AND USEFUL IN FURNISHING WATER SERVICE TO ITS CUSTOMERS	)	**Docket No. 08-00039**

TENNESSEE AMERICAN WATER COMPANY'S RESPONSES TO THE FIRST DISCOVERY REQUEST OF THE CONSUMER ADVOCATE AND PROTECTION DIVISION TO TENNESSEE AMERICAN WATER COMPANY

The Tennessee American Water Company ("TAWC") hereby responds as follows to the First Discovery Request of the Consumer Advocate and Protection Division ("CAPD") to the TAWC:

GENERAL OBJECTIONS

(1) TAWC objects to all requests that seek information protected by the attorney-client privilege, the work product doctrine and/or any other applicable privilege or restriction on disclosure.

(2) TAWC objects to the definitions and instructions accompanying requests to the extent definitions and instructions contradict, are inconsistent with, or impose any obligations beyond those required by applicable provisions of the Tennessee Rules of Civil Procedure or the rules, regulations or orders of the Tennessee Regulatory Authority.

(3) TAWC objects to the definitions of the words "document," "you," "person," "persons," "affiliate," "affiliated," "identify," "identifying," "identification," and "referring or

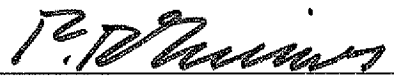
relating to," that accompany the data requests because such definitions are overbroad and unduly burdensome.

(4) The specific responses set forth below are based upon information now available to TAWC, and TAWC reserves the right at any time to revise, correct, add to or clarify the objections or responses and supplement the information and/or documents produced.

(5) TAWC is providing its responses herein without wavier of, or prejudice to, its right at any later time to raise objections to: (a) the competence, relevance, materiality, privilege, or admissibility of the response, or the subject matter thereof; and (b) the use of any response, or subject matter thereof, in any subsequent proceedings.

(6) TAWC objects to each request to the extent that it is unreasonably cumulative or duplicative, or seeks information obtainable from some other source that is more convenient, less burdensome or less expensive.

(7) TAWC objects to each request to the extent it is premature such that it seeks information concerning matters about which discovery is ongoing and/or seeks information to be provided by expert witnesses.



(8) TAWC objects to each request to the extent it seeks information outside TAWC's custody or control.

(9) TAWC objects to the CAPD's requests to the extent that they have exceeded the number of discovery requests authorized by the Tennessee Regulatory Authority in contested case proceedings pursuant to Rule 1220-1-2-.11(5)(a), as modified with respect to the CAPD by the Hearing Officer's Procedural Order dated May 1, 2008. As such, the TAWC has responded to the CAPD's first 80 requests (inclusive of subparts). The TAWC reserves all of its objections with respect to the discovery propounded by the CAPD that is in excess of the limit.

(10) TAWC objects to requests that call upon TAWC to create, categorize, manipulate, customize or otherwise organize data regarding time periods outside of TAWC's historical test year. TAWC objects to all such requests because they are unduly burdensome, seek to have TAWC create work product and seek information that is not relevant to this rate case.

(11) TAWC's specific objections to each request are in addition to the General Objections set forth in this section. These General Objections form a part of each discovery response, and they are set forth here to avoid the duplication and repetition of restating them for each discovery response. The absence of a reference to a General Objection in response to a particular request does not constitute a waiver of any General Objection with respect to that discovery request. All responses are made subject to and without waiver of TAWC's general and specific objections.

Respectfully Submitted,

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Michael Miller

PART I: GENERAL

Question:

1. Identify each and every person whom the company expects to call as an expert witness at the hearing on the merits of this matter and the subject matter on which the expert is expected to testify.

Response:

The Company has provided direct testimony for nine witnesses consisting of the testimony of:

1. John Watson – President
2. Michael Miller – Treasurer/Comptroller
3. Sheila Miller – Asst. Treasurer
4. Robert Shiltz – Sr. Financial Analyst
5. Dr. Edward Spitznagel – Revenue Normalization
6. Joseph Van den Berg – Management Audit
7. Paul Herbert – Cost of Service and Tariff Design
8. John Spanos – Depreciation Study
9. Dr. Michael Vilbert – Cost of Capital

The Company does not anticipate any other witnesses in this case, but retains the right to do so if required.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Michael Miller/Dr. Edward Spitznagel

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

1. Using Mr. Spitznagel's model, please provide a comparison of monthly weather-normalized water utilization with actual utilization for each of the past ten years.

Response:

The Company objects to this question on the grounds that the requested information is not readily available in the format requested is overbroad and unduly burdensome, would be overly burdensome and, in part, is not relevant to this proceeding. Dr. Spitznagel's customer usage adjustments are calculated to be specific to a particular test-period, in this case the historical test-year for the twelve months ended November 2007. The customer usage adjustments for each of the ten years of information requested by the CAPD do not exist and would be extremely burdensome and costly to create. Even if the information was available given the ten-year time period, the Company objects to the relevancy of the requested data, which has already been fully analyzed in several previous general rate cases for TAWC and ruled on by the TRA.

Notwithstanding the objection, please see the attached document that shows the normalized residential and commercial customer usage factors developed by Dr. Spitznagel in the Company's three previous rate cases. Also see two computer files supplied to the parties in this case titled TNAM_2007_Residential_Sales_Tenn._xls and TNAM_2007_Commercial_Sales_Tenn._xls. These two files contain the historical usage data Dr. Spitznagel used to develop his study and testimony in this case.

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

2. Please provide, in Microsoft Excel or comparable format with formulas intact, the mean truncated Palmer Drought Severity Indices for the 30-year period from January 1978 to December 2007 mentioned on page 6 of Dr. Spitznagel's testimony.

Response:

The mean truncated Palmer Drought Severity Indices are provided in Row 70 of the accompanying Excel workbook: TN-CAPD-01-Part II-Q02 attachment.xls that is included on the enclosed CD. The workbook contains all the formulas and information used to derive these values from the original NOAA source data, including the URL at which the NOAA data is located.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Edward L. Spitznagel, Jr.

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

3. Please provide, in Microsoft Excel or comparable format with formulas intact, all inputs to Dr. Spitznagel's regressions in Appendix B to his testimony.

Response:

The inputs to Dr. Spitznagel's regressions are provided in the accompanying Excel workbook: TN-CAPD-01-Part II-Q03 attachment.xls that is included on the enclosed CD. These are, respectively, (1) the daily residential and commercial consumptions in gallons per day, (2) the truncated Palmer Drought Severity Indices from the workbook "CAPD DR1 PART 2 Question 2 attachment.xls," and (3) the values of the variable Since_90. All three sets of data are provided for the years 1998 to 2007. In addition, Dr. Spitznagel has provided sample regressions for residential and commercial consumption for the month of December, which match the results in Appendix B of his testimony.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Sheila Miller

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

4. Please provide a narrative explanation and all supporting data, workpapers, analyses and other documentation underlying the negative $406,877 test year adjustment to the revenues from "Sales for Resale" on line 13 of Exhibit No. 2, Schedule 2. Provide all data and calculations in Microsoft Excel or comparable format with formulas intact.

Response:

Please refer to the response to TRA Data Request 2, Question 2 which details each adjustment relating to revenues.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: John J. Spanos

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

5. Please provide all data, notes and any other documentation that was provided by the Company to Gannett Fleming in connection with its depreciation study. Provide this data and information in the same format as it was provided to Gannett Fleming.

Response:

All data, notes and other documentation that was provided to Gannett Fleming by Tennessee American Water Company in connection with the depreciation study is included on the enclosed CD and labeled as:

TN-CAPD-01-PART II-Q005 Attachment 1.pdf
TN-CAPD-01-PART II-Q005 Attachment 2.pdf
TN-CAPD-01-PART II-Q005 Attachment 3.pdf

Agrees to Trial Balance

*-Reserve Balance is either direct from a specific account on the PSC Report if a one-for-one relationship exists or the reserve on the PSC report is pro-rated to a specific sub-account based upon the Plant Balance for the account and it's percentage of the balance in the related sub-accounts.

The Tennessee-American Water Company, Inc., supplies water utility service to portions of Hamilton and Marion Counties in Tennessee and portions of Catoosa, Dade and Walker Counties in Georgia. The service area in Tennessee includes the Municipalities of Chattanooga, East Ridge, Red Bank, Ridgeside and the Town of Lookout Mountain. The service area in Georgia includes the Municipalities of Rossville and Lookout Mountain in Walker County and portions of the unincorporated areas of Catoosa and Dade Counties.

The Water Company served 65,532 metered customers as of December 31, 1989. Source of supply for the Water Company consists of a surface water supply (Tennessee River). This source of supply is treated at one production facility which is identified as the Citico Treatment Plant and has a rated capacity of 72 MGD. Treated water is delivered into a transmission and distribution system consisting of 1,176 miles of mains, 27 booster pump stations with a total rated capacity of 84.4 MGD, 22 distribution storage reservoirs and standpipes with a total capacity of 24.8 MG, and approximately 3,897 hydrants.

Scope and Purpose

The purpose of this depreciation study is to analyze the service life characteristics and net salvage of the depreciable utility plant in service for the Tennessee-American Water Company, Inc. Using these service life characteristics and net salvage percentages, annual accrual percentages have been recommended for each account of utility plant in service.

In connection with this study a physical inspection of above-ground utility plant was conducted. Additions and retirements data from the early 1920's through 1989 were gathered and analyzed in order to determine service life characteristics. Management's short and long range planning for changes and improvements, as embodied in the Company's Comprehensive Planning Study and five year capital investment budgets,

were reviewed. Also, discussions were held with management concerning current activities which may impact service life or net salvage. Salvage and cost of removal data were reviewed for the period 1975 - 1989. After analyzing service life characteristics, and calculating net salvage percentages, the next task was to determine annual accrual percentages. Data as of December 31, 1989 was used for this purpose.

Calculation of the annual accrual percentages was accomplished by using the remaining life accrual formula:

$$DA\% = \frac{UPIS - DR - (NS\% \times UPIS)}{RL} \div UPIS \times 100$$

Where:

DA% = Annual depreciation accrual expressed in percent for each account.

UPIS = Utility plant in service expressed in dollars for each account.

DR = Depreciation reserve for the account, expressed in dollars.

NS% = Net salvage expected for the utility plant in service when it is retired, expressed in percent.

RL = Remaining life for the account, expressed in years.

Method Used

There are two principal methods normally used to calculate depreciation accruals for water utilities, the remaining life method, and the whole life method. The whole life method utilizes the utility plant in service balance, the average service life, and the average net salvage to calculate annual accruals. The net salvage percentage is subtracted from one hundred percent and the balance is divided by the average service life to obtain an annual accrual percentage.

The system used for this depreciation study is the Straight Line Remaining Life System. This system calculates accruals by dividing the utility plant in service balance less the actual depreciation reserve less future net salvage by the remaining life of the account. The latter portion of the formula translates the result into terms of percent.

The advantage to the remaining life method as compared with the whole life method is the remaining life method uses the actual depreciation reserve as part of the formula. This incorporates past retirements and past net salvage directly into the calculation. Actual past salvage is credited to the book reserve and costs of removal are debited against the book reserve. A further advantage to the remaining life method is that it is self correcting over a period of time. Any number of factors influencing the useful service life of an account can change. These factors can result in changes in the average service life and thus the depreciation accrual rate. Since the remaining life method uses the accumulated depreciation reserve, any past under-accrual or over-accrual is automatically corrected when making accrual calculations.

In order to make a remaining life calculation of a depreciation accrual rate, four things must be determined:

(1) The remaining life attributable to each account;

(2) The book depreciation reserve attributable to each account (which is known for each account from the records of the Water Company);

(3) The future net salvage attributable to the account; and

(4) The investment in utility plant in service (which is known for each account from the records of the Water Company).

Determination of Remaining Life

(A) Actuarial Analysis

This approach is used for accounts with adequate retirements data. They are statistically analyzed to develop life estimates using the Iowa series of survivor curves (see Appendix A). A survivor curve is calculated for each account analyzed and is matched visually and by computer program to an appropriate Iowa curve, which gives Average Service Life (ASL) and retirement dispersion. Retirement dispersion is

referred to many times in this report. It means that the average service life is an area under a survivor curve and that retirements are dispersed about the average.

Four different general classifications of dispersions under the Iowa system have been identified and are in general use today. These are the R, L, S, and O. An "R" dispersion means that the maximum rate of retirement occurs to the right of the average service life in a graphical presentation, or after the average service life in terms of age. The "L" dispersion indicates the maximum rate of retirement occurs to the left of the average service life, or before the average service life in terms of age. The "S" dispersion indicates a symmetrical maximum rate of retirement, occurring approximately at the average service life. The "O" dispersion indicates a maximum rate of retirement at the origin of the graph, or at age zero. The "O" dispersion is seldom useful in the analysis of water utility property.

The number associated with a type curve is an indicator of the severity of the model relative to the average retirement rate. Therefore, an R-5 curve has a much higher peak retirement rate than an R-1 curve.

The remaining life for each account analyzed in this manner has been determined from the remaining life characteristics of the matching Iowa curve. This method of analysis was used for 18 accounts, representing 75.83 percent of the total investment in utility plant for the Water Company. A summary of accounts and the method used for each account is presented in Table 1.

(B) Semi-Actuarial Analysis

The semi-actuarial method of analysis involves the simulation of a set of plant balances or retirements for a period of years given the additions to the account. The computer uses retirement dispersion characteristics of the Iowa series of curves (as discussed above and on page 8) to calculate either simulated plant balances or simulated retirements for a period of years. This method checks the variation between the simu-

lated data and actual data for the account and determines an average service life and retirement dispersion using data that is easier to compile versus the actuarial method. This method was used for analysis of two accounts (Accounts 333.4 and 335.4). These accounts have a great volume of retirement activity which would be very difficult and expensive to compile for actuarial analysis. These accounts represent 14.09 percent of the total investment in utility plant for the Water Company.

(C) Structural Method

The third method of determining remaining life involves the estimation of a life span for a structure. This method of analysis was used for accounts representing structures with insufficient retirement data to enable use of the retirement rate method. For structural plant elements (such as pumping, account 304.22; water treatment, account 304.31; water storage, account 330.41; and general structures, accounts 304.51-304.53) an inspection was made, and a life span was estimated for that major structural element based on the age and condition of the structure, and management plans for the future. Auxiliary facilities and equipment (such as roofs, electrical wiring, doors, windows, fencing, security systems, etcetera) while likely to be retired in the interim between the present and the terminal year of the structure, were combined with the remaining life characteristics of the life span property (structures, etc.) to develop a weighted average remaining life for the account as a whole. This approach was used for nine accounts, representing 7.12 percent of the total investment in utility plant for the Water Company.

The terms Weighted Average Age and Weighted Average Remaining Life are used extensively throughout this report. For plant accounts comprised of numerous different vintages of plant investment, or dollar investments made in different years, each vintage year investment has a different age and a different remaining life. Therefore, in order to develop a meaningful statistic for age and remaining life for such

an account, the annual investment is multiplied by the age of that vintage, then this product for each vintage year is summed for the account. The Weighted Average Age is obtained by dividing the sum so developed by the plant balance in the year of the study. This is a direct dollar Weighted Average Age. Each vintage year investment also has a different remaining life based on the retirement dispersion and the average service life determined by analysis. The Weighted Average Remaining Life is determined in the same way as is the weighted average age. The remaining life for each vintage year as determined from the characteristics of the retirement dispersion and average service life is multiplied by the investment surviving for that year. The products for all the vintage years for an account are summed, and the weighted average remaining life is obtained by dividing that sum by the surviving plant balance in the year of the study.

(D) Average Service Life Estimate

For other accounts, estimates of average service life and dispersion were made based on the characteristics of the plant classified by that account. Results of studies for other American Water System companies were compared when making estimates. This approach was used for 12 accounts, representing 2.96 percent of the total plant investment in utility plant for the Water Company. A summary of accounts and methods used is presented in Table 1.

The Book Depreciation Reserve for Each Plant Account

The book depreciation reserve for Tennessee-American Water Company, Inc., is presently maintained by utility plant account. The balance by utility plant account at 12/31/89 was taken directly from the books and records of the Water Company.

Contributions in Aid of Construction/Customer Advances

The Water Company presently depreciates contributed property and customer advances on its books by utility plant account. In this study, the depreciation rates

calculated in Table 3 utilized utility plant and depreciation reserve balances for Accounts 331.4, 333.4, 334.4 and 335.4 which were adjusted and their respective contribution in aid of construction and customer advances amounts were deducted from the balances. Therefore, the depreciation rates calculated for those accounts reflect no contributions in aid of construction or customer advances.

It should be explained that contributions in aid of construction and customer advances were not deducted solely by the account balance at December 31, 1989. Rather, a detailed analysis was conducted to separate the annual activity which the Water Company experienced from these two accounting items. The Water Company maintained an accurate accounting by plant account back to at least 1979 for both utility plant and depreciation reserve balances. It should be noted the majority of contributions and customer advances occurred in the 1979-1989 period. However, prior to 1979, very few records existed and therefore it was determined to be appropriate to estimate the amount of contributions and advances on an annual basis by averaging several years of known data (1985-1989) and using this average to calculate a corresponding percentage by plant account. This percentage was applied to the annual additions which occurred by plant account prior to 1979 in order to obtain an estimate of those contributions and customer advances in earlier years. These estimates were then incorporated into determining a net utility plant balance and accumulated depreciation reserve balance for Accounts 331.4, 333.4, 334.4 and 335.4 at 12/31/89.

Determination of Future Net Salvage

In the remaining life method, past net salvage is incorporated into the calculation of depreciation accruals through use of the book reserve into which past salvage has been credited and against which past cost of removal has been debited. Ideally, future salvage should be estimated by trending past salvage data through the period representing the remaining life of the plant presently in service. In this case,

however, adequate data were not available to make reliable analyses for future trending.

For accounts with little or no data, net salvage was assumed to be zero percent or very close to zero percent unless some overriding factor was present. For example, there is no salvage data for account 340.53, Computers and Peripheral Equipment. This equipment will be removed from service primarily for technical obsolescence. Therefore, it should have some resale value when removed from service with a very low cost of removal and therefore was assigned a positive net salvage of 10%. Appendix B, contained in a separate volume, presents a detailed salvage analysis by account on available data for the period 1975 to 1989.

After information was developed for Remaining Life, Book Reserve, Future Net Salvage by Account, and Plant Investment, depreciation accruals were calculated using the Remaining Life Method.

Actuarial Analysis

As noted earlier, accounts were analyzed using actuarial methods. The service life analysis was conducted through computer processing of the history of additions, retirements and plant balances. The method of computer analysis used is referred to as the "Retirement Rate Method." Actual retirement data is composited by age at the time of study. The computer program then calculates a series of retirement ratios. A ratio is calculated for each year of age in the study year by dividing the amount of plant retired by the amount of plant exposed to retirement at the beginning of that year of age. A survivor curve is plotted from these ratios because the percent of surviving plant can be determined from the retirement ratio at each year of age. Because the utility plant in service is made up of elements having various ages, the resulting plotting usually will not cover an entire service life and the plotting is called a "stub curve." Theoretical curves were developed by Robley Winfrey at Iowa State College

in 1935 and are commonly called the "Iowa Curves." By matching the computer-generated "stub" curves for plant accounts with the theoretical curves and selecting the best match, the historical service life characteristics are established. The longer stub curves permit excellent matching and the shorter ones require more judgment. Please see Appendix A for graphs of matched curves for this study.

There are four series of Iowa Curves: R, L, S and O Modal. R stands for Right; L stands for Left; S stands for Symmetrical; and O stands for Origin. The left modal curves have their maximum retirement rate to the left of, or prior to, the average service life age. The right modal has the maximum retirement rate to the right of, or after, the average service life. Origin modal curves have the maximum retirement rate at the origin and Symmetrical modal curves have the maximum retirement rates symmetrically about the average service life.

The number associated with a type curve is an indicator of the severity of the model relative to the average retirement rate. Therefore, an R-5 curve has a much higher peak retirement rate than does an R-1 curve.

"The families of Iowa-type curves represent a summary of studies of the survivor characteristics of many types of industrial and utility properties. The purpose of these studies was to generalize the attrition of units of physical properties into curves representing expected trends. It is probable that the motivation for the assembly of these curves lay in the desire to present a more coherent approach to the development of life estimates than that employed in the past century. Interest in mathematics and economics as well as in regulatory procedure also may have motivated these studies. Regardless of the motivation, these studies resulted in a series of type curves which set forth what was learned concerning industrial property life characteristics."

The above paragraph is quoted from "The Estimation of Depreciation" by Fitch, Wolf and Bissinger, Depreciation Programs, Inc., Kalamazoo, Michigan, and well

describes the basis for Iowa curves. Please see Table 2 for results of statistical analyses. The result of the actuarial analysis described above must then be balanced with plans, programs and policies of the Company which can have an impact on the ASL of the property being analyzed.

A good case in point is Account 334.42 Bronze Case Meters/Old Style. The overall actuarial analysis for this account yielded a 29 year ASL. However, management policy at present is to install newer style bronze case meters. When these meters are removed from service for periodic testing at 10 years, they are scrapped. Those that pass the first testing period are unlikely to survive the second. For example, manufacturers typically warrant these meters for 15 years or 1.5 million gallons. Therefore, small meters will experience approximately a 10 year ASL. Consideration must be given to the fact that larger meters are rebuilt and restored to service. Therefore, a longer average service life than 10 years is warranted.

Table 2 shows the life characteristics of average service life, average age and average remaining life for all depreciable accounts.

Table 3 shows the results of the depreciation study. The remaining life depreciation accruals by account are calculated per the formula shown on page 3. The depreciation accrual percentages are also calculated in the last column of Table 3. These are calculated for each account by dividing the annual accrual amount by original cost plant investment.

On Table 4 the original cost for net plant investment and book reserve are shown. The net salvage percentage determined as part of this study (in Appendix B) is also shown.

Table 5 presents an overall summary of Tables 1 through 4 and illustrates the derivation of the annual depreciation expense accrual amount and rate.

Table 6 presents a comparison of the current and proposed depreciation charges

at December 31, 1989 and their respective depreciation rates.

Recommendations:

It is recommended that the composite depreciation accrual rates developed in this study and shown on Table 3 be implemented by the Water Company. Since the results of this study require higher revenues for depreciation expense as a Water Company budget item, implementation of these new depreciation accrual rates should take place at the time of resolution of the Water Company's next rate case.

Analysis of Account 304.22 - Pumping Structures

Account 304.22 represents the installed cost of structures, improvements, and appurtenances used for pumping operations. The 12/31/89 utility plant balance is $620,344. The depreciation reserve at 12/31/89 is $165,690.

There are numerous pumping structures throughout the service territory. The structural elements of these stations were assigned a life span in the range of 50-125 years, based on age and condition. A facility may have been assigned a terminal year due to its inter-relationship to another facility. For instance, a main service pumping facility within the water treatment plant would become obsolete at the end of the useful life of the water treatment plant.

The average service life of these facilities was estimated at 60 years. The resulting weighted average remaining life is 22.89 years. The weighted average age is 25.19 years.

Analysis of salvage and cost of removal data for the years 1975-1989 indicate a net salvage factor of zero percent. This result reflects the retirement of a number of small non-structural items. In order to recognize the future cost of removal likely to be experienced at the end of the useful lives of the various booster pumping stations in this account, a net salvage factor of negative 15 percent is assigned to this account in order to be consistent with the salvage factor assigned to all structural accounts.

Analysis of Account 304.31 - Water Treatment Structures

Account 304.31 represents the installed cost of structures and improvements used in connection at the Citico water treatment plant. The 12/31/89 plant balance is $1,643,693. The depreciation reserve balance at 12/31/89 is $233,979.

Structural elements of this account were assigned a life span of 125 years which resulted in an average service life estimate for all elements in these facilities of 75 years. This approach results in a weighted average remaining life of 22.03 years. The weighted average age of the account is 13.53 years.

Net salvage and cost of removal data for the period 1975-1989 resulted in a negative net salvage of 10.22 percent. The majority of the retirement data consisted of non-structural items with no salvage or cost of removal data. The negative net salvage estimate of 10.22 percent is mainly the result of a major renovation which occurred to the existing chemical building in 1988-1989. While the building itself was not retired, a large amount of components were retired and resulted in a high cost of removal in 1989. However, a factor of negative 15 percent was assigned to this account for calculation of depreciation accrual rates in order to be consistent with the net salvage factor assigned to all structural accounts.

Analysis of Account 304.32 - Water Treatment Structures and Improvements - Painting

Account 304.32 represents the recent cost of painting various structures located at the Citico treatment plant. These structures include the Aldrich filter units and other related facilities. The utility plant in service balance at 12/31/89 is $77,313. The depreciation reserve balance at 12/31/89 is $20,539.

Tank painting normally has a useful life of 10-15 years before a reapplication is necessary. In accordance with guidelines used by other American Water System companies and their respective regulatory authorities, a depreciation rate of ten percent was assigned to this account for the calculation of depreciation accruals. In addition, no salvage data was available for analysis. Therefore, the negative 5.00 percent net salvage factor used for Account 330.42 was applied to this account because of similar types of structures being painted. Account 330.42 experienced several instances of tank painting removal costs (sandblasting, clean-up, etc.) which were booked and recorded separately from the new tank painting cost for those facilities.

Analysis of Account 304.4 - Transmission and Distribution Structures and Improvements

Account 304.4 represents the installed cost of a new meter service center and the cost of remodeling associated with the two buildings utilized by the distribution department. The 12/31/89 utility plant balance is $470,321 while the depreciation reserve at 12/31/89 is $6,800.

An average service life of 50 years has been estimated for the various elements of this account. This analysis results in a weighted average age of 4.29 years, and a weighted average remaining life of 32.34 years.

There are no salvage data available for the 1975 to 1989 period because no retirement activity has been experienced in this account. The net salvage factor of negative 15 percent was utilized for this account to be consistent with the factor assigned to all structural accounts in this study.

Analysis of Account 304.51 - Office Structures

Account 304.51 typically represents the installed cost of office structures and appurtenances. However, since the Water Company is presently leasing the main office building it occupies, the account balance reflects only a number of interim improvements made to the facility. The utility plant balance at 12/31/89 is $28,358. The depreciation reserve at 12/31/89 is $9,858.

Since the account balance consists of leasehold improvements, we have utilized a straight curve dispersion with a 20 year average service life to analyze this particular account. The analysis results in a weighted average age of 7.2 years and a weighted average remaining life of 16.4 years.

An analysis of net salvage data from 1975 to 1989 indicates a net salvage factor of negative 1.38 percent. However, since this account contains leasehold improvements, we have applied a zero percent net salvage factor to calculate depreciation accrual rates in this account.

Analysis of Account 304.52 - Stores, Shops, and Garage Structures

Account 304.52 represents the constructed cost of structures and appurtenances used for stores, shops and garage structures. The 12/31/89 utility plant balance is $140,877. The 12/31/89 depreciation reserve is $61,244.

Each structural element was assigned a life span based on age and condition resulting in an average service life of 50 years. The resulting weighted average remaining life is 14.76 years. The weighted average age is 30.78 years.

Analysis of net salvage data for the period 1975 to 1989 indicated a net salvage factor of negative 7.07 percent. This value is the result of one significant non-structural item which was retired at the distribution garage in 1979. However, in order to be consistent with all structural accounts in this study, a negative 15 percent was used for calculating depreciation accrual rates in this account.

Analysis of Account 304.53 - Miscellaneous Structures

This account represents the constructed cost of structures that cannot be classified in any of the other structural accounts. The 12/31/89 utility plant balance is $292,975. The 12/31/89 depreciation reserve is $11,497.

The structural elements of this account were assigned a life span based on age and condition resulting in an average service life of 50 years. The resulting weighted average remaining life is 19.17 years. The weighted average age is 5.46 years.

There are no salvage data available for analysis for the period 1975 to 1989 because no retirement activity was experienced in this account. The net salvage factor of negative 15 percent used for all structural accounts was assigned to this account to calculate depreciation accrual rates as well.

Analysis of Account 306.2 - Lake, River and Other Intakes

Account 306.2 represents the installed cost of lake, river, and other intakes used as a source of supply. Items included are land clearing, conduits, cribbing, fences, gatehouses and equipment, intake piping, intake wells, lighting, screens and racks. Investment in this account consists of the intake structure at the Citico treatment plant located on the Tennessee River. The utility plant in service balance at 12/31/89 is $188,346. The depreciation reserve balance at 12/31/89 is $68,680.

The life span of the structural elements of this account have been keyed to the terminal year of the Citico treatment plant facilities. The average service life of the facilities in this account was estimated at 75 years. The weighted average remaining life of this account is 23.07 years and the weighted average age is 39.74 years.

One retirement has taken place in this account during the 1975-1989 period analyzed for salvage and cost of removal. This retirement resulted in an abnormal negative net salvage percentage of 111 percent. The roof and decking of the intake structure containing the screen house was replaced and the original cost of installing these items was exceeded by the cost of removal. In order to begin recognizing the cost of removal that will likely be experienced at the end of the useful life of the intake structure, a negative 15 percent net salvage percentage has been utilized to calculate depreciation accruals in this study.

Analysis of Account 310.2 - Other Power Production Equipment

Account 310.2 represents the installed cost of electric generation equipment. The 12/31/89 balance of utility plant in service is $149,662. The depreciation reserve at 12/31/89 is $41,558.

The life characteristics determined for Account 311.22 have been applied to Account 310, in that similar equipment and installations are involved. Therefore, a 48 year average service life with an R-4 dispersion was used. The weighted average age of this installation is 10.66 years while the weighted average remaining life is 22.45 years.

Salvage data for Account 310.2 during the period 1975 to 1989 is nonexistent because of the corresponding lack of retirement data. Therefore, the negative 5.00 percent net salvage factor used for Account 311.22 was applied to this account to calculate depreciation accruals due to the similar types of equipment.

Analysis of Account 311.22 - Electrical Pumping Equipment

Account 311.22 represents the installed cost of electric motors, pumps, water piping in the pumping station, electric switchgear, instrumentation, controls, etc. The utility plant balance of electric pumping equipment at 12/31/89 was $2,367,405. The depreciation reserve at 12/31/89 is $1,306,260.

Account 311.22 was analyzed using the actuarial analysis method. Data available for analysis include additions and retirements for the period 1921 to 1989. This analysis yielded a 48 year average service life and an Iowa Curve R-4 dispersion. The weighted average remaining life is 28.88 years and the weighted average age is 20.40 years. Other studies performed for American Water System Companies have yielded results in the range of 26 to 60 years. Therefore, these results fit well into the general range of experience.

Analysis of net salvage for the period 1975 to 1989 yielded an average net salvage of negative 3.35 percent. Therefore, a factor of negative 5.00 percent was used for calculation of depreciation accruals for this account.

Analysis of Account 311.23 - Diesel Pumping Equipment

Account 311.23 represents the installed cost of pumping equipment driven by diesel engines. This also includes water piping in the station, valves, instrumentation, controls, etc. The 12/31/89 balance of utility plant in service is $24,431. The 12/31/89 depreciation reserve balance is $10,059.

The service life characteristics determined for Account 311.22 have been applied to Account 311.23 in that similar equipment and installations are involved. Therefore, an average service life of 48 years was used with an R-4 dispersion. The weighted average remaining life is 32.38 years and the weighted average age is 15.34 years.

There were no salvage data for the period 1975 to 1989 for this account because no corresponding retirements occurred during this period. Therefore, the net salvage factor for Account 311.22, negative 5.00 percent, is assigned to this account for the calculation of depreciation accrual rates.

Analysis of Account 311.27 - Other Pumping Equipment

Account 311.27 represents other pumping equipment. The 12/31/89 plant balance is $4,166. The 12/31/89 depreciation reserve balance is $1,961.

The service life characteristics of Account 311.22 have been applied to this account. The resulting weighted average remaining life is 14.71 years and the weighted average age is 28.76 years.

Net salvage characteristics for Account 311.22 were also used for this account because of the lack of data. This is the result of no retirements occurring during the 1975-1989 period. Therefore, a net salvage factor of negative 5.00 percent was assigned to this account for calculating depreciation accrual rates.

Analysis of Account 320.31 - Water Treatment Equipment

Account 320.31 represents the cost installed of equipment, instruments, controls, etc. used in the treatment of water. This includes chemical treatment equipment, filter media and controls, sedimentation and flocculating facilities. The 12/31/89 balance of utility plant in service is $8,313,431. The 12/31/89 depreciation reserve is $2,010,630.

Data available for analysis include additions and retirements for the period 1921 to 1989. An actuarial analysis was performed, resulting in the selection of an average service life of 36 years with an Iowa Curve S-2 dispersion. The weighted average age is calculated at 18.80 years and the weighted average remaining life is 20.56 years.

Analysis of net salvage data for the period 1975 to 1989 resulted in an overall average of negative 11.68 percent. The trend is toward increasingly negative net salvage. Therefore, a net salvage factor of negative 12.0 percent is used to calculate depreciation accruals for this account.

Analysis of Account 320.33 - Granular Activated Carbon Media

Account 320.33 represents the cost of Granular Activated Carbon filter media for the removal of organic solvents, tastes and odors from treated water. The utility plant in service balances at 12/31/89 is $524,156. The depreciation reserve balance at 12/31/89 is $74,453.

This filter media is typically regarded as having a five year service life. Therefore, remaining lives were calculated using an Iowa Curve R-2.5 dispersion and the five year ASL. The weighted average remaining life is 2.63 years and the weighted average age is 3.00 years.

Salvage and cost of removal data for the 1975-1989 period indicates a net negative salvage factor of 9.8 percent. Therefore, a net salvage factor of negative 10 percent was assigned to this account for the calculation of depreciation accruals.

Analysis of Account 330.41 - Distribution Reservoirs and Standpipes

Account 330.41 represents the cost of reservoirs, tanks, and standpipes used in storing water for distribution. It includes such items as land clearing, fences, gates, landscaping, lighting systems, instrumentation and controls. These storage facilities are located in the Water Company's service area at locations determined by engineering analysis. The 12/31/89 balance of utility plant in service is $2,172,993. The 12/31/89 depreciation reserve balance is $757,137.

Data available for analysis include additions and retirements data for the period 1912 to 1989. There are several tank retirements included in that data, but the data really do not provide the type of record that would make actuarial or semi-actuarial analysis reliable. Therefore, each major tank location was analyzed individually using a 50-100 year life span for the tank structure itself based on age, condition and material of construction. As a result, an average service life of 75 years was estimated for the various elements in this account. Using this approach, the weighted average age is 20.30 years, and the weighted average remaining life is 44.55 years.

Analysis of net salvage data for the period 1975 to 1989 yields an average net salvage of negative 5.51 percent. This result reflects retirement of several small non-structural items for this period. Instead of using the indicated factor, a net salvage factor of negative 15 percent is assigned to this account in order to be consistent with the salvage factor assigned to all structural accounts in this study. This factor is utilized in the calculation of depreciation accruals for this account.

Analysis of Account 330.42 - Distribution Reservoirs and Standpipes - Painting

Account 330.42 represents the cost of painting the various distribution reservoirs and standpipes located within the Water Company's service area. The utility plant in service balance at 12/31/89 is $399,052. The depreciation reserve balance at 12/31/89 is $59,730.

Tank painting normally has a useful life of 10-15 years before a reapplication is necessary. In accordance with guidelines used by other American Water System companies and their respective regulatory authorities, a depreciation rate of ten percent was assigned to this account for the calculation of depreciation accruals. In addition, an analysis of limited salvage data for the 1975-1989 period yielded an average net salvage of negative 3.4 percent. The Water Company, in recent years, has started to book and record separately the cost of removal incurred from earlier tank coatings. Originally, this cost was included as part of the overall new tank painting estimate. Therefore, in order to begin recognizing the increasing cost of removal related to tank painting, a net salvage factor of negative 5.00 percent was assigned to this account.

Analysis of Account 331.4 - Transmission and Distribution Mains

Account 331.4 represents the cost installed of transmission and distribution mains, valves, fittings, etc. It also can include the cost of items such as pavement restoration, pressure regulators, sterilization, and the trenching involved with installation of a main. The utility plant balance at 12/31/89 is $41,650,416, exclusive of contributions in aid of construction (CIAC) and customer advances (CA). The depreciation reserve at 12/31/89 is $5,432,507, exclusive of CIAC and CA.

This account was separated into three subaccounts based solely upon the size of the transmission and distribution mains. Those mains which were four inches and less in diameter were classified in Subaccount 331.41. Those mains which were six inch to ten inch in diameter were classified in Subaccount 331.42. Finally, those mains which were twelve inches and greater in diameter were classified in Subaccount 331.43. It should be noted that prior to 1965 actual recordkeeping of the size of mains installed was incomplete. Therefore, an estimate of the different sizes of main installed each year prior to 1965 was made in order to classify all the mains as far back as possible (1920). The estimate was developed by analyzing all the retirements which occurred by subaccount for each vintage year. A ratio of each subaccount's retirements to the total retirements by vintage year was developed and this ratio was applied to the total additions by vintage year. This method allowed an approximate estimate of annual additions to be developed by subaccount for each vintage year.

The estimated utility plant balance at 12/31/89 for Account 331.41, less CIAC and CA is $5,795,130. The estimated respective utility plant balances for Accounts 331.42 and 331.43 at 12/31/89, exclusive of CIAC and CA are $24,235,709 and $11,619,577. The estimated depreciation reserve balances for Accounts 331.41, 331.42 and 331.43, exclusive of CIAC and CA, are $759,319, $3,176,357 and $1,496,831, respectively.

The data available for actuarial analysis are additions and retirements from 1920 to 1989. The bulk of the investment in the overall account has occurred since the early 1960's.

An actuarial analysis was performed on the retirement data of Subaccount 331.41 which yielded an average service life of 85 years with an Iowa Curve R-1 dispersion. Similar analyses of Subaccounts 331.42 and 331.43 yielded an average service life of 90 years with an Iowa Curve R-3 dispersion and an average service life of 85 years with an Iowa Curve R-3 dispersion, respectively. Because of the similarities of the dispersions and average service lives among the subaccounts, it was decided to utilize a common average service life of 85 years with an Iowa Curve R-3 dispersion in the calculation of remaining lives for these subaccounts.

The calculated weighted average age for Subaccount 331.41 is 28.00 years, Subaccount 331.42 is 15.00 years and Subaccount 331.43 is 18.30 years. The calculated weighted average remaining life for these same subaccounts is 58.12 years, 70.24 years and 67.10 years, respectively.

The initial analysis of salvage data for the overall account yielded an average net salvage of positive 19.85 percent. Annual analyses ranged from negative 62 percent to positive 958 percent. There appeared to be a number of retirement work orders which experienced an unusually high salvage value versus a small retirement and cost of removal amount. Further investigation determined that a number of these retirement work orders were a part of urban renewal projects ongoing in the City of Chattanooga between 1975 and 1980 which received a significant level of federal funds. The high salvage values reflect these contributions in aid of construction for relocating/removing an older distribution main. It is our opinion that those retirement work orders with abnormally high salvage values do not reflect the typical value of the distribution main removed from service. Therefore, an adjusted salvage analysis was conducted with

those retirement work orders removed. In addition, a number of retirement work orders experienced high cost of removal amounts for corresponding low retirement amounts of a number of distribution mains. These work orders were also ignored in the adjusted salvage analysis for Account 331.4.

An analysis of the adjusted net salvage data for the period 1975 to 1989 yielded an average net salvage of negative 13.87 percent. Annual analyses of the adjusted data now range from negative 54 percent to negative 1 percent. The trend in the American Water System is toward increasingly negative net salvage. Therefore, a negative 15.00 percent is used to calculate depreciation accruals for this account. This value is consistent with similar salvage factors used for this account in a number of American Water System companies.

Analysis of Account 333.4 - Services

This account represents the cost installed of service pipes and accessories leading to customers premises from the main in the street. It also includes items such as corporation stops and tees, gate valves, boxes, joints, municipal permits, pavement replacement, tapping the main, etc. The 12/31/89 plant balance, exclusive of CIAC and CA, is $7,485,374. The 12/31/89 depreciation reserve balance, exclusive of CIAC and CA, is $2,562,307.

This account was analyzed using the simulated plant method of analysis. Retirement data was analyzed for the 1920-1989 period. The most appropriate Iowa curve from computer analysis was the R-4, 77 year curve. The weighted average age is 19.8 years. The weighted average remaining life is 57.27 years.

The net salvage analysis for the 1975-1989 period yielded an average net salvage of negative 65.8 percent. The trend of increasing cost of removal has continued with current net salvage figures for the past 15 years, with annual net salvage ranging from negative 183 percent to positive 197 percent. A negative 65 percent net salvage is used for this study for future net salvage. This approach will gradually move toward the indicated amount of net salvage.

Analysis of Account 334.42 - Bronze Case Water Meters/Old Style

Account 334.42 represents the cost of old style bronze case meters used for measuring the quantity of water delivered to users. The estimated account balance for Account 334.42 at 12/31/89, exclusive of CIAC and CA, is $1,312,993. The depreciation reserve at 12/31/89, exclusive of CIAC and CA, is $630,323.

An actuarial analysis of this account was performed using additions data from the 1921 to 1973 period and retirement data from the 1921 to 1989 period. The analysis resulted in an average service life of 29 years with an Iowa S-3 dispersion. This average service life results in a weighted average remaining life of 11.01 years. The weighted average age is 34.10 years.

Net salvage over the 1975 to 1989 period averaged 24.93 percent for the entire Account 334.4 (334.42, 334.43 and 334.44, inclusive). The data from 1975 to 1989 do not indicate a trend and in addition, salvage data could not be separated into different subaccounts for analysis of salvage and cost of removal data. Therefore, a net salvage percentage of 25.00 percent is used to calculate depreciation accruals for this subaccount.

Analysis of Account 334.43 - Plastic Case Water Meters

Account 334.43 represents the cost of plastic case meters used for measuring the quantity of water delivered to users. The estimated account balance for 334.43 at 12/31/89, exclusive of CIAC and CA, is $126,881. The depreciation reserve at 12/31/89, exclusive of CIAC and CA, is $77,610.

An actuarial analysis was conducted for utilizing additions data from the 1973 to 1981 period and retirement data from the 1975 to 1989 period. The analysis resulted in an average service life of 10.5 years with an Iowa L-4 dispersion. The weighted average remaining life was calculated to be 2.53 years. The weighted average age is 9.50 years.

No net salvage data were available for analysis of this subaccount. Plastic case meters have little or no salvage value and therefore, a net salvage factor of zero percent was assigned to this subaccount.

Analysis of Account 334.44 - Bronze Case Water Meters/New Style

Account 334.44 represents the cost of new style bronze case meters used for measuring the quantity of water delivered to users. The estimated account balance for Account 334.44 at 12/31/89, exclusive of CIAC and CA, is $1,011,393. The depreciation reserve at 12/31/89, exclusive of CIAC and CA, is $503,827.

An actuarial analysis of this account was not performed because of the lack of additions and retirement data available for analysis of these lightweight bronze case meters. Therefore, we have assumed the ASL and dispersion calculated for Account 334.42 is appropriate to analyze this account. The analysis of Account 334.42 resulted in an average service life of 29 years with an Iowa S-3 dispersion. This average service life results in a weighted average remaining life of 25.70 years. The weighted average age is 3.30 years.

Net salvage over the 1975 to 1989 period averaged 24.93 percent for the entire Account 334.4 (334.42, 334.43 and 334.44, inclusive). The data from 1975 to 1989 do not indicate a trend and in addition, salvage data could not be separated into different subaccounts for analysis of salvage and cost of removal data. Therefore, a net salvage percentage of 25.00 percent is used to calculate depreciation accruals for this subaccount.

Analysis of Account 334.45 - Meter Installations

Account 334.45 represents the cost of labor employed, materials used and expenses incurred to install customers meters. It includes the cost of meter couplings, yokes, vaults, stops, etc. The account balance at 12/31/89 is $2,318,398. The 12/31/89 depreciation reserve balance is $471,448.

An actuarial analysis was performed on this account utilizing additions data from the 1938 to 1989 period and retirements data from the 1946 to 1989 period. The analysis resulted in an average service life of 60 years with an Iowa L-1 dispersion. This average service life results in a weighted average remaining life of 51.70 years. The weighted average age is 11.10 years.

Salvage data for the 1975 to 1989 period indicate an average net salvage of positive 1.08 percent over the past 15 years. Annual net salvage ranged from negative 108 percent to positive 573 percent. However, the past five years (1985-1989) yielded an average net salvage of negative 3.9 percent. Therefore, since the future trend is toward increasingly negative net salvage, a net salvage factor of negative 5.00 percent was used to calculate depreciation accruals for this account. This value compares favorably with similar factors utilized in American Water System companies.

Analysis of Account 335.4 - Hydrants

This account includes the cost installed of hydrants owned by the utility. It also includes such items as connection to the main, excavation, pavement replacement, pipe, including drains, the tee at the main and valves and valve boxes. The 12/31/89 plant balance, exclusive of CIAC and CA, is $3,531,057. The 12/31/89 depreciation reserve balance, exclusive of CIAC and CA, is $415,823.

This account was analyzed using the Simulated Plant method of analysis. The main reason for using this method is because the hydrants were owned by the City of Chattanooga prior to 1971 and additions and retirement data were not available for analysis. Therefore, the study utilized the data maintained by the Water Company for the 1971 to 1989 period. The analysis resulted in an average service life of 55 years with an Iowa R-1 dispersion. This average service life results in a weighted average remaining life of 46.78 years.

Net salvage for hydrants has traditionally been positive due to the above ground recoverable metal in the hydrant. The average net salvage for hydrants for the period of 1975 to 1989 results in a positive 6.94 percent. Analyses of individual years yields a range of net salvage of positive 134 percent to negative 43 percent. However, the past five years (1985-1989) yielded an average net salvage of negative 18.3 percent. Therefore, since the trend is toward increasingly negative net salvage, a negative 20.00 percent was used to calculate depreciation accrual rates for this account.

Analysis of Account 339.2 - Other Water Source Plant

Account 339.2 represents any source of supply plant not classifiable in one of the other source of supply plant accounts. The 12/31/89 utility plant balance in Account 317 is $8,526. The 12/31/89 depreciation reserve for this account is $1,550.

The various elements in this account were estimated to have an average service life of 30 years. The weighted average age is 13.36 years and the weighted average remaining life is 13.81 years.

No net salvage data were available for analysis because no retirement activity has occurred in this account. A net salvage factor of zero percent was assigned to this account.

Analysis of Account 340.51 - Office Furniture

Account 340.51 represents the cost of office furniture not permanently attached to any structure. Items such as desks, chairs, book cases, shelves, drafting room equipment, file cabinets, tables, etc. are included in this account. The 12/31/89 utility plant in service balance is $270,659. The 12/31/89 depreciation reserve balance is $88,035.

Data available for analysis are additions and retirements for the period 1920 to 1989. An actuarial analysis of the available data yielded a 27 year ASL with an L-2 dispersion. This result is in a reasonable range of results when compared with recent studies conducted for other American Water System Companies. Therefore, this account yields a weighted average age of 7.50 years and a weighted average remaining life of 21.09 years.

Analysis of net salvage data for the period 1975 to 1989 results in an average net salvage of 7.72 percent. Therefore, based on the indicated factor, a net salvage factor of 10.00 percent was used to calculate depreciation accrual rates in this study for this account.

Analysis of Account 340.53 - Computers and Peripheral Equipment

Account 340.53 represents the cost of computer hardware purchased and installed. The account balance at 12/31/89 was $688,356. The 12/31/89 depreciation reserve balance is $114,862.

Computer equipment is subject to rapid changes in technology. It is doubtful that wear and tear or economic conditions will cause the replacement of this equipment, however, better and faster machines will become available. A five year average service life and an Iowa Curve of R-2.5 was assigned to this account. This approach results in a weighted average age of 2.82 years and a weighted average remaining life of 2.72 years.

There are no net salvage data available for analysis for the period 1975 to 1989. Since it is unlikely that this equipment will be given an opportunity to wear out, some salvage value should be assumed. However, because the equipment will likely become obsolete, there will not be a great demand for it. Therefore, a 10 percent salvage value is assigned to calculate depreciation accrual rates for the equipment in this account.

Analysis of Account 340.54 - Other Office Equipment

Account 340.54 represents the cost of such items as typewriters, adding machines, copiers, and other non-computers that are electric or electronic. The account balance at 12/31/89 was $77,641. The 12/31/89 depreciation reserve balance is $37,193.

Data available for analysis include additions and retirements for the period 1966 to 1989. An 18 year ASL with an Iowa Curve S-1 dispersion was assigned to this account for this study based on an actuarial analysis of the data. The weighted average age is 6.30 years and the weighted average remaining life is 12.56 years.

A review of net salvage data for the period 1975 to 1989 indicates net salvage factor of 1.01 percent. Therefore, a net salvage factor of 1.00 percent was used for calculating depreciation accrual rates for this account.

Analysis of Account 340.55 - Computer Software

The balance at 12/31/89 for this account is $33,017. The 12/31/89 depreciation reserve balance is $6,289.

Computer software is a more volatile item than computer hardware. Several generations of software are available at any given time. Greater functionally and ease ot use are being provided with each newer version. A five year ASL and an Iowa Curve of R-2.5 was assigned to this account for this study. This approach results in a weighted average age of 2.89 years, and a weighted average remaining life of 2.55 years.

Net salvage is zero since there is no market for used software.

Analysis of Account 341.52 - Transportation Equipment-Light Duty Trucks

Account 341.52 includes the cost of light trucks used for utility purposes. In addition to trucks it may include truck beds and trailers. The 12/31/89 utility plant balance is $673,778. The 12/31/89 depreciation reserve balance is $221,960.

Data available for analysis includes additions and retirements for the period 1965 to 1989. An actuarial analysis of the available data results in a 7.3 year ASL with an Iowa S-3 dispersion. The weighted average remaining life for this account is 5.03 years. The weighted average age is 3.40 years.

Analysis of net salvage data for the period 1975 to 1989 resulted in a net salvage factor of 19.34 percent. Therefore, a factor of 20.00 percent was used in the calculation of depreciation accruals for this account.

Analysis of Account 341.53 - Transportation Equipment - Heavy Duty Trucks

Account 341.53 includes the cost of heavy or specialty trucks used for utility purposes. In addition to trucks it may include truck beds and trailers. The 12/31/89 utility plant balance is $250,871. The 12/31/89 depreciation reserve balance is $120,256.

Data available for analysis provided inconsistent results by actuarial analysis. Therefore, because of the similarity to Account 341.52, the ASL and dispersion calculated for this account was applied to Account 341.53. This approach resulted in a weighted average remaining life of 2.71 years. The weighted average age is 5.33 years.

Analysis of net salvage data for the period 1975 to 1989 resulted in a net salvage factor of 24.69 percent. Therefore, a factor of 25.00 percent was used in the calculation of depreciation accruals for this account.

Analysis of Account 341.54 - Automobiles

Account 341.54 represents automobiles. The utility plant in service balance at 12/31/89 is $170,378. The depreciation reserve balance at 12/31/89 is $60,601.

An analysis of Account 341.54 using the actuarial analysis method indicates that for the period 1966 to 1989 the average service life of the account was 5.7 years with an Iowa S-2 dispersion. The weighted average remaining life for this account is 3.74 years. The weighted average age is 2.20 years.

Analysis of net salvage data for the period 1975 to 1989 averaged 26.57 percent. Therefore, a salvage factor of 25.00 percent was used to calculate depreciation accruals for this account. This value compares favorably to recent studies conducted for other American Water System Companies.

Analysis of Account 341.55 - Other Transportation Equipment

Account 341.55 represents auxiliary equipment for trucks. The utility plant in service balance at 12/31/89 is $27,968. The depreciation reserve balance at 12/31/89 is $20,003.

Limited retirement data were available for analysis regarding this account. Therefore, remaining lives were calculated based on a 10 year average service life with an Iowa R-1 dispersion. This approach results in a weighted average age of 8.13 years and a weighted average remaining life of 4.97 years.

There are no salvage data available for analysis for this account. Therefore, the net salvage factor for Account 341.54 was used to calculate depreciation accrual rates for this account.

Analysis of Account 342.5 - Stores Equipment

Account 342.5 represents the cost of equipment used for the receiving, shipping, handling, and storage of materials and supplies. Items such as chain falls, counters, cranes, hoists, lockers, scales, shelving, storage bins, etc. are included in this account. The 12/31/89 balance of utility plant in service is $24,022. The 12/31/89 depreciation reserve balance is $4,785.

There were insufficient retirements data to perform an actuarial or semi-actuarial analysis. Generalized data indicate an ASL of twenty years for this account. A straight curve dispersion was used for this study. The weighted average age is 7.81 years and the weighted average remaining life is 16.09 years.

Limited net salvage data were available for the period 1975 to 1989. A zero net salvage factor is assigned in this study to calculate depreciation accrual rates.

Analysis of Account 343.5 - Tools, Shop and Garage Equipment

Account 343.5 represents the cost of tools and equipment used in construction and repair work not specifically provided for in other accounts. It includes air compressors, battery chargers, cable pulling equipment, concrete mixers, machine tools, etc. The 12/31/89 balance of utility plant in service is $252,672. The 12/31/89 depreciation reserve balance is $105,765.

Data available for analysis include additions and retirements for the period 1965 to 1989. An actuarial analysis was performed for this band resulting in an ASL of 16 years with an Iowa Curve L-0 dispersion. The weighted average age is 7.50 years and the weighted average remaining life is 12.50 years.

An analysis of net salvage data for the period 1975 to 1989 yields an overall net salvage for the period of 9.16 percent. Therefore, a net salvage factor of 10.00 percent was used to calculate the depreciation accrual rates for this account.

Analysis of Account 344.5 - Laboratory Equipment

Account 344.5 represents the installed cost of general laboratory equipment not specifically provided for in other accounts. Items such as microscopes, scales, sterilizers, testing machines, etc. are included in this account. The 12/31/89 balance in utility plant in service is $230,314. The 12/31/89 depreciation reserve is ($24,240).

Data available for analysis include additions and retirements for the period 1970 to 1989. An actuarial analysis was performed for this band resulting in an ASL of 11 years with an Iowa Curve L-4 dispersion. The weighted average age is 1.20 years and the weighted average remaining life is 9.94 years.

An analysis of net salvage data for the period 1975 to 1989 yields an overall negative net salvage of 0.63 percent. Therefore, a net salvage factor of zero percent was used to calculate depreciation accruals for this account.

Analysis of Account 345.5 - Power Operated Equipment

Account 345.5 represents the cost of power operated equipment used in construction or repair work. Items such as air compressors, including driving unit and vehicle, boring machines, backhoes, pipe cleaning machines, etc. are included in this account. The 12/31/89 balance in utility plant in service is $190,619. The 12/31/89 depreciation reserve is $52,248.

Data available for analysis include additions and retirements for the period 1965 to 1989. An actuarial analysis was performed on this band of data yielding a 10.5 year ASL with an Iowa Curve R-5 dispersion. The weighted average age is 3.90 years. The weighted average remaining life is 7.34 years.

Analysis of net salvage data for the period 1975 to 1989 indicates a net salvage of 5.96 percent. Therefore, a net salvage factor of 5.00 percent was used to calculate depreciation accrual rates for this account.

Analysis of Account 346.51 - Communications Equipment

Account 346.51 represents the cost of radios, antennae, etc. The balance at 12/31/89 for this account was $245,923. The 12/31/89 depreciation reserve is $148,220.

Data available for analysis include additions for the period 1975 to 1989 and retirements for the period 1981 to 1989. An actuarial analysis was performed resulting in an ASL of 14 years with an Iowa Curve R-3 dispersion. The weighted average age is 5.80 years and the weighted average remaining life is 8.97 years.

An analysis of net salvage data for the period 1975 to 1989 indicated a net negative salvage factor of 0.74 percent. Therefore, a net salvage factor of zero percent was utilized to calculate depreciation accrual rates for this account.

Analysis of Account 346.53 - Communications Equipment - Telephone

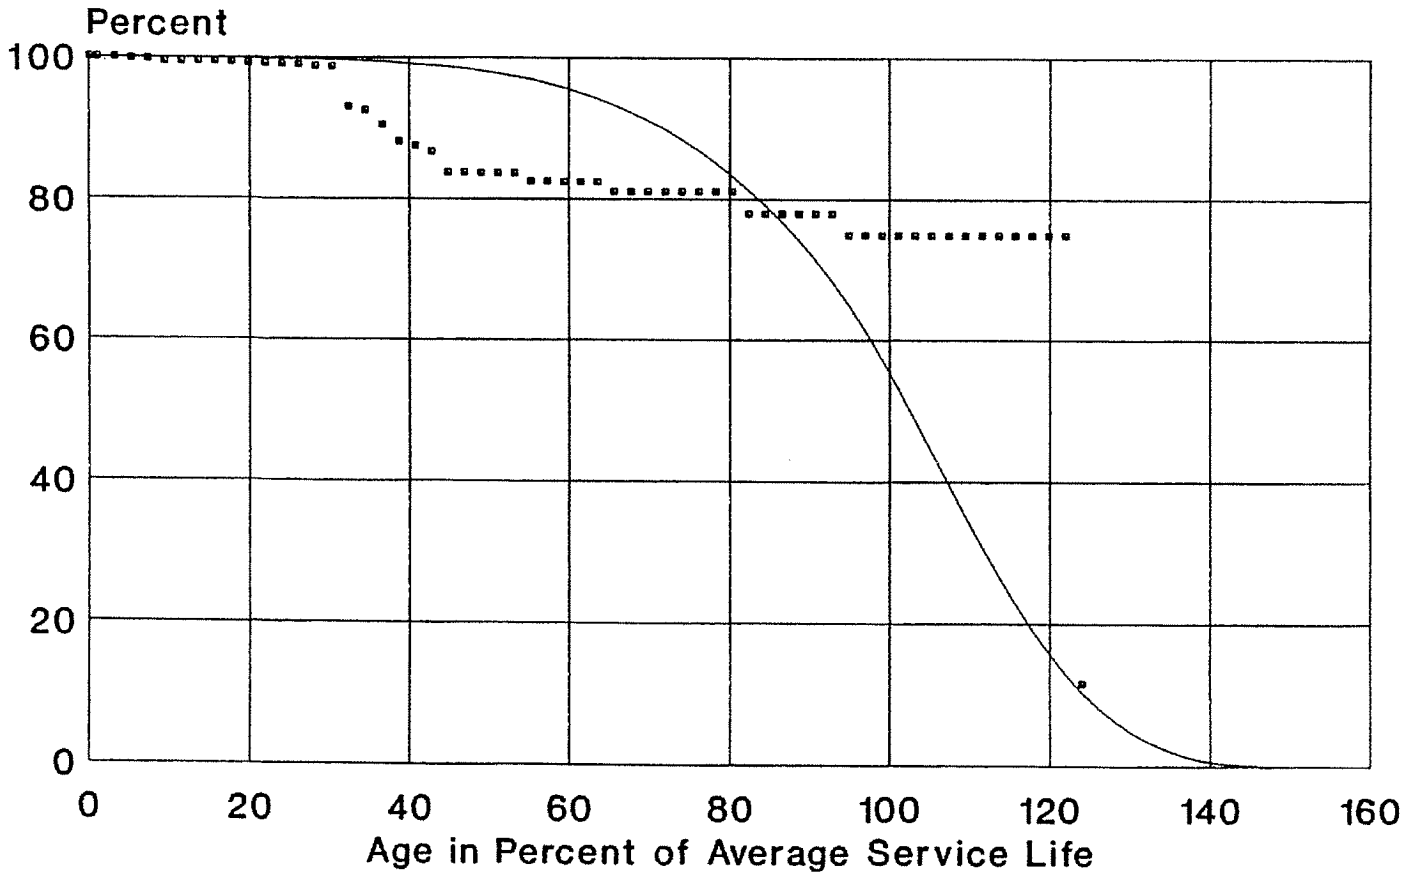
Account 346.53 represents the cost of a telephone and call management information system. The balance at 12/31/89 was $110,977. The depreciation reserve balance at 12/31/89 is $10,504.

This equipment is subject to technological obsolescence. It will likely be retired due to the availability of a better, faster system. A ten year average service life with an Iowa Curve dispersion of R-2.5 was assigned to this account. This approach results in a weighted average age of 5.29 years and a weighted average remaining life of 5.40 years.

It is unlikely this equipment will wear out. Therefore, there should be some salvage value at retirement. However, it will also be obsolete, so salvage equivalent to a significant percentage of original cost is unlikely. Therefore, a 10 percent net salvage was assigned to this account for this calculation of depreciation accruals.

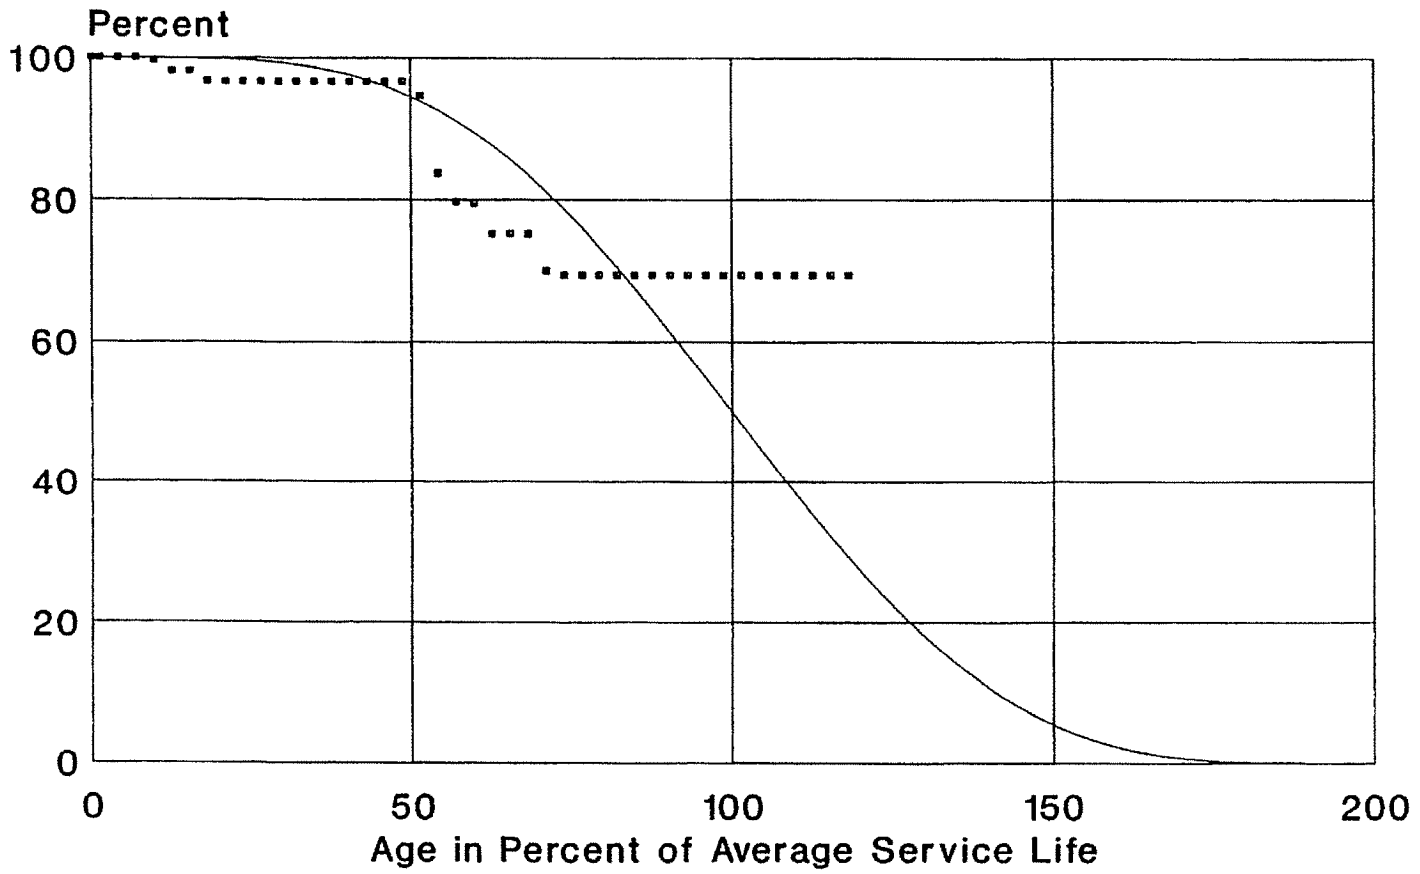
Analysis of Account 347.51 - Miscellaneous Equipment

Account 347.51 represents the cost of equipment, apparatus, etc., not includable in any other account. The 12/31/89 balance in this account is $62,495. The 12/31/89 depreciation reserve is $43,291.



Data available for analysis include additions and retirements for the period 1966 to 1989. An actuarial analysis was performed on this band of data which yielded an average service life of 16 years with an Iowa R-2.5 dispersion. This average service life results in a weighted average remaining life of 10.63 years. The weighted average age is 6.60 years.

Analysis of net salvage data for the period 1975 to 1989 indicates a net salvage of 9.66 percent. However, this result is from one large retirement which experienced a significant salvage value. The remaining retirements experienced zero salvage value. Therefore, a salvage factor of zero percent was used to calculate the depreciation accruals for this account.



APPENDIX A

IOWA CURVES MATCHED WITH STUB CURVES

Account: 311.22
Electric Pumping Equipment

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: John J. Spanos

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

6. Please provide, in Microsoft Excel or comparable format with formulas intact, all of the tables, exhibits and charts in the Gannett Fleming depreciation study.

Response:

The Company objects to this question as unduly burdensome to the extent that it seeks the production of documents in an electronic format that is different from which they currently exist. Notwithstanding its objection, the Company states that the file named TN-CAPD-01-PART II-Q006 Attachment.XLS is included on the enclosed CD and sets forth the Excel spreadsheet from pages III-4 and III-5 of the Depreciation Study. All other tables and charts are only available in text format as an output from the Gannett Fleming in-house programs.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

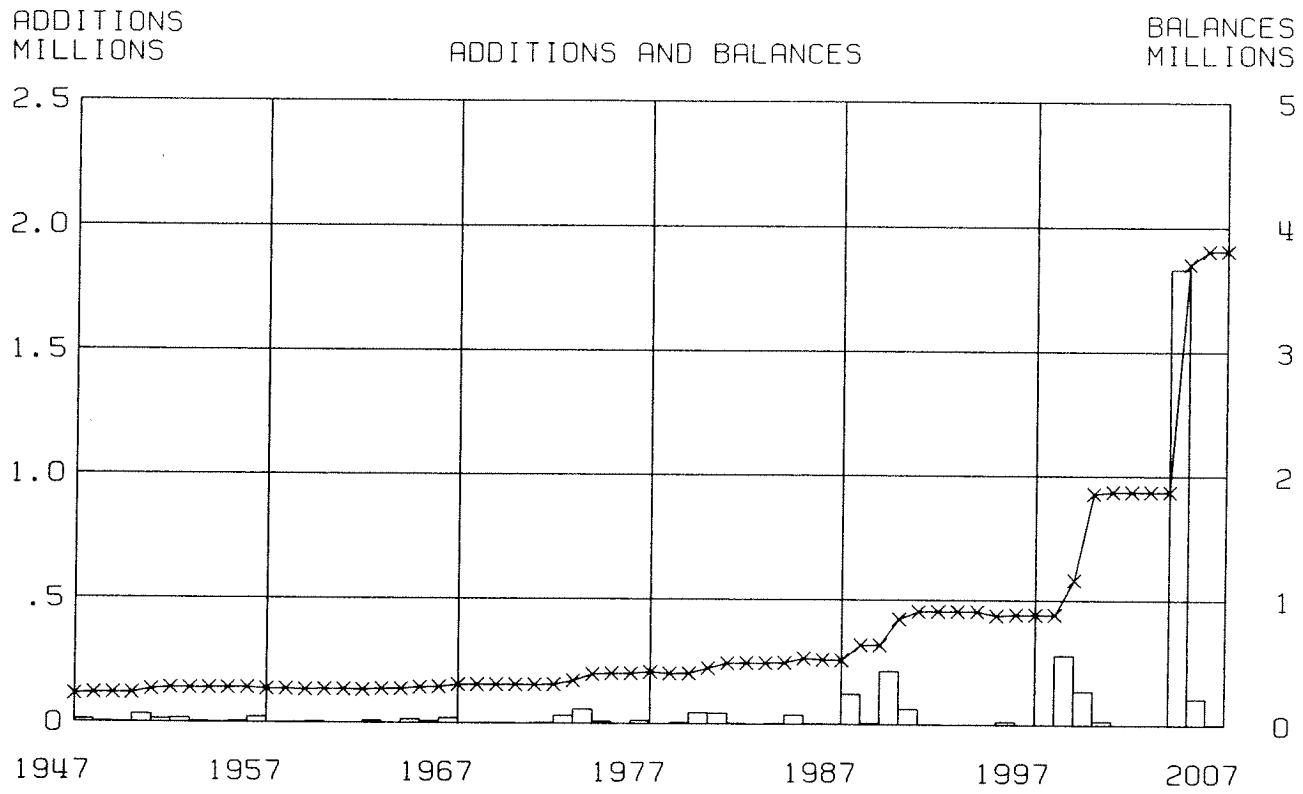
Responsible Witness: John J. Spanos

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

7. Please provide, in Microsoft Excel or Word or comparable format with formulas intact, all workpapers, analyses, studies and other documentation underlying the tables and exhibits in the Gannett Fleming depreciation study. Include in this response the results of all actuarial and Simulated Plant Record studies, all data and studies of other water utilities, and all documentation supporting the life span assumptions made by Gannett Fleming.

Response:



The Company objects to this question as unduly burdensome to the extent that it seeks the production of documents in an electronic format that is different from which they presently exist. Notwithstanding its objection, the Company states that all workpapers, analyses, studies and other documentation underlying the tables and exhibits of the Gannett Fleming depreciation study are attached on the enclosed CD. These documents are not available in Microsoft Excel or Word format as they were created by Gannett Fleming in-house programs. The files are labeled as:

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: John J. Spanos

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

8. For each plant tour of TAWC plant and each meeting with TAWC personnel of Mr. Spanos or other Gannett Fleming personnel:
   a. Identify those in attendance and their titles and job descriptions.
   b. Provide all conversation notes.
   c. Provide all photographs and images.
   d. Provide all visual presentations, documents, brochures and any other material provided to Mr. Spanos or his representative(s).

Response:

a) The following personnel were involved in Tennessee American Water Company Plant Tour and meetings:

Name	Title
John Spanos	Vice President
Fred Johnston	Analyst
Mark Zinnanti	Tanks, Boosters, Treatment Plant
Monty Bishop	Distribution System

b) All notes are attached.

c) All photographs taken during the plant tours are attached.

d) There were no additional presentations, documents, brochures or other material provided to Mr. Spanos other than the attachments produced in response to subparts (b) and (c) of this response.

Subject: Tennessee American site visit

Monty Bishop and Mark Zinnanti will be the individuals you will want to meet with on your site visit to Tennessee. They will both be available February 14 and 15. Mark would be the individual to talk to regarding the tanks, boosters, and treatment plant. Monty is the individual to speak with regarding the distribution system. If you would like assistance with travel plans, you can contact Ginny Scealf at 423-755-7621.

Monty can be reached at 423-755-7617 and Mark at 423-755-7652. If you are aware of specific sites you would like to see you may want to let them know prior to your visit. If you need any additional assistance please let me know.

After your visit, what would be the timeframe that you would have a draft of your study available?

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: John Watson/Michael Miller/John Spanos

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

9. Please identify, describe fully, and provide full documentation of any capital or maintenance plans or programs that the Company has undertaken or is considering undertaking that will extend or shorten the service life of any of its depreciable plant.

Response:

The Company, as any well run Company would be, is continually exploring products and processes which improve the efficiency and level of the service it provides. Examples of programs, changes in the art, and regulations include items such as the Company's effort to monitor and replace mains, hydrants, and services that have reached the end of their useful life; or to improve operational efficiencies and water quality for the customers impacted by older undersized plant, etc. Other areas of operation would be the Company's efforts to appropriately test and/or replace meters with newer technology and more efficient facilities. The changing of meters and/or improvements in water treatment will also aid in meeting current and/or increasing regulatory requirements, but at the same time, will result in ongoing and further future plant changes.

While the Company has numerous infrastructure replacement and preventative maintenance programs, the Company does not believe any of these programs would change the service lives used by Mr. Spanos to develop his recommendations for depreciation expense in this case.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Michael Miller

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

10. Please identify, describe fully, and provide full documentation of any changes that the Company has adopted during the last 20 years with respect to:
    a. The definition of plant units subject to capitalization,
    b. The definition or treatment of salvage and cost of removal,
    c. The definition of plant accounts,
    d. The definition or treatment of depreciation reserves.

Response:

The Company objects to this question on the grounds that the information is not readily available, is over broad, and unduly burdensome to research. The Company also objects on the grounds of relevancy to the extent that historical data from the past twenty years is not relevant. The Company has already provided extensive data in this case for the historical test-year and attrition year included in the petition. Furthermore, the Company has been through extensive review before the TRA in numerous rate proceedings over the years.

Notwithstanding its objection, the Company provides the following response based on Mr. Miller's position of responsibility in the areas of accounting, budgets, finance, and rates for the Company during the entire period covered in the request above.

a. There have been no significant changes in the definition of plant units subject to capitalization. The units of property of the Company have and remain consistent with NARUC accounting guidelines and regulatory guidelines recognized by regulatory commissions and authorities across the country.

b. There has been no significant change in the definition or treatment of salvage and cost of removal. The Company has recognized FAS 143 relating to the accounting for Asset Retirement Obligations. FAS 143 did not change the definition or treatment of salvage or cost of removal, but simply involves a balance sheet reclassification related to a portion of the current depreciation expense (approved by the TRA) impact on accumulated depreciation. For financial reporting purposes only, a portion of the accumulated depreciation is reclassified to create a regulatory asset/liability to reflect the estimate of future salvage and cost of removal being currently recognized for rate recovery. The current depreciation rates of TAWC approved by the TRA include the expected future cost to retire those assets. This method of determining depreciation rates is utilized by most regulatory commissions/authorities across the country. This method is based on the "Matching Principle" used in utility ratemaking. The current depreciation rates of TAWC include both a return of the assets as well as expected future costs to retire that asset so that the cost of service matches the full cost of the asset to the rate payers actually benefiting from the use of that asset. For rate making purposes, the Company continues to reflect the rate base reduction for accumulated depreciation using the full depreciation rates approved by the TRA.

c. There have been no significant changes in the plant accounts. The Company has and continues to record its property using the NARUC guidelines for Utility Plant accounting. There has been some decimalization of the NARUC plant accounts to reflect types of material or property within the NARUC plant accounts (i.e., plastic meter, bronze meter, heavy trucks, light trucks, personal computers, mainframe computers, computer software) because there can be differences in service lives depending on the type of property. These decimalizations enhance or improve the Company's ability to perform

depreciation studies, determine appropriate service lives, and more accurately determine appropriate depreciation rates and rate recovery.

d. There have been no significant changes in the definition or treatment of depreciation reserves. Please see the comments regarding FAS 143 in part b above.

Responsible Witness: John J. Spanos

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

11. Please provide copies of all external correspondence from since January of 2006, inclusive, including correspondence with Mr. Spanos and/or Gannett Fleming, Inc., which deals in any way with the Company's retirement unit costs, depreciation rates, and/or the Depreciation Study.

Response:

The documents attached are copies of the external correspondence since January 2006 with Mr. Spanos and/or Gannett Fleming, Inc. that deal with the Depreciation Study.

Spanos, John J.

We are ok with your suggested changes below to raise the painting classification. Please make that change and provide us a new schedule so we can complete the case. We also need the rates for the 3 classifications with a zero rate just in case their are some additions to those classifications in the case. Thanks.

Subject RE: TN Depreciation Questions

Attached is my newest revision of the depreciation results. I was able to reasonably identify all the subaccounts that you had on the trial balance. I used the reserve amounts that you had by subaccount. However, I made two changes. First, I moved 160,800 of the reserve for 33920 to the 30350 acccount. Second, I transferred 10,710 of reserve from account 348 to 347. I am comfortable with these results however, I would probably recommend an additional transfer of reserve from to 30430 to 30499 (painting) to get the painting rate closer to 10%.

Let me know your thoughts so I can start putting together the report.

TENNESSEE AMERICAN WATER COMPANY

SALVAGE ANALYSIS

AS OF NOVEMBER 30, 2007

1. In account 304.00, Structures and Improvements, why is the amount ($301,642) of retirements in 1994 so much higher than other years?
   Retired Interior Paint/Coating for Aldrich Units 6 & 8 installed-1979 A8185
   Mission Ridge Reservoir " " A8188

2. In account 320.00, Water Treatment Equipment, why are the retirement amounts ($325,913 and $477,165, respectively) in 1989 and 1996 so much higher than other years?
   Primarily retirements of GAC installs 1990-1993 $429,000 R4420& 4539
   Part of Citico Raw Water Static Mixers $30,000 install in 1989 A7125
   Filters 21-26 and Filter House #3 $6,000

3. In account 331.00, Transmission and Distribution Mains, why were there no retirements in 1990 and 1997?
   Have no details for 1990- Per PSC Report amount retired=$100,325
   Missing WO Register for 1997?? Retirements =$127,457

4. In account 333.00, Services, why were there no retirements in 1997?
   Missing WO Register Retirements = $30,472
5. In account 334.00, Meters and Meter Installations, why were there no retirements in 1997 and the retirement amount ($391,624) in 2006 so much higher than other years?
   Not clear why but 4,000 meters were retired in April 2006 for $275K.
   May have been a catch-up from prior months/years
   No Register for 1997 Retirements=$96,456
6. In account 335.00, Hydrants, why was the amount ($145,259) of retirements in 1990 so much higher than other years and no retirements in 1997?
   Not clear why for 1990, may have been a catch-up as a result of 1989 study. Missing register for 1997 Retirements =$16,026

7. In account 340.00, Office Furniture and Equipment, why was the retirement amount ($680,501) in 1999 so much higher than other years?
   Retire IBM System 36 A/C [illegible]
8. In account 341.00, Transportation Equipment, why were there no retirements in 1997, 2000 and 2004? And, why was the retirement amount ($586,744) in 2005 so much higher than other years?

Response to Question #8- Not clear why need Operations response.

9. In account 343.00, Tools, Shop and Garage Equipment, why is the retirement amount ($121,567) in 1992 so much higher than other years?
   Retirement of lights, compressors, hydraulic tools and some adjustments.
10. In account 344.00, Laboratory Equipment, why is the retirement amount ($110,572) in 1992 so much higher than other years?
    Most of decrease in account is due to reclassifying assets to other Plant accounts like furniture, computers, phones, etc.
11. In account 346.00, Communication Equipment, why are the retirement amounts ($113,982 and $183,048, respectively) in 1992 and 2002 so much higher than other years?
    1992-Retire Radio System
    2002- Retire 5 years of improvements Task order 50006729-R. Taylor

Below is a short explanation regarding vehicle purchases in Tennessee. I thought they had leased vehicles for a short period of time which might have affected their purchase and retirements. In 2005 they purchased 18 vehicles which would explain the large amount for retirements.

Subject Re. Fw: Salvage QuestionsLink

Tennessee does not lease vehicles. All vehicles are capital purchases and as a result sometimes there are lean years with regards to numbers of vehicles purchased. While this may not always be a one for one exchange on vehicle purchases versus retirements (sometimes a purchase will replace a vehicle which has previously been wrecked or not economical to repair and simply parked awaiting disposal) for the most part, the numbers of vehicles purchased in a given year is a good indicator of the number of vehicles retired. Conversely, fewer vehicles purchased usually indicates not many retirements in a given year. Listed below are the years in question and the approximate number of vehicles purchased during those years ('97 had to be pieced together due to age of vehicles). As you can see from the list, the years the retirements numbers are low were years of few purchases and in years where we had large purchases of vehicles, 2005 for example, the number of retirements is much greater.

1997 - Purchased approximately six vehicles
2000 - Purchased one vehicle
2004 - Purchased one vehicle
2005 - Purchased eighteen vehicles

Hope this helps. Let me know if you need anything further.

#5 We had fallen behind in the meter compliance program and added additional resources in 2006 to become compliant with meter changes by the end of 2006.

As far as the missing 1997 WO registers...I don't know. We have our 1997 WO Index Book listing the retirements. Randy Taylor is giong to contact Gary Akmentins to discuss.

Subject Fw. Salvage Questions

Below are the responses that Gary Akmentins worked up for Mr. Spanos questions regarding salvage and retirements. He questioned the transportation retirements in 2005. Would that have any bearing on leasing vehicles? I do not know when T[illegible]essee began leasing but it was a thought. Also in 2006 were there a large number of meters installed which resulted in the re[illegible]ment of 4,000 meters?

Please look over Gary's remarks and add any additional details that you might have that would assist Mr. Spanos in completing his study.

Subject Salvage Questions

T[illegible] attached document includes the questions and my responses.

For the most part I cannot answer why retirements are greater in one year versus another year. I do point out the large items that contributed to disposals in that year and hopefully John or Pam know why this is different from the norm.

1997 is an issue. I will check into this further. In many cases there are retirements, per the PSC Report, for this year.

Please review and let me know if you have any questions.

Sheila- I'll call you later this afternoon.

Thanks,

Subject TAW Locations for Depreciation Study

John-

The following are TAW locations used in the CPR that I was unable to match-up with the facility list provided in November:

Glendale - *This tank was located at Signal Mountain Rd / Glendale Road but was retired over 30 years ago .*
Jenkins Rd Tank-New tank that was constructed in 2006 located in the NE quadrant of the Chattanooga distribution system and is in service
Julian Ridge(is the same as Ryall Springs?)Yes there is a Ryall Springs Tank and Ryall Springs Booster Station, however the old Julian Ridge Booster Station and the Julian Ridge Standpipe (0.264 MG) were retired, but they were located on the same property as the present Ryall Springs Tank, which in operation
Pine Brook-This should probably be the Pine Breeze Booster Station which is operational and was completed in 2006 in [illegible]led Bank area.
Sky Harbor-I am trying to think what this might be. The only thing close that comes to mind in Skyline Drive, but if you have more details (vintage or address) it would be helpful. If it is a booster station, this could be the Panorama Booster Station.*This small booster was been retired roughly 5 years ago because it was no longer needed after the Tiftonia tank was built , apparently without an R work Order being written . We will write an R work order . The booster was located at a small motel on the side of Lookout Mountain near Scenic Highway and just below Ruby Falls .*
Stein Hill Tank-I believe this was a proposed tank site (no land actually purchased there) , but this site was later moved to what is now the Jenkins Road Tank (a project also referred to as the East Ridge Zone Storage Improvements), which is the northeastern portion of the Chattanooga distribution system. This tank was completed in 2006.
Tiftonia Project-I can only guess that this relates to the Tifftonia Elevated Tank, this is in service and operational. The existing tank is located on the same land as a older and smaller tank that was removed and retired. There is also a Maple Hill Booster station which is located in Tiftonia downstream from the Tiftonia Elevated Tank just off Cummings Highway, and also there was small tank associated with the Maple Hill booster station called the Maple Hill Tank which was retired, and we still own the site (very small tank site).
White Hall Booster- This is a booster station that is no longer used, because we have made other system improvements which have improved pressure to that area. Pumps and station are still there, but not operated currently. *This booster is abandoned . The remaining assets showing ont he CPR records ($110.13 for a Bristol Pressure Recording Gauge) are not usable and a retirement work order will be written to remove those remaining assets from our CPR Records .*

These items refer either to Tanks or Boosters. Please indicate if these are called by another name. I am concerned that these items are not on the current location list in PowerPlant.

I also note on the facility list that some locations are 'inactive'. These items will need further explanation as it could be perceived that the costs should be moved from Utility Plant to Non-Utility Plant and affecting rate base.

KEITH BISSELL, COMMISSIONER

PAUL ALLEN, EXECUTIVE DIRECTOR
HENRY M. WALKER, GENERAL COUNSEL

TRANSMITTAL LETTER

I HAVE ATTACHED A COPY OF A RECENT COMMISSION ORDER WHICH IS BEING SENT TO PARTIES OF RECORD AND/OR OTHER INTERESTED PARTIES.

PAUL ALLEN
EXECUTIVE DIRECTOR

BEFORE THE TENNESSEE PUBLIC SERVICE COMMISSION
July 18, 1991 NASHVILLE, TENNESSEE

IN RE: PETITION OF TENNESSEE AMERICAN WATER COMPANY FOR APPROVAL OF REVISED DEPRECIATION RATES PURSUANT TO T.C.A. SECTION 65-4-110

DOCKET NO. 91-00183

ORDER

This matter is before the Tennessee Public Service Commission upon the petition of Tennessee American Water Company ("Company") for approval of revised depreciation rates for its property used and useful in rendering utility service to its customers, pursuant to T.C.A. Section 65-1-110.

In the Company's last general rate case, Docket No. U-89-15388, the Commission ordered Tennessee American Water Company to file a depreciation study to establish new depreciation rates and to present the results to the Commission within one year. The petition filed in this docket includes the results of that study. The Staff reviewed the proposed depreciation rates, recommended various adjustments and reached an agreement with the Company as to the proper depreciation rates. The depreciation rates agreed upon are set forth in the attachment to this order. The attachment is hereby incorporated by reference.

The Commission considered this matter at its regularly scheduled Commission Conference on June 11, 1991. It was concluded

that the depreciation rates as agreed upon by the Staff and the Company are reasonable and should be approved to be effective January 1, 1992 or when new rates resulting from the Company's pending rate case (Docket No. 90-05224) become effective, whichever occurs first.

IT IS THEREFORE ORDERED:

1. That the depreciation rates as set out in the attachment to this Order which show original cost plant balance as of December 31, 1989 of $78,172,251, annual depreciation expense accrual of $2,820,022 and an annual depreciation accrual composite rate of 2.66% for all plant are hereby approved.

2. That the depreciation rates approved herein shall be effective on January 1, 1992 or on the effective date of new rates ordered in the Company's pending rate case (Docket No. 90-05224), whichever occurs first.

3. That the Company may include the cost of the depreciation study in its pending rate case (Docket No. 90-05224), to be amortized over an appropriate period.

4. That any party aggrieved with the Commission's decision in this matter may file a Petition for Reconsideration with the Commission within ten (10) days from and after the date of this Order.

5. That any party aggrieved with the Commission's decision in this matter has the right of judicial review by filing a Petition for Review in the Tennessee Court of Appeals, Middle

Section, within thirty (30) days from and after the date of this Order.

CHAIRMAN

COMMISSIONER

COMMISSIONER

ATTEST:

EXECUTIVE DIRECTOR

John-

Here is the 1996 Register(s) for Investment and Retirements. The numbers agree to the G/L but the Vintage detail is not in this file.

If possible, please send back the downloaded details on the R-Base files that you were able to open.

I will check some more to see that we have provided everything that we can.

Thanks,

John-

Attached are the scanned images of survivor balances, at 12/31/89, for accounts 343,345,346 and 348. I had omitted these from the original e-mail as they did not agree to the balances I had. See my comments below. It ppears that the difference is related to CIAC and Advances.

Tom-

When I compared these account balances to the 1990 Commission Report they all agree. The only variance is a wash between Hydrants and Mains of $769.

It's not yet clear why there is a discrepancy between the Commission Report and the Depreciation Study T/B. Based upon a review of the following years(1991, etc) balances in these accounts the Commission Report figures appear correct and not the summary numbers listed with the final Depreciation Study.

The attached schedule compares the balances.

(See attached file: Depr Study Plant Balance at 1989 vs PSC Report.xls)

I'll provide this data to John and unless you wish to discuss further.

Tom-

I sent the Survivor balances to John for all accounts except 343,345,346,and 348. These accounts did not reconcile to the 1989 ending trial balance. Mains is off by about $6 million. Any thoughts on what this issue could be?

Responses to Dale:

The actual study is being sent overnight as requested.
Testimony provides a conclusion of the study
This is my standard testimony that has been quite affective in all other jurisdictions. If additional work is required per Dale's comments then I cannot send the testimony and affidavit today. If you feel it is necessary, then let me know and I will address it tomorrow.

I apologize for not being able to complete this today but I am with another client today and cannot break

Subject RE: TN Rate Case Filing

Here are my comments on John Spanos:

1. Where is the actual study?

2. Does this testimony provide a foundation for every conclusion in the study we will rely on?

3. Shouldn't the actual conclusions from the study be included at the end of the testimony? I think that would be preferable much as we have asked Joe Van den berg to state his conclusions at the end of his testimony.

Thanks.

Dale

Good morning! John Spanos has informed us this morning that he does not have an electronic version of the depreciation study. Therefore, he needs to overnight the number of copies required for our filing to me **today**. I have some other questions for you below as well.

Your guidance is greatly appreciated!

Subject TN Rate Case Filing

Hello Dale . . . I hope all is well. I just wanted to touch basis with you and verify a couple of things in preparation for our filing next week. From the last case I am showing that I sent you a total of 19 (1 original +13 and five extra). Is that enough this time around or do you need additional copies?

I realize that you and Michael both will be reviewing our witness testimony but would you be so kind to forward me the "final version" of each once all revisions have been made? And . . . in what order would you prefer our testimony to appear?

Subject RE: Tennessee American site visit

Folks:

Currently, I am scheduled for a field visit of the Tennessee American Water facilities on Thursday, February 14th and Friday, February 15th. However, it has been suggested that due to timing of the filing I should attempt to come earlier in the week. The only option I have would be to fly in on Monday evening the 11th and tour facilities all day the 12th and the morning of the 13th. The visit requires and hour discussion with Monty on distribution assets and then a tour of the facilities with Mark that will include the treatment plant, office complex, 5-7 booster stations and 10-12 standpipes. Stops at the booster stations will be 15 minutes, standpipes 5 minutes and the treatment plant 30 minutes. It is aggressive but necessary for me to complete a quality study. I do have a few locations that I feel are necessities but the remainder can be determined in discussion with Mark.

I need to make flight and hotel reservations by 3:00 today so I need confirmation on dates.

Thanks

John

Subject: Tennessee American site visit

Monty Bishop and Mark Zinnanti will be the individuals you will want to meet with on your site visit to Tennessee. They will both be available February 14 and 15. Mark would be the individual to talk to regarding the tanks, boosters, and treatment plant. Monty is the individual to speak with regarding the distribution system. If you would like assistance with travel plans, you can contact Ginny Scealf at 423-755-7621.

Monty can be reached at 423-755-7617 and Mark at 423-755-7652. If you are aware of specific sites you would like to see you may want to let them know prior to your visit. If you need any additional assistance please let me know.

After your visit, what would be the timeframe that you would have a draft of your study available?

Charleston, WV 25327

Dear Mike:

Depreciation Study for Tennessee American Water Company

Thank you for the opportunity to submit this proposal to conduct a Depreciation Study for Tennessee American Water Company. This letter describes the scope of the services to be provided, the basis for our compensation and an estimate of the cost of the assignment.

SCOPE OF SERVICES

The depreciation study will consist of two phases (1) the estimation of survivor curves and net salvage percents and (2) the calculation of annual depreciation accrual rates as of December 31, 2007. The survivor curves and net salvage estimates will be based on engineering judgment incorporating statistical analyses of historical retirement data; a field review of facilities; discussions with management regarding its outlook for the property in service; a review of the lives estimated for other water utilities; and a general knowledge of the water industry. We propose to conduct analyses of the entire historical base that incorporates plant accounting information for Tennessee American by account or subaccount and compare to the current estimates.

The second phase of the depreciation study will be based on the application of the survivor curve and net salvage estimates to the surviving original cost by year installed as of December 31, 2007. The calculation of annual depreciation will be based on the use of the straight line method, annual service life procedure using the remaining life basis. However, additional methods and procedures can be performed to identify the most appropriate depreciation rates for future capital recovery.

The two phases of the depreciation study for the water plant will include seven major tasks up to the date of final results. Once the depreciation study is completed, we will prepare a final report to management supporting our findings and methodologies. The following scope of services sets forth our depreciation study work plan.

Task 1. Data Assembly and Review. A written data requirement list for Tennessee American personnel is attached for use in assembling the needed data for the study. The list specifies the data to be obtained for each plant account and the manner in which the data are to be transmitted to Gannett Fleming.

The assembled data will be reviewed by our staff and a "post audit" computer program for control and logic. Irregular or unusual entries will be identified and reviewed with Tennessee American personnel to determine their circumstances and whether they require adjustment. Large retirements also will be identified and explanations as to the cause of such retirements will be requested.

Task 2. Statistical Analyses of Data. The data assembled and reviewed in Task 1 will be analyzed for historical indications of service life using the retirement rate method. If there is a need to utilize the simulated plant record method, then the unaged data will be aged based on statistical aging using selected Iowa type curves. The curves selected for aging retirements will be based on judgment incorporating consideration of the results of analyzing the unaged data with the simulated plant record method, discussions with management related to the forces of retirement and the survivor curves estimated for the account by other water utilities.

Trends in average service life and survivor curve shape will be identified through the use of experience band analyses with the retirement rate model. Experience bands will identify the impact of economic and technological cycles on the service life of property groups. The selection of the bands for analysis will be based on a review of annual addition and retirement levels, a multiple original group life table, and preliminary discussions with operating management related to changes in materials used in construction, changes in installed technology and major retirement programs.

Annual gross salvage and cost of removal will be expressed as percents of the related retirements for all accounts, as appropriate. Moving averages will be used to smooth the annual fluctuations.

Task 3. Field Review and Management Conferences. The field review will include visits to representative treatment plants, pump stations, office buildings and service centers. The purpose of the inspections will be to obtain information related to the operation and condition of the property.

During these visits, we also will meet with appropriate personnel to obtain additional information related to the outlook for the property. The results of the statistical analyses conducted in Task 2, the typical range of lives and salvage used in the industry, and our general experience, will be reviewed with these personnel as a basis for forecasting future survivor and net salvage characteristics. The discussion will focus on the past forces of retirement which produced the historical indications and the extent to which future forces such as economic, technological, physical and environmental, will result in future lives and net salvage values that differ from the past.

Task 4. Preliminary Service Life and Net Salvage Estimates. Preliminary estimates of average service lives, type survivor curves and net salvage percents will be made on the basis of the statistical analyses, observed conditions at the time of the field review, the discussions with management related to outlook and the typical range of lives used in the water utility industries. Calculations of annual and accrued depreciation will be performed.

Task 5. Presentation to Management. The results of the depreciation calculations and the bases for such calculations will be presented to management to insure that the results are in accordance with management's capital recovery policies and outlook. In order to properly provide management with the impact on depreciation as of December 31, 2005, alternative methods and procedures will be presented, if requested. We will review the merits and acceptability of these procedures with management prior to performing the calculations.

Task 6. Final Estimates and Calculations. Final calculations of depreciation accrual rates and reserves by account will be performed in order to reflect appropriate modifications as determined during the review with management, and the combination of the various sets of depreciation rates currently in affect.

Task 7. Draft and Final Reports. A draft report will be prepared for review by management. The report will include an introduction, a description of the methods used in the statistical analyses and depreciation calculations, a narrative discussion of the factors considered in the estimation of service life and net salvage including the content of the account, the statistical support for the estimates, and the summary and detailed tabulations of depreciation by account. After review, comment and discussion, final reports will be prepared and submitted to management. Mr. Spanos will be responsible for all depreciation activities including testimony during a proceeding.

BASIS FOR COMPENSATION AND ESTIMATE OF COST

The Valuation and Rate Division of Gannett Fleming, Inc., will perform the above services and other related services which you may authorize on the basis of hourly billing rates in effect at the time the work is performed, plus reimbursement of direct expenses. A copy of the billing rates currently in effect is attached. Direct expenses include expenditures such as transportation, meals, lodging, incidental expenses incurred while

working at the client's location, and any other expenses required by virtue of the assignment and not incidental to the normal conduct of business. Invoices will be rendered monthly for services performed during the preceding month.

The amount of time required to complete studies varies widely, depending on factors such as availability of basic data, the extent to which assistance is provided to public utility personnel, the complexity of the public utility being studied, and the need to support findings under conditions of adverse intervention. The actual charges for the studies will depend on the amount of time required to complete the assignments.

Inasmuch as we have little control over the amount of time which may be required to prepare for and participate in formal litigation in the event the study is contested, the following estimate of costs excludes those incurred subsequent to the completion and filing of the study. Based on our knowledge of conducting similar studies, the cost of our services to complete this assignment for the water exhibit will not exceed $30,000. Billing rates for services conducted for post-filing services could be revised as of December 2007.

We appreciate the opportunity to submit this proposal to you and assure you that we will carry out the assignment as expeditiously and economically as possible. If you have any questions with respect to the scope of services or estimate of cost, we would be pleased to discuss them with you.

Very truly yours,

GANNETT FLEMING, INC.

John J. Spanos

JOHN J. SPANOS
Vice President
Valuation and Rate Division

TENNESSEE AMERICAN WATER COMPANY
DATA REQUIREMENTS LIST

1. Surviving plant balances by installation year within account as of December 31, 2007. For structures accounts, each installation year should have a location identifier, such as the name of the treatment plant.

2. All plant activity by account from the earliest year through December 31, 2007. Transactions include additions, retirements, transfers, sales and acquisitions. Each entry should include account, type transaction, transaction year, installation year, and amount.

3. A list of locations such as treatment plants, pumping stations, office buildings and standpipes.

4. A plant statement by account as of December 31, 2007. Plant statements for as many years prior to 2007 would be helpful for control purposes.

5. A reserve statement by account as of December 31, 2006. Reserve statements for as many years prior to 2007 would be helpful for control purposes

6. All reserve data by account from the earliest year through December 31, 2007. Transactions include retirements, cost of removal and gross salvage by account and transaction year.

7. Capital budget or forecast plan that details and future replacements or expansion projects.

8. A copy of the last depreciation study with life and salvage parameters and the current depreciation rates in effect.

9. A copy of any stipulations or orders from previous studies/cases that might directly affect service life, salvage percents or depreciation accrual rates.

Subject TN-Mass Account Survivors

John-

Attached are the scanned images of survivor balances, at 12/31/89, for accounts 343,345,346 and 348. I had omitted these from the original e-mail as they did not agree to the balances I had. See my comments below. It appears that the difference is related to CIAC and Advances.

Tom-

When I compared these account balances to the 1990 Commission Report they all agree. The only variance is a wash between Hydrants and Mains of $769.
It's not yet clear why there is a discrepancy between the Commission Report and the Depreciation Study T/B. Based upon a review of the following years(1991, etc) balances in these accounts the Commission Report figures appear correct and not the summary numbers listed with the final Depreciation Study.

The attached schedule compares the balances.

Depr Study Plant Balance at 1989 vs PSC Report.xls

I'll provide this data to John and unless you wish to discuss further.

Thanks,

Tom-

I sent the Survivor balances to John for all accounts except 343,345,346,and 348. These accounts did not reconcile to the 1989 ending trial balance. Mains is off by about $6 million. Any thoughts on what this issue could be?

Mark:

We will plan to be at the office by 8:00 on Tuesday morning unless a better time is necessary.

Here are a list of facilities I would like to see but since I do not know the territory well enough, I hope you will revise the list if some locations are off the beat and path.

Office Complex/Distribution Center
Treatment Plant
Hill City Station
New York Ave booster
St. Elmo Station and Tank
Lookout Mountain Station and Tanks
South Mission Ridge Tank
Citico Booster
Walden Ridge Booster
North End Reservoir
Ryall Springs Tank
South End Reservoir
Jenkins Road Tank
Tiftonia Booster and Tank

If there are any big assets that I missed please consider them on the trip.

Thanks

John

Subject RE: Tennessee American site visit

Folks:

Currently, I am scheduled for a field visit of the Tennessee American Water facilities on Thursday, February 14th and Friday, February 15th. However, it has been suggested that due to timing of the filing I should attempt to come earlier in the week. The only option I have would be to fly in on Monday evening the 11th and tour facilities all day the 12th and the

morning of the 13th. The visit requires and hour discussion with Monty on
distribution assets and then a tour of the facilities with Mark that will
include the treatment plant, office complex, 5-7 booster stations and 10-12
standpipes. Stops at the booster stations will be 15 minutes, standpipes 5
minutes and the treatment plant 30 minutes. It is aggressive but necessary
for me to complete a quality study. I do have a few locations that I feel
are necessities but the remainder can be determined in discussion with Mark.

I need to make flight and hotel reservations by 3:00 today so I need confirmation on dates.

Thanks

John

Okay. I will schedule our trip for February 14 & 15. I assume flying into Chattanooga is the most convenient airport. I plan to get a sampling of tanks, boosters and treatment plants across your territory. As soon as I get this formulated, I will pass it on to Monty and Mark so they can help me determine an aggressive, yet feasible itinerary. I could use a recommendation for a convenient hotel for the 14th.

After the visit, I would expect two week period to complete the draft study.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: John J. Spanos

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

12. Please provide copies of all industry statistics available to Mr. Spanos and/or TAWC relating to depreciation rates and the inputs thereto. Also, identify all industry statistics upon which Mr. Spanos or the Company relied in formulating the depreciation proposals.

Response:

The Company objects to this question on the grounds that it is over broad. Notwithstanding its objection, the Company states that the documents attached were the primary industry statistics relied upon by Mr. Spanos relating to the depreciation proposals.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: John J. Spanos

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

13. On an account-by-account basis, which accounting method is reflected in the life studies; "location-life" or "cradle-to-grave."

Response:

All accounts reflect the "cradle-to-grave" accounting methodology.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Michael Miller/Sheila Miller

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

14. Please explain how the following are treated for purposes of (1) depreciation and (2) salvage and cost of removal:
    a. Customer advances and contributions-in-aid of construction,
    b. Third party reimbursements for moving or replacing plant,
    c. Insurance reimbursements for damage or destruction of Company plant.

Response:

a. Depreciation expense related to property constructed by the Company, but funded by customer advances and contributions-in-aid of construction ("contributions") is not recognized for rate recovery. Utility plant balances are reduced by corresponding balances in the customer advance and contributions to determine depreciation expense recorded on the Company's books and records. Salvage and cost of removal would not be impacted by customer advances or contributions.

b. Third party reimbursements would normally be recorded as contributions as it relates to new construction. If the Company were reimbursed for the cost to retire an asset, those funds would be directly credited to the retirement cost of removal.

c. Insurance reimbursements would be credited to customer advances and contributions as it relates to new construction. If the

Company were reimbursed by an insurance company for the cost to retire an asset, those funds would be directly credited to the retirement cost of removal.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: John Watson/Michael Miller/Sheila Miller

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

15. If possible by plant account, please provide the record for the most recent five years of
    a. Customer advances and contributions-in-aid of construction,
    b. Third party reimbursements for moving or replacing plant,
    c. Insurance reimbursements for damage or destruction of Company plant.

    Please separate, wherever possible, reimbursements for removing old plant from reimbursements for constructing replacement plant.

Response:

a. The Company objects to this request on the grounds that the request is vague, ambiguous, overbroad, and unduly burdensome. Notwithstanding these objections, please see the attached schedule, which recaps CIAC's and customer advances by plant account for the past five years.
b. The Company objects to this request on the grounds that the requested information is unduly burdensome to produce and not readily available in the requested format. Notwithstanding these objections, please see the attached schedule that provides a list of the reimbursements that TAWC has received on projects due to TDOT relocations. The reimbursements are embedded in the information provided in the response to Part A above.
c. The Company objects on the grounds that the request is unduly burdensome, overbroad, and not readily available in the requested format. To determine if any insurance reimbursements were charged as credits to the retirement of

assets would require an exhaustive search of every retirement record. Notwithstanding these objections, to the extent any insurance reimbursements related to new construction have been received, they are embedded in the information provided in response to Part B above. To the extent, if any, insurance claims were credited to cost of removal they are embedded in the RWIP (for uncompleted retirements of property) or in the per books accumulated depreciation balance utilized by the Company in this filing.

The Tennessee-American Water Company, Inc., supplies water utility service to portions of Hamilton and Marion Counties in Tennessee and portions of Catoosa, Dade and Walker Counties in Georgia. The service area in Tennessee includes the Municipalities of Chattanooga, East Ridge, Red Bank, Ridgeside and the Town of Lookout Mountain. The service area in Georgia includes the Municipalities of Rossville and Lookout Mountain in Walker County and portions of the unincorporated areas of Catoosa and Dade Counties.

The Water Company served 65,532 metered customers as of December 31, 1989. Source of supply for the Water Company consists of a surface water supply (Tennessee River). This source of supply is treated at one production facility which is identified as the Citico Treatment Plant and has a rated capacity of 72 MGD. Treated water is delivered into a transmission and distribution system consisting of 1,176 miles of mains, 27 booster pump stations with a total rated capacity of 84.4 MGD, 22 distribution storage reservoirs and standpipes with a total capacity of 24.8 MG, and approximately 3,897 hydrants.

Scope and Purpose

The purpose of this depreciation study is to analyze the service life characteristics and net salvage of the depreciable utility plant in service for the Tennessee-American Water Company, Inc. Using these service life characteristics and net salvage percentages, annual accrual percentages have been recommended for each account of utility plant in service.

In connection with this study a physical inspection of above-ground utility plant was conducted. Additions and retirements data from the early 1920's through 1989 were gathered and analyzed in order to determine service life characteristics. Management's short and long range planning for changes and improvements, as embodied in the Company's Comprehensive Planning Study and five year capital investment budgets,

were reviewed. Also, discussions were held with management concerning current activities which may impact service life or net salvage. Salvage and cost of removal data were reviewed for the period 1975 - 1989. After analyzing service life characteristics, and calculating net salvage percentages, the next task was to determine annual accrual percentages. Data as of December 31, 1989 was used for this purpose.

Calculation of the annual accrual percentages was accomplished by using the remaining life accrual formula:

$$DA\% = \frac{UPIS - DR - (NS\% \times UPIS)}{RL} \div UPIS \times 100$$

Where:

DA% = Annual depreciation accrual expressed in percent for each account.

UPIS = Utility plant in service expressed in dollars for each account.

DR = Depreciation reserve for the account, expressed in dollars.

NS% = Net salvage expected for the utility plant in service when it is retired, expressed in percent.

RL = Remaining life for the account, expressed in years.

Method Used

There are two principal methods normally used to calculate depreciation accruals for water utilities, the remaining life method, and the whole life method. The whole life method utilizes the utility plant in service balance, the average service life, and the average net salvage to calculate annual accruals. The net salvage percentage is subtracted from one hundred percent and the balance is divided by the average service life to obtain an annual accrual percentage.

The system used for this depreciation study is the Straight Line Remaining Life System. This system calculates accruals by dividing the utility plant in service balance less the actual depreciation reserve less future net salvage by the remaining life of the account. The latter portion of the formula translates the result into terms of percent.

The advantage to the remaining life method as compared with the whole life method is the remaining life method uses the actual depreciation reserve as part of the formula. This incorporates past retirements and past net salvage directly into the calculation. Actual past salvage is credited to the book reserve and costs of removal are debited against the book reserve. A further advantage to the remaining life method is that it is self correcting over a period of time. Any number of factors influencing the useful service life of an account can change. These factors can result in changes in the average service life and thus the depreciation accrual rate. Since the remaining life method uses the accumulated depreciation reserve, any past under-accrual or over-accrual is automatically corrected when making accrual calculations.

In order to make a remaining life calculation of a depreciation accrual rate, four things must be determined:

(1) The remaining life attributable to each account;

(2) The book depreciation reserve attributable to each account (which is known for each account from the records of the Water Company);

(3) The future net salvage attributable to the account; and

(4) The investment in utility plant in service (which is known for each account from the records of the Water Company).

Determination of Remaining Life

(A) Actuarial Analysis

This approach is used for accounts with adequate retirements data. They are statistically analyzed to develop life estimates using the Iowa series of survivor curves (see Appendix A). A survivor curve is calculated for each account analyzed and is matched visually and by computer program to an appropriate Iowa curve, which gives Average Service Life (ASL) and retirement dispersion. Retirement dispersion is

referred to many times in this report. It means that the average service life is an area under a survivor curve and that retirements are dispersed about the average.

Four different general classifications of dispersions under the Iowa system have been identified and are in general use today. These are the R, L, S, and O. An "R" dispersion means that the maximum rate of retirement occurs to the right of the average service life in a graphical presentation, or after the average service life in terms of age. The "L" dispersion indicates the maximum rate of retirement occurs to the left of the average service life, or before the average service life in terms of age. The "S" dispersion indicates a symmetrical maximum rate of retirement, occurring approximately at the average service life. The "O" dispersion indicates a maximum rate of retirement at the origin of the graph, or at age zero. The "O" dispersion is seldom useful in the analysis of water utility property.

The number associated with a type curve is an indicator of the severity of the model relative to the average retirement rate. Therefore, an R-5 curve has a much higher peak retirement rate than an R-1 curve.

The remaining life for each account analyzed in this manner has been determined from the remaining life characteristics of the matching Iowa curve. This method of analysis was used for 18 accounts, representing 75.83 percent of the total investment in utility plant for the Water Company. A summary of accounts and the method used for each account is presented in Table 1.

(B) Semi-Actuarial Analysis

The semi-actuarial method of analysis involves the simulation of a set of plant balances or retirements for a period of years given the additions to the account. The computer uses retirement dispersion characteristics of the Iowa series of curves (as discussed above and on page 8) to calculate either simulated plant balances or simulated retirements for a period of years. This method checks the variation between the simu-

lated data and actual data for the account and determines an average service life and retirement dispersion using data that is easier to compile versus the actuarial method. This method was used for analysis of two accounts (Accounts 333.4 and 335.4). These accounts have a great volume of retirement activity which would be very difficult and expensive to compile for actuarial analysis. These accounts represent 14.09 percent of the total investment in utility plant for the Water Company.

(C) Structural Method

The third method of determining remaining life involves the estimation of a life span for a structure. This method of analysis was used for accounts representing structures with insufficient retirement data to enable use of the retirement rate method. For structural plant elements (such as pumping, account 304.22; water treatment, account 304.31; water storage, account 330.41; and general structures, accounts 304.51-304.53) an inspection was made, and a life span was estimated for that major structural element based on the age and condition of the structure, and management plans for the future. Auxiliary facilities and equipment (such as roofs, electrical wiring, doors, windows, fencing, security systems, etcetera) while likely to be retired in the interim between the present and the terminal year of the structure, were combined with the remaining life characteristics of the life span property (structures, etc.) to develop a weighted average remaining life for the account as a whole. This approach was used for nine accounts, representing 7.12 percent of the total investment in utility plant for the Water Company.

The terms Weighted Average Age and Weighted Average Remaining Life are used extensively throughout this report. For plant accounts comprised of numerous different vintages of plant investment, or dollar investments made in different years, each vintage year investment has a different age and a different remaining life. Therefore, in order to develop a meaningful statistic for age and remaining life for such

an account, the annual investment is multiplied by the age of that vintage, then this product for each vintage year is summed for the account. The Weighted Average Age is obtained by dividing the sum so developed by the plant balance in the year of the study. This is a direct dollar Weighted Average Age. Each vintage year investment also has a different remaining life based on the retirement dispersion and the average service life determined by analysis. The Weighted Average Remaining Life is determined in the same way as is the weighted average age. The remaining life for each vintage year as determined from the characteristics of the retirement dispersion and average service life is multiplied by the investment surviving for that year. The products for all the vintage years for an account are summed, and the weighted average remaining life is obtained by dividing that sum by the surviving plant balance in the year of the study.

(D) Average Service Life Estimate

For other accounts, estimates of average service life and dispersion were made based on the characteristics of the plant classified by that account. Results of studies for other American Water System companies were compared when making estimates. This approach was used for 12 accounts, representing 2.96 percent of the total plant investment in utility plant for the Water Company. A summary of accounts and methods used is presented in Table 1.

The Book Depreciation Reserve for Each Plant Account

The book depreciation reserve for Tennessee-American Water Company, Inc., is presently maintained by utility plant account. The balance by utility plant account at 12/31/89 was taken directly from the books and records of the Water Company.

Contributions in Aid of Construction/Customer Advances

The Water Company presently depreciates contributed property and customer advances on its books by utility plant account. In this study, the depreciation rates

calculated in Table 3 utilized utility plant and depreciation reserve balances for Accounts 331.4, 333.4, 334.4 and 335.4 which were adjusted and their respective contribution in aid of construction and customer advances amounts were deducted from the balances. Therefore, the depreciation rates calculated for those accounts reflect no contributions in aid of construction or customer advances.

It should be explained that contributions in aid of construction and customer advances were not deducted solely by the account balance at December 31, 1989. Rather, a detailed analysis was conducted to separate the annual activity which the Water Company experienced from these two accounting items. The Water Company maintained an accurate accounting by plant account back to at least 1979 for both utility plant and depreciation reserve balances. It should be noted the majority of contributions and customer advances occurred in the 1979-1989 period. However, prior to 1979, very few records existed and therefore it was determined to be appropriate to estimate the amount of contributions and advances on an annual basis by averaging several years of known data (1985-1989) and using this average to calculate a corresponding percentage by plant account. This percentage was applied to the annual additions which occurred by plant account prior to 1979 in order to obtain an estimate of those contributions and customer advances in earlier years. These estimates were then incorporated into determining a net utility plant balance and accumulated depreciation reserve balance for Accounts 331.4, 333.4, 334.4 and 335.4 at 12/31/89.

Determination of Future Net Salvage

In the remaining life method, past net salvage is incorporated into the calculation of depreciation accruals through use of the book reserve into which past salvage has been credited and against which past cost of removal has been debited. Ideally, future salvage should be estimated by trending past salvage data through the period representing the remaining life of the plant presently in service. In this case,

however, adequate data were not available to make reliable analyses for future trending.

For accounts with little or no data, net salvage was assumed to be zero percent or very close to zero percent unless some overriding factor was present. For example, there is no salvage data for account 340.53, Computers and Peripheral Equipment. This equipment will be removed from service primarily for technical obsolescence. Therefore, it should have some resale value when removed from service with a very low cost of removal and therefore was assigned a positive net salvage of 10%. Appendix B, contained in a separate volume, presents a detailed salvage analysis by account on available data for the period 1975 to 1989.

After information was developed for Remaining Life, Book Reserve, Future Net Salvage by Account, and Plant Investment, depreciation accruals were calculated using the Remaining Life Method.

Actuarial Analysis

As noted earlier, accounts were analyzed using actuarial methods. The service life analysis was conducted through computer processing of the history of additions, retirements and plant balances. The method of computer analysis used is referred to as the "Retirement Rate Method." Actual retirement data is composited by age at the time of study. The computer program then calculates a series of retirement ratios. A ratio is calculated for each year of age in the study year by dividing the amount of plant retired by the amount of plant exposed to retirement at the beginning of that year of age. A survivor curve is plotted from these ratios because the percent of surviving plant can be determined from the retirement ratio at each year of age. Because the utility plant in service is made up of elements having various ages, the resulting plotting usually will not cover an entire service life and the plotting is called a "stub curve." Theoretical curves were developed by Robley Winfrey at Iowa State College

in 1935 and are commonly called the "Iowa Curves." By matching the computer-generated "stub" curves for plant accounts with the theoretical curves and selecting the best match, the historical service life characteristics are established. The longer stub curves permit excellent matching and the shorter ones require more judgment. Please see Appendix A for graphs of matched curves for this study.

There are four series of Iowa Curves: R, L, S and O Modal. R stands for Right; L stands for Left; S stands for Symmetrical; and O stands for Origin. The left modal curves have their maximum retirement rate to the left of, or prior to, the average service life age. The right modal has the maximum retirement rate to the right of, or after, the average service life. Origin modal curves have the maximum retirement rate at the origin and Symmetrical modal curves have the maximum retirement rates symmetrically about the average service life.

The number associated with a type curve is an indicator of the severity of the model relative to the average retirement rate. Therefore, an R-5 curve has a much higher peak retirement rate than does an R-1 curve.

"The families of Iowa-type curves represent a summary of studies of the survivor characteristics of many types of industrial and utility properties. The purpose of these studies was to generalize the attrition of units of physical properties into curves representing expected trends. It is probable that the motivation for the assembly of these curves lay in the desire to present a more coherent approach to the development of life estimates than that employed in the past century. Interest in mathematics and economics as well as in regulatory procedure also may have motivated these studies. Regardless of the motivation, these studies resulted in a series of type curves which set forth what was learned concerning industrial property life characteristics."

The above paragraph is quoted from "The Estimation of Depreciation" by Fitch, Wolf and Bissinger, Depreciation Programs, Inc., Kalamazoo, Michigan, and well

describes the basis for Iowa curves. Please see Table 2 for results of statistical analyses. The result of the actuarial analysis described above must then be balanced with plans, programs and policies of the Company which can have an impact on the ASL of the property being analyzed.

A good case in point is Account 334.42 Bronze Case Meters/Old Style. The overall actuarial analysis for this account yielded a 29 year ASL. However, management policy at present is to install newer style bronze case meters. When these meters are removed from service for periodic testing at 10 years, they are scrapped. Those that pass the first testing period are unlikely to survive the second. For example, manufacturers typically warrant these meters for 15 years or 1.5 million gallons. Therefore, small meters will experience approximately a 10 year ASL. Consideration must be given to the fact that larger meters are rebuilt and restored to service. Therefore, a longer average service life than 10 years is warranted.

Table 2 shows the life characteristics of average service life, average age and average remaining life for all depreciable accounts.

Table 3 shows the results of the depreciation study. The remaining life depreciation accruals by account are calculated per the formula shown on page 3. The depreciation accrual percentages are also calculated in the last column of Table 3. These are calculated for each account by dividing the annual accrual amount by original cost plant investment.

On Table 4 the original cost for net plant investment and book reserve are shown. The net salvage percentage determined as part of this study (in Appendix B) is also shown.

Table 5 presents an overall summary of Tables 1 through 4 and illustrates the derivation of the annual depreciation expense accrual amount and rate.

Table 6 presents a comparison of the current and proposed depreciation charges

at December 31, 1989 and their respective depreciation rates.

Recommendations:

It is recommended that the composite depreciation accrual rates developed in this study and shown on Table 3 be implemented by the Water Company. Since the results of this study require higher revenues for depreciation expense as a Water Company budget item, implementation of these new depreciation accrual rates should take place at the time of resolution of the Water Company's next rate case.

Analysis of Account 304.22 - Pumping Structures

Account 304.22 represents the installed cost of structures, improvements, and appurtenances used for pumping operations. The 12/31/89 utility plant balance is $620,344. The depreciation reserve at 12/31/89 is $165,690.

There are numerous pumping structures throughout the service territory. The structural elements of these stations were assigned a life span in the range of 50-125 years, based on age and condition. A facility may have been assigned a terminal year due to its inter-relationship to another facility. For instance, a main service pumping facility within the water treatment plant would become obsolete at the end of the useful life of the water treatment plant.

The average service life of these facilities was estimated at 60 years. The resulting weighted average remaining life is 22.89 years. The weighted average age is 25.19 years.

Analysis of salvage and cost of removal data for the years 1975-1989 indicate a net salvage factor of zero percent. This result reflects the retirement of a number of small non-structural items. In order to recognize the future cost of removal likely to be experienced at the end of the useful lives of the various booster pumping stations in this account, a net salvage factor of negative 15 percent is assigned to this account in order to be consistent with the salvage factor assigned to all structural accounts.

Analysis of Account 304.31 - Water Treatment Structures

Account 304.31 represents the installed cost of structures and improvements used in connection at the Citico water treatment plant. The 12/31/89 plant balance is $1,643,693. The depreciation reserve balance at 12/31/89 is $233,979.

Structural elements of this account were assigned a life span of 125 years which resulted in an average service life estimate for all elements in these facilities of 75 years. This approach results in a weighted average remaining life of 22.03 years. The weighted average age of the account is 13.53 years.

Net salvage and cost of removal data for the period 1975-1989 resulted in a negative net salvage of 10.22 percent. The majority of the retirement data consisted of non-structural items with no salvage or cost of removal data. The negative net salvage estimate of 10.22 percent is mainly the result of a major renovation which occurred to the existing chemical building in 1988-1989. While the building itself was not retired, a large amount of components were retired and resulted in a high cost of removal in 1989. However, a factor of negative 15 percent was assigned to this account for calculation of depreciation accrual rates in order to be consistent with the net salvage factor assigned to all structural accounts.

Analysis of Account 304.32 - Water Treatment Structures and Improvements - Painting

Account 304.32 represents the recent cost of painting various structures located at the Citico treatment plant. These structures include the Aldrich filter units and other related facilities. The utility plant in service balance at 12/31/89 is $77,313. The depreciation reserve balance at 12/31/89 is $20,539.

Tank painting normally has a useful life of 10-15 years before a reapplication is necessary. In accordance with guidelines used by other American Water System companies and their respective regulatory authorities, a depreciation rate of ten percent was assigned to this account for the calculation of depreciation accruals. In addition, no salvage data was available for analysis. Therefore, the negative 5.00 percent net salvage factor used for Account 330.42 was applied to this account because of similar types of structures being painted. Account 330.42 experienced several instances of tank painting removal costs (sandblasting, clean-up, etc.) which were booked and recorded separately from the new tank painting cost for those facilities.

Analysis of Account 304.4 - Transmission and Distribution Structures and Improvements

Account 304.4 represents the installed cost of a new meter service center and the cost of remodeling associated with the two buildings utilized by the distribution department. The 12/31/89 utility plant balance is $470,321 while the depreciation reserve at 12/31/89 is $6,800.

An average service life of 50 years has been estimated for the various elements of this account. This analysis results in a weighted average age of 4.29 years, and a weighted average remaining life of 32.34 years.

There are no salvage data available for the 1975 to 1989 period because no retirement activity has been experienced in this account. The net salvage factor of negative 15 percent was utilized for this account to be consistent with the factor assigned to all structural accounts in this study.

Analysis of Account 304.51 - Office Structures

Account 304.51 typically represents the installed cost of office structures and appurtenances. However, since the Water Company is presently leasing the main office building it occupies, the account balance reflects only a number of interim improvements made to the facility. The utility plant balance at 12/31/89 is $28,358. The depreciation reserve at 12/31/89 is $9,858.

Since the account balance consists of leasehold improvements, we have utilized a straight curve dispersion with a 20 year average service life to analyze this particular account. The analysis results in a weighted average age of 7.2 years and a weighted average remaining life of 16.4 years.

An analysis of net salvage data from 1975 to 1989 indicates a net salvage factor of negative 1.38 percent. However, since this account contains leasehold improvements, we have applied a zero percent net salvage factor to calculate depreciation accrual rates in this account.

Analysis of Account 304.52 - Stores, Shops, and Garage Structures

Account 304.52 represents the constructed cost of structures and appurtenances used for stores, shops and garage structures. The 12/31/89 utility plant balance is $140,877. The 12/31/89 depreciation reserve is $61,244.

Each structural element was assigned a life span based on age and condition resulting in an average service life of 50 years. The resulting weighted average remaining life is 14.76 years. The weighted average age is 30.78 years.

Analysis of net salvage data for the period 1975 to 1989 indicated a net salvage factor of negative 7.07 percent. This value is the result of one significant non-structural item which was retired at the distribution garage in 1979. However, in order to be consistent with all structural accounts in this study, a negative 15 percent was used for calculating depreciation accrual rates in this account.

Analysis of Account 304.53 - Miscellaneous Structures

This account represents the constructed cost of structures that cannot be classified in any of the other structural accounts. The 12/31/89 utility plant balance is $292,975. The 12/31/89 depreciation reserve is $11,497.

The structural elements of this account were assigned a life span based on age and condition resulting in an average service life of 50 years. The resulting weighted average remaining life is 19.17 years. The weighted average age is 5.46 years.

There are no salvage data available for analysis for the period 1975 to 1989 because no retirement activity was experienced in this account. The net salvage factor of negative 15 percent used for all structural accounts was assigned to this account to calculate depreciation accrual rates as well.

Analysis of Account 306.2 - Lake, River and Other Intakes

Account 306.2 represents the installed cost of lake, river, and other intakes used as a source of supply. Items included are land clearing, conduits, cribbing, fences, gatehouses and equipment, intake piping, intake wells, lighting, screens and racks. Investment in this account consists of the intake structure at the Citico treatment plant located on the Tennessee River. The utility plant in service balance at 12/31/89 is $188,346. The depreciation reserve balance at 12/31/89 is $68,680.

The life span of the structural elements of this account have been keyed to the terminal year of the Citico treatment plant facilities. The average service life of the facilities in this account was estimated at 75 years. The weighted average remaining life of this account is 23.07 years and the weighted average age is 39.74 years.

One retirement has taken place in this account during the 1975-1989 period analyzed for salvage and cost of removal. This retirement resulted in an abnormal negative net salvage percentage of 111 percent. The roof and decking of the intake structure containing the screen house was replaced and the original cost of installing these items was exceeded by the cost of removal. In order to begin recognizing the cost of removal that will likely be experienced at the end of the useful life of the intake structure, a negative 15 percent net salvage percentage has been utilized to calculate depreciation accruals in this study.

Analysis of Account 310.2 - Other Power Production Equipment

Account 310.2 represents the installed cost of electric generation equipment. The 12/31/89 balance of utility plant in service is $149,662. The depreciation reserve at 12/31/89 is $41,558.

The life characteristics determined for Account 311.22 have been applied to Account 310, in that similar equipment and installations are involved. Therefore, a 48 year average service life with an R-4 dispersion was used. The weighted average age of this installation is 10.66 years while the weighted average remaining life is 22.45 years.

Salvage data for Account 310.2 during the period 1975 to 1989 is nonexistent because of the corresponding lack of retirement data. Therefore, the negative 5.00 percent net salvage factor used for Account 311.22 was applied to this account to calculate depreciation accruals due to the similar types of equipment.

Analysis of Account 311.22 - Electrical Pumping Equipment

Account 311.22 represents the installed cost of electric motors, pumps, water piping in the pumping station, electric switchgear, instrumentation, controls, etc. The utility plant balance of electric pumping equipment at 12/31/89 was $2,367,405. The depreciation reserve at 12/31/89 is $1,306,260.

Account 311.22 was analyzed using the actuarial analysis method. Data available for analysis include additions and retirements for the period 1921 to 1989. This analysis yielded a 48 year average service life and an Iowa Curve R-4 dispersion. The weighted average remaining life is 28.88 years and the weighted average age is 20.40 years. Other studies performed for American Water System Companies have yielded results in the range of 26 to 60 years. Therefore, these results fit well into the general range of experience.

Analysis of net salvage for the period 1975 to 1989 yielded an average net salvage of negative 3.35 percent. Therefore, a factor of negative 5.00 percent was used for calculation of depreciation accruals for this account.

Analysis of Account 311.23 - Diesel Pumping Equipment

Account 311.23 represents the installed cost of pumping equipment driven by diesel engines. This also includes water piping in the station, valves, instrumentation, controls, etc. The 12/31/89 balance of utility plant in service is $24,431. The 12/31/89 depreciation reserve balance is $10,059.

The service life characteristics determined for Account 311.22 have been applied to Account 311.23 in that similar equipment and installations are involved. Therefore, an average service life of 48 years was used with an R-4 dispersion. The weighted average remaining life is 32.38 years and the weighted average age is 15.34 years.

There were no salvage data for the period 1975 to 1989 for this account because no corresponding retirements occurred during this period. Therefore, the net salvage factor for Account 311.22, negative 5.00 percent, is assigned to this account for the calculation of depreciation accrual rates.

Analysis of Account 311.27 - Other Pumping Equipment

Account 311.27 represents other pumping equipment. The 12/31/89 plant balance is $4,166. The 12/31/89 depreciation reserve balance is $1,961.

The service life characteristics of Account 311.22 have been applied to this account. The resulting weighted average remaining life is 14.71 years and the weighted average age is 28.76 years.

Net salvage characteristics for Account 311.22 were also used for this account because of the lack of data. This is the result of no retirements occurring during the 1975-1989 period. Therefore, a net salvage factor of negative 5.00 percent was assigned to this account for calculating depreciation accrual rates.

Analysis of Account 320.31 - Water Treatment Equipment

Account 320.31 represents the cost installed of equipment, instruments, controls, etc. used in the treatment of water. This includes chemical treatment equipment, filter media and controls, sedimentation and flocculating facilities. The 12/31/89 balance of utility plant in service is $8,313,431. The 12/31/89 depreciation reserve is $2,010,630.

Data available for analysis include additions and retirements for the period 1921 to 1989. An actuarial analysis was performed, resulting in the selection of an average service life of 36 years with an Iowa Curve S-2 dispersion. The weighted average age is calculated at 18.80 years and the weighted average remaining life is 20.56 years.

Analysis of net salvage data for the period 1975 to 1989 resulted in an overall average of negative 11.68 percent. The trend is toward increasingly negative net salvage. Therefore, a net salvage factor of negative 12.0 percent is used to calculate depreciation accruals for this account.

Analysis of Account 320.33 - Granular Activated Carbon Media

Account 320.33 represents the cost of Granular Activated Carbon filter media for the removal of organic solvents, tastes and odors from treated water. The utility plant in service balances at 12/31/89 is $524,156. The depreciation reserve balance at 12/31/89 is $74,453.

This filter media is typically regarded as having a five year service life. Therefore, remaining lives were calculated using an Iowa Curve R-2.5 dispersion and the five year ASL. The weighted average remaining life is 2.63 years and the weighted average age is 3.00 years.

Salvage and cost of removal data for the 1975-1989 period indicates a net negative salvage factor of 9.8 percent. Therefore, a net salvage factor of negative 10 percent was assigned to this account for the calculation of depreciation accruals.

Analysis of Account 330.41 - Distribution Reservoirs and Standpipes

Account 330.41 represents the cost of reservoirs, tanks, and standpipes used in storing water for distribution. It includes such items as land clearing, fences, gates, landscaping, lighting systems, instrumentation and controls. These storage facilities are located in the Water Company's service area at locations determined by engineering analysis. The 12/31/89 balance of utility plant in service is $2,172,993. The 12/31/89 depreciation reserve balance is $757,137.

Data available for analysis include additions and retirements data for the period 1912 to 1989. There are several tank retirements included in that data, but the data really do not provide the type of record that would make actuarial or semi-actuarial analysis reliable. Therefore, each major tank location was analyzed individually using a 50-100 year life span for the tank structure itself based on age, condition and material of construction. As a result, an average service life of 75 years was estimated for the various elements in this account. Using this approach, the weighted average age is 20.30 years, and the weighted average remaining life is 44.55 years.

Analysis of net salvage data for the period 1975 to 1989 yields an average net salvage of negative 5.51 percent. This result reflects retirement of several small non-structural items for this period. Instead of using the indicated factor, a net salvage factor of negative 15 percent is assigned to this account in order to be consistent with the salvage factor assigned to all structural accounts in this study. This factor is utilized in the calculation of depreciation accruals for this account.

Analysis of Account 330.42 - Distribution Reservoirs and Standpipes - Painting

Account 330.42 represents the cost of painting the various distribution reservoirs and standpipes located within the Water Company's service area. The utility plant in service balance at 12/31/89 is $399,052. The depreciation reserve balance at 12/31/89 is $59,730.

Tank painting normally has a useful life of 10-15 years before a reapplication is necessary. In accordance with guidelines used by other American Water System companies and their respective regulatory authorities, a depreciation rate of ten percent was assigned to this account for the calculation of depreciation accruals. In addition, an analysis of limited salvage data for the 1975-1989 period yielded an average net salvage of negative 3.4 percent. The Water Company, in recent years, has started to book and record separately the cost of removal incurred from earlier tank coatings. Originally, this cost was included as part of the overall new tank painting estimate. Therefore, in order to begin recognizing the increasing cost of removal related to tank painting, a net salvage factor of negative 5.00 percent was assigned to this account.

Analysis of Account 331.4 - Transmission and Distribution Mains

Account 331.4 represents the cost installed of transmission and distribution mains, valves, fittings, etc. It also can include the cost of items such as pavement restoration, pressure regulators, sterilization, and the trenching involved with installation of a main. The utility plant balance at 12/31/89 is $41,650,416, exclusive of contributions in aid of construction (CIAC) and customer advances (CA). The depreciation reserve at 12/31/89 is $5,432,507, exclusive of CIAC and CA.

This account was separated into three subaccounts based solely upon the size of the transmission and distribution mains. Those mains which were four inches and less in diameter were classified in Subaccount 331.41. Those mains which were six inch to ten inch in diameter were classified in Subaccount 331.42. Finally, those mains which were twelve inches and greater in diameter were classified in Subaccount 331.43. It should be noted that prior to 1965 actual recordkeeping of the size of mains installed was incomplete. Therefore, an estimate of the different sizes of main installed each year prior to 1965 was made in order to classify all the mains as far back as possible (1920). The estimate was developed by analyzing all the retirements which occurred by subaccount for each vintage year. A ratio of each subaccount's retirements to the total retirements by vintage year was developed and this ratio was applied to the total additions by vintage year. This method allowed an approximate estimate of annual additions to be developed by subaccount for each vintage year.

The estimated utility plant balance at 12/31/89 for Account 331.41, less CIAC and CA is $5,795,130. The estimated respective utility plant balances for Accounts 331.42 and 331.43 at 12/31/89, exclusive of CIAC and CA are $24,235,709 and $11,619,577. The estimated depreciation reserve balances for Accounts 331.41, 331.42 and 331.43, exclusive of CIAC and CA, are $759,319, $3,176,357 and $1,496,831, respectively.

The data available for actuarial analysis are additions and retirements from 1920 to 1989. The bulk of the investment in the overall account has occurred since the early 1960's.

An actuarial analysis was performed on the retirement data of Subaccount 331.41 which yielded an average service life of 85 years with an Iowa Curve R-1 dispersion. Similar analyses of Subaccounts 331.42 and 331.43 yielded an average service life of 90 years with an Iowa Curve R-3 dispersion and an average service life of 85 years with an Iowa Curve R-3 dispersion, respectively. Because of the similarities of the dispersions and average service lives among the subaccounts, it was decided to utilize a common average service life of 85 years with an Iowa Curve R-3 dispersion in the calculation of remaining lives for these subaccounts.

The calculated weighted average age for Subaccount 331.41 is 28.00 years, Subaccount 331.42 is 15.00 years and Subaccount 331.43 is 18.30 years. The calculated weighted average remaining life for these same subaccounts is 58.12 years, 70.24 years and 67.10 years, respectively.

The initial analysis of salvage data for the overall account yielded an average net salvage of positive 19.85 percent. Annual analyses ranged from negative 62 percent to positive 958 percent. There appeared to be a number of retirement work orders which experienced an unusually high salvage value versus a small retirement and cost of removal amount. Further investigation determined that a number of these retirement work orders were a part of urban renewal projects ongoing in the City of Chattanooga between 1975 and 1980 which received a significant level of federal funds. The high salvage values reflect these contributions in aid of construction for relocating/removing an older distribution main. It is our opinion that those retirement work orders with abnormally high salvage values do not reflect the typical value of the distribution main removed from service. Therefore, an adjusted salvage analysis was conducted with

those retirement work orders removed. In addition, a number of retirement work orders experienced high cost of removal amounts for corresponding low retirement amounts of a number of distribution mains. These work orders were also ignored in the adjusted salvage analysis for Account 331.4.

An analysis of the adjusted net salvage data for the period 1975 to 1989 yielded an average net salvage of negative 13.87 percent. Annual analyses of the adjusted data now range from negative 54 percent to negative 1 percent. The trend in the American Water System is toward increasingly negative net salvage. Therefore, a negative 15.00 percent is used to calculate depreciation accruals for this account. This value is consistent with similar salvage factors used for this account in a number of American Water System companies.

Analysis of Account 333.4 - Services

This account represents the cost installed of service pipes and accessories leading to customers premises from the main in the street. It also includes items such as corporation stops and tees, gate valves, boxes, joints, municipal permits, pavement replacement, tapping the main, etc. The 12/31/89 plant balance, exclusive of CIAC and CA, is $7,485,374. The 12/31/89 depreciation reserve balance, exclusive of CIAC and CA, is $2,562,307.

This account was analyzed using the simulated plant method of analysis. Retirement data was analyzed for the 1920-1989 period. The most appropriate Iowa curve from computer analysis was the R-4, 77 year curve. The weighted average age is 19.8 years. The weighted average remaining life is 57.27 years.

The net salvage analysis for the 1975-1989 period yielded an average net salvage of negative 65.8 percent. The trend of increasing cost of removal has continued with current net salvage figures for the past 15 years, with annual net salvage ranging from negative 183 percent to positive 197 percent. A negative 65 percent net salvage is used for this study for future net salvage. This approach will gradually move toward the indicated amount of net salvage.

Analysis of Account 334.42 - Bronze Case Water Meters/Old Style

Account 334.42 represents the cost of old style bronze case meters used for measuring the quantity of water delivered to users. The estimated account balance for Account 334.42 at 12/31/89, exclusive of CIAC and CA, is $1,312,993. The depreciation reserve at 12/31/89, exclusive of CIAC and CA, is $630,323.

An actuarial analysis of this account was performed using additions data from the 1921 to 1973 period and retirement data from the 1921 to 1989 period. The analysis resulted in an average service life of 29 years with an Iowa S-3 dispersion. This average service life results in a weighted average remaining life of 11.01 years. The weighted average age is 34.10 years.

Net salvage over the 1975 to 1989 period averaged 24.93 percent for the entire Account 334.4 (334.42, 334.43 and 334.44, inclusive). The data from 1975 to 1989 do not indicate a trend and in addition, salvage data could not be separated into different subaccounts for analysis of salvage and cost of removal data. Therefore, a net salvage percentage of 25.00 percent is used to calculate depreciation accruals for this subaccount.

Analysis of Account 334.43 - Plastic Case Water Meters

Account 334.43 represents the cost of plastic case meters used for measuring the quantity of water delivered to users. The estimated account balance for 334.43 at 12/31/89, exclusive of CIAC and CA, is $126,881. The depreciation reserve at 12/31/89, exclusive of CIAC and CA, is $77,610.

An actuarial analysis was conducted for utilizing additions data from the 1973 to 1981 period and retirement data from the 1975 to 1989 period. The analysis resulted in an average service life of 10.5 years with an Iowa L-4 dispersion. The weighted average remaining life was calculated to be 2.53 years. The weighted average age is 9.50 years.

No net salvage data were available for analysis of this subaccount. Plastic case meters have little or no salvage value and therefore, a net salvage factor of zero percent was assigned to this subaccount.

Analysis of Account 334.44 - Bronze Case Water Meters/New Style

Account 334.44 represents the cost of new style bronze case meters used for measuring the quantity of water delivered to users. The estimated account balance for Account 334.44 at 12/31/89, exclusive of CIAC and CA, is $1,011,393. The depreciation reserve at 12/31/89, exclusive of CIAC and CA, is $503,827.

An actuarial analysis of this account was not performed because of the lack of additions and retirement data available for analysis of these lightweight bronze case meters. Therefore, we have assumed the ASL and dispersion calculated for Account 334.42 is appropriate to analyze this account. The analysis of Account 334.42 resulted in an average service life of 29 years with an Iowa S-3 dispersion. This average service life results in a weighted average remaining life of 25.70 years. The weighted average age is 3.30 years.

Net salvage over the 1975 to 1989 period averaged 24.93 percent for the entire Account 334.4 (334.42, 334.43 and 334.44, inclusive). The data from 1975 to 1989 do not indicate a trend and in addition, salvage data could not be separated into different subaccounts for analysis of salvage and cost of removal data. Therefore, a net salvage percentage of 25.00 percent is used to calculate depreciation accruals for this subaccount.

Analysis of Account 334.45 - Meter Installations

Account 334.45 represents the cost of labor employed, materials used and expenses incurred to install customers meters. It includes the cost of meter couplings, yokes, vaults, stops, etc. The account balance at 12/31/89 is $2,318,398. The 12/31/89 depreciation reserve balance is $471,448.

An actuarial analysis was performed on this account utilizing additions data from the 1938 to 1989 period and retirements data from the 1946 to 1989 period. The analysis resulted in an average service life of 60 years with an Iowa L-1 dispersion. This average service life results in a weighted average remaining life of 51.70 years. The weighted average age is 11.10 years.

Salvage data for the 1975 to 1989 period indicate an average net salvage of positive 1.08 percent over the past 15 years. Annual net salvage ranged from negative 108 percent to positive 573 percent. However, the past five years (1985-1989) yielded an average net salvage of negative 3.9 percent. Therefore, since the future trend is toward increasingly negative net salvage, a net salvage factor of negative 5.00 percent was used to calculate depreciation accruals for this account. This value compares favorably with similar factors utilized in American Water System companies.

Analysis of Account 335.4 - Hydrants

This account includes the cost installed of hydrants owned by the utility. It also includes such items as connection to the main, excavation, pavement replacement, pipe, including drains, the tee at the main and valves and valve boxes. The 12/31/89 plant balance, exclusive of CIAC and CA, is $3,531,057. The 12/31/89 depreciation reserve balance, exclusive of CIAC and CA, is $415,823.

This account was analyzed using the Simulated Plant method of analysis. The main reason for using this method is because the hydrants were owned by the City of Chattanooga prior to 1971 and additions and retirement data were not available for analysis. Therefore, the study utilized the data maintained by the Water Company for the 1971 to 1989 period. The analysis resulted in an average service life of 55 years with an Iowa R-1 dispersion. This average service life results in a weighted average remaining life of 46.78 years.

Net salvage for hydrants has traditionally been positive due to the above ground recoverable metal in the hydrant. The average net salvage for hydrants for the period of 1975 to 1989 results in a positive 6.94 percent. Analyses of individual years yields a range of net salvage of positive 134 percent to negative 43 percent. However, the past five years (1985-1989) yielded an average net salvage of negative 18.3 percent. Therefore, since the trend is toward increasingly negative net salvage, a negative 20.00 percent was used to calculate depreciation accrual rates for this account.

Analysis of Account 339.2 - Other Water Source Plant

Account 339.2 represents any source of supply plant not classifiable in one of the other source of supply plant accounts. The 12/31/89 utility plant balance in Account 317 is $8,526. The 12/31/89 depreciation reserve for this account is $1,550.

The various elements in this account were estimated to have an average service life of 30 years. The weighted average age is 13.36 years and the weighted average remaining life is 13.81 years.

No net salvage data were available for analysis because no retirement activity has occurred in this account. A net salvage factor of zero percent was assigned to this account.

Analysis of Account 340.51 - Office Furniture

Account 340.51 represents the cost of office furniture not permanently attached to any structure. Items such as desks, chairs, book cases, shelves, drafting room equipment, file cabinets, tables, etc. are included in this account. The 12/31/89 utility plant in service balance is $270,659. The 12/31/89 depreciation reserve balance is $88,035.

Data available for analysis are additions and retirements for the period 1920 to 1989. An actuarial analysis of the available data yielded a 27 year ASL with an L-2 dispersion. This result is in a reasonable range of results when compared with recent studies conducted for other American Water System Companies. Therefore, this account yields a weighted average age of 7.50 years and a weighted average remaining life of 21.09 years.

Analysis of net salvage data for the period 1975 to 1989 results in an average net salvage of 7.72 percent. Therefore, based on the indicated factor, a net salvage factor of 10.00 percent was used to calculate depreciation accrual rates in this study for this account.

Analysis of Account 340.53 - Computers and Peripheral Equipment

Account 340.53 represents the cost of computer hardware purchased and installed. The account balance at 12/31/89 was $688,356. The 12/31/89 depreciation reserve balance is $114,862.

Computer equipment is subject to rapid changes in technology. It is doubtful that wear and tear or economic conditions will cause the replacement of this equipment, however, better and faster machines will become available. A five year average service life and an Iowa Curve of R-2.5 was assigned to this account. This approach results in a weighted average age of 2.82 years and a weighted average remaining life of 2.72 years.

There are no net salvage data available for analysis for the period 1975 to 1989. Since it is unlikely that this equipment will be given an opportunity to wear out, some salvage value should be assumed. However, because the equipment will likely become obsolete, there will not be a great demand for it. Therefore, a 10 percent salvage value is assigned to calculate depreciation accrual rates for the equipment in this account.

Analysis of Account 340.54 - Other Office Equipment

Account 340.54 represents the cost of such items as typewriters, adding machines, copiers, and other non-computers that are electric or electronic. The account balance at 12/31/89 was $77,641. The 12/31/89 depreciation reserve balance is $37,193.

Data available for analysis include additions and retirements for the period 1966 to 1989. An 18 year ASL with an Iowa Curve S-1 dispersion was assigned to this account for this study based on an actuarial analysis of the data. The weighted average age is 6.30 years and the weighted average remaining life is 12.56 years.

A review of net salvage data for the period 1975 to 1989 indicates net salvage factor of 1.01 percent. Therefore, a net salvage factor of 1.00 percent was used for calculating depreciation accrual rates for this account.

Analysis of Account 340.55 - Computer Software

The balance at 12/31/89 for this account is $33,017. The 12/31/89 depreciation reserve balance is $6,289.

Computer software is a more volatile item than computer hardware. Several generations of software are available at any given time. Greater functionally and ease ot use are being provided with each newer version. A five year ASL and an Iowa Curve of R-2.5 was assigned to this account for this study. This approach results in a weighted average age of 2.89 years, and a weighted average remaining life of 2.55 years.

Net salvage is zero since there is no market for used software.

Analysis of Account 341.52 - Transportation Equipment-Light Duty Trucks

Account 341.52 includes the cost of light trucks used for utility purposes. In addition to trucks it may include truck beds and trailers. The 12/31/89 utility plant balance is $673,778. The 12/31/89 depreciation reserve balance is $221,960.

Data available for analysis includes additions and retirements for the period 1965 to 1989. An actuarial analysis of the available data results in a 7.3 year ASL with an Iowa S-3 dispersion. The weighted average remaining life for this account is 5.03 years. The weighted average age is 3.40 years.

Analysis of net salvage data for the period 1975 to 1989 resulted in a net salvage factor of 19.34 percent. Therefore, a factor of 20.00 percent was used in the calculation of depreciation accruals for this account.

Analysis of Account 341.53 - Transportation Equipment - Heavy Duty Trucks

Account 341.53 includes the cost of heavy or specialty trucks used for utility purposes. In addition to trucks it may include truck beds and trailers. The 12/31/89 utility plant balance is $250,871. The 12/31/89 depreciation reserve balance is $120,256.

Data available for analysis provided inconsistent results by actuarial analysis. Therefore, because of the similarity to Account 341.52, the ASL and dispersion calculated for this account was applied to Account 341.53. This approach resulted in a weighted average remaining life of 2.71 years. The weighted average age is 5.33 years.

Analysis of net salvage data for the period 1975 to 1989 resulted in a net salvage factor of 24.69 percent. Therefore, a factor of 25.00 percent was used in the calculation of depreciation accruals for this account.

Analysis of Account 341.54 - Automobiles

Account 341.54 represents automobiles. The utility plant in service balance at 12/31/89 is $170,378. The depreciation reserve balance at 12/31/89 is $60,601.

An analysis of Account 341.54 using the actuarial analysis method indicates that for the period 1966 to 1989 the average service life of the account was 5.7 years with an Iowa S-2 dispersion. The weighted average remaining life for this account is 3.74 years. The weighted average age is 2.20 years.

Analysis of net salvage data for the period 1975 to 1989 averaged 26.57 percent. Therefore, a salvage factor of 25.00 percent was used to calculate depreciation accruals for this account. This value compares favorably to recent studies conducted for other American Water System Companies.

Analysis of Account 341.55 - Other Transportation Equipment

Account 341.55 represents auxiliary equipment for trucks. The utility plant in service balance at 12/31/89 is $27,968. The depreciation reserve balance at 12/31/89 is $20,003.

Limited retirement data were available for analysis regarding this account. Therefore, remaining lives were calculated based on a 10 year average service life with an Iowa R-1 dispersion. This approach results in a weighted average age of 8.13 years and a weighted average remaining life of 4.97 years.

There are no salvage data available for analysis for this account. Therefore, the net salvage factor for Account 341.54 was used to calculate depreciation accrual rates for this account.

Analysis of Account 342.5 - Stores Equipment

Account 342.5 represents the cost of equipment used for the receiving, shipping, handling, and storage of materials and supplies. Items such as chain falls, counters, cranes, hoists, lockers, scales, shelving, storage bins, etc. are included in this account. The 12/31/89 balance of utility plant in service is $24,022. The 12/31/89 depreciation reserve balance is $4,785.

There were insufficient retirements data to perform an actuarial or semi-actuarial analysis. Generalized data indicate an ASL of twenty years for this account. A straight curve dispersion was used for this study. The weighted average age is 7.81 years and the weighted average remaining life is 16.09 years.

Limited net salvage data were available for the period 1975 to 1989. A zero net salvage factor is assigned in this study to calculate depreciation accrual rates.

Analysis of Account 343.5 - Tools, Shop and Garage Equipment

Account 343.5 represents the cost of tools and equipment used in construction and repair work not specifically provided for in other accounts. It includes air compressors, battery chargers, cable pulling equipment, concrete mixers, machine tools, etc. The 12/31/89 balance of utility plant in service is $252,672. The 12/31/89 depreciation reserve balance is $105,765.

Data available for analysis include additions and retirements for the period 1965 to 1989. An actuarial analysis was performed for this band resulting in an ASL of 16 years with an Iowa Curve L-0 dispersion. The weighted average age is 7.50 years and the weighted average remaining life is 12.50 years.

An analysis of net salvage data for the period 1975 to 1989 yields an overall net salvage for the period of 9.16 percent. Therefore, a net salvage factor of 10.00 percent was used to calculate the depreciation accrual rates for this account.

Analysis of Account 344.5 - Laboratory Equipment

Account 344.5 represents the installed cost of general laboratory equipment not specifically provided for in other accounts. Items such as microscopes, scales, sterilizers, testing machines, etc. are included in this account. The 12/31/89 balance in utility plant in service is $230,314. The 12/31/89 depreciation reserve is ($24,240).

Data available for analysis include additions and retirements for the period 1970 to 1989. An actuarial analysis was performed for this band resulting in an ASL of 11 years with an Iowa Curve L-4 dispersion. The weighted average age is 1.20 years and the weighted average remaining life is 9.94 years.

An analysis of net salvage data for the period 1975 to 1989 yields an overall negative net salvage of 0.63 percent. Therefore, a net salvage factor of zero percent was used to calculate depreciation accruals for this account.

Analysis of Account 345.5 - Power Operated Equipment

Account 345.5 represents the cost of power operated equipment used in construction or repair work. Items such as air compressors, including driving unit and vehicle, boring machines, backhoes, pipe cleaning machines, etc. are included in this account. The 12/31/89 balance in utility plant in service is $190,619. The 12/31/89 depreciation reserve is $52,248.

Data available for analysis include additions and retirements for the period 1965 to 1989. An actuarial analysis was performed on this band of data yielding a 10.5 year ASL with an Iowa Curve R-5 dispersion. The weighted average age is 3.90 years. The weighted average remaining life is 7.34 years.

Analysis of net salvage data for the period 1975 to 1989 indicates a net salvage of 5.96 percent. Therefore, a net salvage factor of 5.00 percent was used to calculate depreciation accrual rates for this account.

Analysis of Account 346.51 - Communications Equipment

Account 346.51 represents the cost of radios, antennae, etc. The balance at 12/31/89 for this account was $245,923. The 12/31/89 depreciation reserve is $148,220.

Data available for analysis include additions for the period 1975 to 1989 and retirements for the period 1981 to 1989. An actuarial analysis was performed resulting in an ASL of 14 years with an Iowa Curve R-3 dispersion. The weighted average age is 5.80 years and the weighted average remaining life is 8.97 years.

An analysis of net salvage data for the period 1975 to 1989 indicated a net negative salvage factor of 0.74 percent. Therefore, a net salvage factor of zero percent was utilized to calculate depreciation accrual rates for this account.

Analysis of Account 346.53 - Communications Equipment - Telephone

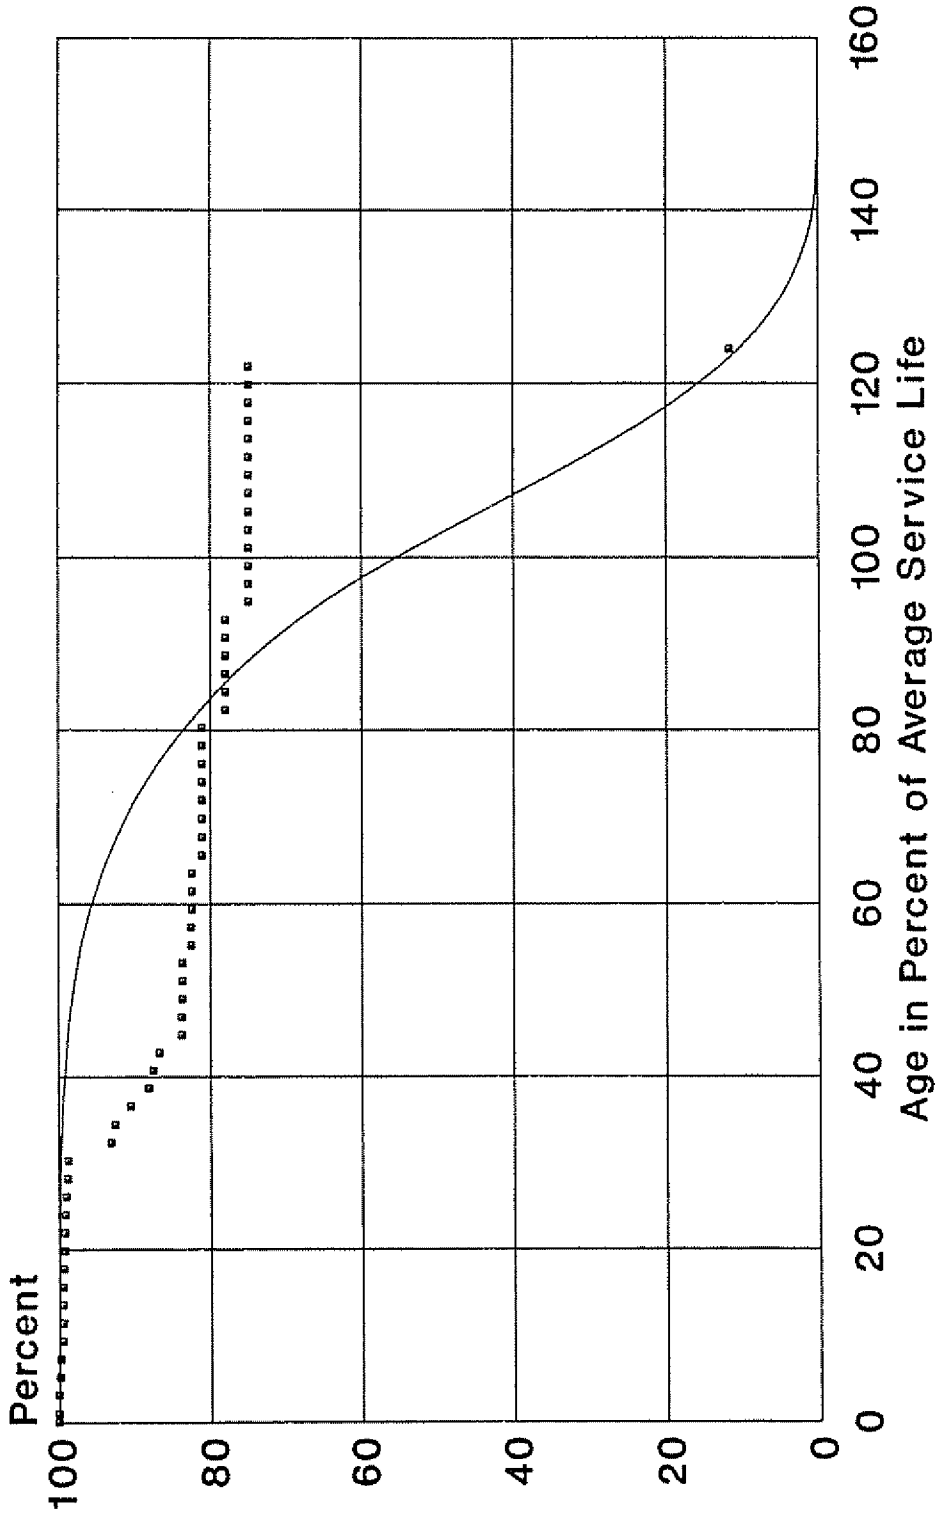
Account 346.53 represents the cost of a telephone and call management information system. The balance at 12/31/89 was $110,977. The depreciation reserve balance at 12/31/89 is $10,504.

This equipment is subject to technological obsolescence. It will likely be retired due to the availability of a better, faster system. A ten year average service life with an Iowa Curve dispersion of R-2.5 was assigned to this account. This approach results in a weighted average age of 5.29 years and a weighted average remaining life of 5.40 years.

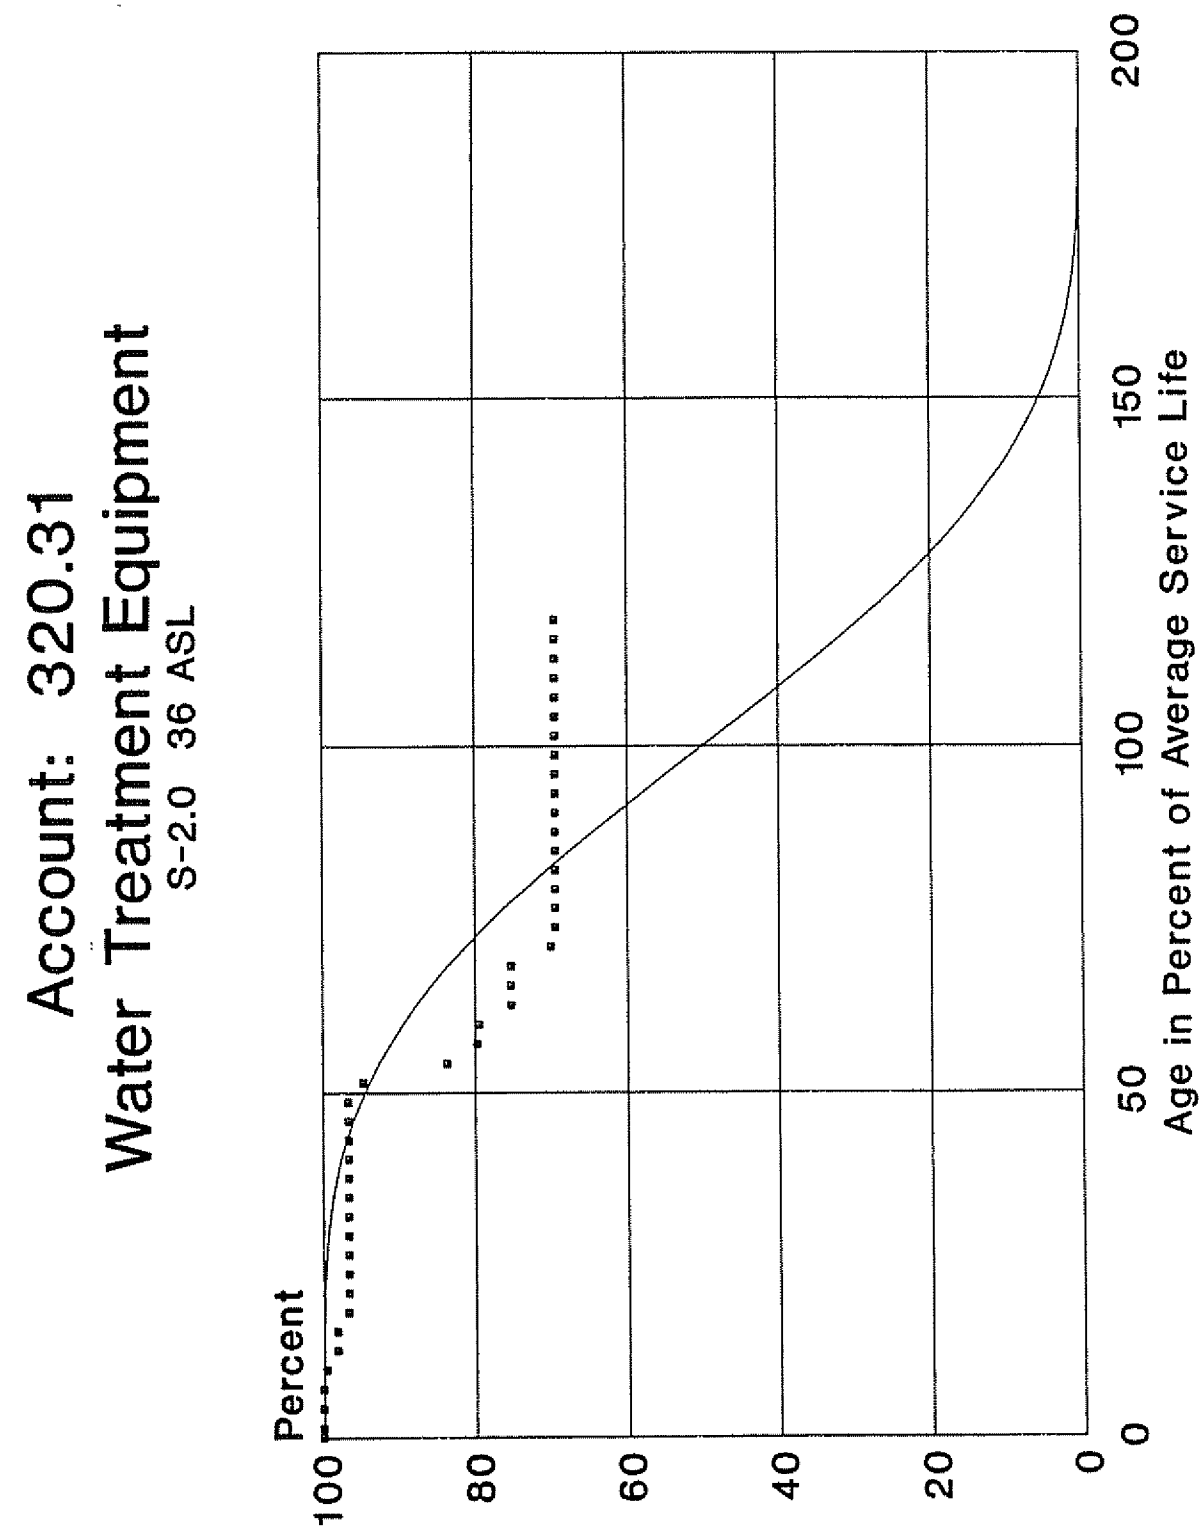
It is unlikely this equipment will wear out. Therefore, there should be some salvage value at retirement. However, it will also be obsolete, so salvage equivalent to a significant percentage of original cost is unlikely. Therefore, a 10 percent net salvage was assigned to this account for this calculation of depreciation accruals.

Analysis of Account 347.51 - Miscellaneous Equipment

Account 347.51 represents the cost of equipment, apparatus, etc., not includable in any other account. The 12/31/89 balance in this account is $62,495. The 12/31/89 depreciation reserve is $43,291.



Data available for analysis include additions and retirements for the period 1966 to 1989. An actuarial analysis was performed on this band of data which yielded an average service life of 16 years with an Iowa R-2.5 dispersion. This average service life results in a weighted average remaining life of 10.63 years. The weighted average age is 6.60 years.



Analysis of net salvage data for the period 1975 to 1989 indicates a net salvage of 9.66 percent. However, this result is from one large retirement which experienced a significant salvage value. The remaining retirements experienced zero salvage value. Therefore, a salvage factor of zero percent was used to calculate the depreciation accruals for this account.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Sheila Miller

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

17. Please identify the depreciation expense that the Company is proposing to include in its test year revenue requirement in this rate case. Please provide all calculations in electronic format, with formulae intact, which underlie this expense. The calculations should show the depreciation rates, the plant balances to which those rates are applied, the date(s) of those balances, and the resultant depreciation charges.

Response:

See the attached schedule. This file is also included on the enclosed CD and labeled as TN-CAPD-01-Part II-Q017 attachment.xls.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Michael Miller/Sheila Miller

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

18. Please explain fully the procedure by which the Company establishes the value of retirements from its mass property accounts. Please provide specific examples of the valuation of the 2006 and 2007 retirements from the three largest mass property accounts.

Response:

The Company objects to the portion of the question about examples of the evaluation of the 2006 and 2007 retirements from the three largest mass property accounts on the grounds that it is overbroad the question is vague as to vintage year, and how many examples. The Company further objects to the "example" portion of the question on the grounds that it is unduly burdensome given that the Company's property records for mass property are in fact **massive** and to reproduce them would be time consuming and extremely costly. Responsive data relating to specific asset retirement data, or utility plant data in general will be available for the CAPD to review at a mutually agreeable time at the Company's offices. Counsel for the CAPD should coordinate any on-site visits through the Company's counsel of record in this case, John Watson and Michael Miller.

Notwithstanding its objections, the Company directs the CAPD to the document titled "AWW Accounting Policies, Property Plant and Equipment". On the second page under the subtitle "Retirements" is a detailed description of the acceptable

methods to price (value) retirements. Due to the confidential nature of this information and the damage that could be caused to AWW and TAWC if its policies and procedures were available to its competitors, TAWC objects to providing this information but will do so pursuant to an appropriate protective order.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: John J. Spanos

PART II: DEPRECIATION & WEATHER NORMALIZATION

Question:

19. Please provide all data, studies, memoranda or other documentation that supports the selection of amortization periods for the accounts subject to amortization.

Response:

The use of amortization accounting has been implemented by almost all utilities since the 1990 ruling in Florida for certain general plant accounts. This ruling was followed by FERC Accounting Release No. 15. The attached spreadsheet sets forth amortization periods for other utilities.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: John Spanos

PART II: QUESTIONS & REQUESTS REGARDING DEPRECIATION & WEATHER NORMALIZATION

Question: Depreciation

20. Please provide the following annual amounts for all plant accounts for the last 10 years (up to, and including, 2007). If the requested data is not available for the last 10 years, please provide the data for as many years as are available. Please provide data in both hard copy and electronic format (Excel or .txt).
    a. Beginning and ending reserve balances
    b. Annual depreciation expense
    c. Annual retirements
    d. Annual Cost of removal and gross salvage
    e. Annual third party reimbursements

Response:

Annual Commission Reports for Tennessee-American Water Company pages W-4 and W-5 contain the data requested for all of the items above. Additionally, data for the years 1998-2007 is attached. An Excel file is included on the enclosed CD that contains the years 2001-2007; however, data for the years 1998-2000 are not available in electronic format. The Excel file is labeled TN-CAPD-01-Part II-Q020 attachment.xls.
