Written evidence before the Ontario Energy Board, Cost of Capital for Union Gas Limited, Inc., Docket No. EB-2005-0520, January 2006.

Direct and rebuttal testimony before the Pennsylvania Public Utility Commission, Return on Equity for Metropolitan Edison Company, Docket No. R-00061366 and Pennsylvania Electric Company, Docket No. R-00061367, April 2006 and August 2006.

Expert report in the United States Tax Court, Docket No. 21309-05, 34th Street Partners, DH Petersburg Investment, LLC and Mid-Atlantic Finance, Partners Other than the Tax Matters Partner, Petitioner, v. Commissioner of Internal Revenue, Respondent, July 28, 2006.

Direct and supplemental testimony before the Federal Energy Regulatory Commission, Docket No. ER06-427-003, on behalf of Mystic Development, LLC on the Cost of Capital for Mystic 8 and 9 Generating Plants Operating Under Reliability Must Run Contract, August 2006 and September 2006.

Direct testimony before the Federal Energy Regulatory Commission, Docket No. ER07-46-000, on behalf of Northwestern Corporation on the Cost of Capital for Transmission Assets, October 2006.

Direct and rebuttal testimony before the Tennessee Regulatory Authority, Case No. 06-00290, on behalf of Tennessee American Water Company, on the Cost of Capital, November, 2006 and April 2007.

Direct testimony before the Public Service Commission of Wisconsin, Docket No. 5-UR-103, on behalf of Wisconsin Energy Corporation, on the Cost of Capital for Wisconsin Electric Power Company and Wisconsin Gas LLC, May 2007.

Rebuttal testimony before the California Public Utilities Commission, Docket No. A. 07-01-036-39, on behalf of California-American Water Company, on the Cost of Capital, May 2007.

Direct testimony before the Public Utilities Commission of the State of South Dakota, Docket No. NG-07-013, on behalf of NorthWestern Corporation, on the Cost of Capital for NorthWestern Energy Company's natural gas operations in South Dakota, June 2007.

Direct testimony before the Public Utilities Commission of Ohio, Case No. 07-551-EL-AIR, Case No. 07-552-EL-ATA, Case No. 07-553-EL-AAM, and Case No. 07-554-EL-UNC, on behalf of Ohio Edison Company, The Toledo Edison Company, and The Cleveland Electric Illuminating Company, on the cost of capital for the FirstEnergy Company's Ohio electric distribution utilities, June 2007.

Direct testimony before the State Corporation Commission of Virginia, Case No. PUE-2007-00066, on behalf of Virginia Electric and Power Company on the cost of capital for its southwest Virginia coal plant, July 2007.

Direct testimony before the Public Utilities Commission of Ohio, Case No. 07-829-GA-AIR, Case No. 07-830-GA-ALT, and Case No. 07-831-GA-AAM, on behalf of Dominion East Ohio Company, on the rate of return for Dominion East Ohio's natural gas distribution operations, September 2007.

APPENDIX B

THE FERC METHODOLOGY: SAMPLE SELECTION AND THE DCF METHOD

I. SAMPLE SELECTION 1

II. THE FERC'S PREFERRED DCF METHOD 4

I. SAMPLE SELECTION

Q1. How did you select your sample of transmission utilities?

A1. I first researched the precedents set by the Commission in choosing proxy groups in past transmission rate cases. In its recent decisions, the Commission has approved, or suggested it would be appropriate to use, proxy groups composed of either (1) transmission-owning companies that operate in the same ISO/RTO, or (2) transmission-owning companies that operate in the "broader, but inter-related RTO markets" in which the applicant operates, and which have a "direct link," or "direct correlation," with the applicant's RTO/ISO. For example, in the *Midwest ISO Initial Decision*,[1] the presiding judge ruled that the group of nine Midwest ISO transmission owners or parent corporations of the Midwest ISO transmission owners ("TO") with publicly-traded common stock was the appropriate proxy group in determining the return on equity ("ROE") for the Midwest ISO transmission owners. The Commission affirmed the judge's finding that the proxy group proffered by the Midwest ISO TOs was the appropriate group to use in determining the ROE for the Midwest ISO TOs.[2]

In *ISO New England* (Opinion 489),[3] the Commission agreed with the ALJ's initial decision to reject the argument that New England ISO's ROE should be set at a level comparable to that of the 12.4 percent ROE established by the Commission in *Midwest ISO*. The Commission affirmed the judge's ruling, stating "Using the Midwest ISO as the sole proxy would, in this instance, be inappropriate and must be rejected."[4] In the *New England RTO Rehearing Order*,[5] the Commission accepted the ROE Filers' proposed proxy group consisting of transmission-owning members located in ISO-New England RTO, the New York ISO, and PJM. The Commission accepted the proxy group

---

1 *Midwest Indep. Transmission Sys. Operator, Inc.*, 99 FERC ¶ 63,011, at P 18 (2002).

2 *Midwest Indep. Transmission Sys. Operator, Inc.*, 100 FERC ¶ 61, 292, at P 12 (2002) ("Midwest ISO").

3 *Bangor Hydro-Elec. Co.,* 117 FERC ¶ 61, 129 (2006) ("ISO New England").

4 *Id.* P 74.

5 *ISO New England, Inc.*, 109 FERC ¶ 61,147, at P 204 (2004) ("New England RTO Rehearing Order").

on the grounds that a sample of northeast utility companies was "a sufficiently representative universe of companies for calculating an ROE applicable to the New England Transmission Owners."

The Commission has consistently rejected the inclusion in the proxy group of companies with no direct link to the ISO/RTO in which the applicant operates transmission assets. For example, in *Duquesne Light Co*,[6] the Commission rejected a proxy group that included companies with no direct link to PJM (in which Duquesne operates) or to the broader RTO markets with which PJM interacts. Similarly, in *Trans-Allegheny Interstate Line Company*,[7] the Commission rejected the proposal to include companies with no direct link to PJM in the proxy group. While the Commission has not ruled out the inclusion of other companies in the sample group, it has established a requirement that inclusion of such companies be fully justified:

> We set for hearing TrAILCo's proposed ROE, including the composition of its proxy group. In *Midwest Independent Transmission System Operator, Inc.*, the Commission accepted a proxy group of Midwest ISO transmission owners in setting an ROE applicable to the participating transmission owners in the Midwest ISO. Applying this reasoning here, TrAILCo has not shown that its proposal to include in its proxy group companies that have no direct link to PJM to be just and reasonable. [...] We will also permit TrAILCo and other participants to demonstrate that companies with no direct link to PJM should be included in TrAILCo's proxy group. However, we do not expect such companies to be included in TrAILCo's proxy group unless there is compelling evidence to support a deviation from our general policy of requiring a proxy group to be comprised of transmission owners with a direct link to the same RTO or Independent System Operator in which the applicant is located.[8]

Following the precedents set forth by the Commission as outlined above, I have selected a proxy group of transmission-owning utilities who are members of PJM.

---

6 *Duquesne Light Co.*, 118 FERC ¶ 61,087, at PP 71-73 (2007) ("Duquesne Light Co.").

7 *Trans-Allegheny Interstate Line Co.*, 119 FERC ¶ 61,219 (2007) ("TrAILCo").

8 *TrAILCo*, at P 40.

Q2. Please elaborate on how companies in the PJM were selected for the sample.

A2. Using the PJM's website, I identified all companies that were listed as transmission owning members. I then determined each member company's parent holding company, and eliminated those member companies that were not publicly traded or had no data available from Bloomberg. This initial screen resulted in thirteen companies remaining. I then deleted companies whose primary business line is outside of the electric industry which is consistent with the Commission's Opinion No. 489 ("ISO New England"), where the Commission excluded UGI Holdings because it is primarily a natural gas company.[9] Therefore, UGI Holdings was eliminated, and Valero Power Marketing was eliminated because it is primarily an oil company. Finally, I excluded Allegheny Energy because it has not paid a dividend on common stock since 2002, which makes application of the DCF method unreliable.

The final sample consists of ten companies: American Electric Power Company, Inc., Consolidated Edison, Inc., Constellation Energy Group, Inc., Dominion Resources, Inc., DPL, Inc., Exelon Corp., FirstEnergy Corp., Pepco Holdings, Inc., PPL Corp., and Public Service Enterprise Group, Inc..

Q3. Are there any issues with the remaining companies in your sample?

A3. Possibly. Dominion Resources and Constellation Energy are characterized by Edison Electric Institute's 1st Quarter 2007 Stock Review report as having less than fifty percent regulated assets. These companies were not deleted from the sample because they meet all of the criteria for inclusion, including being transmission-owning members in the PJM with an investment grade bond rating. To my knowledge, the Commission has never before excluded a company because its share of regulated assets was too low. Not only is it important to be consistent in this matter, it is also critical that the Commission not impose so many restrictions that the sample size becomes too small.

---

9 *ISO New England*, at P 37.

II. THE FERC'S PREFERRED DCF METHOD

Q4. What is the purpose of this section of the appendix?

A4. In this section, I discuss the details of my implementation of the Commission-based DCF method based upon my interpretation of various Commission decisions.

Q5. What is the basis of your procedures to implement the Commission-based DCF method?

A5. I have reviewed several Commission decisions and in particular the Commission's Opinion No. 445.[10] On pp. 61,262-63 of Opinion No. 445, the Commission states that:

> In the past, we have consistently applied a one-step, constant growth DCF model for calculating ROEs for electric utilities. The DCF methodology determines the ROE by summing the dividend yield (with an adjustment for the quarterly payment of dividends) and the expected growth rate. The resulting formula is D/P (1+.5g) + g = k, where "D/P" is the dividend yield, "g" is the sustainable growth rate of dividends per share, and "k" is the resulting ROE. The sustainable growth rate is calculated by the following formula: g = br + sv, where "b" is the expected retention ratio, "r" is the expected earned rate of return on common equity, "s" is the percent of common equity expected to be issued annually as new common stock, and "v" is the equity accretion rate.

Thus, the Commission has specified the single-stage DCF model as being its preferred estimation method for electric utilities. The procedure has been used more recently by the Commission in *ISO New England* and *Midwest ISO*, and its continued status as the Commission's preferred method is reaffirmed in Order 679[11] and Order 679-A.[12] Because it is the Commission's preferred method, I present evidence on this version of the dividend yield in a DCF model, as specified in Equation (B-1) below. However, I

---

10 *S. Cal. Edison Co.*, 92 FERC ¶ 61,070 (2000) ("Opinion No. 445" or "Southern California Edison").

11 *Promoting Transmission Investment Through Pricing Reform*, Order No. 679, 71 Fed. Reg. 43,294 (July 31, 2006), FERC Stats. & Regs. ¶ 31,222, at PP 92, 102 (2006).

12 *Promoting Transmission Investment Through Pricing Reform*, Order No. 679-A, 72 Fed. Reg. 1,152 (Jan. 10, 2007), FERC Stats. & Regs. ¶ 31,236, at P 63 (2006).

must note that this approach will tend to underestimate the true cost of capital, all else equal.

The Commission implements the following equation:

$$k = \left[\left(D_0 / P_0\right) \times \left(1 + 0.5g\right)\right] + g \qquad \text{(B-1)}$$

In the Commission-based methodology, P_0 is the stock price calculated as the average of the highest and lowest closing common stock price over the most recent six month period. In other words, the low dividend yield is the annualized dividend divided by the average of the highest closing prices over the most recent six months, and the high dividend yield is the annualized dividend divided by the average of the lowest closing prices over the most recent six months. The estimate of g is either the average long-term (5-year) analyst growth rate forecast or the sustainable growth rate as calculated in Equation (B-2) below.

$$g = (b \times r) + (s \times v) \qquad \text{(B-2)}$$

In Equation (B-2), b is the expected retention ratio, r is the expected return on common equity, s is the expected growth in the number of common equity shares, and v is the accretion ratio.

The procedure in the testimony of Commission staff witnesses Randolph A. Barlow[13] and Franklin D. Knight[14] to implement the DCF model confirm that I have correctly interpreted the Commission's intention for implementation of the model. Both staff witnesses rely on Commission Opinion No. 445 and use the sustainable growth DCF as one of their estimation methods.

---

13 Prepared Direct Answering Testimony of Commission Staff Witness Randolph A. Barlow, Pacific Gas and Electric Company, Dockets Nos. ER03-409-000, ER03-666-000, October 17, 2003.

14 Direct Testimony of Commission Staff Witness Franklin D. Knight, Allegheny Power, Docket No. ER02-136-004, November 25, 2002.

Q6. Exactly how do you implement the Commission-derived DCF method?

A6. The Commission's DCF approach calculates a high and a low dividend yield, sustainable growth rates from *Value Line* information and uses I/B/E/S's long-term growth rates as an alternative source for growth rates. Because I/B/E/S long-term growth rates are no longer accessible for non-members of Thomson Financial, I use Bloomberg BEst estimates instead. In the *New England RTO Rehearing Order*, the Commission stated that it would not "preclude the presiding judge from finding candidates for inclusion in the proxy group for which comparable data can reasonably be substituted for the growth rate data reported by I/B/E/S or *Value Line*."[15] Therefore, I calculate the sustainable growth rate for each sample company using methods that, to the best of my knowledge, are those recently relied upon by the Commission. I then determine the low, high and midpoint cost of equity estimates in accord with these procedures.

Q7. Please explain your calculations in detail.

A7. I obtain recent dividend and stock price information from Bloomberg. I annualize the Quarter 2, 2007 dividends and calculate the high and low average stock prices over the most recent six months using monthly data.[16] The high and low dividend yields are the annualized dividend divided by the average low and high stock price, respectively. Dividend yields for the sample companies calculated in this way are reported in Workpaper # 7, Panel A and B to Table No. MJV-4, Exhibit No. DVP-13 at 13-14.

---

[15] See *New England RTO Rehearing Order*, at P 205.

[16] At the time of the analysis for this proceeding, the most recent six months period available in Bloomberg was April 2007 through September 2007.

To calculate the sustainable growth rate, I calculate each sample company's retention ratio, return on equity, expected growth in shares, and expected accretion ratio using *Value Line* information.[17] The components of the sustainable growth rate are calculated as follows.

Retention Ratio (*b*): I follow the calculation in Opinion No. 445[18] to determine the retention ratio for each of the years, 2007, 2008, and 2011[19] and use the average for my calculations.

Return on Equity (*r*): I again follow the calculation in Opinion No. 445. I calculate the return on equity for each of the years 2007, 2008, and 2010-2012 using *Value Line's* forecasted Earnings per Share ("EPS") and Book Value per Share ("BPS"). The average return on equity for the three years is adjusted using the formula provided in Opinion No. 445.[20] Thus, I multiply the average return on equity by the following adjustment factor:

$$Adjustment\ Factor = \frac{2 \times (1 + Growth\ in\ Common\ Equity)}{2 + Growth\ in\ Common\ Equity} \qquad \text{(B-3)}$$

The growth in common equity is calculated from the calculated common equity figures for 2007 and in 2011. The common equity for 2007 (2011) is determined as the common equity ratio for 2007 (2011) multiplied times the total capital for 2007 (2011). Data on the forecasted common equity ratio and total capital are obtained from *Value Line*.

Growth in Shares (*s*): I have not been able to find a specification for the calculation of the external growth component ("$s \times v$") of the sustainable growth rate in Opinion No. 445. However, I am able to calculate the growth in common shares from *Value Line*

---

17 *Value Line* information is from August 31 and September 28, 2007.

18 See Opinion No. 445, at 61,263.

19 *Value Line* currently reports forecasts for the years 2007, 2008, and the 2010-12 period. I treat the *Value Line* numbers reported for the 2010-12 period to be for the year 2011, the midpoint of the period.

20 See Opinion No. 445, n.38.

information on the expected number of shares outstanding in 2007 and in 2011.[21] This figure is multiplied by the current price-to-book ratio to obtain *s*.[22]

Accretion Ratio (*v*): Opinion No. 445 does not specify the calculation of the accretion ratio, but the use of current data appears to be consistent with prior Commission practice.[23] The method uses *Value Line* information to calculate the accretion ratio as {1 − [1 / (Current Stock Price/Current Book Value)]} using *Value Line's* 2007 data.[24]

Q8. How do you use the sustainable growth rates described above and the long-term growth rate forecasts to determine the sample companies' Commission-based DCF cost of equity?

A8. I calculate each sample company's Commission-based DCF cost of equity, k, using the formula in Equation (B-2): $k = (D_0/P_0) \times (1 + .5g) + g$. For each company I calculate the cost of equity letting *g* take on either the BEst long-term growth rate forecasts or the sustainable growth rate calculated above.[25] I then determine the highest and lowest estimate that results using either the sustainable or BEst growth rate and high or low dividend yields, following the Commission's clarification in *Midwest ISO*.[26] In determining the lowest estimate, I discard any cost of equity estimate that is below the six-month average yield on bonds corresponding of a comparable rating to the company's bond rating plus 100 basis points. This procedure is consistent with Commission

---

21 This calculation appears to be consistent with the calculation performed in *Devon Power, LLC*, 103 FERC ¶ 61,155 (2003) ("Devon Power LLC").

22 See *Devon Power LLC*.

23 The *Devon Power LLC* Order appears to rely on a weighted average of the book value for the past and current year plus current price data. Also, in *City of Vernon, California*, Docket No. EL00-105-007, Docket No. ER00-2019-007, Prepared Direct and Answering Testimony of Staff Witness Douglas M. Green, July 16, 2004 ("Green Testimony"), witness Green states on p. 29 that he used "the company's recent price-to-book ratio."

24 Note that, consistent with Commission documents, I present the external growth components, $s \times v$, as *s* = (growth in shares) × (Price per Share/BPS) and *v* = [1 - BPS/(Price per Share)].

25 BEst estimates are as of September 30, 2007.

26 See *Midwest ISO*, PP 18, 21.

precedent in several proceedings including *ISO New England*, *New England RTO Rehearing Order* and *Southern California Edison*.[27]

Q9. How do you use the sample companies' high and low computed ROEs to arrive at an estimate of the cost of equity?

A9. I first determine a range of reasonable returns as the range between the lowest and the highest ROE of all sample companies, computed as described above. I then compute the cost of equity estimate as the midpoint of the range of reasonable returns. In its decisions regarding the cost of equity for electric transmission companies, the Commission has consistently relied on the midpoint of the range of reasonable returns. The use of the midpoint is specifically mentioned and affirmed by the Commission in, among others, *Midwest ISO, New England RTO Rehearing Order,* and *ISO New England*.[28]

Moreover, in *Consumers Energy*,[29] the Commission specifically rejected and reversed the use of the sample median as an alternative estimate, relying on the precedent set in Opinion Nos. 445 and 446.[30] Acknowledging the fact that the median is frequently used in rate proceedings for regulated gas utilities, the Commission has nonetheless neither accepted nor required the use of the median in rate proceedings for electric utilities. In Order 679-A, the Commission stated:

> We agree with TAPS that averaging each company's low and high DCF return would result in a single average DCF result for each electric company, making it like the single DCF return for gas and oil pipelines, from which a median return on equity for the group can be calculated. While this is an acceptable method, we will not require use of that method in the Commission's DCF analysis because that issue is beyond the scope of this proceeding and is more appropriately addressed in the individual application proceedings.[31]

---

27 Southern California Edison at 61,266.

28 See *Midwest ISO*, at P 30, *New England RTO Rehearing Order*, at P 203, *ISO New England*, at P 14.

29 *Consumers Energy Co.*, 98 FERC ¶ 61,333, at 62,416 (2002) (Opinion No. 456) ("Consumers Energy").

30 *System Energy Resources, Inc.*, 92 FERC ¶ 61,119 (2000) (Opinion No. 446) ("Systems Energy").

31 See Order 679-A, at P 63 n.105.

Therefore, in order to be consistent with past and current Commission methodology, I employ the midpoint of the range of reasonable returns as the estimate of the cost of equity in this proceeding.

DIRECT TESTIMONY OF MICHAEL J. VILBERT ON BEHALF OF CALIFORNIA-AMERICAN WATER COMPANY

I. INTRODUCTION AND SUMMARY

A. Introduction

Q1. Please state your name, address and position.

A1. My name is Michael J. Vilbert, and I am a Principal at The Brattle Group, 44 Brattle Street, Cambridge, MA 02138.

Q2. What is the purpose of your testimony?

A2. I have been asked by California-American Water Company ("California American Water") to evaluate whether the adoption of a water revenue adjustment mechanism

STEEFEL, LEVITT & WEISS
A PROFESSIONAL CORPORATION
ONE EMBARCADERO CENTER, 30TH FLOOR · SAN FRANCISCO, CA 94111-3719

("WRAM"), or a conservation loss adjustment mechanism ("CLAM"), together I will refer to these as revenue adjustment mechanisms ("RAMs"), would warrant a reduction in the allowed rate of return on equity for a regulated water utility. The answer to this question requires consideration of several factors: first, what is the policy goal of the RAM? If it is to remove the risk created by implementation of adoption of a policy promoting conservation, there would be no effect on the cost of capital if the RAM is well designed. Second, the conditions under which a RAM might or might not affect the cost of capital must be considered. The answer depends critically on the mechanism proposed, how it might be implemented and how the adoption of a RAM interacts with other aspects of the regulatory system. Whether an adjustment to the allowed return on equity is warranted depends upon the answers to these questions.

Q3. Please describe your job and your educational experience.

A3. I am a Principal of The Brattle Group ("Brattle"), an economic, environmental and management consulting firm with offices in Cambridge, Washington, London, San Francisco and Brussels. My work concentrates on financial and regulatory economics. I hold a B.S. from the U.S. Air Force Academy and a Ph.D. in finance from the Wharton School of Business at the University of Pennsylvania.

Q4. Please summarize the parts of your background and experience that are particularly relevant to your testimony on these matters.

A4. Brattle's specialties include financial economics, regulatory economics, and the gas and electric industries. I have worked in the areas of cost of capital, investment risk and related matters for many industries, regulated and unregulated alike, in many forums. I have testified or filed cost of capital testimony before the Federal Energy Regulatory Commission, the Arizona Corporation Commission, the Pennsylvania Public Utility Commission, the Public Service Commission of West Virginia, the Public Service Commission of Ohio, the Tennessee Regulatory Authority, the Public Service

Commission of Wisconsin, the South Dakota Utilities Commission, the Canadian National Energy Board, Alberta Energy and Utilities Board, the Ontario Energy Board, and the Labrador & Newfoundland Board of Commissioners of Public Utilities. I have also testified before this Commission. Appendix A contains more information on my professional qualifications.

B. Summary

Q5. Please summarize your testimony.

A5. This testimony focuses on several topics including how adoption of a RAM may or may not affect the cost of capital. First, a regulated utility has an incentive to increase sales because, in general, increased sales generate higher earnings. A RAM is being considered as a result of the promulgation of policies by the California Public Utilities Commission (the "Commission" or the "PUC") that promote conservation and a general reduction in the quantity of water consumed. (I will refer to the collection of such policies as the "conservation policy".) The RAM is intended to remove the incentive to increase sales and to reduce the regulated company's risk from the conservation policy. Risk would increase for the utility because forecast sales may not adequately reflect the effect on consumption (i.e., sales) from implementation of the conservation policy. Failure to meet sales forecasts would result in not fully recovering costs unless some other measures were adopted to ensure full cost recovery. The adoption of a RAM, if it is well designed, would simply offset the additional risk created by pursuit of the conservation policy. In other words, the starting point for consideration of the effect of the RAM on the cost of capital is not the cost of capital of the water utility before implementation of the conservation policy but after.[1]

[1] This particular point was first brought to my attention by my partner, Dr. A. Lawrence Kolbe, also of *The Brattle Group*.

STEEFEL, LEVITT & WEISS

Second, not all risks affect the cost of capital, so the RAM would only affect the cost of capital if it reduces the risk that affects the cost of capital. Therefore, it is necessary to determine which types of risk are affected by the proposed RAM. The division of a company's total risk into components that do and do not affect the cost of capital is discussed in more detail below. If the RAM is well developed, it would simply offset the new risk created so it must also be shown that the RAM more than reduces the risk created by adoption of the conservation policies. If the RAM were shown to affect the cost of capital, the next step would be to determine how large the effect may be and how the magnitude of the effect can be estimated. This is likely to be difficult, if not impossible, because the available sample of regulated water utilities is limited and estimating the cost of capital is imprecise. In particular, there is not a good sample of comparable water utilities that have had a RAM-like mechanism in place for a period of time. Of course, the magnitude of the effect depends upon the mechanism proposed and how it is implemented.

Third, adopting regulatory procedures that evaluate the effect on the utility's cost of capital resulting from individual Commission decisions on elements of cost recovery is likely to be poor regulatory policy, because it opens the door to endless debates about the effect of many other policies also one at a time.

Fourth, if the regulated water utilities in California can only expect to earn their allowed return on equity if they manage to sell more than forecast (because, for example, their costs are consistently underestimated in the ratemaking process), the implementation of a RAM would require an increase in the allowed return in order for the utility to again expect to earn its cost of capital on average.

Fifth, any effect of a RAM must be considered in the whole context of regulation in California. The electric utilities have had an Electric Revenue Adjustment Mechanism

STEEFEL, LEVITT & WEISS
A PROFESSIONAL CORPORATION
ONE EMBARCADERO CENTER, 30TH FLOOR · SAN FRANCISCO, CA 94111-3719
Telephone: (415) 788-0900 · Facsimile: (415) 788-2019

("ERAM")[2] in place for many years,[3] but there is no indication that the cost of capital for the California electric utilities was explicitly adjusted for this fact.

As a final point, it is important to note that the current Commission procedures do not directly consider financial risk in determining the allowed rate of return on equity. It is well established in financial theory that financial risk affects the cost of equity. Higher financial risk leads to a higher cost of equity. There are well established financial theories to measure and compensate for financial risk. Moreover, differences in financial risk will lead to much greater differences in the cost of capital than any plausible effect of a RAM. The Commission should focus on differences in financial risk before any attempt to adjust for the effect of a RAM.

For all of these reasons adjusting the allowed return as a result of implementing a RAM is not warranted.

II. REVENUE ADJUSTMENT MECHANISMS

Q6. In general, what is the purpose of a revenue adjustment mechanism for a regulated utility?

A6. In general, revenue adjustment mechanisms are designed to fully or partially decouple the normal relationship between volumes sold and the recovery of the regulated company's fixed costs. To understand the issue it is useful to first discuss cost of service ratemaking. A utility's revenue requirement is the sum of all of its fixed costs, including its cost of capital,[4] and variable costs. Therefore the revenue requirement is equal to total fixed

[2] The successor to the ERAM is the Distribution Revenue Adjustment Mechanism ("DRAM").

[3] In 1982, PG&E was the first electric utility in California (and the country) to adopt an ERAM.

[4] The overall cost of capital includes the costs of debt, preferred equity, and common equity and income taxes and depreciation.

costs plus variable cost per unit times the expected number of units to be sold. See equation (1) below:

$$RR_f = FC_f + AVC_f \times Q_f \quad \textbf{(1)}$$

Where

RR_f = Revenue Requirement,

FC_f = Fixed Costs,

VC_f = Variable Cost, and

Q_f = Quantity. The "f" subscript means that each of the quantities is a forecast.

In simplest terms, rates are set so that dividing the revenue requirement by the expected volumes to be sold equals the rate per unit. If actual volumes sold equal the forecast and costs are as forecast, the revenue requirement would be fully recovered. Note that in this simple example, the rate for each unit sold includes the recovery of the variable cost of producing the unit plus a pro rata share of the fixed costs. Equation (2) below shows that the price paid for a unit of consumption includes a portion of fixed cost recovery, where P denotes the price customers pay.

$$\frac{RR_f}{Q_f} = \frac{FC_f}{Q_f} + \frac{VC_f}{Q_f} \times Q_f \quad \textbf{(2)}$$

$$P = \frac{FC_f}{Q_f} + VC_f$$

Q7. You have illustrated the simplest rate structure possible. How is recovery of the revenue requirement affected by different rate structures?

A7. Of course, rate structures usually are much more complicated than illustrated in this simple example. Rates to customers can be divided into a fixed and variable portion as well as having different rates per unit of consumption depending upon the level of consumption per period, but the essence of the example is generally unchanged: normally, some of the utility's fixed costs are recovered in the variable portion of the rate.

STEEFEL, LEVITT & WEISS
A PROFESSIONAL CORPORATION
ONE EMBARCADERO CENTER, 30TH FLOOR · SAN FRANCISCO, CA 94111-3719
Telephone: (415) 788-0900 · Facsimile: (415) 788-2019

Under these more complicated rate structures, full recovery of the revenue requirement still requires that volumes sold be equal to volumes forecast.[5]

Q8. What is the effect on the earned return on equity of selling more or less than the forecast volumes?

A8. The effect on the earned return on equity depends, in part, on the rate structure, but assuming that a portion of the utility's authorized fixed costs are recovered in the portion of rates that varies with volume, the return on equity varies directly with sales. Absent a RAM, higher (lower) sales than forecast increases (decreases) the earned return on equity. This is because common stock is the residual claimant to a company's cash flows. Any variation in cost recovery results in a higher or lower realized return on equity.

Q9. Why are regulatory commissions interested in revenue adjustment mechanisms at this time?

A9. The focus on the conservation of natural resources including energy and water resources has dramatically increased in recent years. Conservation is seen as beneficial not only because of its environmental benefits, but also because conservation is viewed as a cheaper alternative to producing more water, electricity, natural gas, etc. Consumers have an incentive to conserve, i.e., use less, because consumers would pay less, but the incentive for utilities is the opposite. Under traditional rate making, utilities earn a higher return on equity by selling more, and therefore utilities have an incentive to increase sales. Regulatory commissions have recognized this incentive conflict for utilities. Revenue adjustment mechanisms have been proposed to address the conflict and reduce the risk resulting from the adoption of the conservation policies.

[5] Full recovery of costs in this example assumes that costs have been accurately forecast. Errors in forecasts result in under or over recovery of actual costs.

Q10. Why does the adoption of conservation policies increase the risk of the utility?

A10. Adoption of policies aimed at reducing consumption increases the risk that the company would not fully recover its costs. As noted above, a portion of the rate charged for a unit of consumption includes recovery of fixed costs, and a reduction in the volumes sold would impact the earned return on equity if the effects of the conservation policy are not accurately forecast.

Q11. How do revenue adjustment mechanisms offset the risk of a conservation policy and attempt to address the conflict of interest?

A11. Revenue adjustment mechanisms vary, but in general, they are intended to offset the loss of authorized fixed cost recovery from lower sales volumes by attempting to ensure up to full recovery of fixed costs regardless of the actual volumes sold. They do this by tracking actual volumes sold relative to forecast volumes and determining the amount of authorized fixed costs to be recovered per unit of volume sold. If volumes sold are lower (higher) than forecast, the portion of forecast fixed costs under (over) recovered is determined and set for recovery (refund) through an adder (credit) to consumers' bills. The time period between the variation in sales and the corresponding adjustment to authorized fixed cost recovery varies and may or may not include the carrying costs of the balance, but this is the essence of the mechanisms. Note that even with a RAM in place the utility is at risk for any difference in actual and forecast costs.

Q12. If the RAM is well designed, wouldn't it simply remove the risk created by the policy to pursue conservation?

A12. Yes. If the RAM is well designed, the utility's risk would be returned to its risk level before the adoption of the conservation policy. In that case, no reduction in the cost of capital would be warranted because the net risk would be unchanged.

Q13. Is it possible that a RAM could reduce the utility's risk to a level below the risk before the implementation of the conservation policy?

A13. Yes, it is possible, but this raises a whole series of policy concerns that have not been explicitly addressed. If the risk to the utility's investors has been reduced below the level before implementation of the conservation policy, the risk must have been transferred to another party. In this case, it would be transferred to ratepayers, but such a result requires analysis as to whether this is in the best interest of the ratepayers in the long run.

Q14. Why do you question whether the transfer of risk to the rate payers is a good idea?

A14. Risk that can be controlled by the utility induces the utility to be more efficient than it might otherwise be. If cost recovery is guaranteed in all circumstance, the utility's incentive for efficiency is substantially reduced. Instead, the utility may focus on cost justification because any cost justified is fully recovered. It has been demonstrated repeatedly that a focus on cost justification results in inefficiency. Government owned or heavily regulated utilities around the world have been privatized in an effort to squeeze out such inefficiencies. Examples abound. The breakup of the telecommunications industry, deregulation of the trucking industry, the introduction of competition into the delivery of packages are all examples of industries in which competition (risk) resulted in reduction of costs to consumers. Of course, the result may not be exactly as envisioned as shown by the electric industry and the airline industry restructuring,[6] but the goals were the same.

Q15. How does all of this apply to the water industry?

A15. Before the adoption of the conservation policy, there was a balance of risk among the utility and ratepayers. If adoption of a RAM alters that balance, there should be a debate

[6] The restructuring of the airline industry certainly reduced costs and inefficiency, but it also has had the effect of reducing service quality.

about the proper allocation of risk between the utility and ratepayers. Before any such policy is adopted, the ramifications should be fully explored. For example, a RAM that is deemed to remove more risk than was created by the conservation policy risks creating inefficiency as a result. Of course, this concern would not apply to any risk that the utility could not control such as weather related risk.

Q16. Why do you say that the mechanisms "attempt to ensure up to full recovery of fixed costs"?

A16. There are a number of reasons that a RAM would not result in full recovery of actual fixed costs, as opposed to forecast fixed costs. First, actual fixed costs always differ from forecast fixed costs, and for water utilities in California it appears that generally the utilities are authorized less than full recovery of all fixed costs. This topic is addressed in more detail below in Section III.B. Under fair regulation, the error in estimating actual fixed costs should average out over time. Sometimes, forecast costs may be too high and sometimes too low, but on average the forecast error should be zero. If the forecast error is systematically positive or negative, this would present a problem for fair regulation as well as for implementing a RAM. This issue is discussed in more detail below.

Second, some RAMs attempt to distinguish between variation in sales due to conservation or due to differences in weather versus other reasons for variations in sales. In that case, authorized fixed cost recovery can vary simply because of an error in the measurement of the amount of conservation or the amount of variation due to weather.

Third, without a carrying charge equal to the company's overall cost of capital, delay in the recovery (refund) of any variation in authorized fixed cost recovery will affect the recovery of authorized fixed costs. In other words, sales greater or less than forecast would still increase or decrease equity return.

Fourth, embedded in a RAM is an assumption that the variable cost per unit does not change as volume changes. This can be addressed by providing an additional mechanism that adjusts for variations in marginal and average variable costs recovered in the variable price. In particular, if the variable costs change at different levels of service, and there has not been a proper implementation of a mechanism to capture the marginal/average cost differential, then the return on equity will be affected because there is a mismatch between the forecast and actual average variable cost per unit sold.

Q17. Have the details of the water revenue adjustment mechanism for regulated water utilities been determined?

A17. To my knowledge the Commission has not ruled on the exact details of the proposed RAM, but in general it is likely to similar to the DRAM adopted and now in place in California for electric utilities. The effect of a RAM on a utility's cost of capital depends critically on the mechanism proposed and how it is implemented. If the RAM adopted for the water utilities is similar in nature to the DRAM, the Commission has already implicitly addressed the effect on the cost of capital for the electric utilities and has not imposed a reduction in the cost of capital.

III. RISK AND THE COST OF CAPITAL

Q18. What topics does this section address?

A18. This section describes the effect of risk on the cost of capital. The section starts with a discussion of the cost of capital and then proceeds to a discussion of the different types of risk. In particular, it discusses how total risk can be divided into two components one of which is risk that affects the cost of capital and one of which is risk that does not. Risks that affect the cost of capital are frequently labeled systematic risk, and risks that do not are labeled diversifiable.

A. The Cost of Capital and Risk

Q19. Please formally define the "Cost of Capital."

A19. The cost of capital can be defined as the *expected rate of return in capital markets on alternative investments of equivalent risk.* In other words, it is the rate of return investors require based on the risk-return alternatives available in competitive capital markets. The cost of capital is a type of opportunity cost: it represents the rate of return that investors could expect to earn elsewhere without bearing more risk. "Expected" is used in the statistical sense: the mean of the distribution of possible outcomes. The terms "expect" and "expected" in this testimony, as in the definition of the cost of capital itself, refer to the probability-weighted average over all possible outcomes.

The definition of the cost of capital recognizes a tradeoff between risk and return that is known as the "security market risk-return line," or "security market line" for short. This line is depicted in Figure 1. The higher the risk, the higher is the cost of capital. A version of Figure 1 applies for all investments. However, for different types of securities, the location (i.e., the intercept and the slope) of the line may depend on corporate and personal tax rates.

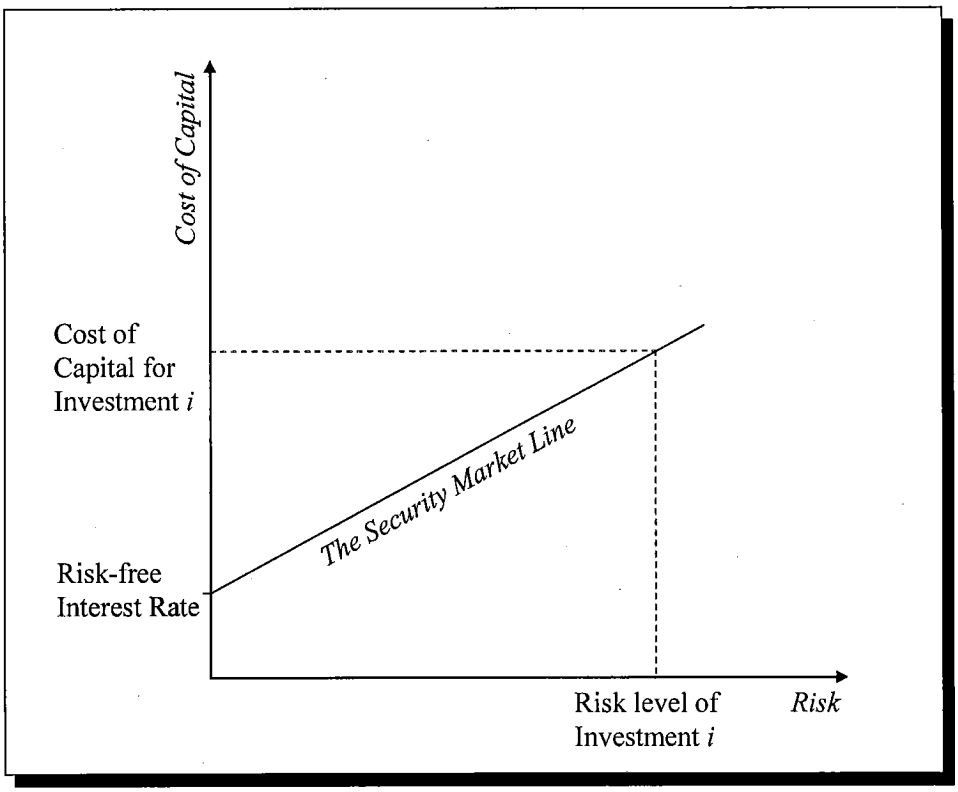

Figure 1: The Security Market Line

Q20. Why is the cost of capital relevant in rate regulation?

A20. It has become routine in U.S. rate regulation to accept the "cost of capital" as the right expected rate of return on utility investment.[7] That practice is normally viewed as consistent with the U.S. Supreme Court's opinions in *Bluefield Waterworks & Improvement Co. v. Public Service Commission*, 262 U.S. 678 (1923), and *Federal Power Commission v. Hope Natural Gas*, 320 U.S. 591 (1944).

From an economic perspective, rate levels that give investors a fair opportunity to earn the cost of capital are the lowest levels that compensate investors for the risks they bear. Over the long run, an expected return above the cost of capital makes customers overpay for

[7] A formal link between the cost of capital as defined by financial economics and the right expected rate of return for utilities is established by Stewart C. Myers, "Application of Finance Theory to Public Utility Rate Cases," *The Bell Journal of Economics and Management Science*, 3:58-97 (Spring 1972).

STEEFEL, LEVITT & WEISS

service. Regulatory commissions normally try to prevent such outcomes, unless there are offsetting benefits (e.g., from incentive regulation that reduces future costs). At the same time, an expected return below the cost of capital does a disservice not just to investors but, more importantly, to customers as well. In the long run, such a return denies the company the ability to attract capital, to maintain its financial integrity, and to expect a return commensurate with that of other enterprises attended by corresponding risks and uncertainties.

More important for customers, however, are the economic issues an inadequate return raises for them. In the short run, deviations of the expected rate of return on the rate base from the cost of capital may seemingly create a "zero-sum game"-- investors gain if customers are overcharged, and customers gain if investors are shortchanged. But in fact, even in the short run, such action may adversely affect the utility's ability to provide stable and favorable rates because some potential efficiency investments may be delayed or because the company is forced to file more frequent rate cases. In the long run, inadequate returns are likely to cost customers -- and society generally -- far more than what may be gained in the short run. Inadequate returns lead to inadequate investment, whether for maintenance or for new plant and equipment. The costs of an undercapitalized industry can be far greater than the short-run gains from shortfalls in the cost of capital. Moreover, in capital-intensive industries (such as the water industry), systems that take a long time to decay cannot be fixed overnight. Thus, it is in the customers' interest not only to make sure the return investors expect does not exceed the cost of capital, but also to make sure that it does not fall short of the cost of capital, either.

Of course, the cost of capital cannot be estimated with perfect certainty, and other aspects of the way the revenue requirement is set may mean investors expect to earn more or less than the cost of capital even if the allowed rate of return equals the cost of capital exactly. However, a commission that sets rates so investors expect to earn the cost of capital on

STEEFEL, LEVITT & WEISS

ONE EMBARCADERO CENTER, 30TH FLOOR · SAN FRANCISCO, CA 94111-3719
Telephone: (415) 788-0900 · Facsimile: (415) 788-2019

average treats both customers and investors fairly, and acts in the long-run interests of both groups.

B. Asymmetric Risk and Allowed Returns

Q21. If a commission sets the allowed return equal to the cost of capital, is that sufficient to ensure that the regulated company has a fair opportunity to earn its cost of capital?

A21. In general, yes, but there are circumstances in which it would not. Specifically, if the regulated company faces a substantial level of asymmetric risk, the regulated company may not expect to earn its cost of capital on average. Asymmetric risk for a regulated company exists when the possibility of a large negative outcome is not balanced by the possibility of a corresponding positive outcome, or if the regulated company consistently fails to earn its allowed return because of other factors in the way rates are set. In such a situation, the regulated company will expect to earn less than its cost of capital, and its treatment would not meet the requirements established by the Supreme Court discussed above. The solution would be to either remove the source of the asymmetric risk or set the allowed return high enough so that the regulated company can again expect to earn its cost of capital.

Q22. Does asymmetric risk affect the cost of capital?

A22. Maybe. In general, asymmetric risk affects the probability that a regulated utility would expect to earn its allowed return, but it may not affect its cost of capital. The cost of capital would be affected if the asymmetric risk were correlated with changes in the capital markets. However, if a regulated utility faces substantial asymmetric risk, the allowed return on equity would have to be increased in order for the regulated company to expect to earn its cost of capital on average.

Q23. Please expand the discussion of how a regulator can correct the effect of asymmetric risk.

STEEFEL, LEVITT & WEISS
A PROFESSIONAL CORPORATION
ONE EMBARCADERO CENTER, 30TH FLOOR · SAN FRANCISCO, CA 94111-3719
Telephone: (415) 788-0900 · Facsimile: (415) 788-2019

A23. There are two ways to correct asymmetric risk. The first is to add a premium to the allowed rate of return on equity for the regulated company so that it can again expect to earn its cost of capital on average. The premium would be just large enough to offset the expected level of asymmetric risk. The second method is to remove the source of the asymmetric risk, which in this example means insuring that the way rates are set provides the company a fair opportunity to earn its allowed return on equity. I believe that removing the source of the asymmetric risk is a more efficient and cost effective way to establish the conditions necessary for the regulated company to expect to earn its cost of capital on average.

Q24. Is this an issue for California American Water Company at this time?

A24. Yes. Beginning in 2001 and for every year since, California American Water has not been able to earn its allowed return, and the gap between authorized and achieved return on equity has been increasing. In fact, the actual earned return on equity in 2005 and 2006 has been negative. This is a clear indication that California American Water is facing substantial asymmetric risk that must be addressed. This is in contrast to the period 1979 to 2000, during which California American Water earned 10.6 percent on average compared to an average authorized 10.5 percent. See Table 1 below for a comparison of the allowed and earned return on equity since calendar year 2000.

Table 1

	2000	2001	2002	2003	2004	2005	2006
Authorized Return on Equity	10.23%	10.17%	10.11%	10.10%	10.04%	10.04%	10.04%
Realized Return on Equity	12.56%	9.61%	3.17%	4.04%	2.99%	-0.38%	-2.82%
Difference	2.33%	-0.56%	-6.94%	-6.06%	-7.05%	-10.42%	-12.86%

Note that the realized return on equity has been steadily declining since 2000, and California American Water has had a *negative* return on equity during 2005 and 2006.

Q25. What is the source of the asymmetric risk for California American Water?

A25. In general, the asymmetric risk appears to be the result of a mismatch between costs authorized for recovery and costs actually experienced. For example, some test year costs

STEEFEL, LEVITT & WEISS
A PROFESSIONAL CORPORATION
ONE EMBARCADERO CENTER, 30TH FLOOR · SAN FRANCISCO, CA 94111-3719
Telephone: (415) 788-0900 · Facsimile: (415) 788-2019

such as health care premiums are only authorized to increase at the rate of inflation in the second and third years between rate cases, but it is well known that these categories of costs have increased much more rapidly than that. Additional examples include capital investment beyond the amounts forecast, delayed recovery for "advice letter" capital investments, pension cost increases greater than allowed, salary increases greater than allowed due to promotions and advancements, and the inability to update costs based on more recent information after the initial rate case filing.

Q26. Would the adoption of a RAM affect the asymmetric risk faced by the regulated water utilities in California?

A26. Yes. The adoption of a RAM is likely to increase asymmetric risk. If the ability to sell more than forecast is one of the only ways that a regulated water utility can hope to earn its allowed return, implementation of a RAM may require an increase rather than a decrease in the allowed return in order for the company to again expect to earn its cost of capital on average.[8] For example, if the utility's costs consistently turn out to be above the forecast values used in the ratemaking process, the company would need to sell more than forecast to recover its actual costs. If the possibility of recovering more than forecast fixed costs is eliminated under the RAM, then as long as underestimation persists, the only way for the company to earn its cost of capital would be if the allowed return were increased sufficiently so that the return actually expected to be earned would be equal to the cost of capital. Preferably, the systematic underestimation of costs should be eliminated.

Q27. Please explain why an increase in the allowed return would be necessary.

[8] This situation is complicated by the interaction of the RAM and the asymmetric risk. If the RAM reduces systematic risk, the cost of capital would be reduced, but the allowed return would still need to be set higher than the cost of capital due to the asymmetric risk.

STEEFEL, LEVITT & WEISS
A PROFESSIONAL CORPORATION
ONE EMBARCADERO CENTER, 30TH FLOOR · SAN FRANCISCO, CA 94111-3719
Telephone: (415) 788-0900 · Facsimile: (415) 788-2019

A27. Regulatory commissions normally try to set the allowed return equal to the company's cost of capital. Under fair regulation, the company should expect to earn its allowed return on average - sometimes more and sometimes less. In those circumstances, setting the allowed return equal to the cost of capital results in the company earning its cost of capital on average. On the other hand, if the company consistently fails to earn its allowed rate of return on equity due to some aspect of the regulatory system, then the allowed return must be set to a value sufficiently high so that the company can again expect to earn its cost of capital on average. To the extent that water utilities rely on selling more than forecast to earn their cost of capital, implementation of a RAM would increase the asymmetry inherent in the regulatory system and require an increase in the allowed return. However, it is preferable and likely to be less costly to customers to ensure that costs are forecast more accurately.

C. Types of Risk

Q28. Please describe the different types of risk.

A28. The total risk of holding a company's stock can be divided in several different ways. In general total risk is measured by the total variation in the stock's return, i.e., its variance, but total risk is not the risk that affects a company's cost of capital. The risks that affect a company's cost of capital are labeled systematic or market risk while those that do not are labeled diversifiable, because they can be avoided by holding a diversified portfolio of investments.

Q29. Please describe diversification and diversifiable risk.

A29. A stock's expected return is its cost of capital, but the realized returns are different from expected return during any period of time. The returns on individual stocks are not perfectly correlated which simply means that just because the return on one stock is higher (lower) than expected for a period, it does not necessary mean the return on another stock will also be higher (lower) than expected. Because investments are not perfectly

STEEFEL, LEVITT & WEISS

ONE EMBARCADERO CENTER, 30TH FLOOR · SAN FRANCISCO, CA 94111-3719
Telephone: (415) 788-0900 · Facsimile: (415) 788-2019

correlated, investors can reduce their total risk by combining investments, i.e., creating a portfolio of investments. The expected return of the portfolio will be the market-value weighted-average of the expected returns of the investments in the portfolio, but the total risk of the portfolio will be less than the weighted-average of the total risks of the individual investments. Figure 2 below illustrates the effect on the total risk of the portfolio as the number of different investments in the portfolio increases.[9] Note that at some point, adding additional investments to the portfolio will not result in any further reduction in risk. The risk that remains is called non-diversifiable risk. It is also called systematic or market risk. The risk that was eliminated through the formation of a portfolio is called diversifiable risk. Portfolio theory says that investors receive compensation in the form of expected return only for non-diversifiable risk. They receive no return for bearing diversifiable risk because diversifiable risk can be avoided by forming a portfolio.[10]

[9] The example assumes that each security added to the portfolio has the same level of systematic risk, but the point would not change if the individual securities varied in the amount of systematic risk.

[10] The theory of risk and return, as well as of diversification and portfolio risk, is well-established and explained, for example, in Chapters 7 and 8 of Brealey, Myers and Allen, *Principles of Corporate Finance*, 8th ed., McGraw-Hill, 2006.

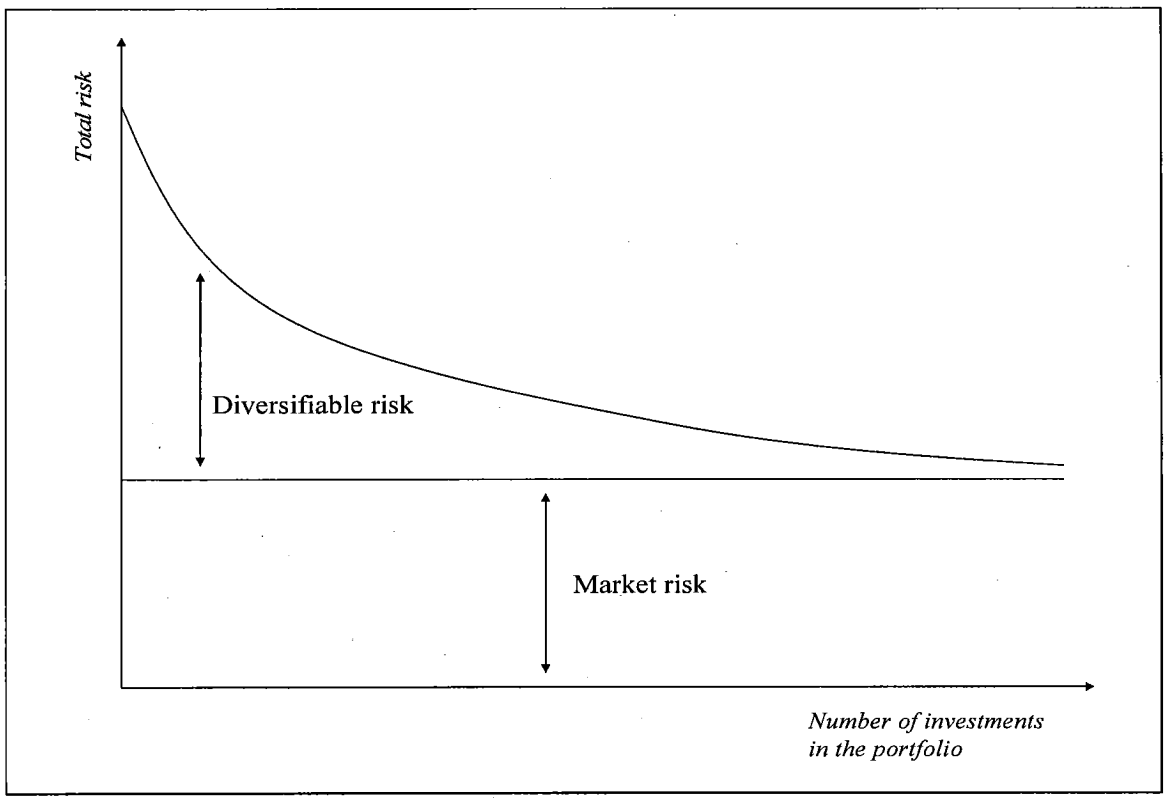

Figure 2: Market Risk vs. Diversifiable Risk

Q30. Why aren't investors compensated for diversifiable risk?

A30. Investors holding an individual stock may like to be compensated for total risk but they will not be. A stock that is more risky is worth less to that individual for a given stream of cash flows. Diversified investors would see that the stock's systematic risk is less than its total risk and bid the price up to reflect that fact that a portion of the stock's total risk could be diversified away. Non-diversified investors will only be able to buy the stock at a price that reflects its systematic risk not its total risk and because their portfolio is undiversified, will bear the total risk of the asset.

Q31. What is the relevance of the division of total risk into diversifiable and non-diversifiable (systematic) components to the adoption of a RAM and its effect on the utility's cost of capital?

A31. There are four issues of importance with regard to the effect of the adoption of a RAM on a utility's cost of capital. First, as noted above, if the RAM merely restores the level of

STEEFEL, LEVITT & WEISS
A PROFESSIONAL CORPORATION
ONE EMBARCADERO CENTER, 30TH FLOOR · SAN FRANCISCO, CA 94111-3719
Telephone: (415) 788-0900 · Facsimile: (415) 788-2019

risk to the level faced by the utility before the adoption of the conservation policies, there would be no adjustment required for the cost of capital. Second, if the RAM only has the effect of reducing a company's diversifiable risk, it would have no effect on the company's cost of capital. Investors can eliminate diversifiable risk through holding the company's stock in a portfolio. They will not pay more for a company (i.e., reduce their required cost of capital) because a commission has removed diversifiable risk through a RAM. Investors can easily diversify their investments for themselves. Third, the RAM only affects the cost of capital to the extent that systematic (non-diversifiable) risk is reduced, so the key to determining whether the RAM has any effect on the cost of capital hinges on demonstrating its effect on systematic risk. Of course, the RAM may affect both systematic and diversifiable risk, but it is only the effect on systematic risk that matters for cost of capital. Finally, focusing on systematic risk highlights an omission in the Commission's traditional cost of capital procedures. Specifically, systematic risk can be further divided into business risk and financial risk. Sample selection focuses on selecting a sample of companies of comparable business risk to use to estimate the utility's cost of capital, but the sample companies may have very different levels of financial risk among themselves and relative to the regulated utility. Traditionally, no direct consideration is made of differences in financial risk between the sample and the regulated company. This omission is highly likely to have a much larger effect on the cost of equity than the adoption of a RAM would have, depending, of course, on the provisions of the RAM.

Q32. Can you please provide a simple illustration of the division of total risk into its components?

A32. Yes. Figure 3 illustrates the different types of risk facing investors and the effect of regulatory actions on these risks. Decisions by the regulator can mitigate the effects of business and regulatory risk on the regulated company, but regulatory actions can also increase risk. As shown in Figure 3 below, the regulator's decisions can shift some risks

STEEFEL, LEVITT & WEISS
A PROFESSIONAL CORPORATION
ONE EMBARCADERO CENTER, 30TH FLOOR · SAN FRANCISCO, CA 94111-3719
Telephone: (415) 788-0900 · Facsimile: (415) 788-2019

to the customers. To the extent that regulatory actions have truly reduced business and regulatory risk without creating new risks, the overall cost of capital would be reduced. However, it must also be kept in mind that although actions by regulators can indirectly affect stock prices, they cannot directly affect the prices investors will pay for a company's equity.

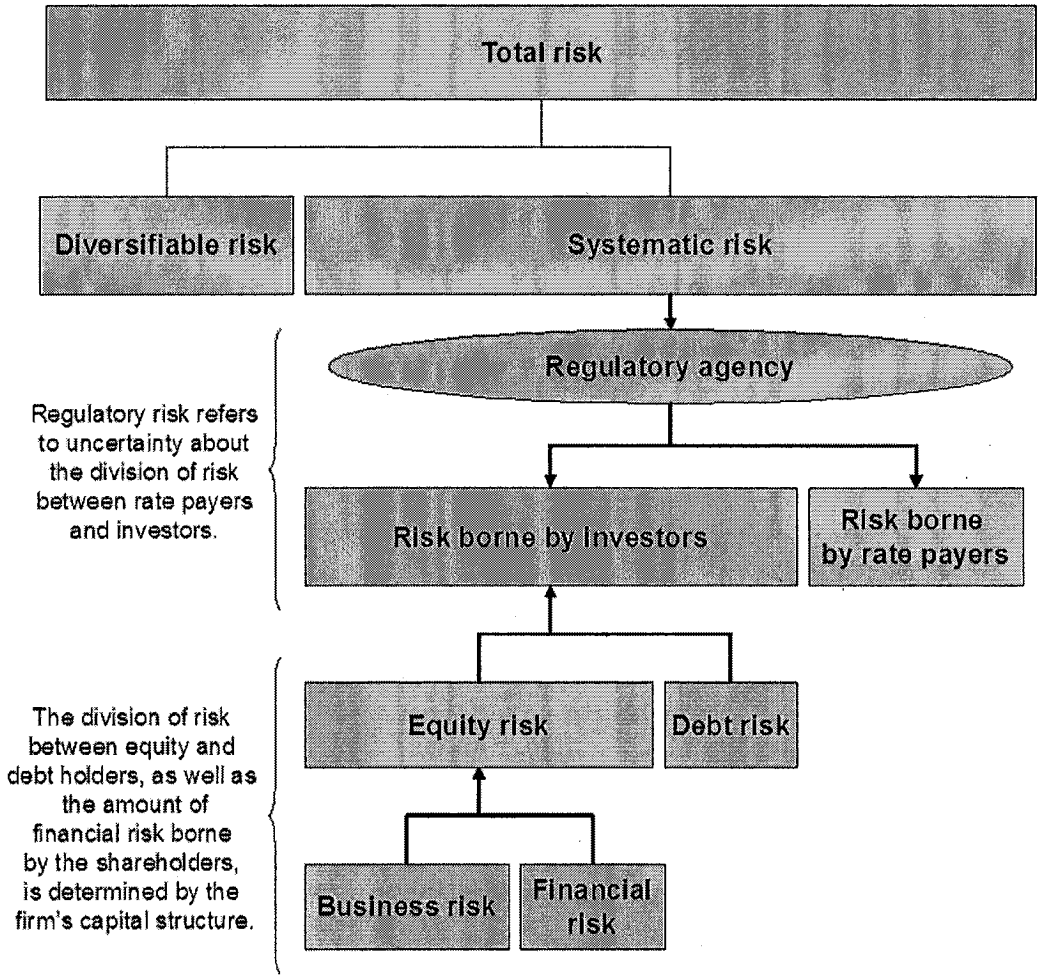

Figure 3: Different types of risk and the effect of regulatory actions and capital structure.

D. Business Risk & Financial Risk: Capital Structure and the Cost of Equity

Q33. Please explain briefly the difference between business risk and financial risk.

A33. Business risk is the risk of a company from its line of business if it used no debt financing. When a firm uses debt to finance its assets, the business risk of the assets is shared between the debt holders and the equity holders, but the equity holders bear more of the

STEEFEL, LEVITT & WEISS
A PROFESSIONAL CORPORATION
ONE EMBARCADERO CENTER, 30TH FLOOR · SAN FRANCISCO, CA 94111-3719
Telephone: (415) 788-0900 · Facsimile: (415) 788-2019

risk because debt holders have a prior claim on the company's cash flows. Equity holders are residual claimants, which simply means that equity holders get paid last. In other words, the use of debt imposes financial risk on the equity holders.

Q34. Please explain why it is necessary to report the cost of equity adjusted for capital structure.

A34. Briefly, rate regulation in North America tends to focus on the components of the overall cost of capital, and in particular, on what the "right" cost of equity and capital structure should be. Frequently, there is no consideration of whether the financial risks of the sample companies differ among themselves or differ from the regulated company. The cost of equity estimated using the standard models (e.g., the DCF model or the risk positioning model) reflects both the business and financial risk of the sample companies. However, the overall cost of capital depends primarily on the business the firm is in, i.e., business risk, while the costs of the debt and equity components depend not only on this business risk alone but also on the distribution of revenues between debt and equity, i.e. financial risk.

E. Implications for Analysis

Q35. Please explain the implications of the relationship between capital structure and the cost of equity in your testimony.

A35. The risk equity holders carry, and therefore the cost of equity, depends on the capital structure. As leverage increases, financial risk increases, and hence the required return on equity increases. An approach that estimates the cost of equity for each firm in a sample selected to have similar business risk without explicit consideration of the market value capital structure (i.e., the financial risk) underlying those costs risks material errors. The costs of equity of the sample companies at their actual market-value capital structures do not necessarily reflect the same degree of financial risk as faced by equity holders in the regulated company, and thus could lead to an unfair rate of return if the sample's cost of

STEEFEL, LEVITT & WEISS
A PROFESSIONAL CORPORATION
ONE EMBARCADERO CENTER, 30TH FLOOR · SAN FRANCISCO, CA 94111-3719
Telephone: (415) 788-0900 · Facsimile: (415) 788-2019

equity estimate were simply and mechanically applied to the regulated company's capital structure. This problem can be avoided by calculating each sample company's ATWACC (after-tax weighted-average cost of capital) using its market value capital structure. Using the sample's average overall cost of capital (i.e., the average of the sample companies' ATWACCs) as an estimate of the company's cost of capital, the corresponding return on equity at the filed regulatory capital structure is then determined. This procedure ensures that the capital structure (i.e., financial risk) and the estimated cost of equity are consistent with the market derived sample information. In Appendix B I provide a detailed discussion of the effects of debt on the cost of equity.

Q36. Can you provide a simple example of the calculation of the cost of equity consistent with the market-determined estimate of the sample's average overall cost of capital?

A36. Yes. Consider the following equation to calculate the ATWACC:[11]

$$ATWACC = r_D \times (1 - T_C) \times D + r_E \times E \quad \textbf{(3)}$$

where r_D = market cost of debt,

r_E = market cost of equity,

T_C = corporate income tax rate,

D = percentage of debt in the capital structure, and

E = percentage of equity in capital structure.

The cost of equity consistent with overall cost of capital estimate (ATWACC) from the sample, the market cost of debt and equity, the marginal corporate income tax rate and the amount of debt and equity in the capital structure can be determined by solving equation (1) for r_E.

[11] Note that this equation assumes that only debt and equity are in the capital structure, but it is straight forward to add preferred equity to the equation.

IV. COST OF CAPITAL AND ADOPTION OF A RAM

Q37. Please outline the topics addressed in this section of your testimony.

A37. This section first reviews the nature of the Electric Revenue Adjustment Mechanism ("ERAM") that has been in place in California for a number of years. No specific reduction in the allowed return for electric utilities has been implemented. It then turns to the conditions necessary for the adoption of a RAM to affect the cost of capital for a regulated water utility in California, and if there is an effect on the cost of capital, how the effect might be measured.

A. Electric Revenue Adjustment Mechanism

Q38. You note that electric utilities in California have had an ERAM in place since 1982. Please describe the history of the ERAM.

A38. In 1982, California became the first state to adopt electric decoupling through a plan submitted by Pacific Gas & Electric called an ERAM. The program's main purpose was to remove the disincentives for energy efficiency and conservation by separating electric utilities' revenues from sales.[12] The ERAM enabled the utilities to recover their forecast fixed costs regardless of their actual sales. Any over- or under-collection of the forecasted base rate revenues would be refunded to or recovered from rate-payers in terms of rate adjustments.[13] A study in 1994 carried out by Eto, Stoft, and Belden from University of California, Berkeley, on the implementation of ERAM by Pacific Gas & Electric and by San Diego Gas & Electric concluded that ERAM helped reduce variations in rates to customers and lessen variations in revenue to the utilities.[14]

Telephone: (415) 788-0900 · Facsimile: (415) 788-2019

In 1996, the ERAM was eliminated due to the deregulation of the electric industry in California, but deregulation did not adequately promote energy conservation. As a result, the ERAM has been resurrected for the CPUC regulated electric distribution companies in California. In September 2003, PG&E reached an agreement with parties in its general rate case stating to adopt the "Distribution Revenue Adjustment Mechanism" (DRAM) and "Utility Generation Balancing Account" (UGBA) (regarded as revenue decoupling mechanisms), which became effective on January 1, 2004.[15] Southern California Edison and San Diego Gas & Electric have similar revenue decoupling mechanisms in place.[16]

B. The Effect of a RAM on the Cost of Capital

Q39. Please outline the conditions necessary for the adoption of a RAM to affect a utility's cost of capital.

A39. As noted above, the total risk faced by equity holders in a regulated company consists of business risk, financial risk and regulatory risk. A portion of total risk can be avoided by investors through diversification and therefore that portion is not part of the risk reflected in the cost of capital. Only the part of total risk which is non-diversifiable (i.e., systematic) affects the cost of capital; so, a RAM must reduce a company's systematic risk to have any effect on its cost of capital. For example, to the extent that a proposed RAM results in the removal of California American Water's weather-related risk, it would not affect the cost of capital because weather risk is normally a diversifiable risk (i.e., investors can avoid it, for example by including in their portfolio water utilities in different parts of the country). Weather risk is part of total risk, and it does affect the likelihood that the company will earn its allowed rate of return, but because weather risk

(continued...)
Department of Energy under Contract No. DE-AC03-76SF00098.

[15] *See* PG&E Form 8-K.

[16] *See* EEI Q2 2007 *Financial Update*, p. 10.

is diversifiable, it is not part of the risks affecting the cost of capital.[17] Removing weather risk would not reduce the company's cost of capital. Finally, none of these mechanisms removes financial risk.

Q40. If a RAM affected the cost of capital, would it be possible to measure accurately its individual effect on the utility's cost of capital?

A40. There is a danger of attempting to estimate the cost of capital "one risk at a time." Estimating the cost of capital is frequently controversial. Attempting to estimate precisely the effect of one change in regulatory procedures will be even more difficult and imprecise. Estimating the cost of capital for each risk individually is likely to result in an estimate that is much higher or much lower than estimating the cost of capital for the total systematic risk of the company. It would be like estimating the cost of an automobile by measuring the cost of each individual part. Each risk must first be categorized as either diversifiable (no effect on the cost of capital) or systematic (affects cost of capital). For those systematic risks, the cost of capital for each risk must then be estimated. However, the returns of the available sample companies reflect their full systematic risk, not any one component. Furthermore, there are not enough sample companies to create a sample with only a subset of the risk characteristics on which we may want to focus. In short, the difficulty of estimating the cost of capital for the individual risks is likely to make an accurate determination of the size of the cost of capital adjustment necessary for adoption of a RAM impossible even if it were determined that the RAM would affect systematic risk.

Q41. Please describe the sample of publicly traded water companies.

[17] The *cost of capital* is *the expected rate of return in capital markets on alternative investments of equivalent risk* and therefore an ex ante concept.

A41. The sample of publicly traded water utilities consists of eight companies[18] but the sample companies are relatively small and frequently lack the full set of data required to estimate the cost of capital using both the DCF and the risk positioning methods.

Q42. Why would the size and quality of the available sample of water utilities make the determination of the effect of the adoption of a RAM on the cost of capital difficult?

A42. Ideally, an empirical determination of the effect of a RAM on the cost of capital would be determined by estimating the cost of capital for water utilities some of which have a RAM and some of which do not. This is not currently the case for the available sample of water utilities. Moreover, even if a few of the sample companies were to adopt a RAM, it would still be extremely difficult to determine the effect on the cost of capital because the cost of capital estimates for the individual sample companies vary substantially even without having a RAM. It would be difficult to determine how much of any observed variation in cost of capital estimates is from differences in risk due to the RAM compared to a variation due to some other reason.

Q43. Please describe the danger for customers and California American Water if the effect of a RAM on the cost of capital is over estimated.

A43. The water industry is the most capital intensive industry in the country, which means that the water industry has more capital invested for every dollar of revenue than any other industry. Moreover, the water industry is facing rapidly increasing demands for new capital investment to replace aging infrastructure, to expand service and to meet increasingly stringent environmental and safety regulations. Reducing a utility's allowed return on equity below its cost of capital will hinder the utility's ability to acquire the

[18] The available sample companies include American States Water, Aqua American, California Water Services Group, Connecticut Water Services Inc., Middlesex Water, SJW Corp, Southwest Water Company and York Water Company of which half are considered small-cap stocks by *Value Line*, for example.

capital necessary to meet its need for capital investment. Moreover, reducing the allowed return on equity will have a disproportionate effect on water utilities' cash flow because capital costs are such a large part of the revenue requirement for water utilities, and depreciation rates are based upon depreciation lives that can be as long as 100 years although the composite average is in the range of 30 to 40 years. The point is that investment needs are high, and the return of the capital invested takes a long time. Ultimately, customers suffer from any potential underinvestment in the industry, and the costs of underinvestment are likely to far exceed the costs to customers of setting the allowed return too high.

Q44. Do you have an example of the water infrastructure investment required in California?

A44. Yes. According to the American Society of Civil Engineers 2005 Report Card, California has the following required water infrastructure needs:[19]

- California's drinking water infrastructure needs $17.5 billion over the next 20 years.
- California loses 222 million gallons of drinking water a day due to leaking pipes.
- California has $14.4 billion in wastewater infrastructure needs.
- There are 44 state determined deficient dams in California.
- California has 336 high hazard dams. A high hazard dam is defined as a dam whose failure would cause a loss of life and significant property damage. The estimated rehabilitation cost for California's most critical dams is estimated at $679 million.

To meet these investment needs and others associated with environmental standards and the development of new supply, the water utilities in California will require access to the

capital markets. Establishing a system in which the allowed return on equity is judged to be inadequate by investors or in which the utility cannot expect to earn its allowed return on average will make it much more difficult (if not impossible) to acquire the full amount of capital required.

V. CONCLUSIONS

Q45. What are your conclusions regarding the possible adoption of a RAM on the cost of capital for regulated water utilities in California?

A45. In general, I recommend that the cost of capital not be adjusted for the possible adoption of a RAM for several reasons.

First, a well designed RAM should merely remove the increased risk that resulted from the adoption of policies that promote conservation. Recognition of the increase in risk from the policy and the corresponding reduction of that risk from adoption of a RAM should result in no net change in risk for the utility for a well designed RAM. Therefore, no cost of capital adjustment is warranted. This conclusion seems to be consistent with the PUC's conclusion with regard to the effect of the ERAM/DRAM for California's electric utilities.

Second, if the RAM were determined to more than offset the level of risk of the conservation policy, there should first be a policy debate about whether this is a desirable outcome because such a result could lead to inefficiency in the provision of water service. It would also be necessary to determine the type of risk being reduced. If the RAM affects only diversifiable risk, such as weather related volume risk, no cost of capital adjustment is warranted. Only in the case that the net effect of the RAM is determined to reduce the risk that affects the cost of capital, i.e., systematic risk, would it be necessary to determine the magnitude of the effect on the cost of capital.

Determining the magnitude of the effect on the cost of capital is likely to be very difficult if not impossible to accomplish accurately because there are a limited number of publicly traded water utilities to include in a sample. Estimating the cost of capital with the precision necessary to estimate the effect of the adoption of the RAM is likely to exceed the precision of the models, because cost of capital estimation models estimate the cost of capital for a sample company as a whole. Any estimate of the cost of capital from the sample must consider any differences in the regulatory environment, business and financial risk of that sample company compared to the California companies in order to interpret the results accurately.

Overestimating the effect on the cost of capital could handicap the water utilities in acquiring the capital necessary to meet the increasing demands for access to high quality water. Underestimating the effect on the cost of capital means that customers pay more for service than necessary, but that increased cost is likely to be far less expensive to customers in the long run than the costs from under investment in the water infrastructure.

Third, attempting to adjust the allowed return for this one new provision is poor regulatory policy because it inevitably leads to debates about whether other regulatory provisions have been accurately considered in the allowed cost of capital.

Fourth, the adoption of the RAM could result in an even more asymmetric regulatory environment for water utilities in California. One measure of a fair regulatory system is that the regulated company can expect to earn its allowed return on average. If it consistently fails to earn its allowed return, the regulatory system is asymmetric and unfair. If the RAM were to make that asymmetry worse, then the appropriate response to adoption of a RAM would be to *increase* not decrease the allowed return in order to provide the utility an opportunity to earn its cost of capital.

Fifth, any effect of a RAM must be considered in the whole context of regulation in California. The electric utilities have had such a mechanism in place for many years, but there is no indication that their allowed return on equity was explicitly adjusted for this fact.

Finally, and perhaps most significantly, the current Commission procedures do not directly consider differences in financial risk. It is well established in financial theory that financial risk affects the cost of equity. Higher financial risk leads to a higher cost of equity, and there are well established financial theories to measure and compensate for financial risk. Moreover, differences in financial risk will lead to much greater differences in the cost of capital than any plausible effect of a RAM. The Commission should focus on differences in financial risk before any attempt to adjust for the effect of a RAM.

For all of these reasons, the Commission should not adjust the allowed return for water utilities if a RAM were adopted.

APPENDIX A

RÉSUMÉ

APPENDIX A

RESUME

MICHAEL J. VILBERT **PRINCIPAL**

Michael Vilbert is an expert in cost of capital, financial planning and valuation who has advised clients on these matters in the context of a wide variety of investment and regulatory decisions. He received his Ph.D. in Financial Economics from the Wharton School of the University of Pennsylvania, an MBA from the University of Utah, an M.S. from the Fletcher School of Law and Diplomacy, Tufts University, and a B.S. degree from the United States Air Force Academy. He joined The Brattle Group in 1994 after a career as an Air Force officer, where he served as a fighter pilot, intelligence officer, and professor of finance at the Air Force Academy.

REPRESENTATIVE CONSULTING EXPERIENCE

- In a securities fraud case, Dr. Vilbert designed and created a model to value the private placement stock of a drug store chain as if there had been full disclosure of the actual financial condition of the firm. He analyzed key financial data and security analysts' reports regarding the future of the industry in order to recreate pro forma balance sheet and income statements under a variety of scenarios designed to establish the value of the firm.

- For pharmaceutical companies rebutting price-fixing claims in antitrust litigation, Dr. Vilbert was a member of a team that prepared a comprehensive analysis of industry profitability. The analysis replicated, tested and critiqued the major recent analyses of drug costs, risks and returns. The analyses helped develop expert witness testimony to rebut allegations of excess profits.

- For an independent electric power producer, Dr. Vilbert created a model that analyzed the reasonableness of rates and costs filed by a natural gas pipeline. The model not only duplicated the pipeline's rates, but it also allowed simulation of a variety of "what if" scenarios associated with cost recovery under alternative time patterns and joint cost allocations. Results of the analysis were adopted by the intervenor group for negotiation with the pipeline.

- For the CFO of an electric utility, Dr. Vilbert developed the valuation model used to support a stranded cost estimation filing. The case involved a conflict between two utilities over the responsibility for out-of-market costs associated with a power purchase contract between them. In addition, he advised and analyzed cost recovery mechanisms

that would allow full recovery of the stranded costs while providing a rate reduction for the company's rate payers.

- Dr. Vilbert has testified as well as assisted in the preparation of testimony and the development of estimation models in numerous cost of capital cases for natural gas pipeline, water utility and electric utility clients before the Federal Energy Regulatory Commission ("FERC") and state regulatory commissions. These have spanned standard estimation techniques (e.g., Discounted Cash Flow and Risk Positioning models). He has also developed and applied more advanced models specific to the industries or lines of business in question, e.g., based on the structure and risk characteristics of cash flows, or based on multi-factor models that better characterize regulated industries.

- Dr. Vilbert has valued several large, residual oil-fired generating stations to evaluate the possible conversion to natural gas or other fuels. In these analyses, the expected pre- and post-conversion station values were computed using a range of market electricity and fuel cost conditions.

- For a major western electric utility, Dr. Vilbert helped prepare testimony that analyzed the prudence of QF contract enforcement. The testimony demonstrated that the utility had not been compensated in its allowed cost of capital for major disallowances stemming from QF contract management.

- Dr. Vilbert analyzed the economic need for a major natural gas pipeline expansion to the Midwest. This involved evaluating forecasts of natural gas use in various regions of the United States and the effect of additional supplies on the pattern of natural gas pipeline use. The analysis was used to justify the expansion before the FERC and the National Energy Board of Canada.

- For a Public Utility Commission in the Northeast, Dr. Vilbert analyzed the auction of an electric utility's purchase power agreements to determine whether the outcome of the auction was in the ratepayers' interest. The work involved the analysis of the auction procedures as well as the benefits to ratepayers of transferring risk of the PPA payments to the buyer.

- Dr. Vilbert led a team tasked to determine whether bridge tolls were "just and reasonable" for a non-profit port authority. Determination of the cost of service for the authority required estimation of the value of the authority's assets using the trended original cost methodology as well as evaluation of the operations and maintenance budgets. Investment costs, bridge traffic information and inflation indices covering a 75 year period were utilized to estimate the value of four bridges and a passenger transit line valued in excess of $1 billion.

- Dr. Vilbert helped a recently privatized railroad in Brazil develop an estimate of its revenue requirements, including a determination of the railroad's cost of capital. He also helped evaluate alternative rate structures designed to provide economic incentives to

shippers as well as to the railroad for improved service. This involved the explanation and analysis of the contribution margin of numerous shipper products, improved cost analysis and evaluation of bottlenecks in the system.

- For a utility in the Southeast, Dr. Vilbert quantified the company's stranded costs under several legislative electric restructuring scenarios. This involved the evaluation of all of the company's fossil and nuclear generating units, its contracts with Qualifying Facilities and the prudence of those QF contracts. He provided analysis concerning the impact of securitizing the company's stranded costs as a means of reducing the cost to the ratepayers and several alternative designs for recovering stranded costs.

- For a recently privatized electric utility in Australia, Dr. Vilbert evaluated the proposed regulatory scheme of the Australian Competition and Consumer Commission for the company's electric transmission system. The evaluation highlighted the elements of the proposed regulation which would impose uncompensated asymmetric risks on the company and the need to either eliminate the asymmetry in risk or provide additional compensation so that the company could expect to earn its cost of capital.

- For an electric utility in the Southwest, Dr. Vilbert helped design and create a model to estimate the stranded costs of the company's portfolio of Qualifying Facilities and Power Purchase contracts. This exercise was complicated by the many variations in the provisions of the contracts that required modeling in order to capture the effect of changes in either the performance of the plants or in the estimated market price of electricity.

- Dr. Vilbert helped prepare the testimony responding to a FERC request for further comments on the appropriate return on equity for electric transmission facilities. In addition, Dr. Vilbert was a member of the team that made a presentation to the FERC staff on the expected risks of the unbundled electric transmission line of business.

- Dr. Vilbert and Mr. Frank C. Graves, also of The Brattle Group, prepared testimony evaluating an innovative Canadian stranded cost recovery procedure involving the auctioning of the output of the province's electric generation plants instead of the plants themselves. The evaluation required the analysis of the terms and conditions of the long-term contracts specifying the revenue requirements of the plants for their entire forecasted remaining economic life and required an estimate of the cost of capital for the plant owners under this new stranded cost recovery concept.

- Dr. Vilbert served as the neutral arbitrator for the valuation of a petroleum products tanker. The valuation required analysis of the Jones Act tanker market and the supply and demand balance of the available U.S. constructed tanker fleet.

TESTIMONY

Direct and rebuttal testimony before the Alberta Energy and Utilities Board on behalf of TransAlta Utilities Corporation in the matter of an application for approval of its 1999 and 2000 generation tariff, transmission tariff, and distribution revenue requirement, October 1998.

Direct testimony before the Federal Energy Regulatory Commission on behalf of Central Maine Power in Docket No. ER00-982-000, December 1999.

Direct testimony before the Alberta Energy and Utilities Board on behalf of TransAlta Utilities Corporation for approval of its 2001 transmission tariff, May 2000.

Direct testimony before the Federal Energy Regulatory Commission on behalf of Mississippi River Transmission Corporation in Docket No. RP01-292-000, March 2001.

Written evidence, rebuttal, reply and further reply before the National Energy Board in the matter of an application by TransCanada PipeLines Limited for orders pursuant to Part I and Part IV of the *National Energy Board Act*, Order AO-1-RH-4-2001, May 2001, Nov. 2001, Feb. 2002.

Written evidence before the Public Utility Board on behalf of Newfoundland & Labrador Hydro - Rate Hearings, October 2001.

Direct testimony (with William Lindsay) before the Federal Energy Regulatory Commission on behalf of DTE East China, LLC in Docket No. ER02-1599-000, April 2002.

Direct and rebuttal reports before the Arbitration Panel in the arbitration of stranded costs for the City of Casselberry, FL, Case No. 00-CA-1107-16-L, July 2002.

Direct reports before the Arbitration Board for Petroleum products trade in the Arbitration of the Military Sealift Command vs. Household Commercial Financial Services, fair value of sale of the Darnell, October 2002.

Direct testimony and hearing before the Arbitration Panel in the arbitration of stranded costs for the City of Winter Park, FL, In the Circuit Court of the Ninth Judicial Circuit in and for Orange County, FL, Case No. C1-01-4558-39, December 2002.

Direct testimony before the Federal Energy Regulatory Commission on behalf of Florida Power Corporation, dba Progress Energy Florida, Inc. in Docket No. SC03-1-000, March 2003.

Direct report before the Arbitration Panel in the arbitration of stranded costs for the Town of Belleair, FL, Case No. 000-6487-C1-007, April 2003.

Direct and rebuttal reports before the Alberta Energy and Utilities Board in the matter of the Alberta Energy and Utilities Board Act, R.S.A. 2000, c. A-17, and the Regulations under it; in the matter of the Gas Utilities Act, R.S.A. 2000, c. G-5, and the Regulations under it; in the matter of the Public utilities Board Act, R.S.A. 2000, c. P-45, as amended, and the Regulations under it; and in the matter of Alberta Energy and Utilities Generic Cost of Capital Hearing, Proceeding No. 1271597, July 2003, November 2003.

Written evidence before the National Energy Board in the matter of the National Energy Board Act, R.S.C. 1985, c. N–7, as amended, (Act) and the Regulations made under it; and in the matter of an application by TransCanada PipeLines Limited for orders pursuant to Part IV of the *National Energy Board Act*, for approval of Mainline Tolls for 2004, RH-2-2004, January 2004.

Direct and rebuttal testimony before the Public Service Commission of West Virginia, on Cost of Capital for West Virginia-American Water Company, Case No 04-0373-W-42T, May 2004.

Direct and rebuttal testimony before the Federal Energy Regulatory Commission on Energy Allocation of Debt Cost for Incremental Shipping Rates for Edison Mission Energy, Docket No. RP04-274-000, December 2004 and March 2005.

Direct testimony before the Arizona Corporation Commission, Cost of Capital for Paradise Valley Water Company, a subsidiary of Arizona-American Water Company, Docket No. WS-01303A-05, May 2005.

Written evidence before the Ontario Energy Board, Cost of Capital for Union Gas Limited, Inc., Docket No. EB-2005-0520, January 2006.

Direct and rebuttal testimony before the Pennsylvania Public Utility Commission, Return on Equity for Metropolitan Edison Company, Docket No. R-00061366 and Pennsylvania Electric Company, Docket No. R-00061367, April 2006 and August 2006.

Expert report in the United States Tax Court, Docket No. 21309-05, 34th Street Partners, DH Petersburg Investment, LLC and Mid-Atlantic Finance, Partners Other than the Tax Matters Partner, Petitioner, v. Commissioner of Internal Revenue, Respondent, July 28, 2006.

Direct and supplemental testimony before the Federal Energy Regulatory Commission, Docket No. ER06-427-003, on behalf of Mystic Development, LLC on the Cost of Capital for Mystic 8 and 9 Generating Plants Operating Under Reliability Must Run Contract, August 2006 and September 2006.

Direct testimony before the Federal Energy Regulatory Commission, Docket No. ER07-46-000, on behalf of Northwestern Corporation on the Cost of Capital for Transmission Assets, October 2006.

Direct and rebuttal testimony before the Tennessee Regulatory Authority, Case No. 06-00290, on behalf of Tennessee American Water Company, on the Cost of Capital, November, 2006 and April 2007.

Direct testimony before the Public Service Commission of Wisconsin, Docket No. 5-UR-103, on behalf of Wisconsin Energy Corporation, on the Cost of Capital for Wisconsin Electric Power Company and Wisconsin Gas LLC, May 2007.

Rebuttal testimony before the California Public Utilities Commission, Docket No. A. 07-01-036-39, on behalf of California-American Water Company, on the Cost of Capital, May 2007.

Direct testimony before the Public Utilities Commission of the State of South Dakota, Docket No. NG-07-013, on behalf of NorthWestern Corporation, on the Cost of Capital for NorthWestern Energy Company's natural gas operations in South Dakota, June 2007.

Direct testimony before the Public Utilities Commission of Ohio, Case No. 07-551-EL-AIR, Case No. 07-552-EL-ATA, Case No. 07-553-EL-AAM, and Case No. 07-554-EL-UNC, on behalf of Ohio Edison Company, The Toledo Edison Company, and The Cleveland Electric Illuminating Company, on the cost of capital for the FirstEnergy Company's Ohio electric distribution utilities, June 2007.

Direct testimony before the State Corporation Commission of Virginia, Case No. PUE-2007-00066, on behalf of Virginia Electric and Power Company on the cost of capital for its southwest Virginia coal plant, July 2007.

Direct testimony before the Public Utilities Commission of Ohio, Case No. 07-829-GA-AIR, Case No. 07-830-GA-ALT, and Case No. 07-831-GA-AAM, on behalf of Dominion East Ohio Company, on the rate of return for Dominion East Ohio's natural gas distribution operations, September 2007.

APPENDIX B

EFFECT OF DEBT ON THE COST OF EQUITY

APPENDIX B

EFFECT OF DEBT ON THE COST OF EQUITY

I. AN OVERVIEW OF THE ECONOMIC LITERATURE 1

A. TAX EFFECTS 1
1. Base Case: No Taxes, No Risk to High Debt Ratios 2
2. Corporate Tax Deduction for Interest Expense 3
3. Personal Tax Burden on Interest Expense 5

B. NON-TAX EFFECTS 7

II. EXPANDED EXAMPLE 11

A. DETAILS OF DIFFERENT LEVELS OF DEBT 12

B. THE IMPACT OF INCOME AND INTEREST 15

C. THE EFFECT OF TAXES 18

D. COMBINED EFFECTS 23

Q1. What is the purpose of this Appendix?

A1. In this appendix, I provide details on the effects of debt on the cost of equity. First, I summarize a fairly large body of financial research on capital structure. Second, I provide an extended example to illustrate the effect of debt on the cost of equity.

I. AN OVERVIEW OF THE ECONOMIC LITERATURE

Q2. What is the focus of the economic literature on the effects of debt?

A2. The economic literature focuses on the effects of debt on the value of a firm. The standard way to recognize one of these effects, the impact of the fact that interest expense is tax-deductible, is to discount the all-equity after-tax operating cash flows generated by a firm or an investment project at a weighted average cost of capital, typically known in textbooks as the "WACC." The textbook WACC equals the *market*-value weighted average of the cost of equity and the *after-tax*, *current* cost of debt. However, rate regulation in North America has a legacy of working with another weighted-average cost of capital, the *book*-value weighted average of the cost of equity and the *before-tax*, *embedded* cost of debt. To distinguish the concepts, I refer to the after-tax weighted-average cost of capital as ATWACC.

Q3. How is this section of the appendix organized?

A3. It starts with the tax effects of debt. It then turns to other effects of debt.

A. TAX EFFECTS

Q4. What are the key findings in the literature regarding tax effects?

A4. Three seminal papers are vital for this literature. The first assumes no taxes and risk-free debt. The second adds corporate income taxes. The third adds personal income taxes.

1. Base Case: No Taxes, No Risk to High Debt Ratios

Q5. Please start by explaining the simplest case of the effect of debt on the value of a firm.

A5. The "base case," no taxes and no costs to excessive debt, was worked out in a classic 1958 paper by Franco Modigliani and Merton Miller, two economists who eventually won Nobel Prizes in part for their body of work on the effects of debt.[1] Their 1958 paper made what is in retrospect a very simple point: if there are no taxes and no risk to the use of excessive debt, use of debt will have no effect on a company's operating cash flows (i.e., the cash flows to investors as a group, debt plus equity combined). If the operating cash flows are the same regardless of whether the company finances mostly with debt or mostly with equity, then the value of the firm cannot be affected at all by the debt ratio. In cost of capital terms, this means the overall cost of capital is constant regardless of the debt ratio, too.

In the base case, issuing debt merely divides the cash flows into two pools, one for bondholders and one for shareholders. If the divided pools have different priorities in claims on the cash flows, the risks and costs of capital will differ for each pool. But the risk and overall cost of capital of the entire firm, the sum of the two pools, is constant regardless of the debt ratio. Thus,

$$r_1^* = r_{A1} \qquad \text{(B-1a)}$$

where r^*_1 is the overall after-tax cost of capital at any particular capital structure and r_{A1} is the all-equity cost of capital for the firm. (The "1" subscripts distinguish the case where there are no taxes from subsequent equations that consider first corporate and then both corporate and personal taxes.) With no taxes and no risk to debt, the overall cost of capital does not change with capital structure.

This implies that the relationship of the overall cost of capital to the component costs of debt and equity is

[1] Franco Modigliani and Merton H. Miller (1958), "The Cost of Capital, Corporation Finance and the Theory of Investment," *American Economic Review*, 48, pp. 261-297.

$$r_{E1} \times \left(\frac{E}{V}\right) + r_{D1} \times \left(\frac{D}{V}\right) = r_1^* \qquad \text{(B-1b)}$$

with the overall cost of capital (r^*) on the *right* side, as the *independent* variable, and the costs of equity (r_E) and debt (r_D) on the left side, as *dependent* variables determined by the overall cost of capital and by the capital structure (i.e., the shares of equity (E) and debt (D) in overall firm value (V=E+D)) that the firm happens to choose. Note that if equation (B-1a) were correct, the equation that solved it for the cost of equity would be,

$$r_{E1} = r_1^* + (r_1^* - r_D) \times \left(\frac{D}{E}\right) \qquad \text{(B-1c)}$$

Note also that (D/E) gets exponentially higher in this equation as the debt-to-value ratio increases[2] i.e., the cost of equity increases exponentially with leverage.

2. Corporate Tax Deduction for Interest Expense

Q6. What happens when you add corporate taxes to the discussion?

A6. If corporate taxes exist with risk-free debt (and if only taxes at the corporate level matter, not taxes at the level of the investor's personal tax return), the initial conclusion changes. Debt at the corporate level reduces the company's tax liability by an amount equal to the marginal tax rate times interest expense. All else equal, this will add value to the company because more of the operating cash flows will end up in the hands of investors as a group. That is, if only corporate taxes mattered, interest would add cash to the firm equal to the corporate tax rate times the interest expense. This increase in cash would increase the value of the firm, all else equal. In cost of capital terms, it would reduce the overall cost of capital.

How much the value of the firm would rise and *how far* the overall cost of capital would fall would depend in part on how often the company adjusts its capital structure, but this is a second-order effect in practice. (The biggest effect would be if companies could

[2] For example, at 20-80, 50-50, and 80-20 debt-equity ratios, (D/E) equals, respectively, (20/80) = 0.25, (50/50) = 1.0, and (80/20) = 4.0. The extra 30 percent of debt going from 20-80 to 50-50 has much less impact on (D/E) [i.e., by moving it from 0.25 to 1.0] than the extra 30 percent of debt going from 50-50 to 80-20 [i.e., by moving it from 1.0 to 4.0]. Since the cost of equity equals a constant risk premium times the debt-equity ratio, the cost of equity grows ever more rapidly as you add more and more debt.

issue riskless perpetual debt, an assumption Profs. Modigliani and Miller explored in 1963, in the second seminal paper;[3] this assumption could *not* be true for a real company.) Prof. Robert A. Taggart provides a unified treatment of the main papers in this literature and shows how various cases relate to one another.[4] Perhaps the most useful set of benchmark equations for the case where only corporate taxes matter are:

$$r_2^* = r_{A2} - r_D \times t_C \times \left(\frac{D}{V}\right) \tag{B-2a}$$

$$r_2^* = r_{E2} \times \left(\frac{E}{V}\right) + r_D \times \left(\frac{D}{V}\right) \times (1 - t_C) \tag{B-2b}$$

which imply for the cost of equity,

$$r_{E2} = r_{A2} + (r_{A2} - r_D) \times \left(\frac{D}{E}\right) \tag{B-2c}$$

where the variables have the same meaning as before but the "2" subscripts indicate the case that considers corporate but not personal taxes.

Note that Equation (B-2a) implies that when only corporate taxes matter, the overall after-tax cost of capital declines steadily as more debt is added, until it reaches a minimum at 100 percent debt (i.e., when D/V = 1.0). Note also that Equation (B-2c) still implies an exponentially increasing cost of equity as more and more debt is added. In fact, except for the subscript, Equation (B-2c) looks just like Equation (B-1c).

However, whether any value is added and whether the cost of capital changes at all also depends on the effect of taxes at the personal level.

3. Personal Tax Burden on Interest Expense

Q7. How do personal taxes affect the results?

A7. Ultimately, the purpose of investment is to provide income for consumption, so personal taxes affect investment returns. For example, in the U.S., municipal bonds have lower interest rates than corporate bonds because their income is taxed less heavily at the personal level. In general, capital appreciation on common stocks is taxed less heavily than interest on corporate bonds because (1) taxes on unrealized capital gains are deferred until the gains are realized, and (2) the capital gains tax rate is lower. Dividends are taxed less heavily than interest, also, under current tax law.[5] The effects of personal taxes on the cost of common equity are hard to measure, however, because common equity is so risky.

Professor Miller, in his Presidential Address to the American Finance Association,[6] explored the issue of how personal taxes affect the overall cost of capital. The paper pointed out that personal tax effects could offset the effect of corporate taxes entirely.

Q8. Is it likely that the effect of personal taxes will completely neutralize the effect of corporate taxes?

A8. I do not believe so, although the likelihood of such a result would be increased if the current federal tax reductions on dividends and capital gains became permanent rather than expiring in 2010. However, personal taxes are important even if they do not make the corporate tax advantage on interest vanish entirely. Capital gains and dividend tax advantages definitely convey some personal tax advantage to equity, and even a partial personal advantage to equity reduces the corporate advantage to debt.

The Taggart paper explores the case of a partial offset, also. With personal taxes, the risk-free rate on the security market line is the after-personal-tax rate, which must be

[5] The current maximum personal tax rate on dividend income was extended to the end of 2010 by the President on May 17, 2006. It is uncertain whether the reduced rates on dividend income will be further extended.

[6] Merton H. Miller (1977), "Debt and Taxes," *The Journal of Finance*, 32: 261-276, the third of the seminal papers mentioned earlier.

equal for risk-free debt and risk-free equity.[7] Therefore, the pre-personal-tax risk-free rate for equity will generally not be equal to the pre-personal-tax risk-free rate for debt. In particular, $r_{fE} = r_{fD}H[(1!t_D)/(1!t_E)]$, where r_{fE} and r_{fD} are the risk-free costs of equity and debt and t_E and t_D are the personal tax rates for equity and debt, respectively. In terms of the cost of debt, the Taggart paper's results imply that a formal statement of these effects can be written as:[8]

$$r_3^* = r_{A3} - r_D \times t_N \times \left(\frac{D}{V}\right) \quad \text{(B-3a)}$$

$$= r_{E3} \times \left(\frac{E}{V}\right) + r_D \times \left(\frac{D}{V}\right) \times (1 - t_C) \quad \text{(B-3b)}$$

which imply

$$r_{E3} = r_{A3} + \left[r_{A3} - r_D \times \left(\frac{1-t_D}{1-t_E}\right)\right] \times \left(\frac{D}{E}\right) \quad \text{(B-3c)}$$

Suppose, for example, that $t_C = 0.35$ percent, $t_E = 7.7$ percent and $t_D = 40$ percent. Then $[(1!t_D)/(1!t_E)] = 0.65 = (1!t_C)$. That condition corresponds to Miller's 1977 paper, in which the net personal tax advantage of equity fully offsets the net corporate tax advantage of debt. Note also that in that case, $t_N = 0$.[9] Therefore, if the personal tax advantage on equity fully offsets the corporate tax advantage on debt, Equation (B-3a) confirms that the overall after-tax cost of capital is a constant.

However, it is unlikely that the personal tax advantage of equity fully offsets the corporate tax advantage of debt. If taxes were all that mattered (i.e., if there were no

---

[7] As Prof. Taggart notes (his footnote 9), it is not necessary that a specific, risk-free equity security exist as long as one can be created synthetically, through a combination of long and short sales of traded assets. Such constructs are a common analytical tool in financial economics.

[8] The net all-tax effect of debt on the overall cost of capital, t_N, equals $\{[t_C+t_E!t_D!(t_CHt_E)] / (1!t_E)\}$, where t_D is the personal tax rate on debt, as before. This measure of net tax effect is designed for use with the cost of debt in Equation (B-3a), which seems more useful in the present context. The Taggart paper works with a similar measure, but one which is designed for use with the cost of risk-free equity in the equivalent Taggart equation.

[9] In the above example, $t_N = \{[0.35+0.077!0.4!(0.35H0.077)] / (1.0!0.077)\} = 0.0/0.923 = 0$.

other costs to debt), the overall after-corporate-tax cost of capital would still fall as debt was added, just not as fast.

Finally, note that the overall after-tax cost of capital, Equation (B-3b), still uses the corporate tax rate even when personal taxes matter. Equations (B-2b) and (B-3b) both correspond to the usual formula for the ATWACC. Personal taxes affect the way the cost of equity changes with capital structure -- Equation (B-3c) -- but not the formula for the overall after-tax cost of capital given that cost of equity.

B. NON-TAX EFFECTS

Q9. Please describe the non-tax effects of Debt.

A9. If debt is truly valuable, firms should use as much as possible, and competition should drive firms in a particular industry to the same, optimal capital structure for the industry. If debt is harmful on balance, firms should avoid it. Neither picture corresponds to what we actually see. A large economic literature has evolved to try to explain why.

Part of the answer clearly is the costs of excessive debt. Here the results cannot be reduced to equations, but they are no less real for that fact. As companies add too much debt, the costs come to outweigh the benefits. Too much debt reduces or eliminates financial flexibility, which cuts the firm's ability to take advantage of unexpected opportunities or weather unexpected difficulty. Use of debt rather than internal financing may be taken as a negative signal by the market.

Even if the company is generally healthy, more debt increases the risk that the company cannot use all of the interest tax shields in a bad year. As debt continues to grow, this problem grows and others may crop up. Management begins to worry about meeting debt payments instead of making good operating decisions. Suppliers are less willing to extend trade credit, and a liquidity shortage can translate into lower operating profits.

Ultimately, the firm might have to go through the costs of bankruptcy and reorganization. Collectively, such factors are known as the costs of "financial distress."[10]

The net tax advantage to debt, if positive, is affected by costs such as a growing risk that the firm might have to bear the costs of financial distress. First, the expected present value of these costs offsets the value added by the interest tax shield. Second, since the likelihood of financial distress is greater in bad times when other investments also do poorly, the possibility of financial distress will increase the risks investors bear. These effects increase the variability of the value of the firm. Thus, firms that use too much debt can end up with a higher overall cost of capital than those that use none.

Other parts of the answer include the signals companies send to investors by the decision to issue new securities, and by the type of securities they issue. Other threads of the literature explore cases where management acts against shareholder interests, or where management attempts to "time" the market by issuing specific securities under different conditions. For present purposes, the important point is that no theory, whether based on taxes or on some completely different issue, has emerged as "the" explanation for capital structure decisions by firms. Nonetheless, despite the lack of a single "best" theory, there is a great deal of relevant empirical research.

Q10. What does that research show?

A10. The research does not support the view that debt makes a material difference in the value of the firm, at least not once a modest amount of debt is in place. If debt were truly valuable, competitive firms should use as much debt as possible short of producing financial distress, and competitive firms that use less debt ought to be less profitable. The research shows exactly the opposite.

[10] See, for example, Section 18.3 of Brealey, Myers and Allen, 2006, *Principles of Corporate Finance*, 8th Edition, McGraw-Hill/Irwin, 2006.

For example, Kester[11] found that firms in the same industry in both the U.S. and Japan do not band around a single, "optimal" capital structure, and the most profitable firms are the ones that use the *least* debt. This finding comes despite the fact that both countries at the time (unlike the U.S. currently) had fully "classical" tax systems, in which dividends are taxed fully at both the corporate and personal level. Wald[12] confirms that high profitability implies low debt ratios in France, Germany, Japan, the U.K., and the U.S. Booth *et al.* find the same result for a sample of developing nations.[13] Fama and French[14] analyze over 2000 firms for 28 years (1965-1992, inclusive) and conclude, "Our tests thus produce no indication that debt has net tax benefits."[15] A paper by Graham[16] carefully analyzes the factors that might have led a firm not to take advantage of debt. It confirms that a large proportion of firms that ought to benefit substantially from use of additional debt, including large, profitable, liquid firms, appear not to use it "enough."

This research leaves us with only three options: either (1) apparently good, profit-generating managers are making major mistakes or deliberately acting against shareholder interests, (2) the benefits of the tax deduction on debt are less than they appear, or (3) the non-tax costs to use of debt offset the potential tax benefits. Only the first of these possibilities is consistent with the view that the tax deductibility of debt conveys a material cost advantage. Moreover, if the first explanation were interpreted to mean that otherwise good managers are acting against shareholder interests, either deliberately or by mistake, it would require the additional assumption that their competitors (and potential acquirers) let them get away with it.

Q11. Are there any explanations in the financial literature for this puzzle other than stupid or self-serving managers at the most profitable firms?

A11. Yes. For example, Stewart C. Myers, a leading expert on capital structure, made it the topic of his Presidential Address to the American Finance Association.[17] The poor performance of tax-based explanations for capital structure led him to propose an entirely different mechanism, the "pecking order" hypothesis. This hypothesis holds that the net tax benefits of debt (i.e., corporate tax advantage over personal tax disadvantage) are at most of a second order of importance relative to other factors that drive actual debt decisions.[18] Similarly, Baker and Wurgler (2002)[19] observe a strong and persistent impact that fluctuations in market value have on capital structure. They argue that this impact is not consistent with other theories. The authors suggest a new capital structure theory based on market timing -- capital structure is the cumulative outcome of attempts to time the equity market.[20] In this theory, there is no optimal capital structure, so market timing financing decisions just accumulate over time into the capital structure outcome. (Of course, this theory only makes sense if investors do not recognize what managers are doing.)

Q12. Do inter-firm differences within an industry explain the wide variations in capital structure across the firms in an industry?

A12. No. This view is contradicted by the empirical research. As mentioned before, it has long been found that the most profitable firms in an industry, i.e., those in the best position to take advantage of debt, use the least.[21] Graham (2000) carefully examines differences in firm characteristics as possible explanations for why firms use "too little"

[21] For example, Kester, *op. cit.* and Wald, *op. cit.*

debt and concludes that such differences are *not* the explanation: firms that ought to benefit substantially from more debt by all measurable criteria, if the net tax advantage of debt is truly valuable, voluntarily do not use it.[22]

Nor does the research support the view that firms are constantly trying to adjust their capital structures to optimal levels. Additional research on the pecking order hypothesis demonstrates that firms do not tend towards a target capital structure, or at least do not do so with any regularity, and that past studies that seemed to show the contrary actually lacked the power to distinguish whether the hypothesis was true or not.[23] In the words of the Shyam-Sunder - Myers paper p. 242, "If our sample companies did have well-defined optimal debt ratios, it seems that their managers were not much interested in getting there."

II. EXPANDED EXAMPLE

Q13. What topics do you cover in this section?

A13. The discussion in my testimony did not detail the impact of different starting points for the level of debt nor did it address income earned on the investment, interest expense, or taxes. This section covers these topics. First, it discusses how the level of debt affects the cost of equity. Second, it addresses the influence of income and interest on the investment. Third, it explains the impact of taxes on capital structure decisions. The final topic covered in this section is the combined consequence of tax and non-tax effects of debt.

---

[22] While not contradicting Graham's finding that differences in firm characteristics do not explain capital structure differences, Nengjiu Ju, Robert Parrino, Allen M. Poteshman, and Michael S. Weisbach, "Horses and Rabbits? Trade-Off Theory and Optimal Capital Structure," *Journal of Financial and Quantitative Analysis*, June 2005, pp. 1-24, looks at the issue in a different manner. Their paper uses a dynamic rather than static model to analyze the tradeoff between the tax benefits of debt and the risk of financial distress. It finds that bankruptcy costs by themselves are enough to explain observed capital structures, once dynamic effects are considered. This means debt is not as valuable as suggested by the traditional static analysis (of the sort used by Graham).

[23] Lakshmi Shyam-Sunder and Stewart C. Myers (1999), "Testing static tradeoff against pecking order models of capital structure," *Journal of Financial Economics* 51:219-244.

A. Details Of Different Levels Of Debt

Q14. Why does more debt mean more risk for equity holders?

A14. Debt magnifies the variability of the equity return. As a simple example, think of an investor who takes money out of her savings and invests $100,000 in real estate. The future value of the real estate is uncertain. If the real estate market booms, she wins. If the real estate market goes down, she loses. Figure B-1 below illustrates this.

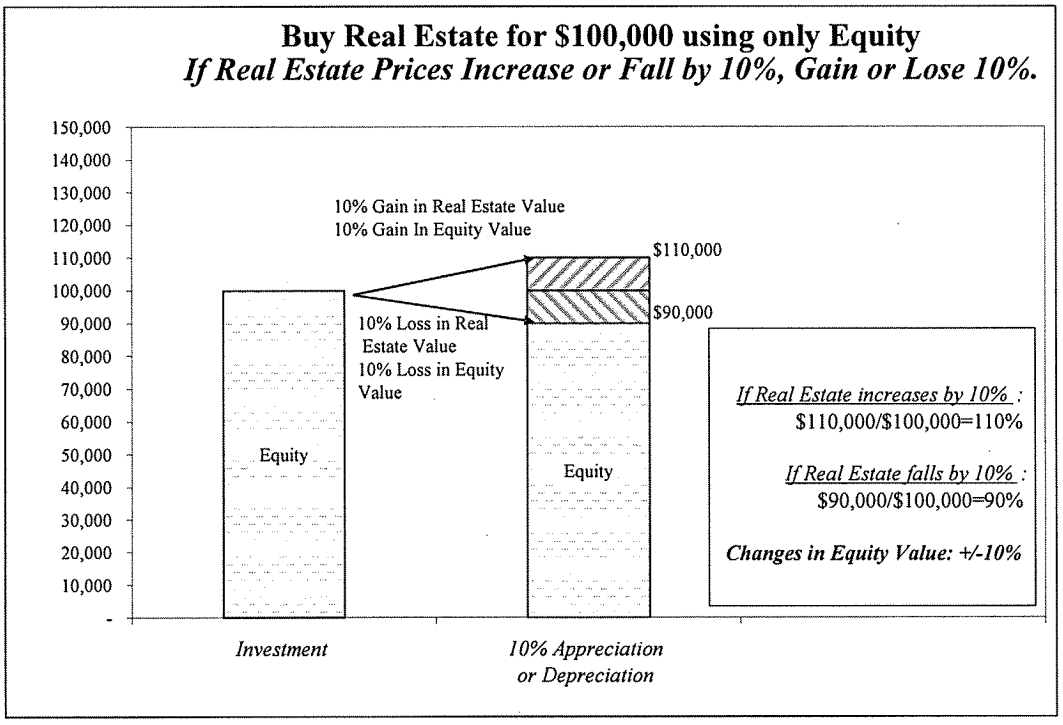

Figure B-1

In the scenario above, the investor financed her real estate purchase through 100 percent equity. Suppose instead that the investor had financed 50 percent of her real estate investment with a mortgage of $50,000. The mortgage lender does not expect to share in any benefits from increases in real estate values. Neither does the mortgage lender expect to share in any losses from falling real estate values, i.e., the investor carries the entire risk of fluctuating real estate prices. Figure B-2 illustrates this effect.

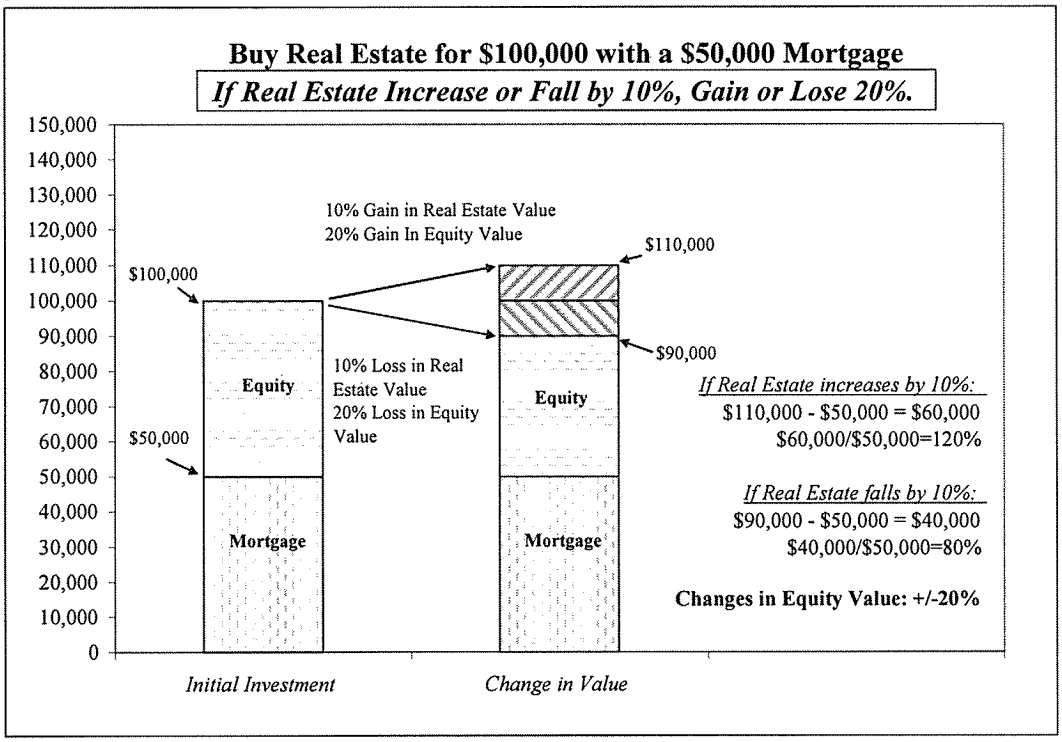

Figure B-2

In Figure B-2 where the investor financed her purchase through 50 percent equity and 50 percent debt, the variability in the investor's equity return is two times greater than that of Figure B-1. The entire fluctuation of 10 percent from rising or falling real estate prices falls on the investor's $50,000 equity investment. The lesson from the example is obvious, debt adds risk to equity.

Q15. What happens if the investor finances the real estate purchase with different proportions of debt?

A15. The equity return becomes more variable when the mortgage percentage is a greater proportion of the initial price. Table B-1 below calculates the return on equity when real estate prices increase by 10 percent when mortgages are 0 percent, 30 percent, 50 percent, and 70 percent of the initial price.

Table B-1: The Impact of Leverage on the Return on Equity

	100% Equity	70% Equity	50% Equity	30% Equity
Debt	$0	$30,000	$50,000	$70,000
Original Equity Investment	$100,000	$70,000	$50,000	$30,000
Increase in Market Value of Equity	$10,000	$10,000	$10,000	$10,000
Return on Equity Investment	10%	14.3%	20%	33.3%

Note that going from 70 percent equity down to 50 percent equity increases the return on the equity investment by 5.7 percent while going from 50 percent equity to 30 percent equity increases the return on equity by 13.3 percent. This illustrates a general point; the rate of return on equity increases more quickly at higher levels of debt than at lower levels. Investors demand a higher equity rate of return to bear more risk and debt magnifies equity's risk at an ever increasing rate. Therefore, the required equity rate of return goes up at an ever increasing rate as debt is added. This is not only basic finance theory, it is the everyday experience of anyone who buys a home. The bigger the mortgage, the more percentage risk the equity faces from changes in housing prices.

Q16. Please provide an example that illustrates why market values are relevant.

A16. Suppose in the above example that the investor has invested in real estate 10 years ago. Further assume that depreciation has reduced the book value of the real estate from $100,000 to $75,000 and assume the investor has paid off 40 percent of his $50,000 mortgage. Thus, the investor has a remaining mortgage of $30,000 (= 60% H $50,000). The book value of the investor's equity investment is therefore $45,000 (= $75,000 - $30,000).

What happens now if real estate prices rise or fall 20 percent? To answer that question, we need to know how real estate prices have developed over the past 10 years. If the market value of the real estate now is $200,000 then a 20 percent decrease in the price of

real estate ($40,000) is almost equal to the investor's book value equity. However, his market value equity (or net worth) is equal to the value of the real estate minus what he owes on the mortgage. If we assume that the market value of the mortgage equals the unpaid balance ($30,000), then the investor's net worth is calculated as follows:

Net Worth	=	Market Value of Real Estate	-	Remaining Mortgage
	=	$200,000	-	$30,000
	=	$170,000		

Therefore, the rate of return on equity due to a 20 percent decline in real estate prices is calculated in Table B-2.

Table B-2: Calculating the Rate of Return on Equity

Decline in Real Estate Value	$40,000
Market-Value Equity	$170,000
Rate of Return on Equity	- $40,000/$170,000 = -23.5%

B. THE IMPACT OF INCOME AND INTEREST

Q17. How does earning income from the investment and paying interest on debt affect the results?

A17. In the following explanation, I ignore income taxes which I deal with in Section C below. Assume the investor is receiving income, e.g., rent, from the real estate. Specifically, assume the investor receives $500 per month in income after all non-interest expenses ($6,000 per year). Also, assume that the expected appreciation is 5 percent per year, so the expected market value is $105,000 after one year. Then the expected rate of return from the real estate with all equity financing is:

$$\text{Expected Return on Equity @ 0\% debt} = \frac{\text{Expected Net Income + Expected Appreciation}}{\text{Initial Investment}}$$

$$= \frac{\$6{,}000 + (\$105{,}000 - \$100{,}000)}{\$100{,}000}$$

$$= 11\%$$

Now suppose that the mortgage interest rate were 5 percent. Then at a mortgage equal to 50 percent, or $50,000, interest expense would be ($50,000 x 0.05), or $2,500. The expected equity rate of return would be:

$$\text{Expected Return on Equity @ 50\% debt} = \frac{\text{Expected (Net Income + Appreciation) – Int. Expense}}{\text{Initial } \textit{Equity} \text{ Investment}}$$

$$= \frac{\$6{,}000 + \$5{,}000 - \$2{,}500}{\$50{,}000}$$

$$= 17\%$$

Notice that the expected return on equity is higher as is the risk carried by equity.

Q18. Can you provide a more general illustration?

A18. Yes. Figure B-3 uses these assumptions at different mortgage levels to plot both (i) the expected rate of return on the equity in the dwelling, and (ii) the realized rate of return on

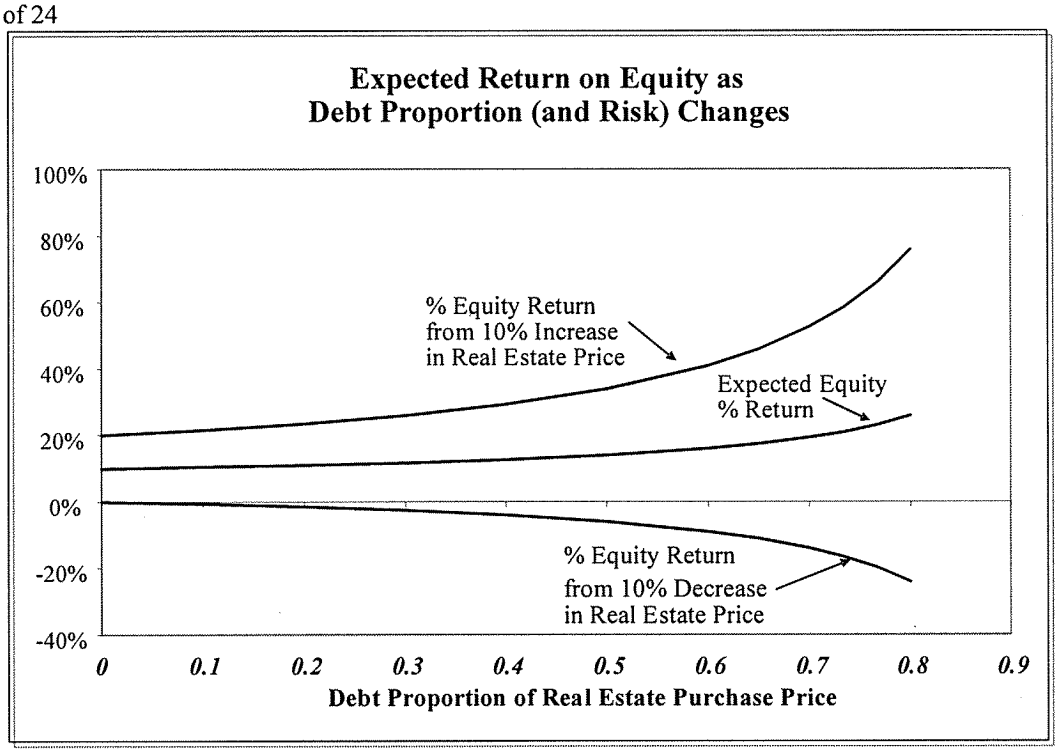

Figure B-3

that equity in a year if the dwelling value increases by 10 percent more than the expected 5 percent rate (i.e., if the value increases by 15 percent) or by 10 percent less than expected (i.e., if it decreases by 5 percent).[24]

The expected rate of return on equity increases at an increasing rate as the investor finances more and more of the real estate through loans (e.g., with a mortgage). Since equity bears all the risk of increases or decreases in real estate values (absent financial distress or bankruptcy), the amount of risk the buyer bears grows at an ever increasing rate as the mortgage percentage also increases.

Q19. What are the implications of this example?

A19. Any time an individual or a company uses debt to finance part an investment, the same risk magnifies. For example, if an investor buys stocks "on margin" -- by borrowing part of the money used to buy the stock -- the expected rate of return will be higher as will the

[24] For simplicity, the figure assumes the debt's interest rate is independent of the debt proportion. This might not always be true, and in general would not be true for a corporation that issued debt. However, the general shape of the graphs remains the same.

risks the investor carries. As an everyday example, imagine investing your retirement savings in a stock portfolio bought with as much margin as possible. If you were lucky, you could end up living very well in retirement. But you would be taking a lot of risk on the opposite outcome, since your portfolio could decline by more than 100 percent of your initial investment.

The same risk-magnifying effects happen when companies borrow to finance part of their investments.

C. The Effect Of Taxes

Q20. What is the impact of taxes?

A20. Analyzing the net effect of taxes in capital structure decisions by corporations is an important part of the financial research. (Other parts of that research address such issues as the risk of financial distress or bankruptcy, and the signals corporations send investors by the choice of how to finance new investments.) The bottom line is that taxes complicate the picture without changing the basic conclusion.

Q21. Please describe the potential impact of taxes.

A21. Interest expense is tax-deductible for corporations. That increases the pool of cash the corporation gets to keep out of its operating earnings (i.e., its earnings before interest expense). With no debt, 100 percent of operating income is subject to taxes. With debt, only the equity part of the operating income is subject to taxes.

All else equal, the extra money kept from operating income increases the value of the corporation. The standard way to recognize that increase in value is to use an after-tax weighted-average cost of capital as a discount rate when valuing a company's operating cash flows.

Q22. Do personal taxes affect the value of debt, too?

A22. Yes, but in the other direction. One offset to debt's tax benefits at the corporate level is its higher tax burden at the personal level. Investors care about the money they get to

keep after all taxes are paid, and while the corporation saves taxes by opting for debt over equity, individuals pay more taxes on interest than on capital gains from equity (and for now, on dividends as well).

Q23. Are there factors other than taxes matter?

A23. Absolutely, "all else" does not remain equal as more debt is added. The more debt, the more the non-tax effects of debt offset the tax benefits. Other costs include such effects as a loss of flexibility, the possibility of sending negative signals to investors, and a host of costs and risks associated with the danger of financial distress.

Q24. Does the tradeoff between the tax and non-tax effects of debt mean that firms have well-defined, optimal capital structures?

A24. No, this sort of "tradeoff" model does not explain actual corporate behavior. A substantial body of economic research confirms that real-world corporations act as if, after a moderate amount of debt is in place, the tax benefits of debt are not worth debt's other costs. In country after country and in industry after industry, the most profitable corporations in an industry tend to use the least debt. The research on this point is quite thorough, and the finding that the most profitable companies tend to use the least debt in a given industry is robust. Yet these are the companies with the most operating income to shield from taxes, who would benefit most if interest tax shields were truly valuable net of debt's other costs. They also presumptively are the best-managed on average (else why are they the most profitable?). This means it is unrealistic to suppose that more debt is always better, or that greater tax savings due to higher interest expense always add value to the firm on balance.

Q25. If the tradeoff model doesn't explain capital structure decisions by firms, is there a model that does?

A25. No single model has (yet) emerged as 'the" explanation of capital structure. However, several alternative models attempt to model the tradeoff (e.g., the "pecking order" hypothesis and "agency cost" explanations).

Q26. What does the absence of an agreed theory of capital structure in the financial literature imply about the overall effect of debt on the value of the firm?

A26. The findings of the financial literature mean that within an industry, there is no well-defined optimal capital structure. The use of some debt does convey some value advantage in most industries, but that advantage is offset by other costs as firms add more debt.[25] The range of capital structures over which the value of the firm in any industry is maximized is wide and should be treated as flat. The location and level of that range, however, does vary from industry to industry, just as the overall cost of capital varies from industry to industry.

Figure B-4 illustrates the picture that emerges from the research. This figure shows the present value of an investment in each of four different industries. For simplicity, the investment is expected to yield $1.00 per year forever. For firms in relatively high-risk industries (Industry 1 in the graph, the lowest line), the $1.00 perpetuity is not worth much and any use of debt decreases firm value. For firms in relatively low-risk industries (Industry 4 in the graph), the perpetuity is worth more and substantial amounts of debt make sense. Industries 2 and 3 are intermediate cases.

The maximum net rate at which taxes can increase value in this figure equals 20 percent of interest expense, representing a balance between the corporate tax advantage to debt and the personal tax disadvantage. The figure plots the maximum possible impact of taxes on value as a separate line, starting at the all-equity value of the lowest-risk industry (Industry 4).

[25] Note that if debt did increase the value of the firm materially, competition would tend to take that value away, since issuing debt is an easy-to-copy competitive strategy. Prices would fall as firms copied the strategy, lowering operating earnings and passing the net tax advantages to debt through to customers (just as happens under rate regulation). Therefore, if also there were a narrow range of optimal capital structures within an industry, competition would drive all firms in the industry to capital structures within that range. This does not happen in practice, which contradicts one or both of the assumptions, i.e., (1) that debt adds material value on balance, and/or (2) that there is a narrow range of optimal capital structures.

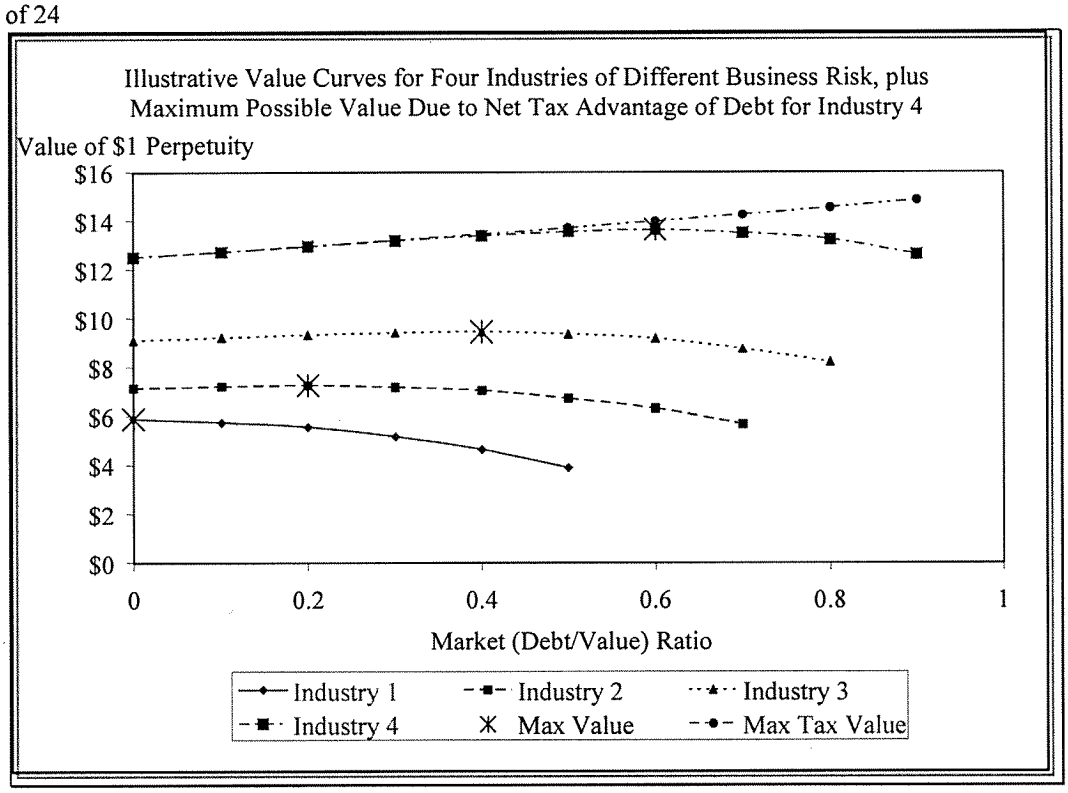

Figure B-4

Figure B-4 identifies a particular point as the maximum value on each of the four curves. However, the research shows that reliable identification of this maximum point, except in the extreme case where no debt should be used, is impossible. In accord with the research, the graph is prepared so that in none of the industries does a change in capital structure make much difference near the top of the curve. Even Industry 4, which increases in value at the maximum rate as quite a lot of debt is added, eventually must reach a broad range where changes in the debt ratio make little difference to firm value, given the research. For Industry 4, debt makes less than a 2 percent difference in the total value of the firm for debt-to-value ratios between 40 and 70 percent. (While these particular values are illustrative, numbers of this order of magnitude are the only ones consistent with the research.)

Q27. What does this imply for the overall cost of capital?

A27. Figure B-5 plots the after-tax weighted-average costs of capital ("ATWACCs") that correspond to the value curves in Figure B-4. This picture just turns Figure B-4 upside

down.[26] All the same conclusions remain, except that they are stated in terms of the overall cost of capital instead of the overall firm value. In particular, except for high-risk industries, the overall cost of capital is essentially flat across a broad middle range of capital structures for each industry, which is the only outcome consistent with the research. For Industry 4, for example, the ATWACC changes by less than 15 basis points for debt-to-value ratios between 40 and 70 percent.

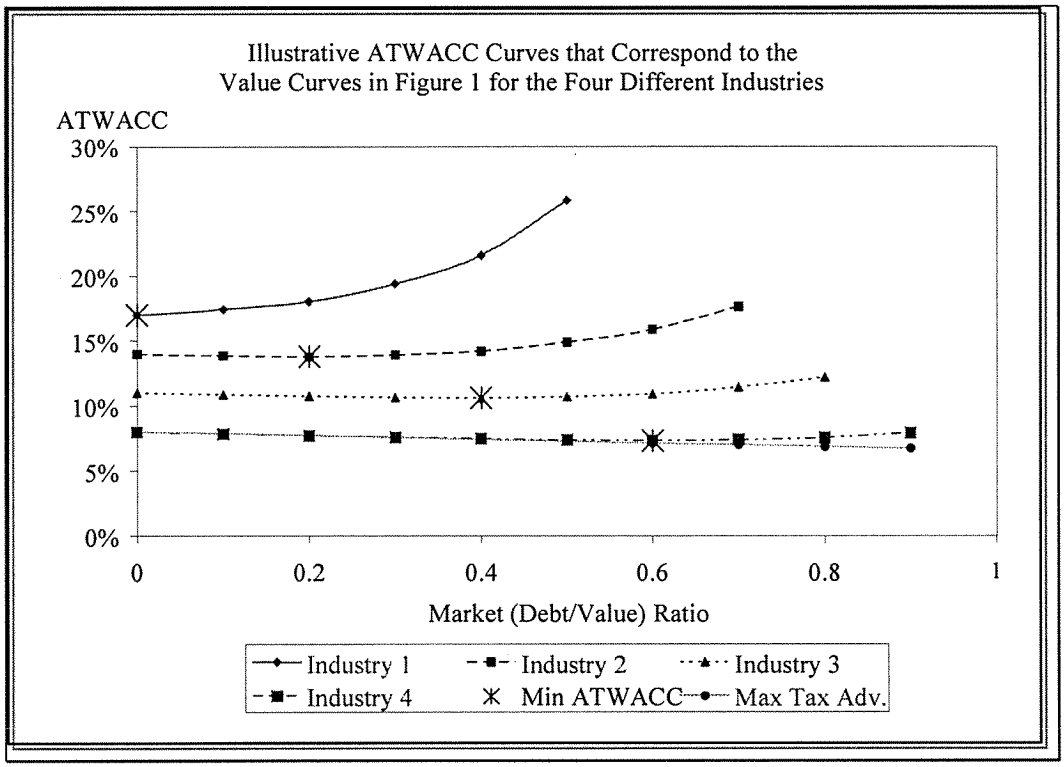

Figure B-5

Q28. How does this discussion relate to estimation of the right cost of equity for ratemaking purposes?

A28. When an analyst estimates the cost of equity for a sample of companies, s/he does so at the sample's actual market-value capital structure. That is, the sample evidence corresponds to ATWACCs that are already out somewhere in the broad middle range in

[26] Note that the actual estimated ATWACC at higher debt ratios will tend to underestimate the ATWACC that corresponds to the value curves in Figure B-4, which are depicted in Figure B-5, and so will tend to overestimate the value of debt to the firm. The reason is that some of the non-tax effects of excessive debt, such as a loss of financial flexibility, may be hard to detect and not show up in cost of capital measurement.

which changes in the debt ratio have little or no impact on the overall value of the firm or the ATWACC.

An analyst therefore should assume the ATWACCs for the sample companies are literally flat. This assumption always provides the exact tradeoff between the cost of equity and capital structure at the literal minimum of the company's ATWACC curve. The research shows that this minimum is actually a broad, flat region, as depicted above. If the company happens to be somewhat to one side or the other of the literal minimum within this region, the recommended procedure may lead to a small understatement or overstatement of the amount that the cost of equity will change as capital structure changes. The degree of this under- or overstatement, however, is very small compared to the inherent uncertainty in estimating the cost of equity in the first place. Otherwise, the financial research would have found very different results about the existence of a narrowly defined optimal capital structure.

D. COMBINED EFFECTS

Q29. Please summarize the implications for the combined impact of the tax and non-tax effects of debt.

A29. The most profitable firms do not behave as if the precise amount of debt they use makes any material difference to value, and competition does not force them into an alternative decision, as it would if debt were genuinely valuable. The explanation that fits the facts and the research is that within an industry, there is no well-defined optimal capital structure. Use of some debt does convey an advantage in most industries, but that advantage is offset by other costs as firms add more debt. The range of capital structures over which the value of the firm in any industry is maximized is wide and should be treated as flat. The location and level of that range, however, does vary from industry to industry, just as the overall cost of capital varies from industry to industry. To conclude that more debt does add more value, once the firm is somewhere in the normal range for the industry, is to conclude that corporate management in general is either blind to an

easy source of value or otherwise incompetent (and that their competitors let them get away with it).

The finding that there is no narrowly defined optimal capital structure implies that analysts should estimate the ATWACCs for a sample of companies in a given industry and treat the average ATWACC value as independent of capital structure (at least within a broad middle range of capital structures). The right cost of equity for a rate-regulated company in the same industry is the number that yields the same ATWACC at the capital structure used to set the revenue requirement, since that is the cost of equity that (estimation problems aside) the sample companies would have had if their market-value capital structures had been equal to the regulatory capital structure.

REBUTTAL TESTIMONY OF DR. MICHAEL J. VILBERT ON BEHALF OF CALIFORNIA-AMERICAN WATER COMPANY

Q1. Please state your name, address and position.

A1. My name is Michael J. Vilbert, and I am a Principal at The Brattle Group, 44 Brattle Street, Cambridge, MA 02138.

Q2. Please describe your job and your educational experience.

A2. I am a Principal of The Brattle Group, ("Brattle"), an economic, environmental and management consulting firm with offices in Cambridge, Washington, London, San Francisco and Brussels. My work concentrates on financial and regulatory economics. I

STEEFEL, LEVITT & WEISS
A PROFESSIONAL CORPORATION
ONE EMBARCADERO CENTER · 30TH FLOOR · SAN FRANCISCO, CA 94111-3719
Telephone: (415) 788-0900 · Facsimile: (415) 788-2019

hold a B.S. from the U.S. Air Force Academy and a Ph.D. in finance from the Wharton School of Business at the University of Pennsylvania.

Q3. Did you submit direct testimony in this proceeding?

A3. Yes. I submitted direct testimony ("Vilbert Direct") on October 19, 2007.

Q4. What is the purpose of your rebuttal testimony?

A4. I have been asked by California-American Water Company ("California American Water" or the "Company") to respond to the direct testimony of Ms. Terry L. Murray ("Murray Direct") on behalf of the Division of Ratepayer Advocates with regard to the effect of the introduction of a proposed Water Revenue Adjustment Mechanism ("WRAM") on the required rate of return on equity for a regulated water utility company.

Q5. What is the Murray Direct's opinion in this regard?

A5. The Murray Direct recommends a 50-100 basis points reduction in the allowed return on equity ("ROE"),[1] and proposes a method by which the Commission could estimate an ROE adjustment using a forecast of the reduction in accounting earnings variability induced by the WRAM. More precisely, the Murray Direct recommends that the portion of the ROE in excess of the rate of return on 30-year Treasury bonds be reduced by a fraction equal to the forecast fractional reduction in the Company's earnings volatility, adjusted for seasonality.[2]

[1] Murray Direct, p. 20.

[2] Murray Direct, p. 15.

Q6. Do you believe that the Murray Direct recommendation is well-founded?

A6. No. The Murray Direct's recommendation relies on two assumptions: 1) that a WRAM reduces accounting earnings variability, and 2) that lower accounting earnings variability translates one-for-one into lower systematic risk for the company, and thus into a lower expected return on equity. The Murray Direct justifies the latter assumption by reference to two academic articles.[3] However, as I will explain below, neither of these articles actually provides support for this assumption.

Q7. Does the article by Beaver et al. (1970) provide support for the methodology recommended by Murray Direct?

A7. No. It is important to note the context of the Beaver et al. article. The article notes that many companies do not have traded stock and therefore cannot rely upon market information to estimate the company's beta, its measure of systematic risk, but these companies have a need for a reliable measure of systematic risk in order to make decisions for capital budgeting. As a substitute for market information, the Beaver et al. article hopes to use accounting information to develop a measure of the systematic risk of a firm that does not have traded stock.

To develop this forecast of the systematic risk, the Beaver et al. article starts from the assumption that the systematic risk of the security (its beta) does not change over time.[4] The purpose of their inquiry is to develop a good forecast of the future beta based on currently known variables, and they show that relying on several accounting measures, including the variability of earnings, outperforms the forecast based on the market beta

estimated from historical stock return data. It is also important to stress that the goal in their paper is forecasting, not establishing a causal link between accounting variables and systematic risk. As such, all that is required for a good forecast is correlation between accounting variables and systematic risk. This is a crucial distinction, because in the absence of causality, it does not follow that a change in any of the accounting variables correlated with systematic risk translates into a change in systematic risk. In other words, unless it can be established that systematic risk is *caused* by earnings variability and other accounting variables under consideration, it cannot be established how the systematic risk would be affected by a change in earnings variability, if at all.

Q8. Please elaborate on the distinction between correlation and causation.

A8. When two events are correlated, it means that they tend to occur together. When two variables are positively (negatively) correlated it means that when one variable increases, the other variable will also tend to increase if positively correlated or decrease if negatively correlated. Causation is when one event causes another event to occur. For example, water boils when sufficient heat has been applied. The water is caused to boil by heating it. On the other hand, in the past it was noted that the performance of the U.S. stock market was correlated with the length of women's skirts. The higher the skirt length, the higher the market would be in the future, but there was no causal relationship. In other words, shortening women's skirts would not cause the stock market to increase.

Q9. But surely variation in accounting earnings has a more fundamental relationship to the systematic risk of a company, doesn't it?

A9. Perhaps. Beaver et al. recognize that "the accounting risk measures reflect both the systematic and individualistic risk components."[5] In this context, the Murray Direct

methodology assumes that the WRAM reduces all risks by the same factor, whether they are systematic or diversifiable. If this were true, then the relationship between earnings variability and systematic risk would not change when earnings variability is changed, and one could rely on the estimated relationship between the two measures before the change to make predictions about the effects of the change. However, the Murray Direct does not show that this is likely to be the case, and offers no justification for this assumption. In other words as noted in the Vilbert Direct[6], the effect of the WRAM could be to reduce the variability in earnings that is related to diversifiable risk which would have no effect on the systematic risk of the company. It would therefore not warrant a reduction in the allowed return on equity for the company.

Q10. But Murray Direct points to a theoretical study that "provides a rigorous justification for the use of accounting variables as empirical proxies for market betas."[7]

A10. The article by John et al. (1994) referenced by Murray Direct does not support the use of earnings volatility as a proxy for systematic risk. As stated in their article "This paper derives one set of sufficient conditions so that the market beta can be replaced by an accounting beta."[8] An accounting beta is a quantity computed analogously to the market beta, except it is based on earnings rather than stock returns. It is a measure proportional to the covariance between a firm's earnings and the earnings of the market portfolio. Notice that the relevant quantity is the covariance of earnings with market earnings, not the variance of earnings. Recall that beta is a measure of the covariance of a company's stock returns with the market scaled by the variance of the market returns. The John et al. article does not provide support for the use of the variance of earnings as a proxy for a

stock's market beta. At best, it can be interpreted as supporting a measure of systematic risk based on the covariance of earnings with market earnings, but that is not the quantity suggested by Murray Direct.

Q11. If one were to nonetheless use the relationship between accounting variables and systematic risk advocated by Beaver et al. to predict the effect on beta of changing the firm's earnings volatility, would this imply a one-for-one change in beta, as suggested by Murray Direct?

A11. No. The Beaver et al. article uses three accounting variables to forecast the systematic risk: earnings variability, payout ratio, and average asset growth.[9] The Murray Direct argues that the WRAM would cause a reduction in earnings variability, but makes no statement about the other two variables. However, because the beta estimate developed by Beaver et al. is a linear combination of these three accounting variables and a constant term, a particular percentage change in one of them will not, in general, translate in an equal percentage change in beta. An appropriate implementation of their methodology would involve forecasting the effect of the WRAM on all accounting variables used in the prediction, and then using the estimated linear relationship between these variables and beta to compute the implied change in beta. However, this approach would then rely on the assumption that the structural relationship between earnings variability and the other accounting variables, and beta, remains unchanged after the introduction of the WRAM.[10] This is something that Murray Direct makes no attempt to justify, and is not supported by any of the studies relied upon by the Murray Direct.

[9] Beaver et al., p. 672.

[10] By structural relationship I mean the magnitude of the estimated coefficients that define the linear relation between the accounting variables and beta, such as those given in Table 6 of Beaver et al. While earnings and systematic risk could still be correlated after the introduction of the WRAM, there is no basis on which to assume that the magnitude of the correlation would not change. This is why the article's assumption that the stock's beta does not change over time is important to their results, and why their method cannot be used in the context of the introduction of the WRAM.

Q12. Is the methodology developed by the Beaver et al. article relied on to estimate systematic risk today?

A12. No, I am not aware that it is. Both academics and practitioners rely on stock returns to estimate systematic risk, not on the accounting variables suggested by Beaver et al. In this context, it is important to keep in mind that their results may not be able to be replicated using recent accounting data. The accounting information available for today's companies is vastly different than what was available in the 1950s and 1960s, when the data used by Beaver et al. was generated. Similarly, other available information (e.g., analysts reports and management's forecasts) have changed dramatically and research has shown that the amount and quality of non-accounting information impacts the relationship between market prices and accounting information.[11] Certain relations that may have held at that time could very well not hold today, which may explain why their method is not in widespread use today.

Q13. Please summarize your conclusions regarding the Murray Direct's proposed reduction in the allowed ROE from the adoption of a WRAM.

A13. The recommendation of the Murray Direct relies on the assumption that changes in a firm's earnings variability cause commensurate changes in its systematic risk. However, the article by Beaver et al. on which the Murray Direct primarily relies only establishes that earnings variability and systematic risk are correlated, not causally related. This is not a fault of the article – correlation is all that is needed to ensure an accurate prediction when the underlying structural model does not change. The Murray Direct however suggests using the model in an application for which it was not intended, namely inferring the effect on systematic risk from a change in one of the accounting variables in the model. The original article does not consider this situation. Moreover, the Murray Direct

[11] D. Shores, "The association between interim information and security returns around earnings announcements," Journal of Accounting Research 28, 1990, pp. 164-181.

does not provide an analysis of whether the Beaver et al. model would still apply under this change in assumptions. As a result, the Murray Direct's proposed adjustment to the allowed ROE for regulated water utilities lacks support from the articles on which it relies, and it should not be implemented without such support.

Q14. Does this conclude your rebuttal testimony at this time?

A14. Yes.

I. INTRODUCTION AND SUMMARY

Q1. Please state your name and address for the record.

A1. My name is Michael J. Vilbert. My business address is The Brattle Group, 44 Brattle Street, Cambridge, MA 02138, USA.

Q2. Please summarize your background and experience.

A2. I am a Principal of The Brattle Group, ("Brattle"), an economic, environmental and management consulting firm with offices in Cambridge, Washington, London, San Francisco and Brussels.

My work concentrates on financial and regulatory economics. I hold a B.S. from the U.S. Air Force Academy and a Ph.D. in finance from the Wharton School of Business at the University of Pennsylvania. Appendix A to this written evidence is a more complete description of my professional qualifications.

Q3. What is the purpose of your written evidence in this proceeding?

A3. Trans Québec & Maritimes Pipeline Inc. ("TQM") has asked Brattle (Dr. A. Lawrence Kolbe and me) to estimate the required return for TQM in three ways:

1) as the after-tax weighted-average cost of capital ("ATWACC") necessary to provide it a fair return on its assets;
2) as the deemed equity ratio necessary for a fair return on its assets at the National Energy Board's ("NEB" or the "Board") formula return on equity (based on the 2007 value of 8.46 percent and a 2008 value of 8.71 percent) determined by the NEB; and
3) as the rate of return necessary for a fair return on its assets at a 40 percent deemed equity thickness.

We derive these values based upon the market-determined overall cost of capital estimates from a selection of companies with business risk comparable to that of TQM's assets. Since companies with comparable business risk will have approximately the same overall cost of capital, these estimates provide an estimate of TQM's overall cost of capital. The market-determined costs of equity consistent with the samples' estimated overall cost of capital and with a 40 percent deemed equity thickness are then calculated. Similarly, we derive the equity thickness compatible with the samples' estimated overall cost of capital and the NEB's allowed ROE of 8.46 percent for 2007.[1]

My specific role is to estimate the overall cost of capital for the sample companies, as well as to compute the implied cost of equity and equity thickness for each sample estimate. I provide a range of estimates using both the risk positioning method (also called "equity risk premium" method) and the discounted cash flow ("DCF") estimation method. Dr. Kolbe then uses these estimates, in conjunction with evidence on the relative business risk of TQM, to provide both a recommended ROE at a 40 percent equity thickness and a recommended equity thickness at the 2007 formula ROE of 8.46 percent and at an estimate of the 2008 formula ROE of 8.71 percent.

Q4. Please summarize any parts of your background and experience that are particularly relevant to your written evidence on these matters.

A4. Brattle's specialties include financial economics, regulatory economics, and the gas and electric industries. I have worked in the areas of cost of capital, investment risk and related matters for many industries, regulated and unregulated alike, in many forums. I have testified on the cost of capital before the Alberta Energy and Utilities Board ("AEUB") on behalf of TransAlta Utilities in 1999 and on behalf of NOVA Transmission Ltd. in 2003, before the National Energy Board on behalf of TransCanada PipeLines

[1] Dr. Kolbe also estimates the deemed equity thickness that would be consistent with the expected NEB formula return on equity of about 8.71 percent for 2008.

Limited ("TransCanada") for the Mainline in 2002 and before the Newfoundland & Labrador Board of Commissioners of Public Utilities on behalf of Industrial Customers of Newfoundland and Labrador Hydro in 2001. I filed written evidence before the AEUB in 2000, and before the Ontario Energy Board in 2005. I have also testified before the U.S. Federal Energy Regulatory Commission ("FERC") and before several state regulatory commissions.

Q5. Please outline the steps in your analysis.

A5. To evaluate TQM's cost of capital, I analyze three samples: Canadian regulated utilities, U.S. gas local distribution companies ("Gas LDCs") and a sample of U.S. Master Limited Partnerships ("MLPs") that own and operate natural gas pipelines ("MLP Pipelines") throughout North America.

For each of the benchmark samples, I estimate the market-value capital structures and market costs of debt and preferred stock for the sample companies. These are then combined with cost of equity estimates for the companies using the equity risk positioning approach to compute each firm's overall cost of capital, i.e., its ATWACC. As a check on these results, I use the DCF method to estimate cost of equity for the Canadian Utilities and the Gas LDC samples. Regrettably, the DCF model is difficult to apply reliably to the MLP Pipelines sample due to complexities in the way that distribution growth is divided between the limited partners and the general partner as distributions grow.[2] Because of these concerns, I do not provide DCF estimates for the MLP Pipelines sample.

[2] The FERC has begun to address this issue in the United States as part of ROE deliberations for natural gas pipelines. It had originally raised concerns with the fact that distributions are often in excess of earnings, fearing that this might call into question the standard application of its DCF method to MLP companies. More recently, this concern has expanded to concerns over the correct estimation of the growth component of the DCF model applied to MLPs. The issue is yet to be resolved.

The result of this process is a sample average ATWACC for each benchmark group and each cost of equity estimation method. I report the cost of equity consistent with each sample's average estimated ATWACC as if the sample's average market-value capital structure had been one with a 40 percent equity ratio. This procedure results in a cost of equity that is consistent with the financial risk inherent in a 40 percent deemed equity ratio for TQM and the market-determined information on the sample's average overall average cost of capital. I also report the deemed equity percentage consistent with the NEB's formula ROE for 2007 and the sample average ATWACC.

Q6. Are the return on equity estimates from each of the samples the end of the analysis?

A6. No. The cost of capital and cost of equity capital estimates for the three samples are evaluated by Dr. Kolbe, who first considers TQM's business risk compared to the sample companies and then determines the recommended return on equity for TQM corresponding to the samples' cost of capital evidence at a deemed equity ratio for TQM. He also uses this information to compute the implied equity thickness consistent with TQM's cost of capital and the NEB's 2007 and estimated 2008 allowed formula ROEs.

Q7. Please summarize your findings about the benchmark samples' costs of capital.

A7. Consistent with a regulatory capital structure with 40 percent equity, the best point estimate of the cost of equity is 10½ percent for the Canadian Utilities sample, 10¾ percent for the MLP Pipelines sample and 12 percent for the Gas LDC sample. However the analysis results in a range of estimates for each sample, so I report a range for each sample of plus or minus ½ percentage point. The result is a range of 10 to 11 percent for the Canadian Utilities sample, 10¼ to 11¼ percent for the MLP Pipelines sample and 11½ to 12½ percent for the Gas LDC sample. Taken together this results in an overall range for the return on equity based on the results of all three samples of between 10 and

12½ percent.[3] Although the best point estimate for the MLP Pipelines sample is 10¾, this should be viewed as a lower bound of the estimate of the cost of equity for the sample because the MLP Pipeline's estimates are based solely on data from the limited partner shares, which constitute the MLP's only publicly traded equity.[4] The limited partners' equity is less risky than the general partner's equity and is therefore expected to have a lower cost of capital. As such, estimation based on the limited partner shares will generally underestimate the MLPs' costs of capital and provide an underestimate of TQM's cost of equity.

In terms of implied equity thickness and ATWACC, an equity ratio of 57½ percent for an ATWACC of just slightly less than 6½ percent is appropriate for the Canadian Utilities sample, and an equity ratio of 70 percent for an ATWACC of 7 percent for the Gas LDC sample is consistent with the NEB's currently allowed ROE of 8.46 percent. For the MLP Pipelines sample, the equity ratio is 60 percent for an ATWACC of slightly greater than 6½ percent. Taken together the range of equity thickness consistent with the NEB's allowed ROE of 8.46 percent and the sample evidence is 57½ percent to 70 percent.

For both the Canadian Utilities and the Gas LDC samples, I believe that the results of the DCF model are less reliable than those based upon the risk positioning model; however, the DCF model results serve as a check on the results from the equity risk positioning approach.

Q8. How is your written evidence organized?

---

[3] I specify the return on equity to the nearest ¼ percent because I do not believe that it is possible to estimate the cost of equity more precisely than that. All calculations supporting my analyses are presented in the attached tables labeled Table No. MJV-1 to Table No. MJV-28.

[4] There are exceptions to this as some MLPs have begun to market the GP shares to provide liquidity to the value of certain rights that the GP possesses. Of the MLPs that were suitable for inclusion in my sample, only Enterprise Product Partners currently trades its GP shares.

A8. *Section II* formally defines the cost of capital and touches on the principles relating to the cost of capital and capital structure for a business. Dr. Kolbe's written evidence provides additional detail on these points. *Section III* presents the methods used to estimate the cost of capital for the benchmark samples. *Section IV* provides the associated numerical analyses, and explains the basis of my conclusions for the benchmark samples' overall costs of capital and equity return consistent with the 40 percent deemed equity ratio for TQM. Appendices B through D support *Section III* and *Section IV* with additional details on the sample selection procedures, estimating the market value capital structures and cost of debt, the risk positioning method and the DCF approach including the details of the numerical analyses. *Section V* concludes.

II. COST OF CAPITAL THEORY

A. COST OF CAPITAL AND RISK

Q9. Please formally define the "cost of capital."

A9. The cost of capital can be defined as the expected rate of return in capital markets on alternative investments of equivalent risk. In other words, it is the rate of return investors require based on the risk-return alternatives available in competitive capital markets. The cost of capital is a type of opportunity cost: it represents the rate of return that investors could expect to earn elsewhere without bearing more risk. "Expected" is used in the statistical sense: the mean of the distribution of possible outcomes. The terms "expect" and "expected" in this written evidence, as in the definition of the cost of capital itself, refer to the probability-weighted average over all possible outcomes.

The definition of the cost of capital recognizes a tradeoff between risk and return that is known as the "security market risk-return line," or "security market line" for short. This line is depicted in Figure 1. The higher the risk, the higher the cost of capital. A

version of Figure 1 applies for all investments. However, for different types of securities, the location of the line may depend on corporate and personal tax rates.

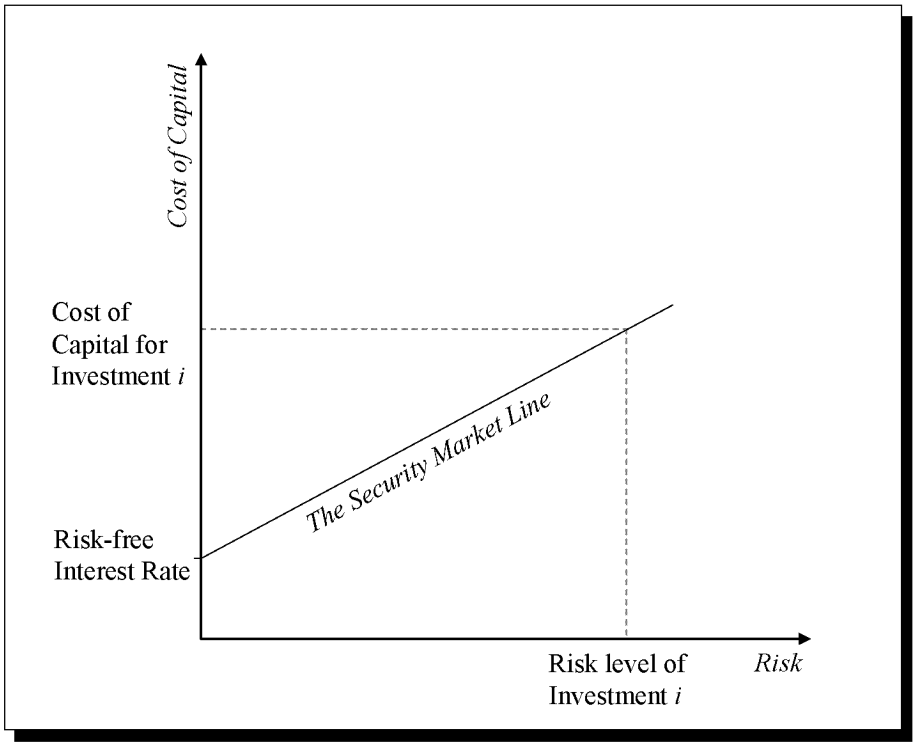

Figure 1: **The Security Market Line**

Q10. Why is the cost of capital relevant in rate regulation?

A10. It has become routine in rate regulation to accept the "cost of capital" as the right expected rate of return on utility investment.[5] That practice normally is viewed as consistent with the U.S. Supreme Court's opinions in Bluefield Waterworks & Improvement Co. v. Public Service Commission, 262 U.S. 678 (1923), and Federal Power

[5] To the best of my knowledge, the first paper formally to link the cost of capital as defined by financial economics with the correct expected rate of return for utilities is Stewart C. Myers, *Application of Finance Theory to Public Utility Rate Cases*, *The Bell Journal of Economics and Management Science*, 3:58-97 (Spring 1972).

Commission v. Hope Natural Gas, 320 U.S. 591 (1944). In Canada the comparable decision is Northwestern Utilities v. City of Edmonton [1929] S.C.R. 186.

From an economic perspective, rate levels that give investors a fair opportunity to earn the cost of capital are the lowest levels that compensate investors for the risks they bear. Over the long run, an expected return above the cost of capital makes customers overpay for service. Regulators normally try to prevent such outcomes, unless there are offsetting benefits to customers (e.g., from incentive regulation that reduces future costs). At the same time, an expected return below the cost of capital shortchanges investors. In the long run, such a return denies the company the ability to attract capital, to maintain its financial integrity, and to expect a return commensurate with that on other enterprises attended by corresponding risks and uncertainties.

More important for customers, however, are the economic issues an inadequate return raises for them. In the short run, deviations of the expected rate of return on the rate base from the cost of capital create a "zero-sum game"-- investors gain if customers are overcharged, and customers gain if investors are shortchanged. In the long run, however, inadequate returns are likely to cost customers -- and society generally -- far more than is gained in the short run. Inadequate returns lead to inadequate investment, whether for maintenance or for new plant and equipment. The costs of an undercapitalized industry can be far greater than the gains from short-run shortfalls from the cost of capital. Moreover, in capital-intensive industries, (such as gas transmission, storage and distribution), systems that take a long time to decay cannot be fixed overnight, either. Thus, it is in the customers' interest not only to make sure the return investors expect does not exceed the cost of capital, but also to make sure that it does not fall short of the cost of capital, either.

Of course, the cost of capital cannot be estimated with perfect certainty, and other aspects of the way the revenue requirement is set may mean investors expect to earn more or less than the cost of capital even if the allowed rate of return equals the cost of capital

exactly. However, a regulator that on average sets rates so investors expect to earn the cost of capital treats both customers and investors fairly, and acts in the long-run interests of both groups.

B. RELATIONSHIP BETWEEN CAPITAL STRUCTURE AND THE COST OF EQUITY

Q11. Please explain why it is necessary to report the return on equity estimated from the samples adjusted for the deemed equity ratio of TQM.

A11. Dr. Kolbe's written evidence covers this topic in detail. Briefly, the cost of equity and the capital structure are inextricably entwined in that the use of debt increases the financial risk of the company and therefore increases the cost of equity. The more debt, the higher the cost of equity for a given level of business risk. Rate regulation normally focuses on the components of the cost of capital, and in particular, on what the "right" cost of equity capital and capital structure should be. The cost of capital depends primarily on the business the firm is in, while the costs of the debt and equity components depend not only on the business risk but also on the distribution of revenues between debt and equity. The cost of capital is thus the more basic concept. Although the cost of capital is constant (ignoring taxes and costs of excessive debt), the distribution of the costs among debt and equity is not. Reporting the average cost of equity estimates from the samples without consideration of the differences in financial risk may result in material errors in the allowed return for TQM. Section III and Appendix B of Dr. Kolbe's evidence set out the principles and procedures on which I rely to calculate the cost of equity consistent with the samples' estimated ATWACC and a 40 percent deemed equity thickness or with the NEB's formula allowed ROE.

C. IMPLICATIONS FOR ANALYSIS

Q12. Please explain how you determine the return on equity for TQM that is consistent with the market evidence on the sample companies' cost of capital.

A12. Traditional approaches often involve estimating the cost of equity for each of the sample firms without explicit consideration of the market-value capital structure underlying those costs. Then, relying on the sample's average cost of equity, one estimates the cost of equity for the company in question. Note that the traditional method often makes no direct connection between differences in the capital structures of the sample firms used to estimate the cost of equity and the regulatory capital structure used to set rates. Consequently, the sample's estimated return on equity does not necessarily correspond to the financial risk faced by investors in the regulated assets. If the sample's estimated cost of equity were adopted without consideration of differences in financial risk, it could lead to an unfair rate of return.

I avoid this problem by calculating each sample company's overall after-tax weighted-average cost of capital using its market value capital structure. Using the sample's average cost of capital, I then determine the return on equity that maintains the sample's estimated average ATWACC at a 40 percent deemed equity ratio. In other words, if I know the cost of debt and TQM's regulatory capital structure, I can calculate the return on equity that results in an ATWACC equal to the sample's average ATWACC. This procedure ensures that the recommended cost of equity is consistent with information from the capital markets on the samples' overall cost of capital and TQM's deemed equity ratio. Similarly, the implied equity thickness given the NEB's formula allowed ROE can also be determined so as to result in an ATWACC equal to the sample's average ATWACC.

Q13. Can you provide a simple example of the calculation of the return on equity consistent with the market-determined estimate of the sample's average cost of capital?

A13. Yes. Consider the following equation:[6]

$$ATWACC = r_D \times (1 - T_C) \times \%D + r_E \times \%E \quad \textbf{(1)}$$

where r_D = market cost of debt,
r_E = market cost of equity,
T_C = corporate income tax rate,
%D = percent debt in the capital structure, and
%E = percent equity in the capital structure.

The return on equity consistent with the sample's cost of capital estimate (the ATWACC), the market cost of debt, the corporate income tax rate and the amount of debt and equity in the capital structure can be determined by solving equation (1) for r_E. Alternatively, if r_E is given and the capital structure is not, one can solve for %E instead.

III. COST OF CAPITAL METHODOLOGY

Q14. How is this section of your testimony organized?

A14. As noted in Section II, I estimate the cost of capital using samples of Canadian regulated utilities, gas distribution companies in the U.S., and companies organized as MLPs that own pipeline assets. This section first outlines the steps involved in selecting these benchmark samples, in determining the market-value capital structure, and in estimating the sample companies' costs of debt. It then turns to the procedures for estimating the costs of equity and describes the two cost of equity estimation methodologies used in this testimony, the Risk Positioning method and DCF approach. These are the foundations

[6] Note that this equation assumes that only debt and equity are in the market value capital structure, but it is straightforward to add preferred equity to the equation.

of my cost of capital calculations, which I present in the following section and which I use to derive my cost of equity and equity thickness estimates from the samples at a deemed equity thickness of 40 percent or for an allowed return of 8.46 percent.

A. SAMPLE SELECTION

Q15. What is the goal of your sample selection procedures?

A15. The cost of capital for a part of a company engaged in different lines of business depends on the risk of the business in which the part is engaged, not on the overall risk of the parent company. According to financial theory, the overall risk of a diversified company equals the market-value-weighted average of the risks of its components.

Estimating the fair total return for TQM's regulated gas transmission assets is the subject of this proceeding. The ideal sample for TQM would be composed of publicly traded pure plays in the regulated natural gas transmission business.[7] Publicly traded firms, firms whose shares are freely traded on stock exchanges, are ideal because the best way to infer the cost of capital is to examine evidence from capital markets on companies in the given line of business.

Unfortunately, the available sample of publicly traded, regulated pure play natural gas transmission companies in Canada is too small to form an ideal sample. However, there is an emerging sample whose assets consist almost exclusively of pipelines. The MLP Pipelines sample is still relatively small, but there are a number of new MLPs that will be available for inclusion in the sample as they become seasoned and their data become available. These are U.S. companies, but some of the MLPs are as close to a pure play in the natural gas transmission line of business as has been available for many years.

[7] "Pure-play" is an investment term referring to companies with operations only in one line of business.

I form benchmark samples to estimate the cost of capital for TQM's assets from the universe of all Canadian Utilities with regulated assets, the universe of Gas LDCs in the industry as classified by the *Value Line Investment Survey Plus Edition*,[8] and the universe of MLP Pipelines listed by Bloomberg and the publicly traded partnerships website (http://naptp.org). I then apply my standard selection procedures to ensure that reliable estimates and a sufficiently large sample are obtained. I require data from S&P or Moody's, *Value Line*, and Bloomberg be available for all sample companies. Moreover, the companies must own some regulated assets, must not exhibit any signs of financial distress, and must not be involved in any substantial merger and acquisition activities that could bias the estimation process. In general, this requires that companies have an investment grade credit rating, a high percentage of regulated assets, no significant merger activity in recent years, and no recent dividend cuts or other activity that could cause the growth rates or beta estimates to be biased. Additional details of the sample selection process can be found in Section IV.B below and in Appendix B.

B. CAPITAL STRUCTURE & THE COST OF DEBT

1. Market-Value Capital Structures

Q16. What capital structure information do you require?

A16. For reasons discussed in Dr. Kolbe's written evidence and explained in detail in his Appendix B, explicit evaluation of the market-value capital structures of the sample companies is vital for a correct interpretation of the market evidence on the return on

[8] An exception is Vectren, a highly regulated company that has more regulated gas assets than electric assets, but which is classified by *Value Line* as an electric company. I include it in the Gas LDC sample, a practice also followed by Bloomberg.

equity. This requires estimates of the market values of common equity, preferred equity and debt, and the current market costs of preferred equity and debt.

Q17. Do you use the same approach to estimate the market value capital structures for each of the samples?

A17. I follow the same principles for all samples. However, due to data issues, the implementation of these principles requires a slight adjustment in the case of the MLP Pipelines sample. Details concerning this calculation for each sample can be found in Appendix B.

a) The Canadian Utilities and the Gas LDC Samples

Q18. Briefly describe how you calculate the market values of common equity, preferred equity and debt for the Canadian Utilities and the Gas LDC samples.

A18. I determine the capital structure for each company by estimating the market values of common equity, preferred equity and debt from the most recent publicly available data.

Briefly, the market value of common equity is calculated as the price per share times the number of shares outstanding. For my risk positioning estimates, I estimate each company's average market value of equity over the most recent five year period. The idea is to optimally match the estimated "betas", which are computed over this five year period, to the degree of financial risk present during their estimation. This addresses one of the Board's concerns with my evidence in the RH-2-2004, Phase II proceeding. Specifically, the Board was concerned that the period used to estimate beta was not the same as the period used to determine the market value capital structure.[9] I compute year-end capital structures for each year between 2002 and the second quarter of 2007, using

[9] See p.55, Reasons for Decision, TransCanada PipeLines Limited., RH-2-2004, Phase II, April 2005. For the Canadian and the MLP Pipelines samples, betas are provided by Bloomberg and computed over a five year period where possible, as detailed in Appendix C. For the Gas LDC sample, betas are provided by *Value Line* (and unadjusted) which also uses five years of historical data to estimate its forecasted betas.

company reported shares outstanding at year end and an average price over the last fifteen trading days of each year.[10] For the current year, information on shares outstanding comes from each company's most recent 10-Q. The year-end capital structures are then weighted as detailed in Appendix B to arrive at an estimate of the five year average capital structure for each company.

Since the DCF estimates utilize current prices and forward-looking growth rates, I only estimate the current market value of equity, again using data from each company's most recent 10-Q on shares outstanding.[11] Specifically, I use the average stock price over 15 trading days ending on the day I obtain the Bloomberg BEst[12] growth rates used in the DCF analysis.[13]

The market value of long-term debt for the companies in the samples is based upon the "Estimated Fair (market) Value" of long-term debt as reported in the companies' 10-Ks (U.S. sample) or annual reports (Canadian Utilities sample). The book value of long-term debt from Bloomberg[14] is "adjusted" by adding the difference between the

---

[10] The data on shares outstanding for each company is obtained from their 10-K for each corresponding year.

[11] I combine the most recent information on outstanding shares from each company's 10-Q with the average stock price over the 15 trading days ending on the day that the earnings growth rate forecasts are obtained from Bloomberg. In this instance, forecasts were obtained on August 28, 2007 for all companies in the Canadian Utilities and Gas LDC samples.

[12] Bloomberg's BEst is a system that gathers and compiles estimates made by stock analysts on the future earnings for the majority of U.S. publicly traded companies. Growth forecasts for the Canadian Utilities companies are also from Bloomberg which sources Thompson Research.

[13] August 28, 2007 for both the Canadian Utilities sample and for the Gas LDC sample. The Gas LDC sample estimates also make use of the most recent *Value Line* sheets to derive implied growth estimates for each company, and these are dated June 15, 2007 for all companies except Vectren Corp., which is dated June 29, 2007. As a minor simplification, it is assumed that these forecasts can be considered *Value Line's* forecasts as of the August 28, 2007 date as well. Thus, capital structures can all be set as of one common date.

[14] The book value of debt from Bloomberg includes all interest-bearing financial obligations that are not current and includes capitalized leases and mandatory redeemable preferred and trust preferred securities in accordance with FASB 150 effective June 2003. See Bloomberg definition of long-term debt for

estimated fair value and the carrying value of long-term debt from the company's 10-K or annual report. The market value of preferred stock for the samples is set equal to its book value because the market values and book values do not vary much and because the percent of preferred stock in the capital structures is relatively small compared to the debt and common equity components.

b) The MLP Pipelines Sample

Q19. What is different in your estimation of the market value capital structures for the MLP Pipeline sample companies?

A19. The MLP companies have different types of equity, not all of which is publicly traded. Specifically, a MLP's equity is divided between the limited partner ("LP") shares and the general partner's ("GP") shares. In some instances, additional classes of LP units are also issued with different rights. As a general rule, however, only one class of the LP shares is publicly traded. Thus no price data are available for the non-traded LP units nor, more importantly, for the GP's equity share. The market value of the traded LP units can be estimated as described earlier, but the lack of price data for the non-traded LP units and for the GP's equity share makes it impossible to directly estimate the total market value of equity for the MLP companies. This is particularly problematic for determining the value of the GP's equity, since in all of the MLPs, the GP is granted "Incentive Distribution Rights" (or "IDRs"), which give the GP an increasing share of the MLPs total cash distributions as these distributions grow to different "tiers". Although the GP supplies only two percent of the book value of equity at inception, the market value of this equity increases more than the LP shares because the GP receives an increasing portion of the partnership's cash flow.[15]

---

additional detail.

[15] The value of the GP share relative to the value of the LP shares can be seen in the one MLP in my sample whose GP shares are now traded, Enterprise Product Partners. Using its price data, I have estimated the market value of the GP equity to be currently about 27 percent of total market value - far from the two percent it commands in book value.

I estimate the MLP's market value of equity by assuming that the GP's equity has a market value in the same proportion as the share of total cash distributions it currently commands. That is, if the GP is currently receiving 25 percent of the MLP's total cash distribution, then an estimate of the total market value of equity is obtained as:[16]

$$0.75 \times \text{Total LP Equity Value} = \$100$$

$$\text{Total Equity Value} = \frac{\$100}{0.75}$$

$$= \$133.33$$

In a discounted cash flow framework, this valuation would be almost exactly correct if the division of cash distributions were going to be fixed forever at this proportion.[17] As noted before, however, the IDR structure provides for the GP's proportion of total cash flow to *increase* as distributions grow. Depending on the specific IDR structure in place, this will generally result in the GP's proportion growing towards 50 percent of total cash flow, albeit at an ever declining growth rate as distributions increase. Since the GP is expected to receive a greater share of growth into the future, the current distribution sharing will still underestimate the market value of the GP's equity.

To approximate the value of the non-traded LP units, I assume a unit value equal to the price of their traded counterpart. These classes of units generally provide for the same distribution as given to the traded LP units, although in some cases rights are subordinated but have additional conversion provisions.

Q20. In light of these issues, how do you estimate the market value of equity for the MLP Pipelines sample?

---

[16] This example ignores the non-traded LP units for simplicity.

[17] I say almost exactly correct because the GP has additional control rights, which would likely lead to greater value as well as some additional risk which would reduce value.

A20. As with the Canadian Utilities and the Gas LDC sample, my estimates require an average capital structure over the period used in estimating the risk positioning parameters. For most of the MLPs in my sample, this is the span between 2002 and the second quarter of 2007.[18] I estimate the GP share as discussed above.

Q21. Are there any issues in calculating the market value of debt for the MLP Pipelines sample companies?

A21. Yes. Some MLPs, notably TC Pipeline Partners and Oneok Partners, do not consolidate their share of debt used to finance some of their income generating assets. Instead they use the equity method of accounting to account for these assets. I estimate these missing debt shares using data from annual reports (see Workpaper #3 to Table No. MJV-24). The MLPs additionally do not report any fair market value adjustments to debt in their annual reports. I therefore estimate a fair market value of debt adjustment based on the adjustments reported by companies in the Gas LDC sample. Specifically, I compute the average fair value-to-book value ratio of debt in the Gas LDC sample for each of the years 2002 through 2007 (see Workpaper #1 to Table No. MJV-24). These ratios represent adjustment factors which are then used to adjust the book value of debt in each year for each of the MLP companies. For example, if in 2002 the market values of debt in the Gas LDC sample were, on average, 1.09 times book value, I would multiply each of the MLPs 2002 book value of debt by 1.09 to obtain an estimate of its market value.

2. Market Costs of Debt and Preferred Equity

Q22. How do you estimate the current market cost of debt?

[18] Boardwalk Pipeline Partners is an exception, since it only has data available going back to 2005.

A22. For all three samples, the market cost of debt for each company used in the analysis is the current yield on an index of utility bonds corresponding to the company's current debt rating for the DCF models or the average debt rating over the beta estimation period for the risk positioning models. The sample companies' bond ratings are reported by Bloomberg.

Note that for the firms in the Gas LDC sample and the MLP Pipelines sample, the bond rating reported by Bloomberg for each company is used with the estimated current yield data on Canadian bonds of an equivalent rating. Calculation of the after-tax cost of debt uses TQM's estimated marginal income tax rate of 31.9 percent.

Q23. How do you estimate the market cost of preferred equity?

A23. The cost of preferred equity is set equal to the cost of debt on Canadian Utilities bonds of a comparable rating. There is to my knowledge no public source for yields on preferred equity delineated by credit rating in Canada. The cost of preferred equity is likely to be somewhat higher than the after-tax cost of debt but lower than the pre-tax cost of debt, but because the amount of preferred equity in the capital structures of the Canadian Utilities sample companies average about three percent and less than one percent for the Gas LDC companies, this approximation will have a minimal impact on the overall results.[19]

C. COST OF EQUITY ESTIMATION

Q24. How do you estimate the cost of equity for your sample companies?

[19] TQM has no preferred securities in its proposed regulatory capital structure.

A24. Recall the definition of the cost of capital from the outset of my testimony: *the expected rate of return in capital markets on alternative investments of equivalent risk*. My cost of capital estimation procedures address three key points implied by the definition:

1. Since the cost of capital is an expected rate of return, it cannot be directly observed; it must be inferred from available evidence.
2. Since the cost of capital is determined in capital markets (e.g., the New York Stock Exchange), data from capital markets provide the best evidence from which to infer it.
3. Since the cost of capital depends on the return offered by alternative investments of equivalent risk, measures of the risks that matter in capital markets are part of the evidence that needs to be examined.

Q25. How does the above definition help in cost of capital estimation?

A25. The definition of the cost of capital recognizes a tradeoff between risk and expected return – the security market line – plotted earlier in Figure 1. Cost of capital estimation methods take one of two approaches: (1) they try to identify a comparable-risk sample of companies and to estimate the cost of capital directly; or (2) they establish the location of the security market line and estimate the relative risk of the security, which jointly determine the cost of capital. In terms of Figure 1, the first approach focuses directly on the vertical axis, while the second focuses both on the security's position on the horizontal axis and on the position of the security market line.

The first type of approach is more direct, but ignores the wealth of information available on securities not thought to be of precisely comparable risk. The "discounted cash flow" or "DCF" model is an example. The second type of approach requires an extra step, but as a result can make use of information on all securities, not just a very limited subset. The Capital Asset Pricing Model ("CAPM") is an example. While both approaches can work equally well if conditions are right, one may be preferable to the

other under other circumstances. In particular, approaches that rely on the entire security market line are less sensitive to deviations from the assumptions that underlie the model, all else equal. I examine both DCF and risk positioning approach evidence for the samples.

1. The Risk Positioning Approach

Q26. Please explain the risk positioning method.

A26. The risk positioning method estimates the cost of equity as the sum of a current interest rate and a company specific risk premium. It is therefore sometimes also known as the equity "risk premium" approach. This approach may sometimes be applied informally. For example, an analyst or regulator may check the spread between interest rates and what is believed to be a reasonable estimate of the cost of capital at one time, and then apply that spread to changed interest rates to get a new estimate of the cost of capital at another time.

More formal applications of the risk positioning approach take full advantage of the security market line depicted in Figure 1 – they use information on all securities to identify the security market line and derive the cost of capital for the individual security based on that security's relative risk. This reliance on the entire security market line makes the method less vulnerable to the kinds of problems that arise for the DCF method, which relies on one stock at a time. The risk positioning approach is widely used and underlies most of the current research published in academic journals on the nature, determinants and magnitude of the cost of capital.

Q27. How are the "more formal" applications of risk positioning approach implemented?

A27. The first step is to specify the current values of the benchmarks that determine the security market line. The second is to determine the security's or investment's relative

risk. The third is to specify exactly how the benchmarks combine to produce the security market line, so the company's cost of capital can be calculated based on its relative risk. All of these elements and how they relate are usefully formulated in the framework of the CAPM.

a) The Capital Asset Pricing Model

Q28. Please start with the CAPM, by describing the model.

A28. As noted above, modern models of capital market equilibrium express the cost of equity as the sum of a risk-free rate and a market risk premium. The CAPM is the longest-standing and most widely used of these theories. The CAPM states that the cost of capital for an investment, *s*, (e.g., a particular common stock) is given by the following equation:

$$r_S = r_f + \beta_S \times MRP \qquad (2)$$

where r_s is the cost of capital for investment S; r_f is the risk-free rate, β_S is the beta risk measure for the investment S; and MRP is the market risk premium.

The CAPM relies on the empirical fact that investors price risky securities to offer a higher expected rate of return than safe securities do. It says that the security market line starts at the risk-free interest rate (that is the return on a zero-risk security, the y-axis intercept in Figure 1, equals the risk-free interest rate). Further, it says that the risk premium of a security over the risk-free rate equals the product of the beta of that security and the risk premium on a value-weighted portfolio of all investments, which by definition has average risk.

The Risk-free Interest Rate

Q29. What interest rates do your procedures require?

A29. Modern capital market theories of risk and return use the short-term risk-free rate of return as the starting benchmark, but regulatory bodies frequently use a version of the risk positioning model that is based upon the long-term risk-free rate. In this proceeding, I rely upon the long-term version of the risk positioning model. Accordingly, the implementation of my procedures requires use of a forecast of the long-term Canadian Government bond rate. I obtain this information from *Consensus Forecasts*.[20]

The Market Risk Premium

Q30. Why is a risk premium necessary?

A30. Experience (e.g., the U.S. market's October Crash of 1987) demonstrates that shareholders, even well diversified shareholders, are exposed to enormous risks. By investing in stocks instead of risk-free Government Treasury bills, investors subject themselves not only to the risk of earning a return well below those they expected in any year but also to the risk that they might lose much of their initial capital. This is why investors demand a risk premium.

In regulatory proceedings, two versions of the CAPM are often reported. The first version measures the market risk premium as the risk premium of average risk common stocks over short-term Treasury bills, which is the usual measure of the "market risk premium" used in capital market theories. The second version measures the risk premium relative to a long-term risk-free rate. To determine the cost of capital in a regulatory proceeding, the MRP should be used with a forecast of the same interest rate used to calculate the MRP (i.e., the short-term Treasury bill rate or the long-term Government rate). In this proceeding, I report results only for the version of the risk positioning model

[20] Every month, *Consensus Forecasts* surveys over 240 financial and economic analysts for their forecasts of a range of variables including inflation, economic growth, interest rates and exchange rates for more than 20 countries.

that relies upon the long-term risk-free rate as is standard in Canadian regulatory proceedings.

Q31. Hasn't the estimate of the MRP been controversial over the recent past?

A31. Yes. Historically, it was generally accepted that the appropriate method to estimate the MRP was to consider the historical average realized return on the market minus the return on a risk-free asset over as long a series of time as possible; however, this procedure came under attack during the period of time generally referred to as the "tech bubble" when the stock markets in the U.S. and Canada reached very high valuation levels relative to traditional metrics of value. The period of the tech bubble also resulted in the average realized return on the market increasing to a very high level. Attempts to explain the high stock market valuation levels centered on the hypothesis that the MRP must be dramatically lower than previously believed, but this hypothesis conflicted with the fact that realized returns over the period were very high. The result was an academic debate on the level of the forward-looking MRP and how best to estimate, a debate that has still not been fully resolved. A discussion of this debate is provided in Appendix C.

Q32. What is your conclusion regarding the MRP?

A32. Much of the controversy over market risk premium has centered on various reasons that the market risk premium may not be as high as frequently estimated in the past. Although none of the arguments are completely persuasive in and of themselves, I generally give some weight to these issues, and did so more conservatively in 2003 in my previous evidence before the NEB in RH-2-2004, Phase II. Specifically, I reduced my 1999 estimate of the Canadian market risk premium from 6.0 percent to 5.5 percent for that proceeding. I further reduced my estimate by 25 basis points for my evidence before the Ontario Energy Board in 2006. However, considering all the evidence including a recent

working paper on the worldwide equity premium[21] and current information on the historical MRP, I conclude that S&P/TSX stocks of average risk today command a premium of about 5.75 percent over the long-term government bond yield. I believe that this results in an estimate of the MRP that is fully consistent with the historical evidence in Canada and the latest academic evidence.

Beta

Q33. Please explain beta in more detail.

A33. The basic idea behind beta is that risks that cannot be diversified away in large portfolios matter more than those that can be eliminated by diversification. Beta is a measure of the risks that cannot be eliminated by diversification. That is, it measures the "systematic" risk of a stock — the extent to which a stock's value fluctuates more or less than average when the market fluctuates.

Diversification is a vital concept in the study of risk and return. (Harry Markowitz won a Nobel Prize for work showing just how important it was.) Over the long run, the rate of return on the stock market has a very high standard deviation, on the order of 15-20 percent per year.[22] But many individual stocks have much higher standard deviations than this. The stock market's standard deviation is "only" about 15-20 percent because when stocks are combined into portfolios, some of the risk of individual stocks is eliminated by diversification. Some stocks go up when others go down, and the average portfolio return — positive or negative — is usually less extreme than that of individual stocks within it.

---

[21] "The Worldwide Equity Premium: A Smaller Puzzle," Elroy Dimson, Paul Marsh, and Mike Staunton, London Business School Working Paper, Revised 7 April 2006.

[22] See Brealey, Myers and Allen, *Principles of Corporate Finance, 8th Edition*, McGraw-Hill Irwin, New York, p. 158.

In the limiting case, if the returns on individual stocks were completely uncorrelated with one another, the formation of a large portfolio of such stocks would eliminate risk entirely. That is, the market's long-run standard deviation would be not 15-20 percent per year, but virtually zero.

The fact that the market's actual annual standard deviation is so large means that, in practice, the returns on stocks are correlated with one another, and to a material degree. The reason is that many factors that make a particular stock go up or down also affect other stocks. Examples include the state of the economy, the balance of trade, and inflation. Thus some risk is "non-diversifiable". Single-factor equity risk premium models are based upon the assumption that all of the factors that affect stock returns can be considered simultaneously, through their impact on one factor, the market portfolio. Other models derive somewhat less restrictive conditions under which several factors might be individually relevant.

Again, the basic idea behind all of these models is that risks that cannot be diversified away in large portfolios matter more than those that can be eliminated by diversification, because there are a large number of large portfolios whose managers actively seek the best risk-reward tradeoffs available. Of course, undiversified investors would like to get a premium for bearing diversifiable risk, but they cannot.

Q34. Why not?

A34. Well-diversified investors compete away any premium rates of return for diversifiable risk. Suppose a stock were priced especially low because it had especially high diversifiable risk. Then it would seem to be a bargain to well diversified investors. For example, suppose an industry is subject to active competition, so there is a large risk of loss of market share. Investors who held a portfolio of all companies in the industry would be immune to this risk, because the loss on one company's stock would be offset by a gain on another's stock. (Of course, the competition might make the whole industry

more vulnerable to the business cycle, but the issue here is the diversifiable risk of shifts in market share among firms.)

If the shares were priced especially low because of the risk of a shift in market shares, investors who could hold shares of the whole industry would snap them up. Their buying would drive up the stocks' prices until the premium rates of return for diversifiable risk were eliminated. Since all investors pay the same price, even those who are not diversified can expect no premium for bearing diversifiable risk.

Of course, substantial non-diversifiable risk remains, as the October Crash of 1987 demonstrates. Even an investor who held a portfolio of all traded stocks could not diversify against that type of risk. Sensitivity to such market-wide movements is what beta measures. That type of sensitivity, whether considered in a single- or multi-factor model, determines the risk premium in the cost of equity.

Q35. What does a particular value of beta signify?

A35. By definition, a stock with a beta equal to 1.0 has average non-diversifiable risk: it goes up or down by 10 percent on average when the market goes up or down by 10 percent. Stocks with betas above 1.0 exaggerate the swings in the market: stocks with betas of 2.0 tend to fall 20 percent when the market falls 10 percent, for example. Stocks with betas below 1.0 are less volatile than the market. A stock with a beta of 0.5 will tend to rise 5 percent when the market rises 10 percent.

Q36. How is beta measured?

A36. The usual approach to calculating beta is a statistical comparison of the sensitivity of a stock's (or a portfolio's) return to the market's return. Many investment services report betas, including FPinfomart,[23] Merrill Lynch's quarterly Security Risk Evaluation,

[23] Beta estimates from *FPinfomart* are not publicly available. FPinfomart.ca is an online media monitoring service that offers timely, reliable and in-depth access to Canada's news and business sources.

Bloomberg and the *Value Line Investment Survey*. Betas are not always calculated the same way, and therefore must be used with a degree of caution, but the basic point that a high beta indicates a risky stock has long been widely accepted by both financial theorists and investment professionals.

Q37. Are there circumstances when the "usual approach" should not be used?

A37. There are at least two cases where the standard estimate of beta should be viewed skeptically. First, companies in serious financial distress seem to "decouple" from their normal sensitivity to the stock market. The stock prices of financially distressed companies tend to change based more on individual news about their particular circumstances than upon overall market movements. Thus, a risky stock could have a low estimated beta if the company was in financial distress. Other circumstances that may cause a company's stock to decouple include an industry restructuring or major changes in a company's supply or output markets.

Second, similar circumstances seem to arise for companies "in play" during a merger or acquisition. Once again, the information about the progress of the proposed takeover is so much more important for that individual stock than day-to-day market fluctuations that, in practice, beta estimates for such companies seem to be too low.

Q38. How reliable is beta as a risk measure?

A38. Scholarly studies have long confirmed the importance of beta for a stock's required rate of return. It is widely regarded as the best single risk measure available. The merits of beta seemed to be challenged in widely publicized work by Professors Eugene F. Fama and Kenneth R. French.[24] However, despite the early press reports of their work as signifying that "beta is dead," it turns out that beta was still a potentially important

[24] See for example, "The Capital Asset Pricing Model: Theory and Evidence", Eugene F. Fama and Kenneth R. French, *Journal of Economic Perspectives*, Volume 18, Summer 2004, pp. 25-46.

explanatory factor (albeit one of several) in their work. Thus, beta remains alive and well as the best single measure of relative risk.

b) The Empirical Capital Asset Pricing Model

Q39. What other equity risk premium model do you use?

A39. Empirical research has long shown that the CAPM tends to overstate the actual sensitivity of the cost of capital to beta: low-beta stocks tend to have higher risk premia than predicted by the CAPM and high-beta stocks tend to have lower risk premia than predicted. A number of variations on the original CAPM theory have been proposed to explain this finding, but this finding can also be used to estimate the cost of capital directly, using beta to measure relative risk without simultaneously relying on the CAPM.

The second model makes use of these empirical findings. It estimates the cost of capital with the equation,

$$r_S = r_f + \alpha + \beta_S \times (MRP - \alpha) \qquad (3)$$

where α is the "alpha" adjustment of the risk-return line, a constant, and the other symbols are defined as above. I label this model the Empirical Capital Asset Pricing Model, or "ECAPM." The alpha adjustment has the effect of increasing the intercept but reducing the slope of the security market line in Figure 1 which results in a security market line that more closely matches the results of empirical tests.

Q40. Why is it appropriate to use the empirical CAPM?

A40. The CAPM has not generally performed well as an empirical model, but its short-comings are directly addressed by the ECAPM. Specifically, the ECAPM recognizes the consistent empirical observation that the CAPM underestimates (overestimates) the cost of capital for low (high) beta stocks. In other words, the ECAPM is based on recognizing

that the actual slope of the risk-return tradeoff is flatter than predicted and the intercept higher based upon repeated empirical tests of the CAPM. The alpha parameter (α) in the ECAPM adjusts for this fact. The difference between the CAPM and the type of relationship identified in the empirical studies is depicted in Figure 2.

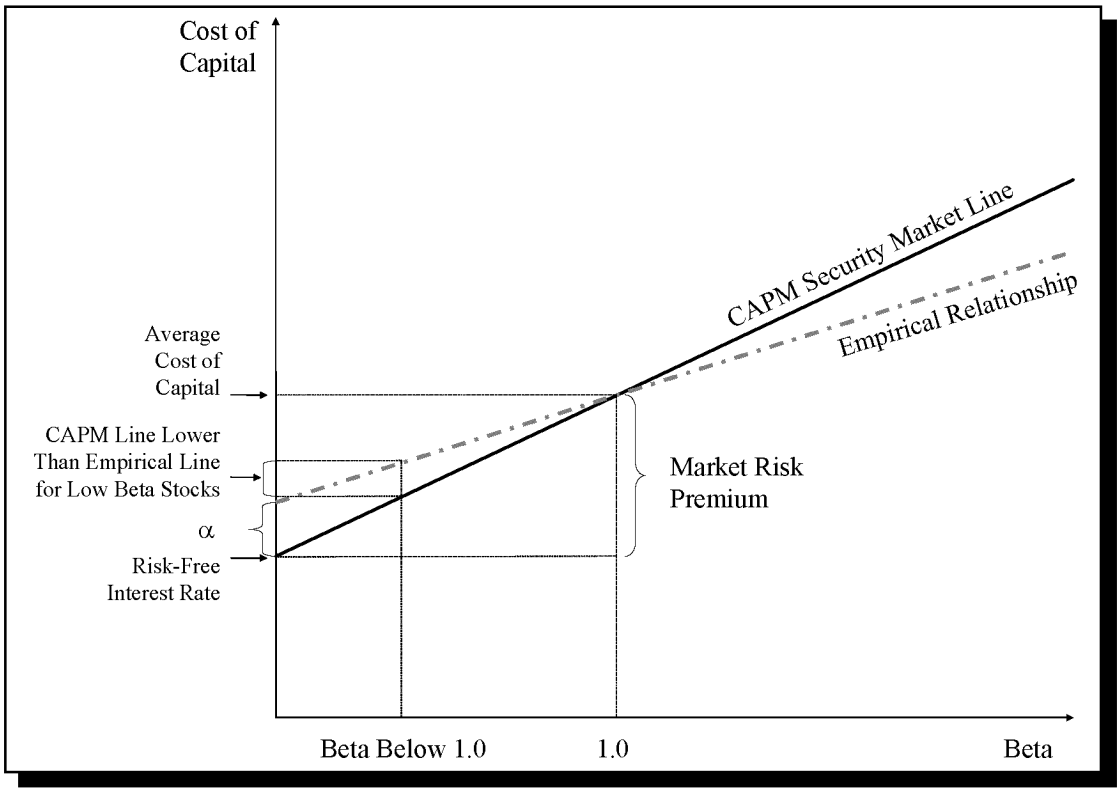

Figure 2: The Empirical Security Market Line

Research supports values for α of one to seven percent when using a short-term interest rate. I use baseline values of α of one percent for the long-term risk-free rate. I also conduct sensitivity tests for different values of α. For the long-term risk-free rate, the corresponding α value sensitivities are computed at zero (the CAPM), one, and two percent. These values are lower than would be justified by the magnitude of the misestimation in the tests of the CAPM, however, I use lower values of α when using a

long-term horizon because use of a long-term risk-free rate incorporates some of the desired effect of using the ECAPM. That is, the long-term risk-free rate version of the security market line has a higher intercept and a flatter slope than the short-term risk-free version which is the version that has been extensively tested. Thus, it is likely that I do not need to make the same degree of adjustment when I use the long-term risk-free rate.

2. The Discounted Cash Flow Model

Q41. Please describe the discounted cash flow approach.

A41. The DCF model takes the first approach to cost of capital estimation, i.e., to attempt to estimate the cost of capital in one step. The method assumes that the market price of a stock is equal to the present value of the dividends that its owners expect to receive. The method also assumes that this present value can be calculated by the standard formula for the present value of a cash flow stream:

$$P = \frac{D_1}{(1+r)} + \frac{D_2}{(1+r)^2} + \frac{D_3}{(1+r)^3} + \cdots + \frac{D_T}{(1+r)^T} \quad (4)$$

where "P" is the market price of the stock; "D_i" is the dividend cash flow expected at the end of period i; "r" is the cost of capital; and "T" is the last period in which a dividend cash flow is to be received. The formula just says that the stock price is equal to the sum of the expected future dividends, each discounted for the time and risk between now and the time the dividend is expected to be received.

Most DCF applications go even further, and make very strong (i.e., unrealistic) assumptions that yield a simplification of the standard formula, which then can be rearranged to estimate the cost of capital. Specifically, if investors expect a dividend

stream that will grow *forever* at a steady rate, the market price of the stock will be given by a very simple formula,

$$P = \frac{D_1}{(r - g)} \tag{5}$$

where "D_1" is the dividend expected at the end of the first period, "g" is the perpetual growth rate, and "P" and "r" are the market price and the cost of capital, as before. Equation (5) is a simplified version of equation (4) that can be solved to yield the well known "DCF formula" for the cost of capital:

$$\begin{aligned} r &= \frac{D_1}{P} + g \\ &= \frac{D_0 \times (1 + g)}{P} + g \end{aligned} \tag{6}$$

where "D_0" is the current dividend, which investors expect to increase at rate g by the end of the next period, and the other symbols are defined as before. Equation (6) says that if equation (5) holds, the cost of capital equals the expected dividend yield plus the (perpetual) expected future growth rate of dividends. I refer to this as the simple DCF model. Of course, the "simple" model is simple because it relies on very strong assumptions.[25]

Q42. Are there other versions of the DCF models besides the "simple" one?

[25] In this context "strong" means assumptions that are unlikely to reflect reality but that also are expected to have a large effect on the estimate.

A42. Yes. The constant growth rate DCF model requires that dividends and earnings grow at the same rate for companies that earn their cost of capital on average.[26] It is inconsistent with the theory on which the model is based to have different growth rates in earnings and dividends over the period when growth is assumed to be constant. If the growth in dividends and earnings were expected to vary over some number of years before settling down into a constant growth period, then it would be appropriate to estimate a multistage DCF model. In the multistage model, earnings and dividends can grow at different rates, but must grow at the same rate in the final, constant growth rate period. A difference between forecasted dividend and earnings rates therefore is a signal that the facts do not fit the assumptions of the simple DCF model.

I consider a variant of the DCF model that relies on slightly less strong assumptions in that it allows for varying dividend growth rates in the near term before assuming a perpetual growth rate beginning in year eleven. I use the forecast growth of GDP as the forecast of the long-term growth rate, i.e. year eleven on. This is a variant of the "multistage" DCF method.

Q43. What are the merits of the DCF approach?

A43. The DCF approach is conceptually sound if its assumptions are met, but can run into difficulty in practice because those assumptions are so strong, and hence so unlikely to correspond to reality. Two conditions are well known to be necessary for the DCF approach to yield a reliable estimate of the cost of capital: the variant of the present value

---

[26] Why must the two growth rates be equal in a steady-growth DCF model? Think of earnings as divided between reinvestment, which funds future growth, and dividends. If dividends grow faster than earnings, there is less investment and slower growth each year. Sooner or later dividends will equal earnings. At that point, growth is zero because nothing is being reinvested (dividends are constant). If dividends grow slower than earnings, each year a bigger fraction of earnings are reinvested. That makes for ever faster growth. Both scenarios contradict the steady-growth assumption. So if you observe a company with different expectations for dividend and earnings growth, you know the company's stock price and its dividend growth forecast are inconsistent with the assumptions of the steady-growth DCF model.

formula that is used must actually match the variations in investor expectations for the growth of dividends, and the growth rate(s) used in that formula must match current investor expectations. Less frequently noted conditions may also create problems (see Appendix D for details). Nevertheless, I believe that the DCF model serves as a useful check on the results of the risk positioning model.

Q44. Do you agree that estimating the "right" dividend growth rate is usually the most difficult part for the implementation of the DCF approach?

A44. Yes, usually finding the right growth rate(s) is the "hard part" of a DCF application. The original approach to estimation of *g* relied on average historical growth rates in observable variables, such as dividends or earnings, or on the "sustainable growth" approach, which estimates *g* as the average book rate of return times the fraction of earnings retained within the firm. But it is highly unlikely that these historical averages over periods with widely varying rates of inflation and costs of capital will equal current growth rate expectations.

Q45. Are the DCF model's assumptions met at this time?

A45. No, not entirely for these industries. As noted earlier, the DCF model was not applied to the MLP Pipelines sample. The DCF model is extremely sensitive to small deviations from its required assumptions. Although there has been relatively less turmoil in the natural Gas LDC line of business in the U.S., for example, both the electric industry and the natural gas industry have been affected by the recent increase in the level and volatility of gas prices which has created extra uncertainty looking forward. Moreover, there have been a number of mergers and acquisitions in the Gas LDC industry. Part of the observed market price for these companies almost certainly reflects the expected cash

flow impacts for investors that would arise from more such mergers,[27] but this potential source of investor cash flow is not generated within the company and so does not show up in the data used to forecast expected growth rates in the DCF model. That is, at present, Gas LDC stock prices will be above the levels justified by those companies' own dividends and growth paths. Instead of Equation (4), their price at the current time is given by

$$P = PV(Expected\ Dividends) + PV(Expected\ Buyout\ Increment) \quad (7)$$

where "PV" indicates "the present value of" the quantity in parentheses. In these circumstances, since the DCF model attributes the entire price to the present value of future dividends, it will underestimate the cost of capital used to value those dividends and produce a downward-biased estimate of the cost of capital.

Q46. Does your multistage DCF estimate overcome these problems?

A46. No, not in these circumstances. The multistage method assumes a particular smoothing pattern and a long-term growth rate afterwards. That can be a useful approach in cases where the basic DCF assumptions are approximately met, but here they are not met even approximately. The smoother growth pattern, for example, might be quite wrong, given the initial uncertainty. And even a perfect forecast of growth that ignored the component of the market price represented by a potential acquisition, as shown in Equation (7), would still produce a materially downward biased DCF estimate of the cost of capital. Until the stability conditions the DCF model requires are restored, the DCF method cannot provide completely reliable estimates of the cost of capital.

[27] See, for example, the *Value Line* summary of the natural gas utility industry, June 15, 2007, which highlights this potential for gas utilities.

IV. TQM AND THE SAMPLES' COST OF CAPITAL ESTIMATES

A. TRANS QUÉBEC & MARITIMES PIPELINE

Q47. Please describe TQM's operations in general terms?

A47. TQM operates natural gas transportation facilities as mandatary of TQM Pipeline and Company, Limited Partnership, of which Gaz Métro Limited Partnership ("Gaz Métro") and TransCanada PipeLines Limited are the limited partners. The facilities were authorized by NEB certificates of public convenience and necessity GC-64, GC-65 and GC-96, and other orders of the Board. The TQM facilities are located in the Province of Québec and extend from a point of interconnection with the TransCanada system at Saint-Lazare to a point near Québec City in the Municipality of Lévis on the south shore of the St. Lawrence River, and from Terrebonne, north of Montréal, to East Hereford on the border of the Province of Québec with the state of New Hampshire, where it interconnects with the Portland Natural Gas Transmission System. TQM's right-of-way covers 572 km and its system has 31 delivery points and two compressor stations.

B. THE BENCHMARK SAMPLES AND THEIR CHARACTERISTICS

Q48. Why is it necessary to use three samples?

A48. The cost of capital for a part of a company depends on the risk of the lines of business in which the *part* is engaged, *not* on the overall risk of the parent company on a consolidated basis. According to financial theory, the overall risk of a diversified company equals the market-value weighted average of the risks of its components. There is no ideal sample of publicly traded pure play Canadian natural gas transmission companies currently available, and as the Board has noted, the companies in the Canadian regulated utilities

sample are not pure plays in the natural gas pipeline business.[28] In an effort to gather as much information as possible about the cost of capital for a regulated natural gas pipeline and to address the Board's concerns regarding comparability of the samples, Dr. Kolbe and I select three samples as benchmarks: Canadian regulated utilities, Gas LDC companies and a sample of U.S. MLPs that own pipeline assets.[29]

The sample of Canadian utilities is used to assess the risks for Canadian utilities in general. Unlike the Canadian Utilities sample, all companies in the Gas LDC sample have operations concentrated in the natural gas industry. However, neither the Canadian Utilities sample nor the Gas LDC sample are pure plays in the natural gas pipeline industry. Although the companies in the MLP Pipelines sample represent nearly pure play companies in pipeline operations, the sample companies are organized with a structure that pays little or no corporate income taxes. However, some of the pipelines are petroleum or natural gas liquids pipelines and some MLPs own non-pipeline assets. To the degree that there are differences in risk among the benchmark samples and TQM, Dr. Kolbe will take that into consideration as he considers the sample evidence and the business risks of TQM.

Additional details of the sample selection process for each sample are described below as well as in Appendix B.

---

[28] Reasons for Decision, TransCanada PipeLines Limited., RH-2-2004, Phase II, April 2005, pp. 54-55.

[29] The companies in the MLP Pipelines sample do not report income or assets by lines of business in the same way the companies in the Canadian Utilities and the Gas LDC samples do; therefore, it is not possible to report the exact percentage of income/assets from regulated lines of business based upon public information for all companies.

1. The Canadian Utilities Sample

Q49. How did you select the Canadian regulated utilities sample?

A49. To construct this sample, I started with the universe of Canadian companies classified as being in the utility industry or in the oil and gas storage and transportation industry in the FPinfomart database.[30] I eliminated companies that were not listed in the FP500 Sales category on FPinfomart which eliminated a number of smaller companies and companies that do not trade on the Toronto Stock Exchange. I then applied additional selection criteria designed to narrow the sample to companies with characteristics similar to that of TQM. I also eliminated companies with unique circumstances which may bias the cost of capital estimates. The final sample consists of the five companies listed in Table 1 below.

[30] The information was extracted in July 2007 from www.fpinformart.ca.

Table 1: Characteristics of the Canadian Utilities Sample

Company [1]	Business Activities [2]	Revenue (2006) ($MM) [3]	Regulated Assets [4]	Market Cap. (2006) ($MM) [5]	S&P Credit Rating (2007) [6]	Beta [7]	Long-Term Growth Estimate [8]
Canadian Utilities (AB)	DI (NG-LDC, E, PL, W)	2,430	MR	6,004	A	0.64	7.9%
Enbridge Inc. (AB, NB, ON, QC, IL, NY, OK, OR, WA)	NG-LDC, L-PL, NG-PL	10,645	MR	14,046	A-	0.69	6.5%
TransCanada Corp. (AB, BC, ON, QC, CA, ME, OR, WA)	NG-T, E G	7,520	MR	19,779	A	0.64	8.1%
Emera Inc. (NS, ME)	E (G, T, D)	1,166	R	2,509	BBB	0.48	6.3%
Fortis Inc. (AB, BC*, NF, PEI, ON, Belize, Grand Cayman, Turks and Caicos Islands)	E (D, G) NG-LDC, NG-T	1,462	R	3,098	A-	0.58	7.9%

*Fortis Inc. did not own assets in BC as of December 2006, but in May 2007 they acquired Terasen Inc. which does.

2. The Gas LDC Sample

Q50. How do you select your sample of U.S. gas local distribution companies?

A50. One reason for use of the Gas LDC sample is to generate a sample of regulated companies whose primary source of revenues is in the regulated portion of the natural gas industry. Therefore, I started with the universe of publicly traded natural gas distribution utilities covered by *Value Line Investment Survey Plus Edition*. This resulted in an initial

group of 23 companies, to which I added Vectren Corporation because it is often viewed as a natural Gas LDC.[31] Vectren is involved in both gas and electric distribution activities, but more of its regulated assets are invested in the gas distribution operations.[32,33] I then eliminated companies by applying additional selection criteria designed to remove companies with unique circumstances which may bias the cost of capital estimates. The final sample consists of the ten Gas LDCs listed in Table 2 below, from which I also consider a sub-sample of five companies with the fewest reliability concerns. Appendix B discusses the selection process for the Gas LDC sample in more detail. Please refer to Dr. Paul Carpenter's evidence for additional information on the risk characteristics of the Gas LDC sample.[34]

Q51. Please compare the characteristics of the Canadian Utilities sample and the Gas LDC sample.

A51. The percentage of regulated assets for the Canadian Utilities sample is somewhat lower to substantially lower than for the Gas LDC sample depending upon classification of assets for the companies in the Canadian Utilities sample.[35]

---

[31] This company is also covered by *Value Line*, but is classified as an Electric Utility due to its regulated electric operations.

[32] Vectren Utility Holdings, Inc.'s 2006 10K reveals that about 57 percent of its assets are regulated natural gas distribution assets and 37 percent are regulated electric assets. Because it has a substantial amount of regulated electric activity, I exclude it from the sub-sample of companies I consider to be the most representative of the natural gas distribution line of business and to be most free of characteristics that may bias cost of equity estimates.

[33] The 24 companies are from *Value Line Investment Survey Plus*, dated June 15, 2007 for all companies except Vectren which is dated June 29, 2007.

[34] It should be noted that whereas regulated assets are displayed in Table 2 below, Dr. Carpenter's written evidence presents data on regulated Property, Plant, and Equipment. As such, classification may differ.

[35] See Table No. MJV-2 (Canadian Utilities sample) and Table No. MJV-13 (Gas LDC sample).

The samples differ primarily in the fact that the Gas LDC sample is concentrated in one segment of the regulated natural gas industry while the Canadian Utilities sample consists of companies in the electric, natural gas pipeline, natural gas distribution and petroleum industries. Therefore, it is more difficult to determine the risk of any single regulated industry using the Canadian Utilities sample because differences in estimated cost of capital among the sample companies could be due to differences in industry risk as well as other factors. In addition, the Canadian Utilities sample's results are potentially affected by the recent increase in the amount of merger activities involving companies in the sample, as well as by the difficulty in estimating beta for the sample companies.[36] Due to mergers and acquisitions within the Gas LDC sample, the companies in the sample are not as close to pure plays as they were the last time I testified before the Board. Therefore, I delete companies with any substantial merger activity from the Gas LDC sample to form a sub-sample that does not suffer from this weakness. Please refer to Appendix B for additional details comparing the two samples.

[36] For example, Fortis remains in the Canadian Utilities sample for purposes of estimating the average capital structure of the sample even though it has recently been involved in an acquisition because removing it would leave only four companies in the sample. The recent acquisition of ANR Pipeline by TransCanada may also have affected the market.

Table 2: Characteristics of the Gas LDC Sample

Company		Revenue (2006) ($MM)	Regulated Assets	Cap. (2006) ($MM)	S&P Credit Rating (2007)	Beta Estimate	Long-Term Growth Estimate
[1]		[2]	[3]	[4]	[5]	[6]	[7]
AGL Resources Inc (FL, GA, MD, NJ, TN, VA)		2,621	MR	3,049	A	0.90	4.8%
Atmos Energy Corp (CO, GA, IA, IL, KS, KY, LA, MO, MS, TN, TX, VA)		6,152	R	2,619	BBB	0.67	5.7%

3. The MLP Pipelines Sample

Q52. Please summarize how you selected your sample of MLP Pipelines?

A52. The MLP Pipelines sample was selected by searching Dividend Detective and the Publicly Traded Partnerships (PTP) website. Forty-nine companies were listed as owning

pipelines. Of those forty-nine, eight had less than investment grade bond ratings, twenty six had no investment rating, one had mergers and acquisitions of over 100 percent of market capitalization, and four had distribution cuts. Of the ten remaining MLPs, four were strictly oil companies. The six remaining are Boardwalk Pipeline Partners, Kinder Morgan Energy Partners, TC Pipelines, Oneok Partners, Enbridge Energy Partners, and Enterprise Products Partners. Their characteristics are summarized in Table 3 below. Operating regions are not explicitly noted in the table because most of these MLPs operate on a national scale with pipelines crossing many states. However, the regulated operations for these pipelines are generally under FERC's jurisdiction.

Q53. Did you consider broadening the sample with other pipeline related MLPs?

A53. Yes. TEPPCO Partners, Buckeye Partners, NuStar Energy, and Sunoco Logistics Partners were considered, but a majority of their business is in the form of U.S. oil pipelines. I do not feel these to be fully representative of either U.S. natural gas pipelines or Canadian natural gas pipelines.

Q54. What are the merits of using the MLP Pipelines as a benchmark sample?

A54. The MLP Pipelines sample is the closest to a pure play natural gas pipeline sample currently available, and the universe of MLP pipeline companies is growing. It is likely that the vast majority of U.S. natural gas pipelines will be incorporated into an MLP type structure over the next few years. As a result, the MLP Pipelines sample will increasingly become the sample that is closest to the ideal of a pure play natural gas pipeline sample.

Table 3: Characteristics of the MLP Pipelines Sample

Company	Revenue (2006) ($MM) [1]	Regulated PP&E [2]	Regulated Natural Gas PP&E [3]	Market Cap. (2006) ($MM) [4]	S&P Credit Rating (2007) [5]	Beta Estimate [6]
Boardwalk Pipeline Partners, LP	608	R	R	3,336	BBB+	0.62
TC Pipelines, LP	63†	R	R	630	A	0.30
ONEOK Partners, LP	4,714*	NR	NR	5,250	BBB	0.37
Enbridge Energy Partners, LP	6,509	MR	MR	3,832	BBB	0.37
Enterprise Products Partners, LP	13,991	MR	MR	12,531	BBB-	0.37
Kinder Morgan Energy Partners, LP	8,955	NR‡	NR‡	11,038	BBB	0.45

[2]-[3] Key: R – Regulated (More than 80% of Property, Plant & Equipment regulated)
MR – Mostly Regulated (50% to 80% of PP&E regulated)
NR – Non Regulated (less than 50% of PP&E regulated)
Source: 2006 Company 10-Ks. See Table No. MJV-23.

[4] Bloomberg, August 28, 2007.

[5] Bloomberg, August 28, 2007.

[6] Most recent reports from *Value Line Plus Edition* dated as of August 3, August 17, and September 14, 2007. Value Line beta is not available for Boardwalk Pipeline Partners due to its shorter history. Bloomberg beta is used instead (see text).

† Net Sales include equity income from investment in Northern Border Pipeline, equity income from investment in Tuscarora and transmission revenues. This number does not account for revenues from Northern Border Pipeline (of which TC Pipelines owns a 50% share), which was US$ 310.9 million in 2006, as reported in the company's 2006 10-K. Neither does it include revenues from Tuscarora (of which TC Pipelines own a 99% share).

‡ Kinder Morgan Energy Partners, LP has significant owernership interests in non-consolidated in pipeline assets (2006 10-K).

* Operating Revenue does not contain equity earnings from investments in Northern Border Pipeline and other non-consolidated affiliates.

Q55. Are there any issues with this sample that warrant caution?

A55. Yes. Boardwalk Pipelines Partners only has two years of data in Bloomberg, while the rest have a full five years. All of the companies had a BBB debt rating, except for TC Pipelines which is A-rated. Because this sample is already small, Oneok Partners despite their merger and acquisition activity of 56% market capitalization, was not excluded. Also, three of the sample companies own a mixture of assets some of which are FERC regulated natural gas pipelines, but some of which are oil and natural gas liquids pipelines regulated by either the FERC or state regulatory commissions. As a result, I report the results for both the full sample of MLP Pipelines and for a sub-sample of MLP Pipelines

companies whose assets are concentrated solely in FERC-regulated natural gas pipelines. This sub-sample is as close to a pure play sample of regulated natural gas pipelines as there is currently available.

C. COST OF EQUITY ESTIMATION

Q56. How do you ensure that the evidence from U.S. sample companies is consistent with Canadian capital markets?

A56. I ensure consistency with the Canadian capital markets by combining the risk measures (beta) of the U.S. sample companies with Canadian capital market parameters to estimate the sample's average overall after-tax weighted-average cost of capital. Beta is a measure of the relative risk of a company compared to the risk of an average stock in the market as discussed above in Section III-C.1. In other words, I use the Canadian risk-free interest rate, tax rates, interest rates on utility bonds and market risk premium to estimate the cost of equity for the Gas LDC and the MLP Pipelines sample companies. The result is cost of capital estimates for the sample companies as if their stocks were trading in Canadian capital markets with a relative risk as measured by the companies' betas.

Note that the unadjusted DCF estimates for the Gas LDC sample are estimates of the cost of equity in the U.S. capital markets. Therefore, I subtract the difference in long-term government bond yields in the U.S. and Canada from the DCF estimates for the Gas LDC sample in order to compare the results on a more consistent basis with the Canadian capital market conditions.

1. Equity Risk Premium Estimates

Q57. How is this section of your evidence on the risk positioning approach to cost of capital estimates organized?

A57. This section first describes the input data used in the CAPM and ECAPM models, then reports the resulting cost of equity estimates for the samples. Appendix C provides additional details on the empirical analysis.

a) Interest Rate Forecasts

Q58. How do you determine the expected risk-free interest rate?

A58. I obtain the forecast of the long-term risk-free rates on government bonds from the survey information available from Consensus Economics, Inc., a London based forecasting survey firm. *Consensus Forecasts* provides forecasts of both the U.S. 10-year Treasury bond rate and the 10-year Government of Canada bond rate. The Consensus Economics forecasts for the year ending August 2008 show that Canadian long-term interest rates are expected to increase over the coming year compared to current rates. The long-term interest rate is expected to be about 5.0 percent including a 20 basis point maturity premium.[37] I add a maturity premium of 20 basis points to the forecast 10-year government bond yield to reflect the additional yield required for bonds of longer maturity.[38]

Q59. Why is it necessary to add a maturity premium to the forecast of the 10-year bond yield?

A59. The addition of the maturity premium is necessary for consistency so that the average bond maturities in the data used to estimate the long-term market risk premium correspond to the maturity of the benchmark for the long-term risk-free rate.[39]

---

[37] *Consensus Forecasts* as of August 2007.

[38] The average term to maturity is reported to be 18 years for the yields provided in the Report on Canadian Economic Statistics 1924-2006.

[39] The 20 basis point addition is a conservative estimate of the premium that investors require to hold bonds with a maturity of 18 years instead of bonds with a maturity of 10 years. The estimate is derived from a

The maturity premium represents the extra return investors demand for tying up their money for longer periods. The *Report on Canadian Economic Statistics 1924-2006,* released by the Canadian Institute of Actuaries in April 2007, reports data on three-month, one-to-three-year, three-to-five-year, five-to-ten year, and long-term Government yields from 1951 through 2006. I use these data to infer a set of maturity premiums for intermediate maturities. See Workpaper #3 to Table No. MJV-9 for details.

Q60. What value do you use for the risk-free interest rate in your risk-positioning model?

A60. I use a value of 5.0 percent for the long-term risk-free interest rate as the benchmark interest rates in the risk positioning analyses. I do not rely on the short-term version of the risk-positioning model in this proceeding.

b) The Estimated Market Risk Premium

Q61. Please remind us of your estimate of the market risk premium.

A61. As I stated earlier, I estimate the market risk premium at 5.75 percent in Canada.

c) Beta Estimates

Q62. How do you normally calculate beta?

A62. My standard approach is to calculate beta by statistical regression of the excess (positive or negative) of the return on the stock over the risk-free rate against the excess return over the risk-free rate on either the S&P/TSX index for the Canadian companies or the NYSE index for the U.S. companies. I normally use monthly return data for the most recent 60-month period for which data exist, but the unique factors affecting the stock market and the utility industry make the most recent 60 month period unsuitable to estimate the

---

yield curve constructed from the historical average maturity premiums of Canadian Government bonds from 1951 through 2006 for bonds with five different average maturities (see Workpaper #3 to Table No. MJV-9).

sample companies' betas. These events have caused the returns of the companies in the samples to "decouple" from their normal relationship to the returns on the market indices. I believe that the risk of the sample companies has increased given the changes in the natural gas market and the restructuring in the electric industry, but betas estimated over the most recent 60 month period have fallen dramatically for both the Canadian Utilities and the Gas LDC samples from estimates based upon data from only a few years earlier. Several of the estimated betas for the individual companies in both samples were very close to zero for the most recent 60 month period. These results cause me to question the validity of the estimates, and I feel alternative methods to estimate betas need to be considered (see below).

Q63. What evidence do you have that the betas estimated over the most recent 60 months are unusual?

A63. Displayed in Figures 3 and 4 below are the estimated average rolling betas of the Canadian Utilities sample and the Gas LDC sample, respectively, for the period June 1995 to July 2007. For each graph, each point on the line represents a beta estimated using monthly excess returns over the previous 60 months. Market returns are represented by either the S&P/TSX or the S&P 500 indices, as appropriate, and risk-free rates are taken as each country's 30-day T-bill returns. Rolling betas allow us to track the changes in the estimated betas over time.

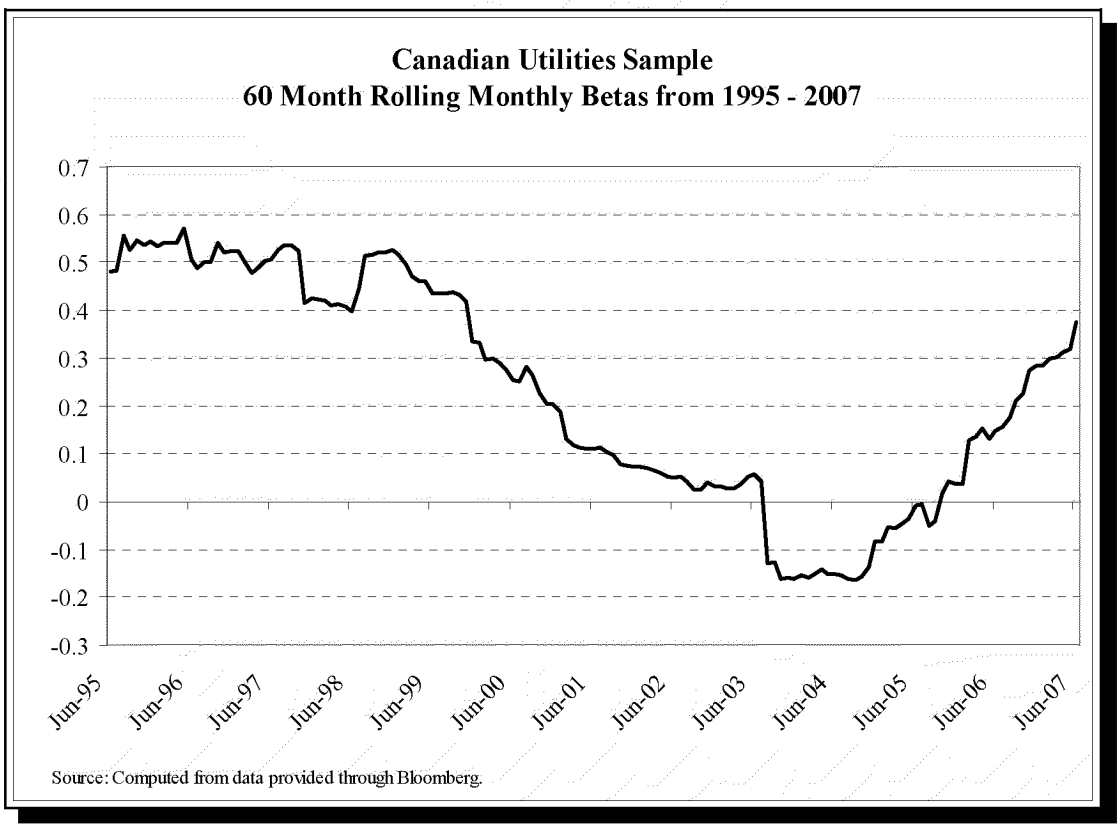

Figure 3: Trends in Canadian utility betas between 1995 and 2007

Q64. Do you believe that this is evidence of the "decoupling" that you mentioned earlier?

A64. Yes, because I do not believe that these beta estimates can be an accurate measure of the relative risk of the sample companies in many of the periods. I therefore modify my computation of betas for the Canadian Utilities sample for this proceeding.

Q65. In light of decoupling illustrated in Figures 3 and 4 of your evidence, how do you estimate the betas for the samples?

A65. For the Gas LDC sample, I am able to rely on forecasts of beta from *Value Line*, but *Value Line* does not provide betas for the companies in the Canadian Utilities sample.

Consequently, I have chosen to instead rely upon betas provided by Bloomberg based upon 260 weeks (five years) of weekly return data.

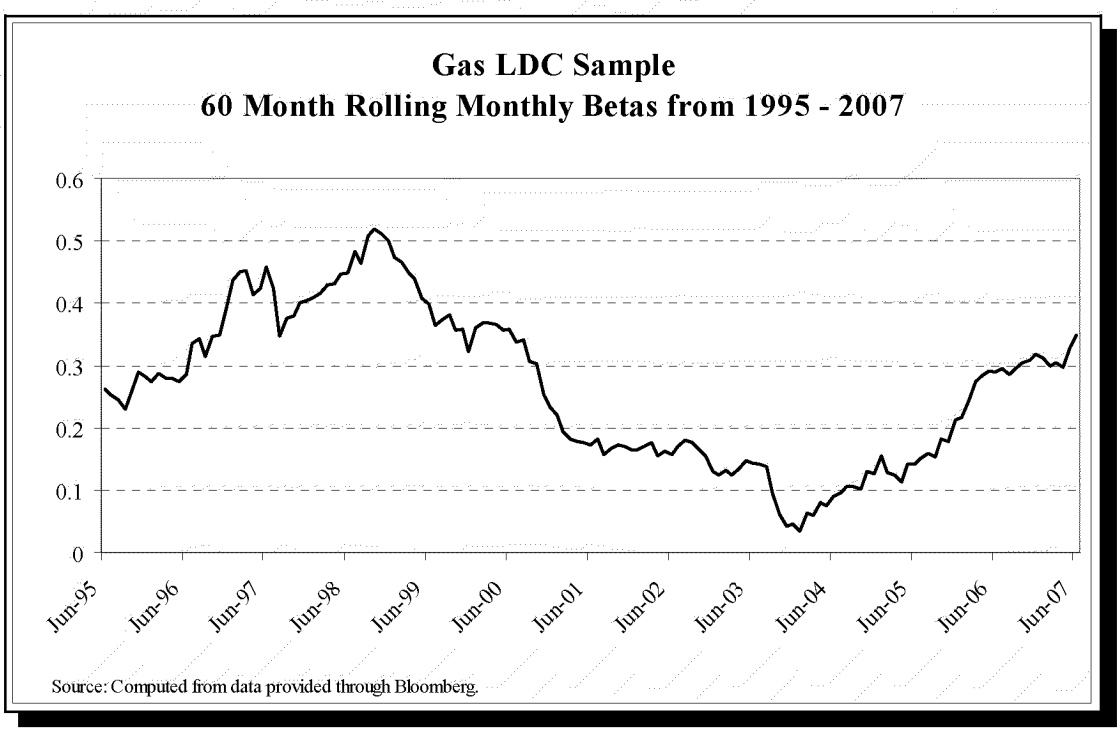

Figure 4: Trends in U.S. Gas LDC betas between 1995 and 2007

Q66. Please discuss the Canadian 260-week beta estimates.

A66. The Bloomberg 260-week betas for the period ending August 28, 2007 are displayed in Workpaper #1 to Table No. MJV-10. Bloomberg adjusts their raw betas towards 1.0 as is standard practice in the industry. This is typically meant to compensate for the observed tendency of betas to regress towards 1.0 in repeated sampling, but is also relevant if one believes that the stock returns being evaluated display interest rate sensitivity. The average adjusted beta is around 0.60, which is consistent with average

monthly betas observed before their plunge at the end of 1999 (see Figure 3). As a forecast, it is also consistent with the recovery observed in betas since 2004.

Q67. Are you satisfied that the 260-week betas for the Canadian samples are completely reliable?

A67. Not entirely. As Figure 3 illustrates, the beta relationship has not been anywhere near stable in the last ten years, and the estimated betas are on an increasing trend. As such, these results must be interpreted with caution, which is partly why additional samples are needed to provide a more complete and reliable picture.

Q68. With respect to the Gas LDC sample, do you have any concerns with the betas obtained from *Value Line*?

A68. I have reviewed the betas estimated by *Value Line*, and the estimated values declined only very slightly over the last few years and have now returned to values that in many cases are higher than their previous levels, as opposed to the dramatic decline that resulted from my standard estimation procedures illustrated in Figure 4 above. *Value Line* uses five years of weekly return data computed as the difference in the logarithms of prices (i.e., they use continuously compounded returns), and computes betas by regressing company returns against the NYSE index returns, again computed on a continuously compounded basis. Their recent beta estimates suggest that *Value Line* also agrees that the risk of these sample companies has not suddenly decreased. It is important to note, however, that the betas reported by *Value Line* are also adjusted towards one. For reasons explained below, I reverse the process to get "unadjusted" values for use in the models for the companies in the Gas LDC sample.

Q69. How do the unadjusted and adjusted betas for the Gas LDC sample companies compare?

A69. *Value Line's* adjusted betas for the Gas LDC sample range from 0.70 to 0.95, with an average of 0.84. The resulting unadjusted betas range from 0.52 to 0.90 (See Workpaper #1 to Table No. MJV-20), with an average of 0.72.[40]

Q70. Why do you "unadjust" the *Value Line* betas?

A70. In the RH-2-2004, Phase II decision the Board expressed concern regarding reliance on U.S. company data.[41] To reduce that concern, I use unadjusted betas for the Gas LDC sample in this proceeding, although I have used adjusted betas when testifying recently in the U.S. because I believe that adjusted betas give a more accurate estimate of the cost of equity for companies regulated on the basis of original cost rate base.[42]

Adjustment moves betas one-third of the way toward a value of one, the average stock beta. The adjustment is designed as a correction for the tendency of companies with low estimated betas to have negative sampling errors and for the tendency of companies with high estimated betas to have positive sampling errors; however, that is not the reason that I normally use adjusted betas.

Companies regulated on the basis of original cost rate base frequently display unusual sensitivity to interest rate changes in a manner similar to bonds. I use adjusted betas when the sample companies display such unusual interest rate sensitivity. The sample companies do not currently display interest rate sensitivity, but I believe that this is because the "decoupling" of the the sample companies' returns from the market return, which is resulting in very low or negative beta estimates for the sample companies, is also making it impossible to detect interest rate sensitivity that companies regulated on the

---

[40] As noted earlier, results from a sub-sample of companies with a high degree of regulation are also considered for the Gas LDC sample. The average adjusted and unadjusted betas for the subsample are 0.83 and 0.72 respectively.

[41] See p.55, Reasons for Decision, TransCanada PipeLines Limited., RH-2-2004, Phase II, April 2005.

[42] Appendix D of Dr. Kolbe's evidence discusses this point in more detail.

basis of an original cost rate base normally display. Nonetheless, even though I believe that adjusted betas would be a better estimate of the relative risk of the Gas LDC sample companies, I use unadjusted betas for these companies because I want to ensure that I address the concerns of the Board expressed in the RH-2-2004, Phase II decision.[43]

Q71. You have not yet discussed how betas are computed for the MLP Pipelines sample. Does *Value Line* provide any such estimates?

A71. Yes. As with the Gas LDC sample, I rely on *Value Line's* estimates of beta for the MLP Pipelines sample. I also unadjust these betas for the reasons explained above (see Workpaper #1 to Table No. MJV-26).

Q72. Why do you use adjusted betas in your analysis of the Canadian Utilities sample?

A72. I use adjusted betas for the Canadian Utilities sample for two reasons. First, in the past when betas were estimated reliably, the companies in the sample exhibited the sensitivity to interest rate changes as predicted by theory for companies regulated on the basis of original cost rate base. I believe that this sensitivity is still present, but the difficulty with estimating the sample companies' betas is making it impossible to detect. Second, as I noted earlier, Figure 3 above shows that the 60-month betas for the Canadian Utilities sample are still increasing from their lows of the "tech bubble" period. Note that using adjusted betas corrects only for the interest rate sensitivity of the companies and not for the expected increase in the risk of the sample companies. I note the expected increase in risk only because I believe that not using adjusted betas would risk underestimating the cost of equity for the sample companies for both reasons. I have adjusted for only one of the two reasons.

---

[43] This adjustment is part of the effort Dr. Kolbe and I are making in this proceeding to address the concerns the Board expressed in the RH-2-2004, Phase II decision and to be as conservative as possible in our judgments in implementing the cost of equity estimation models.

Although I use these adjusted betas in my analysis, I believe that these estimates of the relative risk of the Canadian Utilities sample are likely to be downward biased estimates of the risk of the sample companies because the period of turmoil in the market that resulted in low or negative beta estimates is still included in the estimation period. In other words, the unadjusted betas are likely to be too low for the sample.

d) Equity Risk Premium Results

Q73. What are the cost of equity and overall cost of capital estimates for the samples using the risk positioning approach?

A73. As noted earlier, I use the long-term risk-free rate in the two risk positioning models (CAPM and ECAPM) with two different values for the ECAPM parameter, α, (one and two percent) to produce three estimators for the cost of equity. Then I take the average across companies of these ATWACCs to produce three representative cost of capital estimates for the sample. The sample average ATWACC estimates for each estimation method are then used to determine the cost of equity estimates which are consistent with a deemed equity thickness for TQM of 40 percent and the market cost of debt.[44] I also report the deemed equity percentage that would be consistent with the samples' ATWACC estimates and the NEB's formula ROE. These estimates, along with each sample's representative ATWACC, are reported in Table 4 below. The table also reports analogous estimates for the Canadian Utilities sample, the Gas LDC sample and the MLP Pipelines sample.

Q74. Do you have any preliminary comments regarding the results of the risk positioning models?

[44] See Section II.B for a complete discussion of this procedure and its rationale.

A74. Yes. As shown above in Figures 3 and 4, betas measured in the standard way using 60 months of historical data declined to values very near to zero before recently beginning to recover toward more normal values. Ordinarily, using historical data to estimate beta is not a serious problem because the overall business risk of an industry probably does not change rapidly. For an industry undergoing major changes, however, the beta estimates based upon the historical data may not capture the full changes in risk in the industry. This is true even though information on the probability of change and the likely provisions of the industry changes has been available some months ago. The fall in the estimated betas for both the Gas LDC and Canadian Utilities samples estimated in the standard way might seem to be an unexpected result because the introduction of more competition in the natural gas and electric industries increases risk. However, such "decoupling" of beta from the normal relationship to the market appears to be a common feature of industries undergoing structural changes. This factor also suggests that the risk positioning estimates may be downward biased and is consistent with the information from the DCF model for the samples (see next section).

Table 4: Summary of Risk Positioning Results

2008 Tax Rate: 31.9%	CAPM	α = 1%	α = 2%
[1] **Canadian Utilities Sample**			
Cost of Equity at 40% Equity	10.0%	10.5%	11.0%
Equity Thickness at ROE of 8.46%	53%	57%	61%
Average ATWACC	6.3%	6.5%	6.7%
[2] **Gas LDC Sample**			
Full Sample			
Cost of Equity at 40% Equity	11.9%	12.4%	12.8%
Equity Thickness at ROE of 8.46%	70%	73%	77%
Average ATWACC	7.0%	7.2%	7.4%
Sub-Sample			
Cost of Equity at 40% Equity	11.6%	12.1%	12.5%
Equity Thickness at ROE of 8.46%	67%	71%	74%
Average ATWACC	6.9%	7.1%	7.3%
[3] **MLP Pipelines Sample**			
Full Sample			
Cost of Equity at 40% Equity	10.0%	11.0%	12.0%
Equity Thickness at ROE of 8.46%	53%	62%	70%
Average ATWACC	6.3%	6.7%	7.1%
Sub-Sample			
Cost of Equity at 40% Equity	9.9%	10.8%	11.7%
Equity Thickness at ROE of 8.46%	52%	60%	68%
Average ATWACC	6.2%	6.6%	7.0%
[4] Risk Positioning Parameters			
Risk-Free Rate Estimate:			5.00%
Estimated MRP:			5.75%

[1] See Table 1 for details on the Canadian utilities sample composition. Risk positioning results are from Table No. MJV-12.

[2] See Table 2 for details on the Gas LDC sample composition. Risk positioning results are from Table No. MJV-22.

[3] See Table 3 for details on the MLP pipelines sample composition. Risk positioning results are from Table No. MJV-28.

[4] See Appendix C for details on the risk positioning parameters used in the estimates.

Q75. What conclusions do you draw from the equity risk premium results?

A75. Of the equity risk premium results, the CAPM values deserve the least weight, because this method does not adjust for the empirical finding that the cost of capital is less sensitive to beta than predicted by the CAPM (which my written evidence considers by using the ECAPM). Conversely, the ECAPM numbers deserve the most weight, because this method adjusts for the empirical findings. For the Canadian Utilities sample, the estimates range for 10.0 percent to 11.0 percent compared to a range of 11.9 percent to 12.8 percent for the full Gas LDC sample and 11.6 percent to 12.5 percent for the Gas LDC sub-sample. For the sub-sample of MLP Pipelines with the greatest percentage of natural gas pipeline assets, the estimates range from a low of 9.9 percent to a high of 11.7 percent.

2. DCF Estimates

Q76. What steps do you take in your DCF analyses?

A76. The steps are to collect the data on current market value capital structures, prices, dividends, and growth forecasts. From these estimates, the sample companies' costs of equity are computed and used to determine the return on equity and the equity thickness consistent with the sample's estimated ATWACC and the NEB's current allowed ROE of 8.46 percent.

a) Growth Rates

Q77. What growth rate information do you use?

A77. For reasons discussed above and in Appendix D, historical growth rates today are not relevant as forecasts of current investor expectations for these samples. I therefore use forecasted rates.[45]

The ideal in a DCF application would be a detailed forecast of future dividends, year by year well into the future until a true steady state (constant) dividend growth rate was reached, based on a large sample of investment analysts' expectations. I know of no source of such data. Dividends are ultimately paid from earnings, however, and earnings forecasts from a number of analysts are available for a few years. Investors do not expect dividends to grow in lockstep with earnings, but for companies for which the DCF approach can be used reliably (*i.e.*, for relatively stable companies whose prices do not include the option-like values described in Appendix D), they do expect dividends to track earnings over the long-run. Thus, use of earnings growth rates as a proxy for expectations of dividend growth rates is a common practice.

Accordingly, the first step in my DCF analysis is to examine a sample of investment analysts' forecasted earnings growth rates from Bloomberg and from *Value Line* for companies in the Gas LDC sample. The details are in Appendix D. At present, the data run through the 2010-2012 horizon, which represents on average about a 4½ year forecast (from the 3rd quarter of 2007 to the end of 2011). The longest-horizon forecast growth rates from these sources underlie my simple DCF model (*i.e.*, the standard perpetual-growth model associated with the "DCF formula," dividend yield plus growth). Unfortunately, the longest growth forecast data only go out for a period of about five years, which is too short a period to make the DCF model completely reliable. I also use the five-year forecasts in conjunction with a forecast of the long-run GDP growth rate in

[45] I obtain growth rate forecasts from Bloomberg for the samples as well as from *Value Line* for the Gas LDC sample.

a modest attempt at obtaining a multistage DCF estimate using company-specific growth rates.

Q78. Do these growth rates correspond to the ideal you mentioned above?

A78. No. While forecasted growth rates are the quantity required in principle, the forecasts need to go far enough out into the future so that it is reasonable to believe that investors expect a stable growth path afterwards. As can be seen in Table No. MJV-5 for the Canadian Utilities sample and in Table No. MJV-16 for the Gas LDC sample, the growth rates estimates do not support the view that investors are expecting growth rates equal to the single perpetual growth rate assumed in the simple DCF model. There are also fewer analysts forecasting earnings for the companies in the Canadian Utilities sample on average than for the Gas LDC sample. The five-year growth rate forecasts vary from company to company, but the range for both samples is relatively narrow. The Canadian Utilities sample earnings growth forecasts range from a low of 6.3 percent forecast for Emera to a high of 8.1 percent forecast for TransCanada Corporation. The pattern is similar though a little wider for the Gas LDC sample, whose forecasts vary from 3.4 percent to 6.5 percent. However, in my opinion, a much longer detailed growth rate forecasts than currently available from Bloomberg and *Value Line* would be needed to implement the DCF model in a completely reliable way for these two samples at this time.

b) Dividend and Price Inputs

Q79. What values do you use for dividends and stock prices?

A79. Dividends are for the 3rd quarter of 2007, the last recorded dividend payment reported by Compustat at the time of the preparation of this evidence. This dividend is grown at the estimated growth rate and divided by the price described below to estimate the dividend yield for the simple DCF model.

Stock prices are an average of closing stock prices for the 15-day trading period ending August 28, 2007 for both the Canadian Utilities sample and for the Gas LDC sample. This date coincides with the date that the growth forecasts for the samples was extracted from Bloomberg. A 15-day stock price average is used to guard against anomalous price changes in any single day.

c) DCF Results

Q80. What are the DCF estimates for the samples?

A80. Following the procedures outlined earlier, simple and multistage DCF estimates of the cost of equity are obtained for the Canadian Utilities and the Gas LDC sample companies, and are presented in Table 5 below.[46] Because the analysts' 5-year growth rate forecasts are in general higher than the forecast growth rate for GDP, the simple DCF estimates are higher than the the multistage DCF estimates for both samples. For the Canadian Utilities sample, the multistage DCF estimate is 10.3 percent which is just slightly below the middle of the range of the risk positioning estimates for the sample. For the Gas LDC sample, the multistage cost estimate at 10.6 percent (and also 10.3 percent for the sub-sample) are about 150 bps lower than the risk positioning estimates.

Q81. What conclusions do you draw from the DCF analysis?

A81. The simple DCF model estimates that rely on company-specific growth rate forecasts are less reliable because the long-run growth rate forecast drives the results, and there are *no* objective data on the long-run growth rate investors truly expect, *nor* on when the industry is expected to settle down into some sort of stable-growth equilibrium. The ATWACC and cost of equity estimates that rely on the multistage DCF model are more

[46] See Section III.B of above and Appendix D for details of DCF estimation.

reliable because the long-term growth rate used in the analysis is the forecast growth rate for the economy.

Table 5: Summary of DCF Results

2008 Tax Rate: 31.9%	Simple	Multi Stage
[1] **Canadian Utilities Sample**		
Cost of Equity at 40% Equity	13.7%	10.3%
Equity Thickness at ROE of 8.46%	85%	56%
Average ATWACC	7.7%	6.4%
[2] **Gas LDC Sample**		
Full Sample		
Cost of Equity at 40% Equity	11.5%	10.6%
Equity Thickness at ROE of 8.46%	66%	58%
Average ATWACC	6.9%	6.5%
Sub-Sample		
Cost of Equity at 40% Equity	11.1%	10.3%
Equity Thickness at ROE of 8.46%	63%	56%
Average ATWACC	6.7%	6.4%
[3] Canadian GDP Growth Estimate:		4.14%

[1] See Table 1 for details on the Canadian utilities sample composition. Results are from Table No. MJV-8.
[2] See Table 2 for details on the Gas LDC sample composition. Results are from Table No. MJV-19.
[3] See Appendix D for details on the growth and other DCF parameters used in the estimates.

Although I do not believe one can rely heavily on the DCF estimates, I do believe they provide a useful check on the risk positioning results for both samples. In addition, because the forecast growth rates for the sample companies are more stable than they have been in the recent past, I believe that the simple DCF results for both the Canadian Utilities sample and the Gas LDC sample suggest that the risk positioning model

estimates for the Canadian Utilities sample are probably underestimated which is consistent with the evidence from the risk positioning model for the other samples.

V. CONCLUSIONS

Q82. Please summarize the evidence from the samples regarding the return on equity and deemed equity component that is consistent with the ATWACC evidence from the samples.

A82. Based on the cost of equity estimates displayed in Tables 4 and 5 above, the best estimate of the cost of equity for a deemed equity thickness of 40 percent is 10½ percent with a range of 10 percent to 11 percent for the Canadian Utilities sample. This estimate is only slightly higher than the multistage DCF estimate of 10.3, but it is substantially less than the simple DCF estimate of 13.7 percent. The corresponding estimate of the equity thickness at the NEB allowed ROE is about 57½ percent.

For the Gas LDC sample, the point estimate is 12 percent with a range of 11½ to 12½ percent. This estimate is based on the more reliable sub-sample than on the higher risk positioning estimates from the full Gas LDC sample. As noted earlier, the DCF estimates for the Gas LDC sample are lower than this estimate. The corresponding estimate of the equity thickness at the NEB allowed ROE is about 70 percent.

For the MLP Pipelines sample, the point estimate is 10¾ percent with a range of 10¼ to 11¼ percent, but I believe that this estimate is conservative because of the difficulty of estimating the market value of the GP share of the equity. It is highly likely that the market value (as well as the risk) of the GP shares exceeds the estimate I have used in determining the sample's results. Although I have attempted to addressed this issue in my calculations, I believe that the overall cost of capital estimates for this sample represent a floor as opposed to a midpoint of the likely range of the cost of capital for the

sample. The corresponding estimate of the equity thickness at the NEB allowed ROE is about 60 percent.

Note that in estimating the samples' returns on equity, I round to the nearest ¼ percent because I do not believe that cost of capital estimates can be made more precisely than that.

Q83. What is the cost of equity that you estimate for TQM based upon its relative risk compared to the samples?

A83. Dr. Kolbe interprets these results in relation to TQM's risk and provides a recommended cost of equity and corresponding deemed equity thickness in his written evidence.

Q84. Does this conclude your written evidence?

A84. Yes, it does.

APPENDIX A: QUALIFICATIONS OF MICHAEL J. VILBERT

APPENDIX B: SAMPLE SELECTION

APPENDIX C: RISK POSITIONING APPROACH METHODOLOGY: DETAILED PRINCIPLES AND RESULTS

APPENDIX D: DISCOUNTED CASH FLOW METHODOLOGY: DETAILED PRINCIPLES AND RESULTS

APPENDIX A

QUALIFICATIONS OF MICHAEL J. VILBERT

Michael Vilbert is an expert in cost of capital, financial planning and valuation who has advised clients on these matters in the context of a wide variety of investment and regulatory decisions. He received his Ph.D. in Financial Economics from the Wharton School of the University of Pennsylvania, an MBA from the University of Utah, an M.S. from the Fletcher School of Law and Diplomacy, Tufts University, and a B.S. degree from the United States Air Force Academy. He joined *The Brattle Group* in 1994 after a career as an Air Force officer, where he served as a fighter pilot, intelligence officer, and professor of finance at the Air Force Academy.

REPRESENTATIVE CONSULTING EXPERIENCE

- In a securities fraud case, Dr. Vilbert designed and created a model to value the private placement stock of a drug store chain as if there had been full disclosure of the actual financial condition of the firm. He analyzed key financial data and security analysts' reports regarding the future of the industry in order to recreate pro forma balance sheet and income statements under a variety of scenarios designed to establish the value of the firm.

- For pharmaceutical companies rebutting price-fixing claims in antitrust litigation, Dr. Vilbert was a member of a team that prepared a comprehensive analysis of industry profitability. The analysis replicated, tested and critiqued the major recent analyses of drug costs, risks and returns. The analyses helped develop expert witness testimony to rebut allegations of excess profits.

- For an independent electric power producer, Dr. Vilbert created a model that analyzed the reasonableness of rates and costs filed by a natural gas pipeline. The model not only duplicated the pipeline's rates, but it also allowed simulation of a variety of "what if" scenarios associated with cost recovery under alternative time patterns and joint cost allocations. Results of the analysis were adopted by the intervenor group for negotiation with the pipeline.

- For the CFO of an electric utility, Dr. Vilbert developed the valuation model used to support a stranded cost estimation filing. The case involved a conflict between two utilities over the responsibility for out-of-market costs associated with a power purchase contract between them. In addition, he advised and analyzed cost recovery mechanisms that would allow full recovery of the stranded costs while providing a rate reduction for the company's rate payers.

- Dr. Vilbert has prepared testimony as well as assisted in the preparation of testimony and the development of estimation models in numerous cost of capital cases for natural gas pipeline, water utility and electric utility clients before the Federal Energy Regulatory Commission ("FERC") and state regulatory commissions. These have spanned standard estimation techniques (e.g., Discounted Cash Flow and Risk Positioning models). He has also developed and applied more advanced models specific to the industries or lines of business in question, *e.g.*, based on the structure and risk characteristics of cash flows, or based on multi-factor models that better characterize regulated industries.

- Dr. Vilbert has valued several large, residual oil-fired generating stations to evaluate the possible conversion to natural gas or other fuels. In these analyses, the expected pre- and post-conversion station values were computed using a range of market electricity and fuel cost conditions.

- For a major western electric utility, Dr. Vilbert helped prepare testimony that analyzed the prudence of QF contract enforcement. The testimony demonstrated that the utility had not been compensated in its allowed cost of capital for a major disallowance stemming from QF contract management.

- Dr. Vilbert analyzed the economic need for a major natural gas pipeline expansion to the Midwest. This involved evaluating forecasts of natural gas use in various regions of the United States and the effect of additional supplies on the pattern of natural gas pipeline use. The analysis was used to justify the expansion before the FERC and the National Energy Board of Canada.

- For a Public Utility Commission in the Northeast, Dr. Vilbert analyzed the auction of an electric utility's purchase power agreements to determine whether the outcome of the auction was in the ratepayers' interest. The work involved the analysis of the auction procedures as well as the benefits to ratepayers of transferring risk of the PPA payments to the buyer.

- Dr. Vilbert led a team tasked to determine whether bridge tolls were "just and reasonable" for a non-profit port authority. Determination of the cost of service for the authority required estimation of the value of the authority's assets using the trended original cost methodology as well as evaluation of the operations and maintenance budgets. Investment costs, bridge traffic information and inflation indices covering a 75 year period were utilized to estimate the value of four bridges and a passenger transit line valued in excess of $1 billion.

- Dr. Vilbert helped a recently privatized railroad in Brazil develop an estimate of its revenue requirements, including a determination of the railroad's cost of capital. He also helped evaluate alternative rate structures designed to provide economic incentives to shippers as well as to the railroad for improved service. This involved the explanation and analysis of the contribution margin of numerous shipper products, improved cost analysis and evaluation of bottlenecks in the system.

- For a utility in the Southeast, Dr. Vilbert quantified the company's stranded costs under several legislative electric restructuring scenarios. This involved the evaluation of all of the company's fossil and nuclear generating units, its contracts with Qualifying Facilities and the prudence of those QF contracts. He provided analysis concerning the impact of securitizing the company's stranded costs as a means of reducing the cost to the rate payers and several alternative designs for recovering stranded costs.

- For a recently privatized electric utility in Australia, Dr. Vilbert evaluated the proposed regulatory scheme of the Australian Competition and Consumer Commission for the company's electric transmission system. The evaluation

highlighted the elements of the proposed regulation which would impose uncompensated asymmetric risks on the company and the need to either eliminate the asymmetry in risk or provide additional compensation so that the company could expect to earn its cost of capital.

- For an electric utility in the Southwest, Dr. Vilbert helped design and create a model to estimate the stranded costs of the company's portfolio of Qualifying Facilities and Power Purchase contracts. This exercise was complicated by the many variations in the provisions of the contracts that required modeling in order to capture the effect of changes in either the performance of the plants or in the estimated market price of electricity.

- Dr. Vilbert helped prepare the testimony responding to a FERC request for further comments on the appropriate return on equity for electric transmission facilities. In addition, Dr. Vilbert was a member of the team that made a presentation to the FERC staff on the expected risks of the unbundled electric transmission line of business.

- Dr. Vilbert and Mr. Frank C. Graves, also of *The Brattle Group*, prepared testimony evaluating an innovative Canadian stranded cost recovery procedure involving the auctioning of the output of the province's electric generation plants instead of the plants themselves. The evaluation required the analysis of the terms and conditions of the long-term contracts specifying the revenue requirements of the plants for their entire forecasted remaining economic life and required an estimate of the cost of capital for the plant owners under this new stranded cost recovery concept.

- Dr. Vilbert served as the neutral arbitrator for the valuation of a petroleum products tanker. The valuation required analysis of the Jones Act tanker market and the supply and demand balance of the available U.S. constructed tanker fleet.

TESTIMONY

Direct and rebuttal testimony before the Alberta Energy and Utilities Board on behalf of TransAlta Utilities Corporation in the matter of an application for approval of its 1999 and 2000 generation tariff, transmission tariff, and distribution revenue requirement, October 1998.

Direct testimony before the Federal Energy Regulatory Commission on behalf of Central Maine Power in Docket No. ER00-982-000, December 1999.

Direct testimony before the Alberta Energy and Utilities Board on behalf of TransAlta Utilities Corporation for approval of its 2001 transmission tariff, May 2000.

Direct testimony before the Federal Energy Regulatory Commission on behalf of Mississippi River Transmission Corporation in Docket No. RP01-292-000, March 2001.

Written evidence, rebuttal, reply and further reply before the National Energy Board in the matter of an application by TransCanada PipeLines Limited for orders pursuant to Part I and Part IV of the *National Energy Board Act*, Order AO-1-RH-4-2001, May 2001, Nov. 2001, Feb. 2002.

Written evidence before the Public Utility Board on behalf of Newfoundland & Labrador Hydro - Rate Hearings, October 2001.

Direct testimony (with William Lindsay) before the Federal Energy Regulatory Commission on behalf of DTE East China, LLC in Docket No. ER02-1599-000, April 2002.

Direct and rebuttal reports before the Arbitration Panel in the arbitration of stranded costs for the City of Casselberry, FL, Case No. 00-CA-1107-16-L, July 2002.

Direct reports before the Arbitration Board for Petroleum products trade in the Arbitration of the Military Sealift Command vs. Household Commercial Financial Services, fair value of sale of the Darnell, October 2002.

Direct testimony and hearing before the Arbitration Panel in the arbitration of stranded costs for the City of Winter Park, FL, In the Circuit Court of the Ninth Judicial Circuit in and for Orange County, FL, Case No. C1-01-4558-39, December 2002.

Direct testimony before the Federal Energy Regulatory Commission on behalf of Florida Power Corporation, dba Progress Energy Florida, Inc. in Docket No. SC03-1-000, March 2003.

Direct report before the Arbitration Panel in the arbitration of stranded costs for the Town of Belleair, FL, Case No. 000-6487-C1-007, April 2003.

Direct and rebuttal reports before the Alberta Energy and Utilities Board in the matter of the Alberta Energy and Utilities Board Act, R.S.A. 2000, c. A-17, and the Regulations under it; in the matter of the Gas Utilities Act, R.S.A. 2000, c. G-5, and the Regulations under it; in the matter of the Public utilities Board Act, R.S.A. 2000, c. P-45, as amended, and the Regulations under it; and in the matter

of Alberta Energy and Utilities Generic Cost of Capital Hearing, Proceeding No. 1271597, July 2003, November 2003.

Written evidence before the National Energy Board in the matter of the National Energy Board Act, R.S.C. 1985, c. N–7, as amended, (Act) and the Regulations made under it; and in the matter of an application by TransCanada PipeLines Limited for orders pursuant to Part IV of the *National Energy Board Act*, for approval of Mainline Tolls for 2004, RH-2-2004, January 2004.

Direct and rebuttal testimony before the Public Service Commission of West Virginia, on Cost of Capital for West Virginia-American Water Company, Case No 04-0373-W-42T, May 2004.

Direct and rebuttal testimony before the Federal Energy Regulatory Commission on Energy Allocation of Debt Cost for Incremental Shipping Rates for Edison Mission Energy, Docket No. RP04-274-000, December 2004 and March 2005.

Direct testimony before the Arizona Corporation Commission, Cost of Capital for Paradise Valley Water Company, a subsidiary of Arizona-American Water Company, Docket No. WS-01303A-05, May 2005.

Written evidence before the Ontario Energy Board, Cost of Capital for Union Gas Limited, Inc., Docket No. EB-2005-0520, January 2006.

Direct and rebuttal testimony before the Pennsylvania Public Utility Commission, Return on Equity for Metropolitan Edison Company, Docket No. R-00061366 and Pennsylvania Electric Company, Docket No. R-00061367, April 2006 and August 2006.

Expert report in the United States Tax Court, Docket No. 21309-05, 34th Street Partners, DH Petersburg Investment, LLC and Mid-Atlantic Finance, Partners Other than the Tax Matters Partner, Petitioner, v. Commissioner of Internal Revenue, Respondent, July 28, 2006.

Direct and supplemental testimony before the Federal Energy Regulatory Commission, Docket No. ER06-427-003, on behalf of Mystic Development, LLC on the Cost of Capital for Mystic 8 and 9

Generating Plants Operating Under Reliability Must Run Contract, August 2006 and September 2006.

Direct testimony before the Federal Energy Regulatory Commission, Docket No. ER07-46-000, on behalf of Northwestern Energy Corporation on the Cost of Capital for Transmission Assets, October 2006.

Direct and rebuttal testimony before the Tennessee Regulatory Authority, Case No. 06-00290, on behalf of Tennessee American Water Company, on the Cost of Capital, November 2006 and April 2007.

Direct and rebuttal testimony before the Public Service Commission of Wisconsin, Docket No. 5-UR-103, on behalf of Wisconsin Energy Corporation, on the Cost of Capital for Wisconsin Electric Power Company and Wisconsin Gas LLC, May 2007 and October 2007.

Rebuttal testimony before the California Public Utilities Commission, Docket No. A. 07-01-036-39, on behalf of California-American Water Company, on the Cost of Capital, May 2007.

Direct and rebuttal testimony before the Public Utilities Commission of the State of South Dakota, Docket No. NG-07-013, on behalf of NorthWestern Corporation, on the Cost of Capital for NorthWestern Energy Company's natural gas operations in South Dakota, June 2007 and November 2007.

Direct testimony before the Public Utilities Commission of Ohio, Case No. 07-551-EL-AIR, Case No. 07-552-EL-ATA, Case No. 07-553-EL-AAM, and Case No. 07-554-EL-UNC, on behalf of Ohio Edison Company, The Toledo Edison Company, and The Cleveland Electric Illuminating Company, on the rate of return for the FirstEnergy Company's Ohio electric distribution utilities, June 2007.

Direct testimony before the State Corporation Commission of Virginia, Case No. PUE-2007-00066, on behalf of Virginia Electric and Power Company on the cost of capital for its southwest Virginia coal plant, July 2007.

Direct testimony before the Public Utilities Commission of Ohio, Case No. 07-829-GA-AIR, Case No. 07-830-GA-ALT, and Case No. 07-831-GA-AAM, on behalf of Dominion East Ohio Company, on the rate of return for Dominion East Ohio's natural gas distribution operations, September 2007.

Direct testimony before the Federal Energy Regulatory Commission, Docket No. ER08- -000, on behalf of Virginia Electric and Power Company, on the Cost of Capital for Transmission Assets, October 2007.

Direct and rebuttal testimony before the California Public Utilities Commission, Docket No. A. 07-01-22, on behalf of California-American Water Company, on the Effect of a Water Revenue Adjustment Mechanism on the Cost of Capital, October 2007 and November 2007.

Appendix B

SAMPLE SELECTION

TABLE OF CONTENTS

I. THE CANADIAN UTILITIES SAMPLE B-1

II. THE GAS LDC SAMPLE B-4

III. THE MLP PIPELINES SAMPLE B-7

Appendix B

SAMPLE SELECTION

Q1. What is the purpose of this appendix?

A1. This appendix describes the sample selection procedure for forming the proxy groups and discusses their inter-relationships and limitations. The ideal sample would be a sample of Canadian regulated natural gas pipelines, but such a sample does not exist so I must rely upon other samples. Specifically, I examine the cost of capital for samples of Canadian Utilities, U.S. Gas local distribution companies ("Gas LDCs") and U.S. master limited partnerships ("MLPs") concentrated in the pipeline industry. Each sample is discussed below.

I. THE CANADIAN UTILITIES SAMPLE

Q2. How do you select the Canadian Utilities sample?

A2. The goal of the selection process for this sample is to create a sample of companies whose primary business is as a regulated utility in Canada with business risk generally similar to that of TQM.

To construct this sample, I started with the universe of Canadian companies classified as being in the utilities or energy industry group and categorized as either Electric, Gas, or Pipelines by FPInfomart.[1] I further restricted the sample to those companies that were listed in the FP500 Sales category which eliminated a number of smaller companies. I further eliminated companies without a Bloomberg ticker. This provided a sample of thirteen companies. I then applied additional selection criteria designed to narrow the sample to companies with characteristics similar to that of TQM. I also eliminated companies with unique circumstances which may bias the cost of capital estimates.

[1] The information was extracted in July 2007 from www.fpinformart.ca.

Q3. What are the additional selection criteria you applied?

A3. I eliminated all companies not traded on the Toronto Stock Exchange and companies with a high probability of financial distress.[2] Financial distress is measured by a bond rating of less than BBB-, which is the lowest investment grade credit rating.[3]

Finally, I eliminated companies whose 2006 total revenues were less than $300 million to avoid problems associated with small companies such as thin trading and size effects. Table No. MJV-2 reports whether a company's assets are primarily regulated, mostly regulated, or not regulated.[4] No companies were eliminated for having too low a percentage of regulated assets.

Q4. Why would you normally eliminate companies currently involved in a relatively large merger or acquisition from your sample?

A4. The stock prices of companies involved in mergers are often more affected by news relating to the merger than to movements in the stock market. In other words, the stock price begins to "decouple" from its normal relationship to the stock market (the economy) which is the basis upon which a company's cost of capital is calculated. Instead the stock price of a merger candidate is more affected by the latest speculation on the terms and probability of the merger. Merger activity by many of the remaining Canadian companies (though not necessarily large in relative terms) is another reason why I feel other sample groups should be considered as a cross-check on the Canadian sample results.

---

[2] Usually, I would also eliminate companies that had dividend cuts during the relevant period. In this case, there are no companies eliminated for this reason.

[3] Credit ratings and associated yields were obtained from Bloomberg on August 28, 2007.

[4] I estimate the approximate percentage of each company's assets that are devoted to regulated activities and deem companies for which more than 80% of assets are regulated to be Regulated while companies with 50 to 79 percent regulated assets are Mostly Regulated, and companies who have less than 50 percent regulated assets are deemed Non-Regulated. For the MLP Pipelines sample the percentage of property, plant and equipment was used to be consistent with the information presented in Dr. Carpenter's Written Evidence.

Q5. What companies were eliminated because they do not trade on the Toronto Stock Exchange or due to lack of data?

A5. Hydro-Québec, British Columbia Hydro and Power Authority, Saskatchewan power Corporation, and, Union Gas Limited. No company trading on the Toronto Stock Exchange lacks data.

Q6. Were companies eliminated from the Canadian Utilities sample due to the magnitude of their annual revenues?

A6. Yes, Boralex Inc. and Pacific Northern Gas LTD all had 2006 revenues significantly below $300 million.

Q7. Were any other companies eliminated from the Canadian Utilities sample?

A7. Yes. To avoid double counting ATCO LTD was dropped because it belongs to the same group as Canadian Utilities. TransAlta was eliminated due to divestiture of its transmission assets. Lastly, I did not consider income funds for my sample. Not only is the procedure for reliably estimating their cost of capital complex at best, the tumultuous path they have experienced since the Federal government's announcement to alter their tax status in October 2006 makes them unsuitable candidates.

Q8. What companies constitute the Canadian Utilities sample?

A8. The final sample is comprised of five companies (Canadian Utilities, Emera, Enbridge, TransCanada, and Fortis).

Q9. Do you have any remaining concerns with the final sample?

A9. Unfortunately, these remaining companies have other issues which raise concerns. For example, several companies have non-regulated activities and assets. In addition, several companies have recently engaged in acquisition activities. For example, TransCanada acquired ANR Pipeline in February 2007 and thereby added a substantial amount to its

pipeline assets.[5] Similarly, Fortis Inc. acquired Terasen Gas in May 2007.[6] For these reasons, it is my opinion that additional samples are necessary to provide a more reliable estimate of the Company's cost of capital and its fair return on equity.

II. THE GAS LDC SAMPLE

Q10. How do you select the Gas LDC sample?

A10. To select this sample, I started with the universe of publicly traded natural gas distribution utilities covered by Value Line Investment Survey Plus. This resulted in an initial group of 23 companies, to which I added Vectren Corporation because it is often viewed as a natural gas LDC. Vectren is involved in both gas and electric distribution activities, but more of its regulated assets are invested in the gas distribution operations.[7] This company is also covered by Value Line, but is classified as an Electric Utility due to its regulated electric operations. I then eliminated companies by applying additional selection criteria designed to remove companies with unique circumstances which may bias the cost of capital estimates. The final sample consists of ten gas LDCs, from which I also consider a sub-sample of five companies with the fewest reliability concerns. Table No. MJV-13 reports the classification of the gas LDCs in my Gas LDC sample.

Q11. What are the other selection criteria you applied?

A11. I applied my standard criteria to narrow the sample to those companies likely to have reliable cost of equity estimates. Specifically, I eliminated all companies whose S&P bond rating as reported by Bloomberg was not investment grade, i.e., less than BBB-. To

---

[5] TransCanada Press Release, February 22, 2007.

[6] Fortis Inc. Press Release, May 17, 2007.

[7] Vectren Utility Holdings, Inc.'s 2006 10K reveals that about 57 percent of its assets are regulated natural gas distribution assets and 37 percent are regulated electric assets. Because it has a substantial amount of regulated electric activity, I exclude it from the sub-sample of companies I consider to be the most representative of the natural gas distribution line of business and to be most free of characteristics that may bias cost of equity estimates.

guard against measurement bias caused by "thin trading," I also restricted the sample to companies with total operating revenues greater than $300 million (USD) in 2006 as reported by Bloomberg.[8] Companies with a large merger during the period January 2004 to August 2007 (i.e. the past three and a half years) were also generally removed from the sample, although two companies which would otherwise not survive the process were included since their primary merger activity occurred in 2004. These two companies were Atmos Energy and AGL Resources, and they were subsequently excluded from a sub-sample of cleanest companies I also considered as part of my analysis. The screen for merger activity was primarily done by scanning each company's news history on Bloomberg and a search of company web pages.[9]

Q12. Please elaborate on how companies were eliminated.

A12. Six companies were immediately eliminated due to a lack of long-term earnings per share ("EPS") growth rate estimates from Bloomberg. Of these, five also experienced dividend cuts and had either no bond rating or were rated less than BBB-. From the remaining companies, three were not rated and one had a rating of B+. Keyspan Corp. was eliminated for high levels of merger and acquisition activity ("M&A") and recent dividend cuts. UGI Corp. was removed for high levels of merger activity, and because it primarily sells propane which is not regulated. Southern Union was eliminated for its unusually high levels of M&A activity. Nicor Inc. was eliminated from the sample because it restated earnings for 1999-2001 and because it settled regulatory compliance issues with the Federal Energy Regulatory Commission ("FERC") in 2003.[10]

Q13. Are there any issues with the remaining companies in your sample?

---

[8] Data from Bloomberg was as of August 28, 2007.

[9] This was done in August 2007.

[10] Nicor announced on October 29, 2002 that its earnings for 1999-2001 would be revised downwards by $15-$35 million. March 4, 2003, Nicor released its restated earnings for 1999-2001 along with 2002 earnings.

A13. Perhaps. Several companies in the sample engage in natural gas marketing activities or other non-regulated activities.[11,12] Given the turmoil of the energy trading markets, the companies' cost of capital estimates may be more volatile than those of more stable companies. Although still investment grade, Southwest Gas is at the bottom of the scale of investment grade credit ratings and has a relatively low average equity thickness over the past five years – 41 percent compared an average of 60 percent for the sample.[13] Closer investigation shows that Southwest Gas's capital structure has been shifting rapidly towards equity over the last five years, with a level of about 50 percent over the most recent two years. These factors suggest a potential reliability problem for estimates of this company's cost of capital at this time. The Laclede Group's market cap of about $685 million is a bit smaller than the average of the group and in 2006 the company reported significant income from non-regulated activities.[14] In 2006, Piedmont Natural Gas restated some portions of its 2003-2005 financial reports. Although this can generally lead to less reliable estimates from the equity estimation models, the restatements were not caused by fraudulent activities but were due to an accounting error in the classification of hedging amounts. This type of reclassification would not be expected to change the value of the firm and prices did not show any erratic behavior in the period surrounding the announcement of this reclassification. A potential concern for the DCF estimates is that the industry has experienced a sustained level of merger and acquisition activity over the last five years that has implications for the stability of the industry necessary for the reliable application of the DCF model. Due to the concerns with the sample, I also report the results for a sub-sample of the gas LDC sample that consists of companies with no material data issues.

---

[11] See Attachment C to the Written Evidence of Dr. Carpenter for a description of each sample company.

[12] The percentages of regulated assets calculated for the samples are only estimates due to data reporting limitations.

[13] See Table No. MJV-15 and Workpaper #1 to Table No. MJV-15.

[14] See Attachment C to the Written Evidence of Dr. Carpenter.

III. THE MLP PIPELINES SAMPLE

Q14. How do you select the MLP Pipelines sample?

A14. The Master Limited Partnerships Pipelines ("MLP Pipelines") sample was selected by searching the Dividend Detective and the Publicly Traded Partnerships (PTP) websites.[15] Forty-nine companies were listed as owning pipelines. Of those forty-nine, eight had less than investment grade bond ratings, twenty six had no investment rating, one had mergers and acquisitions of over 100% of market capitalization, and four had distribution cuts. Of the ten remaining MLPs, four were strictly oil companies. The six remaining are Boardwalk Pipeline Partners, Kinder Morgan Energy Partners, TC Pipelines, Oneok Partners, Enbridge Energy Partners, and Enterprise Products Partners. Boardwalk Pipelines Partners only has two years of data in Bloomberg, while the rest have a full five years. All of the companies had a BBB debt rating, except for TC Pipelines which is A-rated. Because this sample is already small, Oneok Partners despite their merger and acquisition activity of 56% market capitalization, was not excluded.

Q15. Did you consider broadening the sample with other utility related MLPs?

A15. Yes. The addition of TEPPCO Partners, Buckeye Partners, NuStar Energy, and Sunoco Logistics Partners was considered, but a majority of their business comes from oil pipelines. Hence, I deemed it to be less representative of a natural gas pipeline in Canada.

Q16. Are there any issues with the remaining companies in this sample?

A16. Yes. Of these six companies, only Boardwalk Pipeline Partners, Oneok Partners, and TC Pipelines conduct a significant amount of business in the natural gas pipeline sector. Kinder Morgan Energy Partners, Enbridge Energy Partners, and Enterprise Products Partners have mixed operations in both crude oil pipelines and natural gas pipelines. Additionally, in recent years several of the companies have expanded their non-regulated

[15] Found at *www.dividenddetective.com* and *www.naptp.org* respectively.

activities, so that less than 50 percent of Oneok Partners' and Kinder Morgan Energy Partners' consolidated property, plant and equipment is regulated as of year-end 2006. However, in the past both companies have had additional regulated property, plant and equipment and now have additional off-balance sheet regulated assets. Therefore, I keep these companies in my sample of MLP Pipelines.

Q17. Above, you commented on data issues for the Canadian Utilities sample. Does the MLP Pipelines sample have data issues?

A17. Yes. There are several data issues with the sample. One company, Boardwalk Energy Partners, has only a about two years of data. The company does not have a *Value Line* beta estimate, so I relied on Bloomberg's estimate. In 2006 Oneok Partners sold part of its pipeline assets, including part of its interest in Northern Border Pipeline and no longer consolidates the pipeline in its financial statements.[16] Similarly, TC Pipelines does not consolidate its holdings in Northern Border Pipeline or Tuscarora Gas Transmission,[17] but accounts for these assets using the equity method of accounting. As noted in my written evidence, I make an adjustment to ensure that the capital structures reflect the debt of these particular equity investments. Further, as also noted, the MLP Pipelines sample companies generally do not disclose information about the fair value of their debt, so I approximated the difference between the fair value and the book value using the Gas LDC sample's ratio of market value to book value of debt. Moreover, two companies, Oneok Partners and Kinder-Morgan Energy Partners appear to have begun investing in non-regulated assets such as gathering systems, natural gas liquids and other energy assets.[18] These factors are described in more detail in my written evidence. Table 3 in my written evidence summarizes the sample's characteristics.

III. COST OF CAPITAL ESTIMATES C-11

Empirical Evidence on the Alpha Factor in ECAPM C-14

Appendix C

RISK POSITIONING APPROACH METHODOLOGY: DETAILED PRINCIPLES AND RESULTS

Q1. What is the purpose of this appendix?

A1. This appendix describes the estimation of the parameters used in the equity risk premium models and the details of the cost of capital estimates obtained from this methodology.

I. RISK-FREE INTEREST RATE FORECAST

Q2. How do you obtain the forecasts of the risk-free interest rate?

A2. I rely on interest rate forecasts from Consensus Economics Inc., a London-based forecast survey firm which provides forecasts of interest rates, inflation rates and other economic indicators for many countries worldwide. In particular, I use the August 13, 2007 *Consensus Forecasts* which forecasts a 4.80 percent yield for the 10-year Canadian Government bonds for the year ending August 2008.[1]

I add a maturity premium of 20 basis points to the 10-year bond yield forecast to adjust the forecast to the average maturity of the long-term bond yields used to estimate the long-term MRP. The bond maturity premium represents the extra return investors demand for tying up their money for longer periods. The addition of the maturity premium is necessary for consistency so that the average bond maturities in the data used to estimate the long-term market risk premium correspond to the maturity of the benchmark for the long-term risk free rate.[2] The addition of the maturity premium provides a yield forecast for Canadian bonds with 15 to 18 years of maturity.

---

[1] See *Consensus Forecasts*, Survey Date, August 13, 2007 published by Consensus Economics, Inc.

[2] The 20 basis point addition is a conservative estimate of the premium that investors require to hold bonds with a maturity of 15-18 years instead of bonds with a maturity of 10 years. The estimate is derived from a yield curve constructed from the historical average maturity premiums of Canadian Government bonds from 1951 through 2006 for bonds with five different average maturities (See Workpaper #3 to Table No. MJV-9).

Q4. What value do you use for the long-term risk-free interest rate in the risk positioning models?

A4. I use a value of 5.0 percent for the long-term risk-free interest rate as the benchmark interest rates in the equity risk premium analyses.

II. MARKET RISK PREMIUM ESTIMATION

Q5. How do you estimate the MRP?

A5. There is presently little consensus on "best practice" for estimating the MRP (which is not the same thing as saying that all practices are equally good). For example, the latest edition of the leading U.S. graduate textbook in corporate finance, after recommending use of the arithmetic average realized excess return on the market for many years (which for a while was noticeably over 9 percent in the U.S.), reviews the current state of the research and expresses the view that a range between 5.0 to 8.0 percent (short-term MRP) is reasonable for the U.S.[3,4]

A top selling text in corporate finance in Canada calculates the average arithmetic market risk premium in Canada to be 6.53 percent over the period 1948-2003 but only 3.84 percent for the period 1957 to 2003.[5] The authors conclude by suggesting that a (short-term) MRP "of around 4 percent is a quite reasonable prediction for the equity MRP in Canada looking to the future. However, we do have to acknowledge that this remains a controversial issue about which experts disagree."[6]

[6] *Ibid.*, p. 282.

My written evidence considers both the historical evidence and the results of scholarly studies of the factors that affect the risk premium for average-risk stocks in order to estimate the benchmark risk premium investors currently expect. I consider the historical differences between the S&P/TSX Composite Index[7] ("S&P/TSX") and the risk-free rate for the Canadian market risk premium, historical differences between the Standard & Poor's 500 ("S&P 500") and the risk-free rate for the U.S. market risk premium, and the relationship between the market returns in Canada and in the U.S. Finally, I reviewed Ibbotson Associates discussion on the "International Cost of Capital" in the *SBBI: Valuation Edition 2007 Yearbook*.[8] The international cost of equity models reviewed in Ibbotson result in estimates of the Canadian MRP that are greater than the MRP in the U.S. rather than less as is the result based upon historical realized returns.

Q6. Please summarize the recent literature on the MRP and the conclusions you draw from it?

A6. Research based upon U.S. data challenges the conventional wisdom of using arithmetic average historical excess returns to estimate the MRP. However, after reviewing the issues in the debate, I remain skeptical for several reasons that the market risk premium has declined substantially in the U.S. or in Canada.

First, despite eye-catching claims like "equity risk premium as low as three percent,"[9] and "the death of the risk premium,"[10] not all recent research arrives at the same conclusion. In his presidential address to the American Finance Association in

---

[7] Prior to May 1, 2002 the key index on the Toronto Stock Exchange was the TSE 300 composite index ("TSE 300") which was always composed of 300 companies. The index was replaced by the S&P/TSX composite index on May 1, 2002. The number of companies in the latter index is not fixed but consists of those companies that meet Standard & Poor's inclusion criteria.

[8] See *SBBI: Valuation Edition 2007 Yearbook*, pp. 175-184.

[10] Arnott, R. and R. Ryan, (2001), "The Death of the Risk Premium," *Journal of Portfolio Management* 27(3):61-84.

2001, Professor Constantinides seeks to estimate the unconditional equity premium based on average historical stock returns.[11] (Note that this address was based upon evidence just before the major fall in market value.) He adjusts the average returns downward by the change in price-earnings ratio because he assumes no change in valuations in an unconditional state. His estimates for 1926 to 2000 and 1951 to 2000 are 8.0 percent and 6.0 percent, respectively, over the 3-month T-bill rate. In another published study in 2001, Professors Harris and Marston use the DCF method to estimate the market risk premium for the U.S. stocks.[12] Using analysts' forecasts to proxy for investors' expectation, they conclude that over the period 1982-1998 the MRP over the **long-term risk-free rate** is 7.14 percent. As yet another example, the paper by Drs. Ibbotson and Chen (2003) adopts a supply side approach to estimate the forward looking long-term sustainable equity returns and equity risk premium based upon economic fundamentals. Their equity risk premium **over the long-term risk-free rate** is estimated to be 3.97% in geometric terms and 5.90% on an arithmetic basis. They conclude their paper by stating that their estimate of the equity risk premium is "far closer to the historical premium than being zero or negative."[13] It is also noteworthy that the most recent edition of Ibbotson Associates' annual yearbook updates this study with more recent data and estimate an MRP of 6.35 percent.[14]

Second, Professor Ivo Welch surveyed a large group of financial economists in 1998 and 1999. The average of the estimated MRP was 7.1 percent in Prof. Welch's first survey[15] and 6.7 percent in his second survey which was based on a smaller number of

individuals. However, a more recent survey by Prof. Welch reported only a 5.5 percent MRP.[16] In characterizing these results Prof. Welch notes that "[T]he equity premium consensus forecast of finance and economics professors seems to have dropped during the last 2 to 3 years, a period with low realized equity premia."[17]

The above quotation from Prof. Welch emphasizes the caution that must attend survey data even from knowledgeable survey participants: the outcome is likely to change quickly with changing market circumstances. Regulators should not, in my opinion, attempt to keep pace with such rapidly changing opinions.

Third, some of the evidence for negative or close to zero market risk premium simply does not make sense. Despite relatively high valuation levels, stock returns remain much more volatile than Treasury bond returns. I am not aware of any empirical or theoretical evidence showing that investors would rationally hold equities and not expect to earn a positive risk premium for bearing the risk.

Fourth, I am unaware of a convincing theory for why the future MRP should have substantially declined. At the height of the stock market bubble in the U.S. and Canada, many claimed that the only way to justify the high stock prices would be if the MRP had declined dramatically,[18] but this argument is heard less frequently now that the market has declined substantially. All else equal, a high valuation ratio such as price-earnings ratio implies a low required rate of return, hence a low MRP. However, there is considerable debate about whether the high level of stock prices (despite the burst of the internet bubble in the last couple of years) represents the transition to a new economy or is simply an "irrational exuberance," which cannot be sustained for the long term. If the former case is true, then the MRP may have decreased permanently. Conversely, the long-run MRP may remain the same even if expected market returns in the short-term are smaller.

[16] Ivo Welch, 2001, "The Equity Premium Consensus Forecast Revisited," School of Management at Yale University working paper. The cited figure is in Table 2.

[17] *Ibid.*, p. 8.

[18] See Robert D. Arnott and Peter L. Bernstein (2002), "What Risk Premium is 'Normal'?", *Financial Analysts Journal* 58:64-85, for an example.

Another common argument for a lower expected MRP is that the U.S. experienced very remarkable growth in the 20th century that was not anticipated at the start of the century. As a result, the average realized excess return is overestimated meaning the standard method of estimating the MRP would be biased upward. However, one recent study by Profs. Jorion and Goetzmann[19] finds, under some simplifying assumptions, that the so-called "survivorship bias" is only 29 basis points[20] and a more recent working paper by Dimson, Marsh, and Staunton find a survivorship bias of only 0.1 percent.[21] Furthermore, "[I]f investors have overestimated the equity premium over the second half of the last century, Constantinides (2002) argues that 'we now have a bigger puzzle on our hands'" Why have investors systematically biased their estimates over such a long horizon?[22]

There are also a number of papers that argue that the MRP is variable and depends on a broad set of economic circumstances. For example, Mayfield (2004) estimates the MRP in a model that explicitly accounts for investment opportunities. He models the process that governs market volatility and finds that the MRP varies with investment opportunities which are linked to market volatility. Thus, the MRP varies with investment opportunities and about half of the measured MRP is related to the risk of future changes in investment opportunities. Based on this approach Mayfield estimates

[20] Dimson, Marsh, and Staunton (2003), "Global Evidence on the Equity Risk Premium," Journal of Applied Corporate Finance, 15, pp. 27-38 make a similar point when they comment on the equity risk premia for 16 countries based on returns between 1900 and 2001: "While the United States and the United Kingdom have indeed performed well, compared to other markets there is no indication that they are hugely out of line." p.4.

[21] Dimson, E., P. Marsh, and M. Staunton (2006), "The Worldwide Equity Premium: A Smaller Puzzle," Working Paper, London Business School, April 2006, p. 22.

[22] Mehra, R., and E.C. Prescott (2003), "The Equity Premium in Retrospect," in *Handbook of the Economics of Finance*, Edited by G.M. Constantinides, M. Harris and R. Stulz, Elsevier B.V, p. 926

the U.S. MRP to be 5.6 percent measured since 1940.[23] However, the problem with such an approach is determining when the MRP has changed and by how much.

To sum up the above, I cite two passages from Profs. Mehra and Prescott's review of the theoretical literature on the equity premium puzzle:[24]

> Even if the conditional equity premium given current market conditions is small, and there appears to be general consensus that it is, this in itself does not imply that it was obvious either that the historical premium was too high or that the equity premium has diminished.
>
> In the absence of this [knowledge of the future], and based on what we currently know, we can make the following claim: over the long horizon the equity premium is likely to be similar to what it has been in the past and the returns to investment in equity will continue to substantially dominate that in T-bills for investors with a long planning horizon.

Q7. Is there other scholarly discussion on the value of the MRP?

A7. Yes. Another line of research was pursued by Steven N. Kaplan and Richard S. Ruback. They estimate the market risk premium in their article, "The Valuation of Cash Flow Forecasts: An Empirical Analysis."[25] Professors Kaplan and Ruback compare published cash flow forecasts for management buyouts and leveraged recapitalization over the 1983 to 1989 period against the actual market values that resulted from these transactions. One of their results is an estimate of the market risk premium over the long-term Treasury bond yield that is based on careful analysis of actual major investment decisions, not realized market returns. Their median estimate is 7.78 percent and their mean estimate is 7.97 percent.[26] This is considerably higher than my estimate of 6.5 percent for the U.S. Even if the maturity premium of Treasury bonds over Treasury bills were only 1 percent,

[23] E. Scott Mayfield (2004), "Estimating the market risk premium," Journal of Financial Economics 73, pp. 465-496.

[24] Mehra, R., and E.C. Prescott, *op cit.*, p. 926.

[25] *Journal of Finance*, 50, September 1995, pp. 1059-1093.

[26] *Ibid*, p. 1082.

well below the best estimate of 1.5 percent, the resulting estimate of the market risk premium over Treasury bills is higher than my estimate of 8.0 percent for the U.S. Because the capital markets in the U.S. and Canada are becoming increasingly integrated, the MRP in Canada will be affected by the investment opportunities in the U.S. and the rest of the world. For example, in a recent study of Canadian utilities Standard & Poor's noted that "[b]oth utilities and power income funds are focused on opportunities south of the Canada-U.S. border."[27]

Q8. Please review the evidence on the historical market risk premium in Canada?

A8. I consider evidence on two different measures of the historical MRP. The first is for use with the short-term risk free rate and the other is based on the constant maturity yields of long-term government bonds. The short-term measure is the average return on the market minus the average annual total return on 3-month Treasury bills. The second measure subtracts the average annual total return on long-term government bonds. The data are from the Report on Canadian Statistics 1924-2006. (See Workpaper #2 to Table No. MJV-9)

From 1936 to 2006, the full period for which long-term Government bond total returns are reported, the data show that the average premium of stocks over three-month Government bills is 6.6 percent. I also examine the "post-War" period. The risk premium for 1948-2006 is also 6.7 percent. (I exclude 1946 and 1947 because their economic statistics appear to be heavily influenced by the War years. They are not really "post-War" years, from an economic viewpoint.) The average risk premium is even higher at 7.1 percent if the full period of data, 1934-2006, for the short-term rate is used.[28] Subtracting the average maturity premium of about one percent for long-term bond yields over Treasury bill yields gives an estimate of 5.5 to 6.0 percent for the MRP over long-

---

[27] Standard & Poor's RatingsDirect, "Industry Report Card: Top Seven Canadian Utilities Reflect Ongoing Sector Stability," October 27, 2006.

[28] Historical data on Government bond yields are not available until 1936 although information on 3-month Treasury bills is available in 1934. Total return on long-term Government bonds extends from 1924.

term bonds.[29] The average premium over the total return on long-term Government bonds is 5.4% for the period 1924 to 2006, the longest period for the available data.[30] The average premium is 5.1 percent for the 1936 to 2006 period and 5.6 percent for the post-war period, 1948 to 2006.

Q9. What is the "long-run realized risk premium"in the U.S.?

A9. From 1926 to 2006, the full period reported, Ibbotson Associates data show that the average premium of stocks over Treasury bills is 8.6 percent[31]. I also examine the "post-War" period. The risk premium for 1947-2006 is 8.4 percent. (I exclude 1946 because its economic statistics are heavily influenced by the War years; *e.g.*, the end of price controls yielded an inflation rate of 18 percent. It is not really a "post-War" year, from an economic viewpoint.) These averages often change slightly when another year of data is added to the Ibbotson series. However, as discussed above, there has been a great deal of academic research on the MRP done recently. This research has put practitioners in a dilemma: there is nothing close to a consensus about how the MRP should be estimated, but a general agreement in the academic community seems to be emerging that the old approach of using the average realized return over long periods gives too high an answer.

For the MRP over the long-term risk-free rate, the Ibbotson Associates data show that the average maturity premium of government bond yields over one month Treasury bills is about 1.5 percent. This suggests that stocks of average risk have commanded a premium of about 7.1 percent over the long-term risk-free rate and a market risk premium of 8.6 percent over the short-term risk-free rate in the U.S.

---

[29] Recall that the maturity premium is the difference in yield for bonds of longer maturity over those with shorter maturity.

[30] The Canadian Government bonds used to estimate the long-term market risk premium represents bonds having an average maturity of 18 years.

[31] Ibbotson Associates, *Stocks, Bonds, Bills, and Inflation: Valuation Edition*, 2007 Yearbook, Appendix A.

Q10. How do you use these estimates of the U.S. MRP to help determine the appropriate Canadian MRP?

A10. The increasing integration of the Canadian capital markets with those in the U.S., which is generally considered to have a higher MRP than Canadian markets, is likely to result in a narrowing of the difference in MRP, resulting in a slight increase in the Canadian MRP. Any estimate of the MRP for Canada must therefore consider the size of the MRP in United States as an important factor in determining the MRP for Canada.

Q11. Given all of the evidence, what is your conclusion on the MRP in Canada?

A11. It is clear that market return information is volatile and difficult to interpret, but my judgment is that the best available evidence on the MRP in Canada is that it lies in the range of 5.25 to 6 percent relative to the long-term risk free rate. This is consistent with a recent study of the MRP for 16 countries using data from more than 100 years (1900 to 2001) by Profs. Dimson, Marsh, and Staunton who report a 5.5 percent arithmetic mean excess return for Canada, over both the long-term and short-term risk-free rate.[32] In a more recent working paper by the same authors, the historical equity premium relative to bonds is 5.67 percent for the period 1900-2005.[33] Dimson, Marsh and Staunton (2007)[34] find an arithmetic equity premium of 5.9 percent over bills (5.7 percent relative to bonds) in Canada for 1900-2006. The realized historical risk premium varies, but the evidence from U.S. market data, scholarly articles and the models referenced in the Ibbotson Yearbook together lead to the conclusion that the MRP is likely to be at the upper end of the range so that 5.75 percent is a reasonable estimate of the risk premium over long-term bonds in Canada.

III. COST OF CAPITAL ESTIMATES

Q11. How do you obtain the final parameter, the beta estimate for your sample companies?

A11. I obtain the beta estimates for my Canadian Utilities sample from Bloomberg and the estimates for the Gas LDC and MLP Pipelines sample companies from *Value Line Investment Survey*. The details of the beta estimates are discussed in my written evidence *Section IV*.1.[35]

Q13. Now that the basic parameters for the risk positioning model have been collected, how do you estimate the cost of equity values for the sample companies?

A13. The procedures for all three samples are basically the same, and for each sample the calculations are displayed in three tables. The first table, e.g., Table No. MJV-10 for the Canadian Utilities sample, presents three cost of equity estimates corresponding to the three versions of the equity risk premium method based upon the long-term risk-free rate. The first estimate is the CAPM estimate and the next two rely upon values of α of one and two percent in the ECAPM. The corresponding tables for the other two samples are Table No. MJV-20 (Gas LDC sample), Table No. MJV-26 (MLP Pipelines sample).

Q14. How do you use the cost of equity results to estimate the companies' overall cost of capital?

A14. For the Canadian Utilities sample, the second of the three tables implementing the risk positioning approach combine the cost of equity estimates from the first table with the sample's average market-value capital structure, cost of debt and preferred and TQM's marginal tax rate to estimate the ATWACC for the sample. These calculations are displayed in Table No. MJV-11 for the Canadian Utilities sample.

---

[35] *Value Line Investment Survey*, June 15 and June 29, 2007 for the Gas LDC sample. *Value Line Investment Survey* August 3, August 17, and September 14, 2007 for the MLP Pipelines sample. Bloomberg as of August 28, 2007.

For the Gas LDC sample and the MLP Pipelines sample, the procedures are the same except that the cost of equity estimates for each individual sample company from the first table in the risk positioning calculations are combined with the individual company's market value capital structure information and the Company's tax rate to estimate the after-tax weighted average cost of capital for each individual company. These calculations are displayed in Table No. MJV-21, Panels A, B and C (Gas LDC sample) and in Table No. MJV-27, Panels A, B, and C (MLP Pipelines sample). Sample averages are reported in the bottom row of each panel.

Q15. How do you use the sample estimates of the ATWACC to determine what the results imply about the appropriate return on equity at 40 percent deemed equity ratio for TQM?

A15. For each of the three samples, the next step in the risk positioning analysis uses the sample representative ATWACC from each panel of the second table (i.e., Table No. MJV-11 for the Canadian Utilities sample, Table No. MJV-21 for the Gas LDC sample, and Table No. MJV-27 for the MLP Pipelines sample). Each estimate of the sample's representative ATWACC is reproduced in column one of the third set of tables (Table No. MJV-12 for the Canadian Utilities sample, Table No. MJV-22 for the Gas LDC sample, Table No. MJV-28 for the MLP Pipelines sample). The third table then reports the return on equity (Column [6]) consistent with each of the three estimates of the sample's average risk positioning ATWACC and a deemed equity ratio of 40 percent for TQM. The sample average ATWACCs and corresponding ROE estimates for each of the samples are displayed in Table 1 in my written evidence.

Q16. What do these values imply for the fair return on equity for TQM?

A16. I discuss the implications of the equity risk positioning results in the main body of my written evidence.

Q17. Does this complete Appendix C?

A17. Yes, except for the Table MJV-C1 which provides the academic references upon which I rely to estimate the value of the α parameter for use in the Empirical Capital Asset Pricing Model.

WRITTEN EVIDENCE OF
MICHAEL J. VILBERT

Table MJV-C1

EMPIRICAL EVIDENCE ON THE ALPHA FACTOR IN ECAPM*

AUTHOR	RANGE OF ALPHA	PERIOD RELIED UPON
Black (1993)[1]	1% for betas 0 to 0.80	1931-1991
Black, Jensen and Scholes (1972)[2]	4.31%	1931-1965
Fama and McBeth (1972)	5.76%	1935-1968
Fama and French (1992)[3]	7.32%	1941-1990
Litzenberger and Ramaswamy (1979)[4]	5.32%	1936-1977
Litzenberger, Ramaswamy and Sosin (1980)	1.63% to 3.91%	1926-1978
Pettengill, Sundaram and Mathur (1995)[5]	4.6%	1936-1990

* The figures reported in this table are for the longest estimation period available and, when applicable, use the authors' recommended estimation technique. Many of the articles cited also estimate alpha for sub-periods which may vary.

1 Black estimates alpha in a one step procedure rather than in an un-biased two-step procedure.
2 Estimate a negative alpha for the subperiod 1931-39 which contain the depression years 1931-33 and 1937-39.
3 Calculated using Ibbotson's data for the 30-day treasury yield.
4 Relies on Lizenberger and Ramaswamy's before-tax estimation results. Comparable after-tax alpha estimate is 4.4%.
5 Pettengill, Sundaram and Mathur rely on total returns for the period 1936 through 1990 and use 90-day treasuries. The 4.6% figure is calculated using auction averages 90-day treasuries back to 1941 as no other series were found this far back.

DISCOUNTED CASH FLOW METHODOLOGY: DETAILED PRINCIPLES AND RESULTS

Q1. What is the purpose of this appendix?

A1. This appendix reviews the principles behind the discounted cash flow or "DCF" methodology and the details of the cost of capital estimates obtained from this methodology.

I. DISCOUNTED CASH FLOW METHODOLOGY PRINCIPLES

Q2. How is this section of the appendix organized?

A2. The first part discusses the general principles that underlie the DCF approach. The second portion describes the strengths and weaknesses of the DCF model and why it is generally less reliable for estimating the cost of capital for the sample companies at the present time than the risk positioning method discussed in Appendix C.

A. SIMPLE AND MULTI-STAGE DISCOUNTED CASH FLOW MODELS

Q3. Please summarize the DCF model.

A3. The DCF model takes the first approach to cost of capital estimation discussed with Figure 1 in Section II-A of my written evidence. That is, it attempts to measure the cost of equity in one step. The method assumes that the market price of a stock is equal to the present value of the dividends that its owners expect to receive. The method also assumes that this present value can be calculated by the standard formula for the present value of a cash flow stream:

$$P = \frac{D_1}{(1+k)} + \frac{D_2}{(1+k)^2} + \ldots + \frac{D_T}{(1+k)^T} \qquad \text{(D-1)}$$

where "P" is the market price of the stock; "D_i" is the dividend cash flow expected at the end of period i; "k" is the cost of capital; and "T" is the last period in which a dividend cash flow is to be received. The formula just says that the stock price is equal to the sum of the expected future dividends, each discounted for the time and risk between now and the time the dividend is expected to be received.

Most DCF applications go even further, and make very strong (*i.e.*, unrealistic) assumptions that yield a simplification of the standard formula, which then can be rearranged to estimate the cost of capital. Specifically, if investors expect a dividend stream that will grow forever at a steady rate, the market price of the stock will be given by a very simple formula,

$$P = \frac{D_1}{(k-g)} \qquad \text{(D-2)}$$

where "D_1" is the dividend expected at the end of the first period, "g" is the perpetual growth rate, and "P" and "k" are the market price and the cost of capital, as before. Equation D-2 is a simplified version of Equation D-1 that can be solved to yield the well known "DCF formula" for the cost of capital:

$$k = \frac{D_1}{P} + g = \frac{D_0 x (1+g)}{P} + g \qquad \text{(D-3)}$$

where "D_0" is the current dividend, which investors expect to increase at rate g by the end of the next period, and the other symbols are defined as before. Equation D-3 says that if Equation D-2 holds, the cost of capital equals the expected dividend yield plus the (perpetual) expected future growth rate of dividends. I refer to this as the simple DCF model. Of course, the "simple" model is simple because it relies on very strong (*i.e.*, very unrealistic) assumptions.

Q4. Are there other versions of the DCF models besides the "simple" one?

A4. Yes. If Equation D-2 does not hold, sometimes other variations of the general present value formula, Equation D-1, can be used to solve for k in ways that differ from Equation D-3. For example, if there is reason to believe that investors do *not* expect a steady growth rate forever, but rather have different growth rate forecasts in the near term (e.g., over the next five or ten years), these forecasts can be used to specify the early dividends in Equation D-1. Once the near-term dividends are specified, Equation D-2 can be used to specify the share price value at the end of the near-term (e.g., at the end of five or ten years), and the resulting cash flow stream can be solved for the cost of capital using Equation D-1.

More formally, the "multi-stage" DCF approach solves the following equation for k:

$$P = \frac{D_1}{(1+k)} + \frac{D_2}{(1+k)^2} + \ldots + \frac{D_T + P_{TERM}}{(1+k)^T} \quad . \tag{D-4}$$

The terminal price, P_{TERM} is estimated as

$$P_{TERM} = \frac{D_{T+1}}{(k - g_{LR})} \tag{D-5}$$

where T is the last of the periods in which a near term dividend forecast is made and g_{LR} is the long-run growth rate. Thus, Equation D-4 defers adoption of the very strong perpetual growth assumptions that underlie Equation D-2 — and hence the simple DCF formula, Equation D-3 — for as long as possible, and instead relies on near term knowledge to improve the estimate of k. I examine both simple and multistage DCF results below.

Q5. What are the merits of the DCF model?

A5. The DCF approach is conceptually sound if its assumptions are met but can run into difficulty in practice because those assumptions are so strong, and hence so unlikely to correspond to reality. Two conditions are well-known to be necessary for the DCF approach to yield a reliable estimate of the cost of capital: the variant of the present value formula, Equation D-1, that is used must actually match the variations in investor expectations for the dividend growth path; and the growth rate(s) used in that formula must match current investor expectations. Less frequently noted conditions may also create problems.

The DCF model assumes that investors expect the cost of capital to be the same in all future years. Investors may not expect the cost of capital to be the same, which can bias the DCF estimate of the cost of capital in either direction.

The DCF model only works for companies for which the standard present value formula works. The standard formula does *not* work for companies that operate in industries or markets that are unstable or for options (*e.g.*, puts and calls on common stocks), and so it will not work for companies whose stocks behave as options do. Option-pricing effects will be important for companies in financial distress, for example, which implies the DCF model will *understate* their cost of capital, all else equal.

In recent years even the most basic DCF assumption, that the market price of a stock in the absence of growth options is given by the standard present value formula (*i.e.*, by Equation D-1 above), has been called into question by a literature on market volatility.[1] In any case, it is still too early to throw out the standard formula, if for no other reasons than that the evidence is still controversial and no one has offered a good

[1] See for example, Robert J. Shiller (1981), "Do Stock Prices Move Too Much to be Justified by Subsequent Changes in Dividends?," *The American Economic Review*, Vol. 71, No. 3, pp. 421-436. John Y. Campbell and Robert J. Shiller (1988), " The Dividend-Price Ratio and Expectations of Future Dividends and Discount Factors," *The Review of Financial Studies*, Vol. 1, No. 3, pp. 195-228. Fama and Kenneth R. French (2001), "Disappearing Dividends: Changing Firm Characteristics or Lower Propensity to Pay?," *Journal of Financial Economics*, Vol. 60, pp. 3-43. Borja Larrain and Motohiro Yogo (2005), "Does Firm Value Move Too Much to be Justified by Subsequent Changes in Cash Flow?," Federal Reserve Bank of Boston, *Working Paper*, No. 05-18.

replacement. But the evidence suggests that it must be viewed with more caution than financial analysts have traditionally applied. Simple models of stock prices may not be consistent with the available evidence on stock market volatility.

Q6. Normally DCF debates center on the right growth rate. What principles underlie that choice?

A6. Finding the right growth rate(s) is indeed the usual "hard part" of a DCF application. The original approach to estimation of *g* relied on average historical growth rates in observable variables, such as dividends or earnings, or on the "sustainable growth" approach, which estimates *g* as the average book rate of return times the fraction of earnings retained within the firm. But it is highly unlikely that historical averages over periods with widely varying rates of inflation, interest rates and costs of capital, such as in the relatively recent past, will equal current growth rate expectations.

A better approach is to use the growth rates currently expected by investment analysts, if an adequate sample of such rates is available. If this approach is feasible and if the person estimating the cost of capital is able to select the appropriate version of the DCF formula, the DCF method should yield a reasonable estimate of the cost of capital for companies not in financial distress and without material option-pricing effects (always subject to recent concerns about the applicability of the basic present value formula to stock prices as well as issues of optimism bias). However, for the DCF approach to work, the basic stable-growth assumption must become reasonable and the underlying stable-growth rate must become determinable *within the period for which forecasts are available*.

Q7. What is the so called "optimism bias" in the earnings growth rate forecasts of security analysts and what is its effect on the DCF analysis?

A7. Optimism bias is related to the observed tendency for analysts to forecast earnings growth rates that are higher than are actually achieved. This tendency to over estimate growth

rates is perhaps related to incentives faced by analysts that provide rewards not strictly based upon the accuracy of the forecasts. To the extent optimism bias is present in the analysts' earnings forecasts, the cost of capital estimates from the DCF model would be too high.

Q8. Does optimism bias mean that the DCF estimates are completely unreliable?

A8. No. The effect of optimism bias is least likely to affect DCF estimates for large, rate regulated companies in relatively stable segments of an industry. Furthermore, the magnitude of the optimism bias (if any) for regulated companies is not clear. This issue is addressed in a paper by Chan, Karceski, and Lakonishok (2003) who sort companies on the basis of the size of the I/B/E/S forecasts to test the level of optimism bias. Utilities constitute 25 percent of the companies in lowest quintile, and by one measure the level of optimism bias is 4 percent. However, the 4 percent figure does not represent the complete characterization of the results in the paper. Table IX of the paper shows that the median I/B/E/S forecast for the first (lowest) quintile averages 6.0 percent. The realized "Income before Extraordinary Items" is 2.0 percent (implying a four percent upward bias in I/B/E/S forecasts), but the "Portfolio Income before Extraordinary Items" is 8.0 percent (implying a two percent downward bias in I/B/E/S forecasts).

The difference between the "Income before Extraordinary Items" and "Portfolio Income before Extraordinary Items" is whether individual firms or a portfolio are used in estimating the realized returns. The first is a simple average of all firms in the quintile while the second is a market value weighted-average. Although both measures of bias have their own drawbacks according to the authors,[2] the Portfolio Income measure gives more weight to the larger firms in the quintile such as regulated utilities. In addition, the paper demonstrates that "analysts' forecasts as well as investors' valuations reflect a wide-spread belief in the investment community that many firms can achieve streaks of

[2] Chan, Karceski, and Lakonishok, *op. cit.*, p. 675.

high growth in earnings."[3] Therefore, it is not clear how severe the problem of optimism bias may be for regulated utilities or even whether there is a problem at all.

Finally, the two-stage DCF model also adjusts for any over optimistic (or pessimistic) growth rate forecasts by substituting the long-term GDP growth rate for the 5-year growth rate forecasts of the analysts in the years after year 5.

B. CONCLUSIONS ABOUT THE DCF MODEL

Q9. Please sum up the implications of this part of the appendix.

A9. The unavoidable questions about the DCF model's strong assumptions — whether the basic present value formula works for stocks, whether option pricing effects are important for the company, whether the right variant of the basic formula has been found, and whether the true growth rate expectations have been identified — cause me to view the DCF method as *inherently* less reliable than the equity risk premium approach, the other approach I use. However, because the DCF method has been widely used in the past and in other forums when the industry's economic conditions were different from today's, I submit DCF evidence in this case. DCF estimates also serve as a check on the values provided by the risk positioning approach methods.

II. EMPIRICAL DCF RESULTS

Q10. How is this part of the appendix organized?

A10. This section presents the details of my DCF analyses, which are summarized in my written evidence. The first part describes some preliminary matters, such as data inputs. Then it turns to the details of the DCF estimates themselves.

In particular, implementation of the simple DCF models described above requires an estimate of the current price, the dividend, and near-term and long-run growth rate

[3] Chan, Karceski, and Lakonishok, *op. cit.*, p. 663.

forecasts. The simple DCF model relies only on a single growth rate forecast, while the multi-stage DCF model employs both near-term individual company forecasts and long-run GDP growth rate forecasts. The remaining parts of this section describe each of these inputs in turn.

A. PRELIMINARY MATTERS

Q11. In Appendix C you discuss estimating cost of capital and implied cost of equity using the Risk Positioning methodology. What, if anything, is different when you use the DCF method?

A11. The timing of the market value capital structure calculations is different in the DCF method and in the equity risk premium method. The equity risk premium method relies on the average capital structure over the period used to estimate beta while the DCF approach uses only current data, so the relevant market value capital structure measure is the most recent that can be calculated. This capital structure is reported in columns [1]-[3] of Tables No. MJV-4 for the Canadian Utilities sample and in Table No. MJV-15 for the Gas LDC sample. Note that I do not apply the DCF approach to the MLP Pipelines sample. Regrettably, the DCF model is difficult to apply reliably to the MLP Pipelines sample due to complexities in the way that distribution growth is divided between the limited partners and the general partner as distributions grow.[4] Because of these concerns, I do not provide DCF estimates for the MLP Pipelines sample.

[4] The FERC has begun to address this issue in the United States as part of ROE deliberations for natural gas pipelines. It had originally raised concerns with the fact that distributions are often in excess of earnings, fearing that this might call into question the standard application of its DCF method to MLP companies. More recently, this concern has expanded to concerns over the correct estimation of the growth component of the DCF model applied to MLPs. The issue is yet to be resolved.

B. GROWTH RATES

Q12. What growth rates do you use?

A12. For reasons discussed above, historical growth rates today are generally unreliable as forecasts of current investor expectations for the either the Canadian Utilities sample or the natural gas distribution industry. I therefore use rates forecasted by security analysts.

The ideal in a DCF application would be a detailed forecast of future dividends, year by year well into the future, based on a large sample of investment analysts' expectations. I know of no source of such data. Dividends are ultimately paid from earnings, however, and earnings forecasts are available for a few years. Investors do not expect dividends to grow in lockstep with earnings, but for companies for which the DCF approach can be used reliably (*i.e.*, for relatively stable companies whose prices do not include the option-like values described previously), they do expect dividends to track earnings over the long-run. Thus, use of earnings growth rates as a proxy for expectations of dividend growth rates is a common practice.

Accordingly, the first step in my DCF analysis is to examine a sample of investment analysts' forecasted earnings growth rates. For the Gas LDC sample, I utilize BEst forecasts as provided by Bloomberg and *Value Line's* forecasted earnings growth while for the Canadian Utilities sample I only utilize BEst forecasts.[5] The projected earnings growth rates for the companies in the Canadian Utilities sample are in Table No. MJV-5 and for the Gas LDC sample in Table No. MJV-16. Column [1] of Table No. MJV-5 reports analysts' forecasts of the long-term earnings growth for the Canadian Utilities companies while column [2] reports the number of analysts that provided a forecast. In Table No. MJV-16 columns [1] and [5] report the forecasted long-term growth rate using BEst and *Value Line*, respectively. Column [2] reports the number of analysts providing a BEst forecast, and column [6] reports the average of the BEst and *Value Line* five-year forecasts. (I treat the *Value Line* forecasts as though they overlap

[5] The growth rates for both samples were downloaded from Bloomberg.

exactly with the forecasts from BEst.) These growth rates underlie my simple and multi-stage DCF analyses.

In particular, the five-year average annual growth rate is the perpetual growth rate I employ in the simple DCF model.[6] In the multi-stage model, I rely on the company-specific growth rate until 2012 and on the long-term GDP forecast for year 2017 onwards. During the years from 2013 to 2016, I assume the growth rate converges linearly towards the long-term GDP forecast, which is reached in 2017.[7]

Q13. Do these growth rates correspond to the ideal you mentioned above?

A13. No, not completely. While forecasted growth rates are the quantity required in principle, the forecasts need to go far enough out into the future so that it is reasonable to believe that investors expect a stable growth path afterwards. As can be seen in Table No. MJV-5 for the Canadian Utilities sample and in Table No. MJV-16 for the Gas LDC sample, the growth rates estimates do not support the view that investors are expecting growth rates equal to the single perpetual growth rate assumed in the simple DCF model. However, the 5-year growth rate estimates for the Canadian Utilities companies are relatively homogeneous as can be seen by reference to Table No. MJV-5. The forecasts for the companies in the Canadian Utilities sample range from 6.3 to 8.1 percent which is a little higher than the long-term forecast of 4.1 percent for the Canadian GDP. Only Emera has one analyst providing a forecast. For the Gas LDC sample, all except one of the long-term growth rates is in the range from 4.1 to 6.5 percent. Only one company (Laclede) in the gas LDC sample has one analyst providing the growth rate estimate. (See Table No. MJV-16) The comparison between the average growth rate forecasts and the growth

---

[6] This growth rate is in Table No. MJV-5 column [1] for the Canadian Utilities sample and in Table No. MJV-16 column [6] for the Gas LDC sample.

[7] For Canada, I use a long-term GDP growth estimate obtained from the Energy Information Administration, International Energy Outlook, May 2007. Because this growth estimate is in real terms, I combine the estimate with the publicly announced long-term inflation target of two percent from the Bank of Canada (see www.bankofcanada.ca). For companies in the Gas LDC sample, I use the long-term U.S. GDP growth estimate from *Blue Chip Economic Indicators* (March, 2007).

in GDP indicate that these growth rate forecasts are not overly optimistic for either sample.

Q14. How well are the conditions needed for DCF reliability met at present?

A14. The requisite conditions for the sample companies are not fully met at this time. Of particular concern for this proceeding is the uncertainty about what investors truly expect the long-run outlook for the sample companies to be. The longest time period available for growth rate forecasts of which I am aware is five years. The long-run growth rate (*i.e.*, the growth rate after the energy industry settles into a steady state, which is certainly *beyond* the next five years for this industry) drives the actual results one gets with the DCF model. Unfortunately, this implies that unless the company or industry in question is stable, so there is little doubt as to the growth rate investors expect, DCF results in practice can end up being driven by the subjective judgment of the analyst who performs the work.

This is a problem at present because it is hard to imagine that today's energy industry would accurately be described as stable. Inflation and interest rates have largely stabilized over the last 10 years, but oil and natural gas prices have increased dramatically recently. The prices of natural gas and petroleum have also exhibited a great deal of volatility recently, and the estimated total amount of recoverable natural gas in the Western Canada Sedimentary Basin is being revised downward. These factors plus the recent rapid increase in the price of natural gas makes demand more uncertain. Additionally, the electric industry as well as both the pipeline industry and the gas distribution sector are going through a series of mergers and acquisitions, which affects the companies' earnings growth rate estimates. This is one reason why companies involved in mergers and acquisitions are normally excluded from the sample. There has also been financial distress among companies specializing in trading natural gas and electricity products which affects both regulated and unregulated companies. Taken

together, these factors mean that it may be some time before the energy industry settles into anything investors will see as a stable equilibrium.

Such circumstances imply that a regulator may often be faced with a wide range of DCF numbers, none of which can be well grounded in objective data on true long-run growth expectations, *because no such objective data now exist.* DCF for firms or industries in flux is *inherently* subjective with regard to a parameter (the long-run growth rate) that drives the answer one gets.

It is clear that much longer detailed growth rate forecasts than currently available from BEst and *Value Line* would be needed to implement the DCF model in a completely reliable way for these two samples at this time; however, the general stability of the 5-year growth rate forecasts for both samples indicates a higher degree of reliability than in the relatively recent past.

C. DIVIDEND AND PRICE INPUTS

Q15. What values do you use for dividends and stock prices?

A15. Dividends are the last recorded dividend payments as reported by Bloomberg, the 3rd-quarter 2007 dividend. This dividend is grown at the estimated growth rate and divided by the price described below to estimate the dividend yield for the simple and multi-stage DCF models.

Stock prices are the average of the closing stock prices for the 15 trading days (approximately three weeks) ending August 28, 2007 for both the Canadian Utilities sample and for the Gas LDC sample. These time periods coincide with the dates I obtained the BEst growth forecasts. I do not use a longer period to measure the price because that would be inconsistent with the principles that underlie the DCF formula. The DCF approach assumes the stock price is the present value of future expected dividends. Stock prices six months or a year ago reflect expectations at that time, which are different from those that underlie the currently available growth forecasts. At the

same time, use of an average over a brief period helps guard against a company's price on a particular day price being unduly influenced by mistaken information, differences in trading frequency, and the like.

The closing stock price is used because it is at least as good as any other measure of the day's outcome, and may be better for DCF purposes. In particular, if there were any single price during the day that would affect investors' decisions to buy or sell a stock, I would suspect that it would be each day's closing price, not the high or low during the day. The daily price changes reported in the financial pages, for example, are from close to close, not from high to high or from low to low.

D. COMPANY-SPECIFIC DCF COST OF CAPITAL ESTIMATES

Q16. What DCF estimates do these data yield?

A16. The cost of equity results for the simple and multi-stage DCF models are shown in Table No. MJV-6 for the Canadian Utilities sample and in Table No. MJV-17 for the Gas LDC sample. Panel A reports the results for the simple DCF method, and Panel B reports the results for the multi-stage DCF method using the long-term GDP growth rate as the perpetual growth rate.

Q17. What overall cost of capital estimates result from the DCF cost of equity estimates?

A17. The capital structure, DCF cost of equity, and cost of debt estimates are combined to obtain the overall after-tax weighted-average cost of capital for each sample company. These results are presented in Table No. MJV-7 for the Canadian Utilities sample and Table No. MJV-18 for the Gas LDC sample. Panel A relies on the simple DCF cost of equity results, and Panel B relies on the multi-stage DCF cost of equity results.

For the Gas LDC sample, I also report the average for the sub-sample of companies that have had no significant merger activities during the last five years instead of three, and which have more than 80% of their assets devoted to regulated activities.[8]

Q18. What information do you report in Tables No. MJV-8 and MJV-19?

A18. These tables report the return on equity consistent with the samples' (and the sub-sample's) estimated overall after-tax weighted-average cost of capital and a deemed equity thickness of 40 percent for TQM. For both the simple DCF and multistage DCF methods, the sample's average ATWACC is reported in column [1] of Table No. MJV-8 and Table No. MJV-19. Column [8] reports the return on equity as if the sample companies' average market value capital structure had been one with 40 percent equity.

Q19. What are the implications of these results?

A19. The implication of these numbers is discussed in my written evidence, along with the findings of the equity risk premium approach.

[8] See Tables No. MJV-2 and MJV-13 for a summary of the Canadian Utilities and Gas LDC sample's regulated assets, respectively. See Tables 1 to 3 for a description of the three samples.

Sources and Notes:

Bloomberg as of August 28, 2007.

Capital structure from 2nd Quarter, 2007 calculated using respective balance sheet information and 15-day average prices ending at period end.

The DCF Capital structure is calculated using 2nd Quarter, 2007 balance sheet information and a 15-trading day average closing price ending on August 28, 2007.

Prices are reported in Workpaper #1 to Table No. MJV-6.

[m] =

(1): 0 if [k] > 0.

(2): The absolute value of [k] if [k] < 0 and |[k]| < [l].

(3): [l] if [k] < 0 and |[k]| > [l].

[p]: Difference between fair value of Long-Term debt and carrying amount of Long-Term debt per company 10-K. Data for adjustment is from 2006 10-K.

Vectren Corp	-	-	-	5.55%	5.55%	5.55%	5.55%
New Jersey Resources Corp	-	-	-	-	-	5.55%	5.55%

Sources and Notes:

[1] - [6]: Ratings based on Workpaper #1 to Table No. MJV-21, Panel A are assumed to equal preferred ratings. Preferred equity yields are from Bloomberg as of August 28, 2007. Assumed preferred yield is equal to debt yield.
[7]: {([1] x 0.5) + ([2] x 0.5) + [3] + [4] + [5] + [6]} / 5.

The report does not publish yield data for AA-rated preferred equity. Therefore, when there is a AA we assumed:
Yield on AA-rated preferred equity = Yield on A-rated bond - {(1/2) x (Yield on BBB-rated bond - Yield on A-rated bond)}.

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

Composition of Proxy Companies	)	
For Determining Gas and Oil	)	Docket No. PL07-2-000
Pipeline Return on Equity	)	

ADDITIONAL INITIAL COMMENTS OF THE INTERSTATE NATURAL GAS ASSOCIATION OF AMERICA ON PROPOSED POLICY STATEMENT

In response to the Commission's "Notice of Technical Conference and Request for Additional Comments,"[1] issued on November 15, 2007, the Interstate Natural Gas Association of America ("INGAA") hereby submits the following additional comments.

BACKGROUND

In its July 19, 2007 Proposed Policy Statement, the Commission proposed to permit inclusion of Master Limited Partnerships ("MLPs") in the proxy group used to determine pipeline rates of return under a discounted cash flow ("DCF") analysis. However, the Commission also proposed to cap the distribution used in the DCF analysis of any MLP at the level of the pipeline's earnings. The cap was proposed to address a concern that allowing distributions in excess of earnings to be used in the DCF calculation would allow a pipeline to double recover depreciation expense by basing its return on equity, in part, on distributions that include a return of capital to unit holders. Proposed Policy Statement at PP 18-19.

In its comments, INGAA demonstrated that the Commission's concerns about a distribution including a return of capital or a depreciation component are misplaced, and that an earnings cap on MLP distributions would be inconsistent with the market-based

[1] *Composition of Proxy Groups for Determining Gas and Oil Pipeline Return on Equity,* 121 FERC ¶ 61,165 (2007).

theory underlying the DCF methodology. In particular, INGAA noted that the Commission itself recognized the inverse relationship between MLP distributions and short-term IBES growth rates, and that the market adjusts to take into account all variables in the DCF formula. *See* Proposed Policy Statement at P 21.

In the November 15 Notice (at P 5), the Commission stated that the existing record is not sufficient for it to determine (1) whether its current method of projecting growth adequately reflects the lower growth potential of MLPs, particularly over the long term, and (2) if not, what alternative method should be used to project the growth of MLPs.

COMMENTS

In its initial comments, INGAA noted that while MLPs generally pay out more in distributions than corporations, the IBES short-term growth rates of MLPs were correspondingly lower than corporations. In its latest Request for Additional Comments, the Commission has questioned whether this same inverse relationship exists with respect to long-term growth rates. Specifically, the Commission seeks comments on whether projections of long-term growth rates for MLPs in the DCF formula should be lower than Gross Domestic Product ("GDP"), which the Commission currently utilizes as the measure of long-term growth.

As a threshold matter, INGAA would note the absence of any empirical evidence that would suggest that MLPs are not able to achieve the same growth over the long term as corporations. INGAA would also note that GDP is itself an imprecise estimate of long-term growth. *See Northwest Pipeline Co.,* Opinion No. 396-B, 79 FERC ¶ 61,309 at 62,382 (1997); *Transcontinental Gas Pipe Line Corp.,* Opinion No. 414-A, 84 FERC ¶

61,084 at 61,423 (1998). The rationale for using GDP as the measure of long-term growth is an expectation that a regulated firm will ultimately grow at the rate of the average firm in the economy. *Northwest Pipeline Co.*, Opinion No. 396-C, 81 FERC ¶ 61,036 at 61,192 (1997).

Therefore, INGAA submits that it is reasonable to conclude that in the long-term MLPs will grow at the same rate as corporations, and that the use of GDP as the measure of long-term growth for both MLPs and corporations is appropriate. To the extent that a limited partner's ("LP") units could be expected, as a theoretical matter, to grow at a lower rate than corporate common shares (see discussion below), it would not necessarily follow that the long-term growth rate for LP units in the DCF model should be lower than GDP. Rather, it could just as easily be concluded that the use of GDP in the DCF model understates the long-term growth rates for corporate shares, and the correct way to adjust for the difference in growth rates between LP units and corporate shares, is to utilize GDP for LP units and increase the growth rate for corporate shares. Given the inability to determine whether GDP understates the growth rate of corporate shares, or overstates the growth rates of LP units in the DCF model, INGAA submits that a reasonable approach would be to continue to utilize GDP in the DCF model as the measure of long-term growth for both types of investor.

In the alternative, INGAA would propose a slight modification to the Commission's current DCF methodology which produces reasonable results in the current economic environment. As explained below, the proposal represents a pragmatic approach that assumes for the sake of argument that GDP is the correct measure of the long-term growth rate for corporate shares, and proposes a slight reduction in the measure

of LP units' long-term growth. As discussed in more detail below, this proposal is based on a purely theoretical analysis. As empirical evidence accumulates over time, the proposal may need to be revisited.

Attached is an analysis prepared by Michael J. Vilbert of the Brattle Group. Mr. Vilbert has a Ph.D. in Financial Economics from the Wharton School of the University of Pennsylvania and is an expert in, among other things, estimating cost of capital. Mr. Vilbert recognizes that predicting long-term growth for use in the DCF model is a matter of estimation and judgment, not precision. In addition, he notes that the choice of model involves a tradeoff between accuracy and simplicity. Because the Commission's current model examines an MLP's distribution yield and projected growth from the perspective of the limited partner, as opposed to the MLP as a whole, Mr. Vilbert proposes one modification to the existing methodology to address the Commission's concern about the long-term growth prospects of MLPs as compared to corporations. Specifically, Mr. Vilbert proposes a long-term growth rate for LPs equal to the average of GDP and the Federal Reserve Bank's target long-term Consumer Price Index rate of inflation. By proposing a long-term growth rate for LPs lower than GDP, Mr. Vilbert's proposal directly addresses the Commission's concern that limited partners' long-term growth rates can be expected to be lower than corporations.

To test the reasonableness of the results of his proposal, Mr. Vilbert also sets forth a Benchmark Model that attempts to reflect more accurately financial theory. This model focuses on the MLP as a whole, and therefore includes the impact of the general partner's Incentive Distribution Rights ("IDRs") in the DCF formula. In addition to incorporating the general partner's share of the MLP's equity, this model assumes a gradual step-down

from short-term growth rates to long-term growth rates, as opposed to the Commission's simpler methodology. Finally, because the long-term growth rates of MLPs, when viewed from the perspective of the MLP as a whole, can be expected to be similar to that of corporations, the Benchmark Model uses GDP as the measure of long-term growth for both types of entities.

As Mr. Vilbert explains, there should be no difference in the overall cost of capital based on organizational structure, assuming that both entities face a similar degree of risk. Thus, when viewed at the entity level, growth rates of MLPs and corporations can be expected to be similar. As a result, the Benchmark Model applies GDP as the measure of the long-term growth rate for both types of entities. In contrast, Mr. Vilbert believes that LP units may not be expected to grow as fast as the MLP itself primarily because MLPs pay out some of their cash flow to general partners. If MLPs and corporations are *assumed* to grow commensurate with GDP, and LP units can be expected to grow at a lower rate than the MLP as a whole, it would follow as a theoretical matter that the growth rate for LP units may be slightly less than GDP. For this reason, Mr. Vilbert has proposed the simple solution of reducing the LP's long-term growth rates to a level that results in a return on equity ("ROE") that is reasonably close to the results of his Benchmark Model.

As shown in Mr. Vilbert's analysis, the proposed simple modification to the Commission's existing model of reducing the long-term growth rate for MLPs to the average of GDP and the rate of inflation, results in an average ROE of 12.44% for a proxy group of six pipeline MLPs. In contrast, Mr. Vilbert's Benchmark Model results in an average ROE of 12.79% for this same proxy group. While the proposed methodology

results in an ROE that is slightly lower than the results of the theoretically more accurate Benchmark Model, INGAA believes that the results are close enough to substantiate the validity of the simpler proposal, at least at the present time.

INGAA would caution, however, that it is proposing this simple solution in an effort to minimize changes to the Commission's current DCF model, and in light of the fact that the results of Mr. Vilbert's Benchmark Model confirm the reasonableness of this approach at this time. However, factors in this analysis, such as inflation rates, could change in a way that results in a divergence of INGAA's proposed solution from actual growth rates of LP units. As more empirical evidence is developed over time regarding the actual growth rates of MLPs and the LP units,[2] adjustments may be required. In other words, INGAA's proposal is a pragmatic approach that is designed to directly address the Commission's concerns with a minimum level of change to the existing methodology. INGAA believes, however, that, as Mr. Vilbert demonstrates in his analysis, the issue is more complex. Should the results of INGAA's proposed expedient modification ever produce unreasonable results, INGAA reserves the right to seek modifications to this approach either pursuant to an industry-wide initiative, or in individual Section 4 rate proceedings.

Finally, INGAA requests that the Commission hear Mr. Vilbert's testimony on behalf of INGAA at the Commission's technical conference on January 23, 2008.

---

[2] Although Mr. Vilbert's Benchmark Model assumes that the growth rates of LP units will have a tendency to be less than those of corporations due to dilution caused by the issuance of new equity to support growth projects, it is very possible that assumption will not be borne out by experience. Whether the issuance of new equity results in dilution is dependent on the nature of the new growth projects being pursued by the MLP *(i.e.*, whether the particular growth transactions are accretive or dilutive by their nature).

REPORT ON THE TERMINAL GROWTH RATE FOR MLPS FOR USE IN THE DCF MODEL

BY
MICHAEL J. VILBERT
OF
THE BRATTLE GROUP

ON BEHALF OF
THE INTERSTATE NATURAL GAS ASSOCIATION OF AMERICA

December 21, 2007

I. EXECUTIVE SUMMARY

This report is a response to the FERC's request for comments on the sustainability of the long-term gross domestic product ("GDP") growth forecast as the terminal growth rate of distributions for Master Limited Partnerships ("MLPs") for use in the Discounted Cash Flow model ("DCF model") as specified by the FERC.

MLP distributions to their limited partner units ("LP units") typically exceed comparable distributions by C-corporations. In general, this would seem to make it more difficult for the MLP to grow as rapidly as a C-corporation because the C-corporation retains more earnings for reinvestment. Consistent with that notion, the Commission observes that commenters generally believe that MLPs will have lower growth potential than corporations, because of their high payout of distributable cash flow. Accordingly, the Commission seeks comments on whether its current method of projecting growth adequately reflects the lower growth potential of MLPs, particularly over the long term and, if not, what it should use as an alternative to project MLP distribution growth.

This report addresses these concerns. In evaluating the growth rate for purposes of the DCF model, it is important to remember that the model is attempting to replicate what investors expect the growth rate of dividends or distributions to be. However, in the absence of evidence regarding investors' expectations, experts are asked to fill the void. This report shows that the Commission's premise -- that MLPs have lower growth potential than C-corporations – may be correct only insofar as it focuses on the publicly-traded LP shares, but it is not accurate as applied to the MLP entity as a whole. In fact, MLPs and C-corporations can be expected to grow at the same long-term ("LT") terminal rate, because the high payout ratios do not restrict the growth of the MLP as a whole. This point is discussed in more detail below.

In the event the FERC determines to use a different LT rate for MLPs, this report proposes a very simple modification to the current FERC DCF model for application to the LP units. The current results produced by that simple model are comparable to results produced by a more theoretically complex application of the DCF model to the MLP as a whole (the "Benchmark Model") and can reasonably be relied upon by the Commission in applying its DCF analysis to

the publicly traded LP units of an MLP. It should be emphasized that no change is proposed for application of the FERC DCF model for C-corporations. In addition, it is also worth noting that alternatives to utilizing the DCF methodology remain available, and the Commission should remain open to utilizing these alternatives.

Note: throughout this report the entity as a whole will be referred to as the MLP. The term LP units will be used when referring to the publicly traded LP units.

A. Simple Modification to the FERC DCF Model for MLPs

The alternative to the current DCF model proposed is to change the "terminal growth rate," which is intended to mean the LT equilibrium growth rate (also referred to as the "steady state" or "constant growth rate") employed in the DCF model. In the current FERC DCF model, the terminal growth rate for C-corporations is assumed to be equal to the forecast of the LT nominal growth rate of GDP and given a weight of one-third. The modification is to change the terminal growth rate to the average of the forecast LT GDP growth rate and the Federal Reserve Bank's ("Fed's") presumed target LT Consumer Price Index ("CPI") inflation rate of about two percent. Currently, the proposed terminal value for the MLP sample companies would be about 3.5 percent.

This proposal preserves as much of the current FERC DCF model as possible while providing reasonably comparable estimates of the cost of equity when compared to the results from the Benchmark Model. At this time, the existing FERC DCF model, using GDP as the long-term growth rate, applied to a sample of MLPs results in a sample average estimated cost of equity slightly greater than the results from the Benchmark Model. In contrast, the results from the modification of the FERC DCF model, using the average of GDP and the Fed's target CPI rate, are slightly lower than the results from the Benchmark Model. Currently, the difference in the two estimates is about 50 bps with the results of the Benchmark model roughly in the middle.

B. Outline of Justification for the Proposed Modification

The FERC has most recently focused on the sustainability of the LT earnings growth rate forecasts for the LP units. As discussed in more detail in Section II below, the concern is plausible for the LP units' growth rate but not for the MLP as a whole. If the DCF model is

applied to the LP units, an adjustment to the LT growth rate is arguably appropriate. The justification for selection of the average of forecast LT GDP growth rate and the target inflation rate as the terminal growth rate for use with LP units is provided below, but it should be recognized that the terminal growth rate for use in the model is an assumption, whether for an MLP or a C-corporation.[1]

The second part, and the most important part, of the justification for the proposed modification is that the results from applying the modification to a sample of LP units are comparable to the results from a more complex and more theoretically accurate Benchmark DCF Model applied to the MLPs as a whole. The more complex model serves as a benchmark against which to measure the results of the proposed modification. The Benchmark Model is designed to capture as many aspects of applying the DCF model to a sample of MLPs as possible, which makes it more complicated and more theoretically accurate. Because the results are currently comparable between the two models, the Commission has some assurance that the simplified model is providing reasonable estimates at this time.

CAVEAT: The fact that results of the two models are currently very similar does not mean that they would always be so. If the simplified model were adopted, it would be important to reaffirm periodically that the results remain comparable.

II. MLP GROWTH RATES

A. WHAT GROWTH RATE?

To discuss MLP earnings growth rates for use in a DCF model, it is important to recognize that two different growth rates are potentially relevant, depending on whether one wishes to estimate the cost of the publicly traded LP equity only or one wishes to estimate the entire MLP's cost of equity. In order to obtain an accurate picture of the cost of capital for an enterprise, it is, of course, necessary to consider all sources of capital. When estimating the cost of LP equity alone,

[1] The determination of a terminal growth rate is necessarily uncertain because it is inherently so difficult to predict investors' expectations the farther out one goes in time. There is no completely satisfying LT growth rate assumption for either C-corporations or MLPs. By contrast, although the ST growth rates in the model are also "forecasts," they are the result of careful analysis by security analysts based upon the best available current information spanning a much short period, generally five years. They are therefore the most reliable data available, and moreover, other than the available short term ("ST") growth rates forecasts, it is not clear what other growth rate forecasts investors may rely on, if any.

growth in earnings per LP share is relevant. Earnings growth for the MLP as a whole is needed to estimate the MLP's entire cost of equity.[2] In general, these two measures of growth will differ 1) because an increasing proportion of earnings accrues to the General Partner ("GP") due to its equity ownership interest (about two percent) and the Incentive Distribution Rights ("IDRs"), which appear to be a feature of all MLPs; and 2) because MLPs may be presumed to issue new equity in order to sustain growth in the long run. As a result, terminal growth in earnings per share (used to estimate the cost of LP equity) will probably be lower than the terminal growth of the MLP's earnings as a whole (used for the MLP's entire cost of equity).

Because there is, in general, only one type of common equity in a C-corporation, there is no need to distinguish between the entire entity and the individual common stock when applying the DCF model to a C-corporation.

B. MLP INCENTIVES FOR GROWTH

At present, MLPs in general distribute a relatively high portion of their available cash flow. This policy has raised the question of how rapidly the distributions can grow compared to a C-corporation, particularly in the long term. IDRs provide the GP a very powerful incentive to grow earnings and distributions for the benefit of the MLP because the GP's share of distributions will grow only as the distributions to the LP units increase and move into different tiers. For C-corporations, the management does not have IDRs so the incentive to grow rapidly may not be as strong.

Incentive Distribution Rights

IDRs are set up to encourage the GP to find ways to benefit LP owners by increasing distributions to the LP units. As distributions increase, the GP's share of the total increases as the level of distributions reaches the "tiers" specified in the MLP's charter. As each tier is reached, a higher percentage of the incremental distributions is paid to the GP. At current rates of growth of distributions, it will take anywhere from 15 to 25 years for the typical MLP's distributions to reach the point at which both the GP distributions and the LP distributions are

[2] The DCF model focuses on cash dividends (C-corporations) or cash distributions (MLPs), but cash flow comes primarily from earnings growth. The growth of dividends or distributions can vary from the growth of earnings in the short-term, but in the long-term, the average growth of earnings and dividends/distributions must be the same.

growing at the same rate in the highest distribution tier. The distributions of most MLPs will enter the highest tier sooner than that but the total distributions will not be divided in approximately equal proportions until much later.

The earnings growth rates reported by security analysts are for the LP units. In general, growth rate estimates for the MLP are not reported, but they can be calculated relatively easily by determining how much of the distribution is owed to the GP. The forecast earnings growth for the MLP as a whole can be determined by calculating how fast the MLP must grow its earnings in order to meet the analysts' forecast of expected distribution growth for the LP units. Please see the attached Technical Appendix for a numerical demonstration of this calculation.

Note that, in general, a C-corporation does not have this issue because there is only one class of equity interest (common stock) and earnings are shared equally among the one class of common stock holders.[3]

Consider the following example. Initially the GP's two percent equity ownership receives two percent of the distributions, but in the top tier, the GP can receive as much as 50 percent of any increase in distributions even though the GP still owns only 2 percent of the equity. The graph below shows the rate of growth of GP distributions as the distributions to the LP units increase and shows how powerful the incentive to grow distributions for the benefit of both the LP units and the GP is likely to be. The GP's share of the total distributions approaches 50 percent as the size of the LP units' distribution increases to high levels.[4]

[3] Some C-corporations have more than one type of common stock, but the payment rules for different categories are not generally similar to IDRs.

[4] This assumes the highest tier allocates 50% of the incremental distributions to the GP.

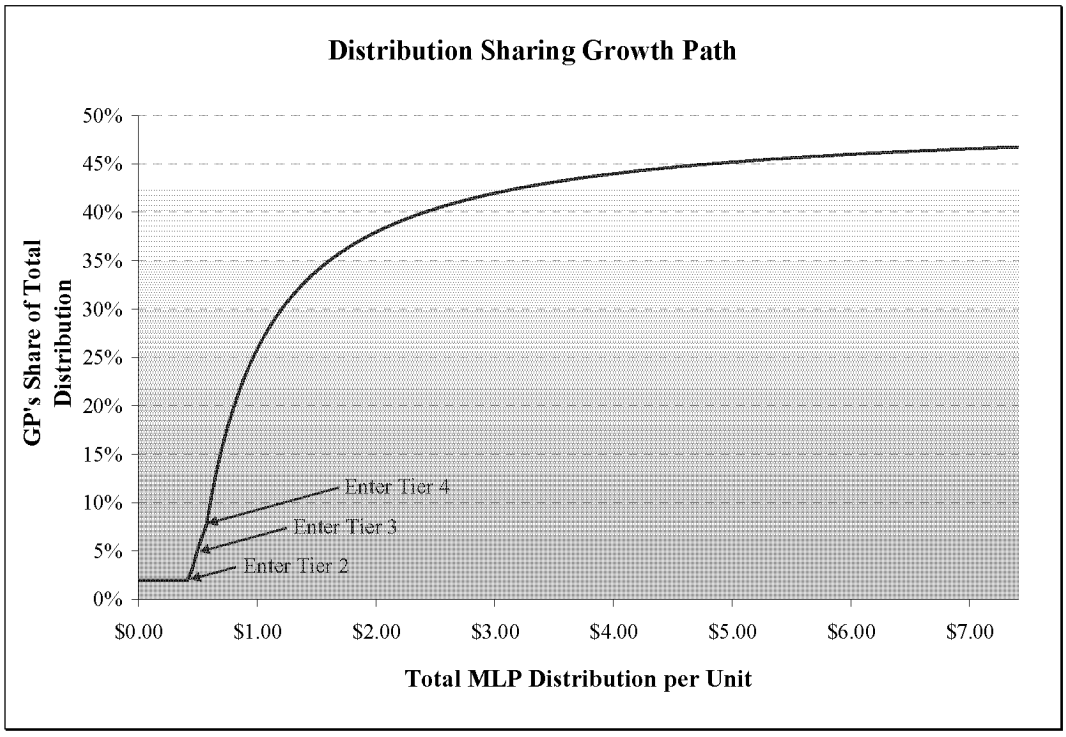

Figure 1: Share of total MLP distributions flowing to the GP as total distributions grow.

Because of the incentive provided by the IDRs, it is likely that an MLP will maintain a high growth rate for an extended period. Estimating how long that period may be will require a number of assumptions, but certainly 10 to 20 years is possible, if not likely.[5] In the Benchmark Model, I have used an estimate of 15 years.[6] In other words, the Benchmark Model assumes that it takes a total of 15 years for the distribution growth rate to reach the terminal GDP growth rate.

C. How is Growth Achieved?

Evaluating the sustainability of a terminal growth rate to apply to a sample of MLPs requires understanding how growth in earnings and distributions per share can be achieved for an MLP or C-corporation. One way is to invest in additional (regulated) assets which earn a higher return than the cost of capital used to purchase the assets. Another way to grow earnings is to increase efficiency so that expenses are reduced. Both MLPs and C-corporations can also grow earnings per share by increasing the financial leverage of the company. By using debt to purchase new

[5] Note that the years that distribution growth may exceed GDP growth (10-20 years) is different from the time it would take for the distributions to the GP to reach about 50% of the total distributions (15-25 years).

[6] See the Technical Appendix for how this assumption enters the model.

assets, earnings per share will increase, but this is achieved by increasing the financial risk of the company's equity. The increased earnings per share are compensation for the increased financial risk inherent in a more leveraged capital structure. Increasing leverage is not likely to increase the market value of equity because the increased risk of the equity is likely to offset the increased earnings per share. There are likely to be other ways to grow as well, but these are the primary ways.

Investing in additional assets financed with a mix of debt and equity can increase earnings per share particularly if the MLP or the C-corporation can issue new equity at a market-to-book ratio greater than 1.0. This is because the book value (i.e., rate base) of the new assets will increase the average rate base of all of the equity of the MLP or the C-corporation. Earnings per share also increase if the new assets earn a greater rate of return than the old assets. A regulated company cannot generally expect to earn a higher rate of return on new regulated assets than on current regulated rate base so growth can depend critically on the market-to-book ratio. Note that simply purchasing pipeline assets may not increase earnings per share if the price paid is greater than the rate base value of the assets because paying greater than book value dilutes the advantage of having a market-to-book ratio greater than 1.

D. SUSTAINABLE LONG-TERM GROWTH

Currently, the FERC has asserted that MLPs will have lower growth potential than that of C-corporations, but the forecast ST growth rates for MLPs are generally higher than GDP growth. Predicting how long an MLP can maintain a high payout rate and continue to grow as fast or faster than GDP is difficult, but it is certain that relatively high growth rates cannot be maintained indefinitely for MLPs (or for C-corporations). That observation raises two additional questions directly relevant to DCF estimation:

1) What is a sustainable LT growth rate for an MLP?

2) What is the path of growth rates as the ST growth rate trends to the (generally) lower LT (sustainable) growth rate? In other words, how long does it take for the ST growth rate to reach the LT growth rate for an MLP?

First, note that these questions are not unique to MLPs -- they are equally applicable to C-corporations. The FERC DCF method answers the first question for C-corporations using the

forecast of LT GDP growth. The second question is addressed by weighting the ST growth rate by two-thirds and the LT growth rate by one-third.[7] It is important to realize that the current FERC DCF method is a compromise because there are no definitive answers to the two questions above for C-corporations or for MLPs.

For the LP units, it is likely that the LT growth rate will be lower than the LT growth rate for a C-corporation given the payout policies of MLPs. The partnership agreement establishes a distribution policy for the MLP which generally encourages paying out a substantial portion of its annual cash flow. Both C-corporations and MLPs generally retain enough cash flow to maintain their property, plant and equipment ("PP&E") to offset annual depreciation; a C-corporation, however, retains more of its cash flow than a similar MLP. This means that the MLP must issue more LP shares than an otherwise identical C-corporation to finance investment in additional assets, all other factors being equal. Put differently, with the same rate base and allowed return on equity, the earnings growth rate for the individual LP units will be lower because the MLP will have more LP shares outstanding as a consequence of a higher payout ratio and because of the portion of distributions paid to the GP.

E. CAN AN MLP GROW AS FAST AS A C-CORPORATION?

Does a generally high payout policy that results in the distribution of substantially all of an MLP's cash flow mean that an MLP simply cannot achieve the same terminal growth at the entity level as a C-corporation? The answer is no. There is no reason or barrier in principle preventing an MLP as a whole from growing as rapidly as a C-corporation; both have an equal opportunity and ability to grow earnings and distributions, and both can achieve growth in very similar ways. There are, however, factors that can affect the relative growth rates of the two business organizations.

Like a C-Corporation issuing stock, MLPs can issue new LP units to raise equity to finance investment in additional assets. If the MLP has been successful in the past with regard to increasing distributions, it is highly likely that new equity can be raised. There will be some issuance costs but these costs are generally fairly small. Moreover, as noted above, the IDRs

[7] This roughly captures the impact of the decreasing growth rate with a single lower number that can be used in the constant growth DCF framework.

provide the GP an incentive to grow that on balance may result in the growth rate of LP distributions matching or even exceeding the growth rate for some C-corporations for an extended period of time.

In contrast, because C-corporations in general retain more of their net income, they do not need to issue as many additional shares to finance growth. Thus, achieving similar growth rates requires the MLP to issue more shares of equity than a C-corporation would need to issue. The consequence is that even though the overall growth rate for a C-corporation and an MLP may be identical, the growth rate of the publicly traded LP units will be lower than for the common equity shares of a similar C-corporation.

F. Terminal Growth Rates for the MLP and the LP Units

As distributions grow, at some point, approximately 15-25 years or more in the future,[8] the LP distributions will be in the highest tier, and the GP and the LP units as a group will each receive 50 percent of the distributions.[9] If the terminal growth rate for the MLP is equal to the LT GDP growth, the GP's distributions and the LP units' distributions in aggregate will grow at the GDP rate. However, it must be remembered that the MLP's growth is financed in part by issuing additional LP units. In theory, therefore, the terminal growth in an LP's earnings per share may be lower than the terminal growth rate of C-Corporations that fund growth more through retained earnings. Both C-corporations and MLPs issue equity in the expectation of investing in assets that provide accretive earnings growth per share including through building Greenfield projects or purchasing additional assets. While one could question how long MLPs as a group can continue to find projects that are accretive to earnings, the evidence to date is that MLPs have been able to maintain growth for an extended period. Nonetheless, for purposes of my theoretical analysis, I assume that LP growth (as opposed to MLP growth) will be lower than C-Corporation growth due to MLPs' issuance of more LP units to fund growth. In other words, when the MLP is growing at the GDP rate, the distributions must be growing at a much slower rate for the individual LP units because the growth is being shared by more LP units and the GP.

---

[8] This estimate depends upon the current tier and the forecast growth rate for each MLP. Some MLPs are already in or near the highest tier.

[9] This assumes that the highest tier provides a 50 percent incentive distribution to the GP. If the highest tier were lower, the GP's share of total distributions would approach that percentage, leaving the remainder for the LP units.

If the terminal growth rate for an MLP is LT GDP growth, the next question is "what is the terminal growth rate for the LP units?" As noted above, it must be acknowledged that there is no definitive answer to this question. Just as for the MLPs and C-corporations which have an assumed growth rate equal to LT GDP growth, it is necessary to assume a terminal growth rate for LP units. However, we do have some available information that we can use to improve the expected accuracy of the assumed level of growth.

Based upon the assumption that the terminal growth rate for the MLP as a whole is equal to the forecast LT GDP growth rate and that investment in additional assets by an MLP requires the issuance of additional LP shares as well as debt, the terminal growth rate of distributions for the individual LP units will be lower than for the MLP as a whole. How much lower? Again, this requires an assumption, but it seems reasonable that the higher the GDP growth, the higher the growth of rate of earnings for MLPs, C-corporations and LP units, so the growth rate for LP units should also be tied to GDP growth. It is also desirable that the assumed value of the terminal growth rate should be observable so that once the approach is agreed upon, determining the value to use in the model should not be a source of additional debate.[10]

The proposed value for the terminal growth rate for the LP units is the average of the forecast LT GDP growth rate and the Fed's target rate of inflation. It is a value that is observable and tied to but less than the forecast LT GDP growth rate. Growth for LP units, although less than the growth rate for the MLP as whole, is likely to be greater than inflation because growth at the rate of inflation would imply little to no real growth in earnings for the MLP. Recall that nominal GDP growth will exceed the rate of inflation if there is a real (i.e., inflation adjusted) increase in GDP. Therefore, a terminal growth rate for LP units equal to the average of the forecast of inflation and GDP growth is a reasonable compromise benchmark for the terminal growth rate of the LP units in the DCF model at this time.

Finally, the proposed terminal growth rate for LP units is not recommended for C-corporations or for MLPs as a whole. The FERC should maintain its current assumption of a terminal growth rate equal to GDP growth because one of the attractive aspects of a growth forecast equal to GDP is that the company or industry remains a constant portion of GDP. If a rate less that GDP

[10] The presumed Fed target inflation rate is derived from various speeches of the Fed's Board of Governors. It is not a published estimate because the Fed does not purport to set a target, but the speeches indicate that a reasonable target would be about 2 percent.

were used for either MLPs or C-corporations, it would mean that the analyst believed that the industry or company would become an increasingly smaller part of the economy. In addition, the forecast nominal GDP growth rate will always exceed the inflation rate as long as there is real, (i.e., inflation adjusted) growth in the economy. Setting the terminal growth rate in the model at the rate of inflation for C-corporations or MLPs would mean that neither would have any real growth in earnings or distributions. Therefore, maintaining the assumption of a terminal growth rate of GDP for both the C-corporations and MLPs is likely to be the best available estimate.

G. SUMMARY

Applying the DCF model to a sample of MLPs requires careful consideration of the parameters of the model. Specifically, analyst forecasts of earnings and distributions growth are for the LP units. Because of the IDRs, the earnings for the MLP as a whole will be higher than for the LP units. In other words, there are two different growth rates, one for the MLP and one for the LP units. The IDRs provide an incentive to the GP to grow distributions for the benefit of the LP units as well as for itself. As a result, the current relatively high payout ratios and ST growth rates, generally greater than GDP growth, are likely to persist for many years. Even when growth slows, there is no reason that the terminal growth rate for the MLP will not be the same as for a C-corporation. If the terminal growth rate for MLPs (and for C-corporations) is equal to the LT GDP growth rate, it is likely that the terminal growth rate for the LP units will be lower because of the increase in the number of LP units outstanding.

III. IMPLEMENTING THE DCF MODEL FOR AN MLP SAMPLE

Section II outlined some of the differences between an MLP and a C-corporation that should be considered when using the DCF model to estimate the cost of equity. The remainder of this report focuses on estimating the cost of equity for a sample of MLPs by application of the DCF method.

It is important to note that there are alternative costs of equity estimation models such as the risk positioning model (e.g., the Capital Asset Pricing Model (CAPM), the Empirical CAPM or the risk premium model) or the Fama-French model. These models may actually be preferable to the

DCF model to estimate the cost of equity for an MLP sample because some of the complications of the DCF model with regard to an MLP can be avoided. In addition, there has been no discussion of the effect of financial risk on the cost of equity in this report. This is an important topic, but neither the alternative models nor adjusting for financial risk are addressed in this report. The purpose here is to answer the question of how best to apply the DCF model to MLPs.

A. What Constitutes an Acceptable Model?

The first issue is to determine or specify the conditions necessary for an acceptable model. For any model, there is a tradeoff between accuracy and simplicity. Ultimately, we would like a model that is as accurate as possible but that is also as simple as possible. Of course, because we do not know the "true" cost of equity, we must estimate it. This means that there is no definitive way to determine whether any estimation method is the "most accurate". However, some methods will be more in accord with financial theory, model more of the characteristics of an MLP and will provide more consistent estimates than other possible methods.

For example, the FERC DCF model for natural gas pipelines is quite simple and until recently has provided estimates of the cost of equity that seemed reasonable, but the number of available C-corporations to include in the sample has declined. The sample of C-corporations is now so small that it calls into question the reliability of the cost of equity estimates. Because many FERC-regulated natural gas pipelines are owned by MLPs, it is logical to add MLPs to the list of companies from which to choose a sample.

B. Capital Structure Issues to Consider for Applying the DCF Model to MLPs

One difficulty with estimating the cost of equity for a sample of MLP companies is that the GP's portion of the equity ownership is not traded in the market.[11] To understand why this is a problem requires an understanding of the distribution of an asset's risk to investors. In corporations, the risk of the assets is generally split among three types of investors: common

[11] Although a number of MLPs have issued traded shares that capture the GP equity value, none of the MLPs that are primarily natural gas pipelines currently do so. The closest is Enterprise Product Partners, LP, which owns a mix of oil and natural gas pipelines.

shareholders, preferred shareholders, and debt holders.[12] Market information on prices and returns are available for all three types of investors.

For an MLP, the risk of the assets is split among a GP, the limited partners, and debt holders. As with a corporation, the risks are divided into three parts, but the risk characteristics of the parts differ from those of a corporation. The presence of the GP does not add additional risk to the underlying business operations of the MLP – the overall risk of the assets should be the same regardless of whether they are organized in an MLP or a C-corporation, and so should their cost of capital. The GP does, however, affect how that risk is divided.

Professors Franco Modigliani and Merton Miller provided the initial analysis showing that capital structure shouldn't affect the value of the firm. In other words, in an efficient market the value of a firm is unaffected by how that firm is financed. The table below illustrates the point, showing that the total cost of capital for the assets (r_A) is unchanged no matter how the equity is proportioned.

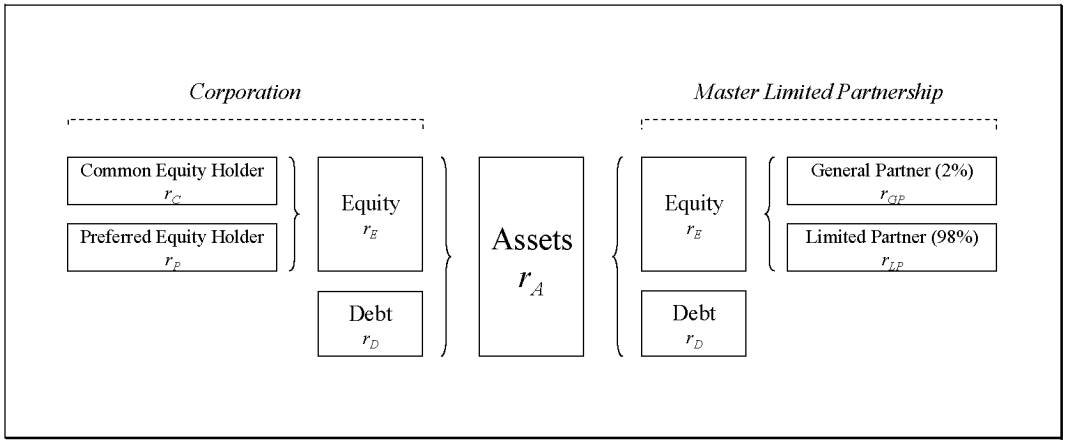

Figure 2: Division of business risks for a corporation and an MLP.

C. Cost of Equity Capital

As highlighted in the figure above, the GP and LP unit holders together share the risk after debt holders have been paid, and each requires a rate of return for bearing that risk. Regulators compensate for these risks by allowing investors to earn a fair and reasonable return on their investments. The rate of return expected by investors should be equal to the cost of capital of the

[12] Preferred equity is more like debt in terms of its required rate of return and scheduled payments. In general, preferred dividends are specified in terms of amount and timing, but failing to pay preferred dividends does not force bankruptcy unlike missing a debt payment.

firm's assets (r_A). That is, the assets of the firm must earn a rate of return that appropriately compensates investors for bearing the risk of the assets. A regulated rate of return that lies below the cost of capital will deter investors from investing much needed capital to maintain infrastructure, while a rate that is too high makes consumers pay too much for the service that is provided. Estimating the appropriate cost of capital that balances between the two is one of the main objectives for regulators.

To estimate r_A for an MLP, we would need to estimate r_{GP}, r_{LP}, and their relative market values.[13] There is, however, little or no market data available for the GP units, which make it more difficult to estimate the GP's cost of capital. Information is available to estimate r_{LP}, but the LP units represent only a portion of the firm's total market value of equity. This means that even if we estimate the cost of equity for the LP units perfectly, we will not have an estimate of the total risk of the assets because we have limited data for the GP's share of the equity.

In applying the DCF model to MLPs, the FERC has expressed a number of concerns that INGAA addressed in earlier comments. In its November 15th Notice, the Commission focused on the terminal growth rate. The Commission asks

- "Whether its current method of projecting growth adequately reflects the lower growth potential of MLPs, *particularly over the long term[.]*"[14] Relatively high payout policies in conjunction with growth rate forecasts that are greater than GDP growth may not be sustainable in the long-term. The implication is that the terminal growth rate is likely to be lower than the forecast of GDP growth.

The correct growth rate to use in the DCF model is always the controversial part of the model whether for C-corporations or for MLPs. A high current dividend yield may simply reflect low

[13] This report is based on the assumption that the underlying business risks of a pipeline organized as an MLP are the same as a pipeline organized as a C-corporation. In other words, the organizational structure does not affect the overall cost of capital for the assets.

[14] In this context, the Commission refers to a newsletter published by an investment banker that uses a projected MLP long-term annual growth rate of 2.5 percent (as compared to a currently projected GDP growth rate of approximately 4.5 percent). Notice at P 5 note 2, citing *MLPs: Safe to Come Back into the Water*, Wachovia Capital Markets, LLC, Equity Research Department, at 9-10 (August 20, 2007). Based on conversations with the authors, the LT growth rates employed there (which actually range between 1.5 and 3 percent), were based on their analysis of the characteristics of the individual MLPs. Importantly, and consistent with the principal finding of this report, those estimates were of LT growth of the publicly-traded LP shares alone, not for the MLPs as a whole.

growth prospects in the future, but the key questions are when and how quickly the ST growth rate may taper off to a lower terminal growth rate, and if so, what is the lower growth rate likely to be. Of course, the accuracy of the DCF model depends upon using a correct growth rate.

D. DCF MODELS

Because the MLP corporate structure is different from that of a C-corporation, the differences must first be understood before attempting to determine whether any modifications to the DCF model or its parameters are necessary to estimate the cost of equity accurately.

First, recall that a portion of the equity of an MLP is owned by the GP, but the lack of price data on the GP claims makes it impossible to estimate directly the MLP's overall cost of equity. It is important to note that the GP's earnings will be derived from the allowed return on equity on the rate base so it is important that the allowed return on equity be high enough to provide the required return on equity for all of the MLP's equity, the LP and GP shares alike.

Second, MLPs have an additional complication with regard to growth rates. Analyst earnings growth forecasts are for the LP units. (See note 14.) This means that the earnings growth of the MLP as a whole must be *higher* than the forecast growth rate for the LP units because the GP claims a higher portion of the earnings as the distributions to LP units increase. LP distribution growth will always be less than or equal to the MLP growth rate because of the IDRs. The distributions to the LP shares over the long term will be less than the earnings growth for the MLP because the GP receives an increasing portion of the distributions as an incentive. In other words, the incremental cash flow owed to the GP increases rapidly as the distributions grow to higher tiers. For many MLPs, when the distribution level reaches the top tier, the GP receives 50 percent of all incremental distributions. Of course, this is not an issue for C-corporations which do not have IDRs.

Finally, LT growth rate estimates (i.e., growth rates for periods longer than five years) are generally not available for either MLPs or for C-corporations. Applying the DCF model to either MLPs or C-corporations requires estimating earnings growth rates after year five, including estimating the terminal growth rate and the path to the terminal growth. Whether a terminal growth rate of forecast LT GDP is sustainable for MLPs is the essence of the FERC's stated concern with regard to growth rates for the MLP sample companies.

E. DCF GROWTH RATES

As noted above, estimating the growth rate in the DCF model is always controversial because a one percentage point difference in the growth rate estimate results in more than a one percentage point difference in the estimated cost of equity. Most DCF applications make very strong (i.e., unrealistic) assumptions that yield a simplification on the cost of capital. The simple DCF model, for instance, assumes that a company's earnings (and dividends, prices, and book value) grow at a constant rate forever. In addition, the model assumes that investors expect the cost of capital to be the same in all future years. Violations of these expectations can bias (in either direction) the DCF estimate of the cost of capital.

Estimating the cost of capital with a constant growth DCF approach for a sample of either MLPs or C-corporations is therefore likely to be unreliable. A simple DCF model, as in any DCF model, requires a distribution yield and a growth rate. The higher the distribution yield or growth rate, or a combination of both, will yield a higher return on equity. MLPs tend to have slightly higher distribution yields than corporations, because they pay out a larger percentage of their earnings to unit holders. In an efficient market, the stock price of an MLP should reflect the higher expected distributions and value the stock in recognition of such distributions. If the stock price diverges, arbitrage should bring it back into line.[15]

Finding the right growth rate(s) is usually the "hard part" of a DCF application whether for an MLP or a C-corporation. The original approach to estimate *g* relied on average historical growth rates in observable variables, such as dividends or earnings, or on the "sustainable growth" approach, which estimates *g* as the average book rate of return times the fraction of earnings retained within the firm. But it is highly unlikely that historical averages over periods with widely varying rates of inflation, interest rates and costs of capital, such as in the relatively recent past, will equal current growth rate expectations.

A better approach is to use the growth rates currently expected by investment analysts, if an adequate sample of such rates is available. If this approach is feasible and if the person estimating the cost of capital is able to select the appropriate version of the DCF formula, the DCF method should yield a reasonable estimate of the cost of capital. However, for the DCF

[15] In this case, arbitrage refers to the actions by investors to buy investments with higher expected returns relative to their risk and to sell investments with lower expected returns relative to their risk.

approach to work the basic stable-growth assumption must become reasonable and the underlying stable-growth rate must become determinable *within the period for which forecasts are available*. Because growth rates are likely to vary in the short run before settling down into a terminal growth rate, it is better to rely on a multi-stage DCF rather than the simple DCF. The Multi-Stage model takes the analyst growth rates, and adjusts them over time to a steady state (usually a long-term GDP forecast). A two-stage model compensates for the unrealistic assumption that growth rates should be constant and allows growth rates to vary before settling down in the sustainable LT growth rate.

F. POSSIBLE DCF MODELS FOR MLPS

This report proposes a simple adjustment to the current FERC DCF model as a compromise to address the problems that are of concern to the Commission. Specifically, it is proposed that the Commission apply the current FERC DCF model to the LP units, but use a terminal growth rate equal to the average of the LT GDP growth rate and the Fed's target LT CPI inflation rate instead of simply GDP growth. This is a very simple solution and retains as much as possible of the current FERC DCF model applied to C-corporations, but it is only recommended here because the current results from the modified FERC model are comparable to a more complex and more theoretically accurate Benchmark DCF model. The second, more complex model, attempts to capture the differences between MLPs and C-corporations that are likely to affect the estimated cost of equity.

To reiterate, the proposed compromise model simply treats the LP units the same as a C-corporation and applies the standard FERC DCF model with one modification. It substitutes the average of forecast LT GDP growth and LT target CPI inflation for the forecast of LT GDP growth as the terminal growth rate in the model. In other words, the distribution yield is calculated in the standard way for the LP using the full distribution and the growth rate is the weighted average of the ST (i.e., 5-year) analysts' growth forecast (two-thirds weight) and the average of the LT GDP and the LT inflation target (one-third weight). This option is based on a sense of "rough justice" in that the LP units are less risky than the MLP equity as a whole because of the GP share, but the terminal growth rate for the LP is likely to be lower than the terminal growth rate for the C-corporations or for the MLP as a whole. No change is proposed

for the C-corporations. Specifically, the forecast of the terminal growth rate would continue to be the forecast LT GDP growth rate.

1. Details on the Benchmark Model

The Benchmark Model applies the DCF model to the MLP as a whole. Because it attempts to model the differences between an MLP and a C-corporation, it is expected to provide more accurate estimates of the cost of equity for the MLP. It attempts to capture the effect of the GP on the risk of the MLP and the differences in growth rates between the LP units and the MLP. The Benchmark Model is discussed in detail in the Technical Appendix. The Technical Appendix lays out the calculations and assumptions involved in the model so that anyone wishing to evaluate the approach has access to all of the information necessary to reproduce the results.

The current FERC DCF method is very simple and straightforward, but it does not take advantage of the computing ease and power available in current computer programs. More complicated models can easily be handled by current programs which would make the task of estimating the cost of capital accurately easier. The Benchmark Model is a true two-stage DCF model which means that the forecast dividend growth rate differs over time. Specifically, the growth rate is constant for the first five years and then trends linearly to the presumed LT sustainable growth rate by year 16 (a linear trend to forecast GDP growth over a 10 year period). The growth rate in the first five years is the growth rate for the MLP as whole which is derived from knowing the growth rate of the LP share, the tier structure of the MLP and where in the tier the MLP's most recent distribution lies. The LP stock price is also increased by an amount that recognizes that the value of the GP share and the LP units is greater than the value of the LP units alone. The calculation of the increase in the LP price necessary to recognize the GP portion of equity is described in detail in the Technical Appendix. The terminal growth rate is assumed to be the same as for the C-corporations, i.e., the forecast of LT GDP growth.

2. Comments on the Benchmark Model

As noted above, the motivation for the more complex model is to provide a benchmark against which to compare the results from other, simpler models. It is expected that the Benchmark Model will provide a "better" estimate of the cost of equity for a sample of MLPs, because it

attempts to recognize the role of the GP in determining the required return on equity. It does this by recognizing that the growth rate of the MLP must be greater than the forecast growth rate of the LP units and recognizing that the GP equity is both riskier and likely to have a higher market value than the LP equity relative to the current value of the distributions it receives. The GP equity is riskier because the cash flows to the GP are more variable. As MLP earnings increase or decrease, the GP's share of distributions increases or decreases more rapidly than the LPs' share.

Of course, it is an assumption that the Benchmark Model provides a better estimate of the cost of equity because no one knows the *true* cost of equity. It must be estimated, but some models incorporate more of the underlying features of the investment than others at the expense of more complexity. The Benchmark Model adds complexity to replicate more precisely the cash flows and other aspects of an MLP.

Specific comments:

First, no step in the application of the Benchmark Model requires judgment once the parameters of the model are agreed upon.

Second, the Benchmark Model considers both the GP's and the LP's equity shares.

Third, the Benchmark Model could be applied equally to MLPs or C-corporations.

Fourth, the LT growth rate is assumed to be equal to forecast GDP growth, but the path to get to the terminal growth rate requires an assumption on how fast the transition is likely to take.

Fifth, the Benchmark Model increases the price of the GP equity share by more than the GP's current share of distributions, because the expected growth rate of distributions to the GP is higher than for the LP units. This adjustment has the effect of reducing the estimated cost of equity slightly when the Benchmark Model is applied to MLPs. Therefore, the GP adjustments made in the Benchmark Model include elements that can both increase and decrease the estimated cost of equity when applied to MLPs.

It is important to recognize that the LP unit owners take into account the distribution rights of the GPs when making their investment decisions. Therefore the market price of the LP units fully reflects the IDR structure of the MLP.

3. Comparison of the Results

The table below shows the results of the Benchmark Model applied to a representative sample of MLPs compared to the proposed modified version of the FERC DCF model for pipelines.[16] As can be seen, the proposed modification to the FERC DCF model actually produces results that are slightly less than the Benchmark analysis. However, the two models currently provide average cost of equity estimates for the sample that are relatively close, although estimates for the individual companies vary. This result is a function of financial data used at the time of the preparation of this report and should not be interpreted to mean that the results will always be this close. However, looking at the individual company results suggests that the two models will produce numbers which are "close" to one another. This is the concept of rough justice that is the motivation to change the terminal growth rate for applying the FERC DCF method to the LP units, as slightly modified, in order to preserve the simplicity of the current FERC DCF model. Note that had the current FERC DCF method been applied to the MLP sample, the result would have been 12.94 percent, about 50 basis points higher, reflecting the higher terminal growth rate in the model. Although the results of both the modified and current FERC DCF model when applied to the LP units is within the range of estimation error for the Benchmark Model, the modification to the FERC's current DCF model is proposed primarily in recognition that the terminal growth rate for the LP units is likely to be lower than for the MLP as a whole.

[16] I have not examined, nor have I expressed an opinion on, the issue of the composition of the proxy group.

Table 1: Comparison of DCF Results by Model.

	Benchmark DCF Model on the MLPs (Multi-Stage) [1]	Proposed Modified FERC DCF on LP Units [2]
Boardwalk Pipeline Partners, L.P.	12.16%	12.08%
Growth Rate	*(12.53%)*	*(6.69%)*
Oneok Partners, L.P.	12.55%	11.82%
Growth Rate	*(10.11%)*	*(5.37%)*
TC Pipelines, L.P.	11.30%	10.91%
Growth Rate	*(6.30%)*	*(3.82%)*
Enbridge Energy Partners, L.P.	12.62%	12.17%
Growth Rate	*(8.37%)*	*(4.74%)*
Enterprise Products Partners, L.P.	13.93%	13.77%
Growth Rate	*(10.49%)*	*(7.31%)*
Kinder Morgan Energy Partners, L.P.	14.17%	13.89%
Growth Rate	*(9.91%)*	*(7.06%)*
Average	12.79%	12.44%

Sources and Notes:

[1]: Growth rates are 5-year forecasts for the entire MLP based on forecasts for the LP units (see text). Terminal growth rate is assumed to be the forecast GDP growth rate of 4.92%. This is reached after five years of short-term growth and ten years of detrending.

[2]: Growth rate calculated as: ((2/3) x Analysts' Forecasts) + ((1/3) x Terminal Growth Rate). Terminal growth rate per share is estimated at 3.46%. It is computed as the average of forecast GDP growth and a presumed 2% targeted inflation rate by the Federal Reserve.

IV. SUMMARY OF CONCLUSIONS ON MLP GROWTH AND THE DCF MODEL

The MLP structure generates a number of issues for the application of the DCF model. The growth rate is of critical importance in the DCF model, but there is no forecast for earnings growth rates for longer than five years. In addition, the equity in an MLP is divided between the LP units and the GP, but market information on prices and growth rates are generally only available for the LP units. Because of the IDRs, the GP has a powerful incentive to work to ensure that the MLP's earnings grow as rapidly as possible which benefits both the LP unit holders and the GP. As a result, it is likely that the LP units will have high distribution yields as well as 5-year earnings growth forecasts that exceed GDP growth. It is also likely that the relatively high 5-year earnings growth rates cannot be sustained indefinitely, although the

incentive provided by the IDRs make it probable that the MLP will maintain high growth rates for an extended period.

The proposed option to apply a slight modification to the current FERC DCF model to the LP units is admittedly a simplification, but the results from the simplified model currently track the results of the more complex and more theoretically accurate Benchmark Model closely. Although that outcome may not always be true, the availability of the Benchmark Model or other alternative theoretical models can serve periodically as a check on the reasonableness of the simplified model.

APPENDIX A

RESUME

MICHAEL J. VILBERT **PRINCIPAL**

Michael Vilbert is an expert in cost of capital, financial planning and valuation who has advised clients on these matters in the context of a wide variety of investment and regulatory decisions. He received his Ph.D. in Financial Economics from the Wharton School of the University of Pennsylvania, an MBA from the University of Utah, an M.S. from the Fletcher School of Law and Diplomacy, Tufts University, and a B.S. degree from the United States Air Force Academy. He joined The Brattle Group in 1994 after a career as an Air Force officer, where he served as a fighter pilot, intelligence officer, and professor of finance at the Air Force Academy.

REPRESENTATIVE CONSULTING EXPERIENCE

- In a securities fraud case, Dr. Vilbert designed and created a model to value the private placement stock of a drug store chain as if there had been full disclosure of the actual financial condition of the firm. He analyzed key financial data and security analysts' reports regarding the future of the industry in order to recreate pro forma balance sheet and income statements under a variety of scenarios designed to establish the value of the firm.

- For pharmaceutical companies rebutting price-fixing claims in antitrust litigation, Dr. Vilbert was a member of a team that prepared a comprehensive analysis of industry profitability. The analysis replicated, tested and critiqued the major recent analyses of drug costs, risks and returns. The analyses helped develop expert witness testimony to rebut allegations of excess profits.

- For an independent electric power producer, Dr. Vilbert created a model that analyzed the reasonableness of rates and costs filed by a natural gas pipeline. The model not only duplicated the pipeline's rates, but it also allowed simulation of a variety of "what if" scenarios associated with cost recovery under alternative time patterns and joint cost allocations. Results of the analysis were adopted by the intervenor group for negotiation with the pipeline.

- For the CFO of an electric utility, Dr. Vilbert developed the valuation model used to support a stranded cost estimation filing. The case involved a conflict between two utilities over the responsibility for out-of-market costs associated with a power purchase contract between them. In addition, he advised and analyzed cost recovery mechanisms

that would allow full recovery of the stranded costs while providing a rate reduction for the company's rate payers.

- Dr. Vilbert has testified as well as assisted in the preparation of testimony and the development of estimation models in numerous cost of capital cases for natural gas pipeline, water utility and electric utility clients before the Federal Energy Regulatory Commission ("FERC") and state regulatory commissions. These have spanned standard estimation techniques (e.g., Discounted Cash Flow and Risk Positioning models). He has also developed and applied more advanced models specific to the industries or lines of business in question, e.g., based on the structure and risk characteristics of cash flows, or based on multi-factor models that better characterize regulated industries.

- Dr. Vilbert has valued several large, residual oil-fired generating stations to evaluate the possible conversion to natural gas or other fuels. In these analyses, the expected pre- and post-conversion station values were computed using a range of market electricity and fuel cost conditions.

- For a major western electric utility, Dr. Vilbert helped prepare testimony that analyzed the prudence of QF contract enforcement. The testimony demonstrated that the utility had not been compensated in its allowed cost of capital for major disallowances stemming from QF contract management.

- Dr. Vilbert analyzed the economic need for a major natural gas pipeline expansion to the Midwest. This involved evaluating forecasts of natural gas use in various regions of the United States and the effect of additional supplies on the pattern of natural gas pipeline use. The analysis was used to justify the expansion before the FERC and the National Energy Board of Canada.

- For a Public Utility Commission in the Northeast, Dr. Vilbert analyzed the auction of an electric utility's purchase power agreements to determine whether the outcome of the auction was in the ratepayers' interest. The work involved the analysis of the auction procedures as well as the benefits to ratepayers of transferring risk of the PPA payments to the buyer.

- Dr. Vilbert led a team tasked to determine whether bridge tolls were "just and reasonable" for a non-profit port authority. Determination of the cost of service for the authority required estimation of the value of the authority's assets using the trended original cost methodology as well as evaluation of the operations and maintenance budgets. Investment costs, bridge traffic information and inflation indices covering a 75 year period were utilized to estimate the value of four bridges and a passenger transit line valued in excess of $1 billion.

- Dr. Vilbert helped a recently privatized railroad in Brazil develop an estimate of its revenue requirements, including a determination of the railroad's cost of capital. He also helped evaluate alternative rate structures designed to provide economic incentives to shippers as well as to the railroad for improved service. This involved the explanation

and analysis of the contribution margin of numerous shipper products, improved cost analysis and evaluation of bottlenecks in the system.

- For a utility in the Southeast, Dr. Vilbert quantified the company's stranded costs under several legislative electric restructuring scenarios. This involved the evaluation of all of the company's fossil and nuclear generating units, its contracts with Qualifying Facilities and the prudence of those QF contracts. He provided analysis concerning the impact of securitizing the company's stranded costs as a means of reducing the cost to the ratepayers and several alternative designs for recovering stranded costs.

- For a recently privatized electric utility in Australia, Dr. Vilbert evaluated the proposed regulatory scheme of the Australian Competition and Consumer Commission for the company's electric transmission system. The evaluation highlighted the elements of the proposed regulation which would impose uncompensated asymmetric risks on the company and the need to either eliminate the asymmetry in risk or provide additional compensation so that the company could expect to earn its cost of capital.

- For an electric utility in the Southwest, Dr. Vilbert helped design and create a model to estimate the stranded costs of the company's portfolio of Qualifying Facilities and Power Purchase contracts. This exercise was complicated by the many variations in the provisions of the contracts that required modeling in order to capture the effect of changes in either the performance of the plants or in the estimated market price of electricity.

- Dr. Vilbert helped prepare the testimony responding to a FERC request for further comments on the appropriate return on equity for electric transmission facilities. In addition, Dr. Vilbert was a member of the team that made a presentation to the FERC staff on the expected risks of the unbundled electric transmission line of business.

- Dr. Vilbert and Mr. Frank C. Graves, also of The Brattle Group, prepared testimony evaluating an innovative Canadian stranded cost recovery procedure involving the auctioning of the output of the province's electric generation plants instead of the plants themselves. The evaluation required the analysis of the terms and conditions of the long-term contracts specifying the revenue requirements of the plants for their entire forecasted remaining economic life and required an estimate of the cost of capital for the plant owners under this new stranded cost recovery concept.

- Dr. Vilbert served as the neutral arbitrator for the valuation of a petroleum products tanker. The valuation required analysis of the Jones Act tanker market and the supply and demand balance of the available U.S. constructed tanker fleet.

TESTIMONY

Direct and rebuttal testimony before the Alberta Energy and Utilities Board on behalf of TransAlta Utilities Corporation in the matter of an application for approval of its 1999 and 2000 generation tariff, transmission tariff, and distribution revenue requirement, October 1998.

Direct testimony before the Federal Energy Regulatory Commission on behalf of Central Maine Power in Docket No. ER00-982-000, December 1999.

Direct testimony before the Alberta Energy and Utilities Board on behalf of TransAlta Utilities Corporation for approval of its 2001 transmission tariff, May 2000.

Direct testimony before the Federal Energy Regulatory Commission on behalf of Mississippi River Transmission Corporation in Docket No. RP01-292-000, March 2001.

Written evidence, rebuttal, reply and further reply before the National Energy Board in the matter of an application by TransCanada PipeLines Limited for orders pursuant to Part I and Part IV of the *National Energy Board Act*, Order AO-1-RH-4-2001, May 2001, Nov. 2001, Feb. 2002.

Written evidence before the Public Utility Board on behalf of Newfoundland & Labrador Hydro - Rate Hearings, October 2001.

Direct testimony (with William Lindsay) before the Federal Energy Regulatory Commission on behalf of DTE East China, LLC in Docket No. ER02-1599-000, April 2002.

Direct and rebuttal reports before the Arbitration Panel in the arbitration of stranded costs for the City of Casselberry, FL, Case No. 00-CA-1107-16-L, July 2002.

Direct reports before the Arbitration Board for Petroleum products trade in the Arbitration of the Military Sealift Command vs. Household Commercial Financial Services, fair value of sale of the Darnell, October 2002.

Direct testimony and hearing before the Arbitration Panel in the arbitration of stranded costs for the City of Winter Park, FL, In the Circuit Court of the Ninth Judicial Circuit in and for Orange County, FL, Case No. C1-01-4558-39, December 2002.

Direct testimony before the Federal Energy Regulatory Commission on behalf of Florida Power Corporation, dba Progress Energy Florida, Inc. in Docket No. SC03-1-000, March 2003.

Direct report before the Arbitration Panel in the arbitration of stranded costs for the Town of Belleair, FL, Case No. 000-6487-C1-007, April 2003.

Direct and rebuttal reports before the Alberta Energy and Utilities Board in the matter of the Alberta Energy and Utilities Board Act, R.S.A. 2000, c. A-17, and the Regulations under it; in the matter of the Gas Utilities Act, R.S.A. 2000, c. G-5, and the Regulations under it; in the

matter of the Public utilities Board Act, R.S.A. 2000, c. P-45, as amended, and the Regulations under it; and in the matter of Alberta Energy and Utilities Generic Cost of Capital Hearing, Proceeding No. 1271597, July 2003, November 2003.

Written evidence before the National Energy Board in the matter of the National Energy Board Act, R.S.C. 1985, c. N–7, as amended, (Act) and the Regulations made under it; and in the matter of an application by TransCanada PipeLines Limited for orders pursuant to Part IV of the *National Energy Board Act*, for approval of Mainline Tolls for 2004, RH-2-2004, January 2004.

Direct and rebuttal testimony before the Public Service Commission of West Virginia, on Cost of Capital for West Virginia-American Water Company, Case No 04-0373-W-42T, May 2004.

Direct and rebuttal testimony before the Federal Energy Regulatory Commission on Energy Allocation of Debt Cost for Incremental Shipping Rates for Edison Mission Energy, Docket No. RP04-274-000, December 2004 and March 2005.

Direct testimony before the Arizona Corporation Commission, Cost of Capital for Paradise Valley Water Company, a subsidiary of Arizona-American Water Company, Docket No. WS-01303A-05, May 2005.

Written evidence before the Ontario Energy Board, Cost of Capital for Union Gas Limited, Inc., Docket No. EB-2005-0520, January 2006.

Direct and rebuttal testimony before the Pennsylvania Public Utility Commission, Return on Equity for Metropolitan Edison Company, Docket No. R-00061366 and Pennsylvania Electric Company, Docket No. R-00061367, April 2006 and August 2006.

Expert report in the United States Tax Court, Docket No. 21309-05, 34th Street Partners, DH Petersburg Investment, LLC and Mid-Atlantic Finance, Partners Other than the Tax Matters Partner, Petitioner, v. Commissioner of Internal Revenue, Respondent, July 28, 2006.

Direct and supplemental testimony before the Federal Energy Regulatory Commission, Docket No. ER06-427-003, on behalf of Mystic Development, LLC on the Cost of Capital for Mystic 8 and 9 Generating Plants Operating Under Reliability Must Run Contract, August 2006 and September 2006.

Direct testimony before the Federal Energy Regulatory Commission, Docket No. ER07-46-000, on behalf of Northwestern Corporation on the Cost of Capital for Transmission Assets, October 2006.

Direct and rebuttal testimony before the Tennessee Regulatory Authority, Case No. 06-00290, on behalf of Tennessee American Water Company, on the Cost of Capital, November, 2006 and April 2007.

Direct and rebuttal testimony before the Public Service Commission of Wisconsin, Docket No. 5-UR-103, on behalf of Wisconsin Energy Corporation, on the Cost of Capital for Wisconsin Electric Power Company and Wisconsin Gas LLC, May 2007 and October 2007.

Rebuttal testimony before the California Public Utilities Commission, Docket No. A. 07-01-036-39, on behalf of California-American Water Company, on the Cost of Capital, May 2007.

Direct and rebuttal testimony before the Public Utilities Commission of the State of South Dakota, Docket No. NG-07-013, on behalf of NorthWestern Corporation, on the Cost of Capital for NorthWestern Energy Company's natural gas operations in South Dakota, June 2007 and November 2007.

Direct testimony before the Public Utilities Commission of Ohio, Case No. 07-551-EL-AIR, Case No. 07-552-EL-ATA, Case No. 07-553-EL-AAM, and Case No. 07-554-EL-UNC, on behalf of Ohio Edison Company, The Toledo Edison Company, and The Cleveland Electric Illuminating Company, on the cost of capital for the FirstEnergy Company's Ohio electric distribution utilities, June 2007.

Direct and rebuttal testimony before the State Corporation Commission of Virginia, Case No. PUE-2007-00066, on behalf of Virginia Electric and Power Company on the cost of capital for its southwest Virginia coal plant, July 2007 and December 2007.

Direct testimony before the Public Utilities Commission of Ohio, Case No. 07-829-GA-AIR, Case No. 07-830-GA-ALT, and Case No. 07-831-GA-AAM, on behalf of Dominion East Ohio Company, on the rate of return for Dominion East Ohio's natural gas distribution operations, September 2007.

Direct testimony before the Federal Energy Regulatory Commission, Docket No. ER08- -000, on behalf of Virginia Electric and Power Company, on the Cost of Capital for Transmission Assets, October 2007.

Direct testimony before the California Public Utilities Commission, Docket No. A. 07-____, on behalf of California-American Water Company, on the Effect of a Water Revenue Adjustment Mechanism on the Cost of Capital, October 2007.

TECHNICAL APPENDIX

APPLYING THE DCF MODEL TO MLPS AT THE ENTITY LEVEL

I. INTRODUCTION

This Technical Appendix provides the details of the development of the Benchmark Model, which is used to estimate the cost of equity for the MLP as a whole. This model is intended to provide a measuring stick against which alternative models can be compared. By its design, the Benchmark model captures more carefully the nuances of the MLP's financial structure and its potential growth path. In this sense, it is expected to provide cost of equity estimates that are more reliable and consistent than many simpler models. It does so, however, at the expense of additional complexity. Of course, all models are estimates and subject to measurement error. The Benchmark Model incorporates as many aspects as is reasonably possible at present when applying DCF to a sample of MLPs.

II. MODELING ASSUMPTIONS

All models are simplifications of reality. They are so because they are designed to capture only a certain fundamental relationship underlying a phenomenon of interest. As such, assumptions must be made. The assumptions made throughout this appendix are no different than those commonly made when applying an asset pricing model – the FERC DCF model included. Specifically, the assumptions are

Assumption 1: Financial markets are reasonably efficient.

This assumption means that market prices reflect and quickly adjust to publicly available information.

Assumption 2: Financial asset prices are such that they do not allow arbitrage opportunities.

This is often described as the "no free-lunch" assumption. Prices should not allow someone to make a risk free profit through some combination of trades.

III. DECOMPOSING A MLP'S COST OF EQUITY

When assumptions 1 and 2 are met, the entire cost of equity (residual return after accounting for debt) of a MLP will satisfy:

$$k_{MLP} = \frac{V_{LP}}{V_{LP} + V_{GP}} k_{LP} + \frac{V_{GP}}{V_{LP} + V_{GP}} k_{GP} \quad (1)$$

Where k_{MLP}, k_{LP}, and k_{GP} represent the total cost of equity of the MLP, the cost of LP equity, and the cost of GP equity respectively, and similarly, V_{LP} and V_{GP} represent the market value of all LP equity and all GP equity.

Equation (1) quantifies the statement made in the main body of the report that a MLP's total cost of equity is composed of the cost of LP equity and GP equity, and that these costs should be weighted according to their relative value in the total market value of equity. It is important to recognize that this is a mathematical equality once the assumptions above have been made – there is no wiggle room for interpretation. One can argue about the assumptions, but if we are not willing to accept the basic assumptions above, then we cannot accept any DCF model – indeed, any standard pricing model – as valid. So the assumptions will be taken as given throughout the remainder of this appendix.

Equation (1) also provides a roadmap to estimating the cost of equity for a MLP – compute the total market value of each type of equity and estimate each type's cost of equity using some pricing methodology. The problem with doing this for a MLP, however, is that there is typically no direct price or analyst growth data available for the GP equity component. As such, direct estimation of the MLP's total cost of equity requires additional assumptions. However, reasonable estimates can be obtained using the fact that GP distributions are related to LP distributions by a well-defined function. The value and growth of GP equity is a derivative of LP equity for which there is market data. Assuming no arbitrage and market efficiency, one can therefore produce market-based estimates of the cost of equity for the MLP as a whole.

IV. WHY IS THE TOTAL COST OF EQUITY RELEVANT?

In computing the return on equity ("ROE") on operations by the underlying assets, the fact that a GP or LP exists is not relevant so long as the underlying operating business risk is the same. That is, if you have an otherwise identical C-corporation and a MLP, both with the same amount of debt in their capital structures, each should be given the opportunity to earn the same expected return on the same residual risk after paying the cost of debt. In an efficient market under the above assumptions, this would certainly be the case. The *Hope* and *Bluefield* standard therefore demands that the same apply to a regulated company.[1] If the cost of LP equity is lower than the overall cost of MLP equity, applying the lower cost of LP equity to the entire equity base would result in an entity organized as a MLP earning less than another entity organized as a C-corporation. This is despite the fact that both allocate identical residual risk to equity holders. In other words, the manner in which equity owners have agreed to divide the residual risk and its associated return is not relevant to determining how much expected return is fair

[1] U.S. Supreme Court's opinions in Bluefield Waterworks & Improvement Co. v. Public Service Commission, 262 U.S. 678 (1923), and Federal Power Commission v. Hope Natural Gas, 320 U.S. 591 (1944).

compensation for that same residual risk being held.[2] All companies should be given the same opportunity to earn the same return on equivalent investments whether organized as a MLP or as a C-corporation.

As discussed below, GP equity is generally riskier than LP equity. This means that the cost of GP equity is generally going to be higher than the cost of LP equity, and that the cost of LP equity will generally underestimate the true weighted-average cost of equity for the MLP as a whole. Understanding why the risk of GP is likely to exceed the risk of the LP equity requires an understanding of incentive distribution rights ("IDRs") which are characteristic of MLPs.

V. MLP INCENTIVE DISTRIBUTION RIGHTS, RISK SHARING, AND GROWTH

The relationship between LP distributions and GP distributions is governed over time by the IDR schedule of a MLP. By understanding how IDRs impact growth and the risk allocations to the GP and LP over time, one can establish a market-based estimate of the GP's equity value

A. IDRs and the Relationship Between GP and LP Distributions

The IDR schedule of a MLP sets up a series of tiers and distribution sharing arrangements for any given LP distribution level ($ per unit). Specifically, each tier is defined by a range of distributions per LP unit ranges. The IDR schedule then dictates a marginal sharing rule of how additional distributions within each tier flow to the LP (and therefore to the GP). For each tier, the sharing rate dictates how much each additional dollar to the LP unit represents of the additional total MLP cash distribution per share. Although this may appear complicated, it is easier to understand through an example. Consider the following tier structure for a hypothetical master limited partnership called "MLP XYZ, L.P."

Table 1: Incentive Distribution Rights for "MLP XYZ, L.P."

		Marginal Percentage Interest in Total MLP Distributions	
	LP Quarterly Distribution	LP Unitholders	General Partner
Tier 1	up to $0.4025	98%	2%
Tier 2	above $0.4025 up to $0.4375	85%	15%
Tier 3	above $0.4375 up to $0.5250	75%	25%
Tier 4	above $0.5250	50%	50%

[2] This is also why financial leverage matters in computing a fair return on equity as defined by the Supreme Court precedents. The role of leverage is not just a theoretical notion – it is a mathematical reality of how risk and returns are divided. This is why adjustment for financial risk is warranted when trying to apply results from one group of companies to another.

Suppose the current quarterly LP distribution per unit is 43¢, so that MLP XYZ is operating in the upper end of its second tier. To calculate the total MLP distribution paid per LP unit, the amount can be broken up by tiers. First, compute the total distribution coming out of tier 1 – up to its range cap. In MLP XYZ's case, the tier 1 cap is 40.25¢, which represents 98% of the total distribution coming from this tier. Since the current LP distribution is greater than the tier 1 cap, the total distribution from tier 1 is computed at the cap:

$$\begin{aligned} 0.98 \times D_{MLP} &= D_{LP} \\ \text{or } D_{MLP} &= \frac{D_{LP}}{0.98} \\ &= \frac{40.25}{0.98} \\ &= 41.07 \end{aligned}$$

Since the additional LP distribution (43¢ – 40.25¢ = 2.75¢) flows entirely from tier 2, it therefore demands that the MLP distribute a total additional amount of:

$$\frac{2.75 \text{ cents}}{0.85} = 3.24 \text{ cents per LP unit}$$

That is, the additional LP distribution of 2.75¢ into tier 2 represents 85% of the total MLP distribution from that tier. Together, this tells us that when MLP XYZ distributes 43¢ per LP unit, it actually distributes a total of 44.31¢ (= 41.07¢ + 3.24¢). The additional 1.31¢ per unit is the amount flowing to the GP. Note that if the LP distribution had been in the third tier instead, then the contribution from tier 2 would have been computed at the tier 2 cap (as was done for tier 1 in this example) instead, and the residual amount grossed up using the tier 3 marginal sharing rate of 75 percent.

Another way to look at how the MLP distributes cash is to look directly at the implied share of distributions flowing to each of the LP and GP holders for any given LP distribution. For example, the calculation above shows that when MLP XYZ distributes 43¢ to each LP unit, 97.04 percent of the MLP's total cash distribution (= 43¢ / 44.31¢) goes to LP equity, while 2.96 percent goes to GP equity. More generally, each MLP's IDR schedule defines an entire sharing relationship between GP and LP equity. This is conveniently quantified by the function $s(D_{LP})$, which represents the share of total distributions that flow to the GP when the LP unit distribution is D_{LP}. Total MLP distributions can then always be written as

$$D_{MLP} = \frac{D_{LP}}{1 - s(D_{LP})} \tag{2}$$

The sharing function $s(D_{LP})$ for MLP XYZ is given in Figure 1 below.

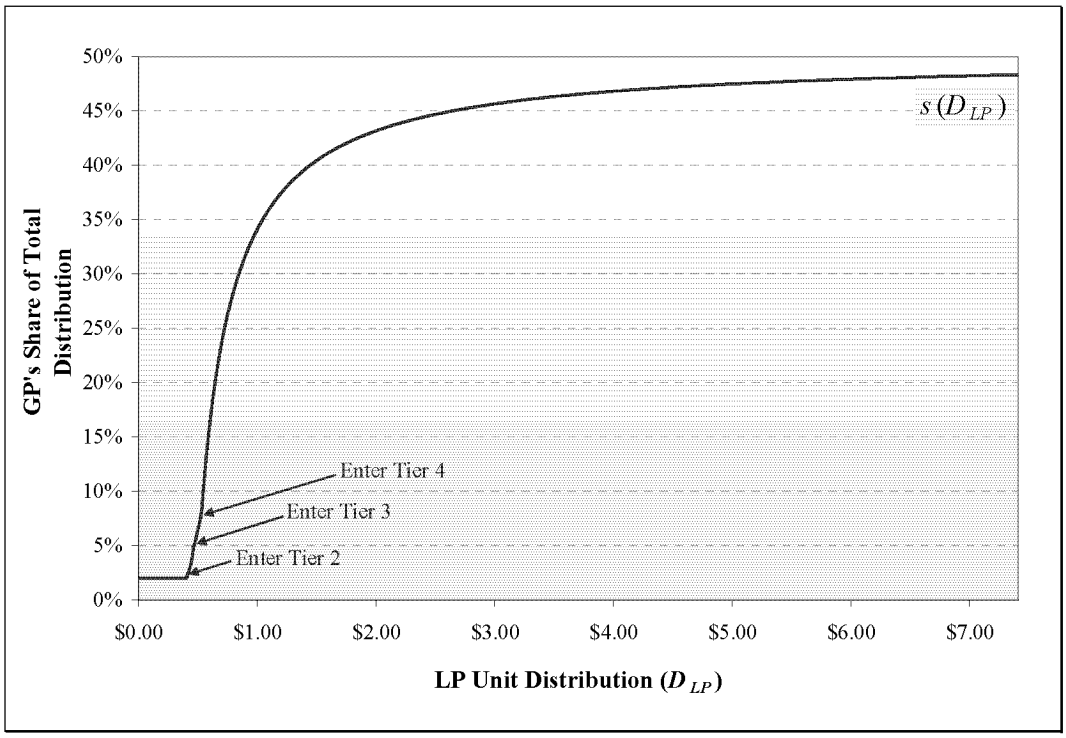

Figure 1: The sharing function $s(D_{LP})$ for MLP XYZ which graphs the proportion of total distributions going to the GP at every LP distribution level.

B. GROWTH PATHS OF LP AND GP DISTRIBUTIONS

IDRs complicate the growth paths of LP and GP distributions. For example, consider a MLP currently in its second distribution tier out of four possible tiers. Even in the situation where the overall MLP is expected to have constant, steady state growth of total distributions into the relevant future, neither the GP nor the LP will have constant distribution growth. In fact, the growth path of each is a rather complicated function for many years (see Figure 2).

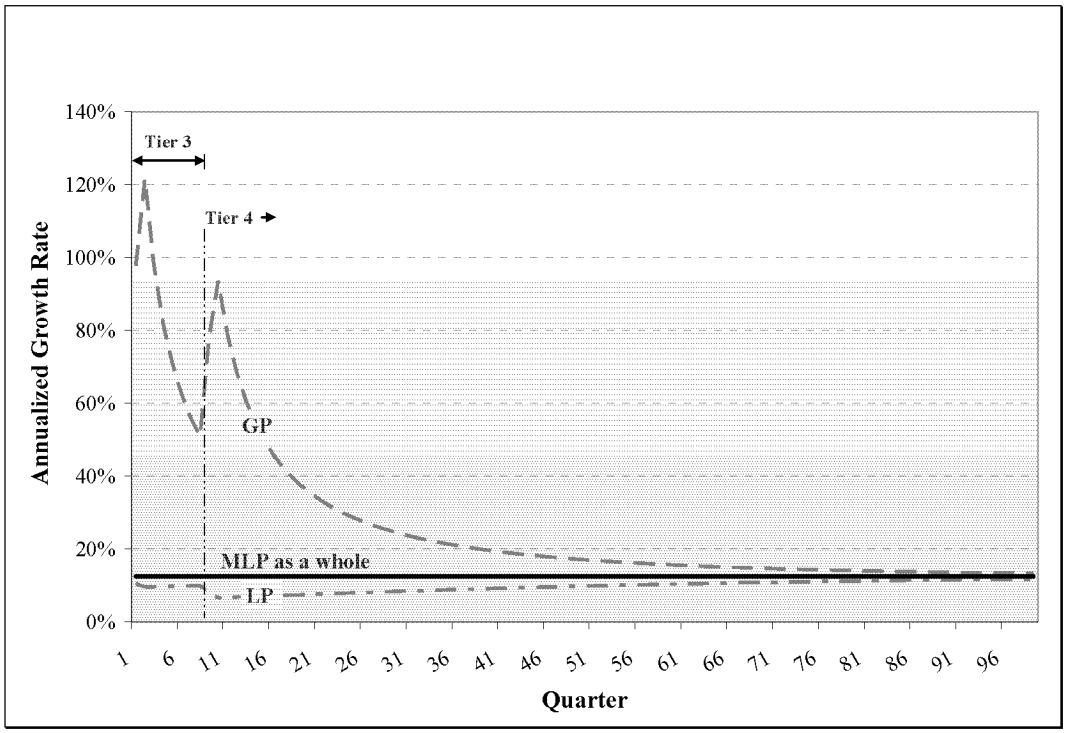

Figure 2: LP and GP Distributions Growth with Constant Entity Growth

The complications are driven by the tier structure and how it allocates much of the MLP's initial growth to the GP. As the MLP moves through the tiers, the way that growth and risks are shared between the LP and GP changes. It is interesting to note that when distributions are well into the final tier, the growth and risk allocated to the LP and GP converge. This suggests that the cost of LP and GP equity also converges over time.

VI. DCF ESTIMATION OF THE OVERALL COST OF MLP EQUITY

A. THE STANDARD DCF MODEL

The fundamental DCF model assumes that the market price of an asset equals the present value of the cash flow it generates over time, where discounting is done at a rate which reflects the cash flow's risk. This model also assumes that the present value can be calculated by the formula:[3]

$$P = \frac{D_1}{(1+k)} + \frac{D_2}{(1+k)^2} + \frac{D_3}{(1+k)^3} + \cdots \tag{3}$$

where "P" is the market price of the asset; "D_t" is the distribution expected at the end of period t (i.e., subscript period 1, 2, 3, … in the equation); and "k" is the cost of capital. In words, the formula says that

[3] Sometimes referred to as the internal rate of return (IRR) formulation.

an asset's current price is equal to the sum of its expected future cash distributions, each discounted to reflect their risk and time until received.

It is often useful to re-write this formula in terms of a series of expected growth rates instead:

$$P = \frac{D_0(1+g_1)}{(1+k)} + \frac{D_1(1+g_2)}{(1+k)^2} + \frac{D_2(1+g_3)}{(1+k)^3} + \cdots \tag{4}$$

where g_t is the expected distribution growth in time t. This equation reinforces that when growth paths are complicated, applying DCF to estimate the cost of equity can also be complicated. If one believes that a firm is in some "steady state" for the foreseeable future, so that expected growth can reasonably be modeled as constant over time, then equation (4) reduces to a much simpler form:

$$P = \frac{D_1}{(k-g)} \tag{5}$$

where "D_1" is the dividend expected at the end of the first period, "g" is the perpetual growth rate, and "P" and "k" are the market price and the cost of capital, as before. Equation (5) is a simplified DCF model that can be solved to yield the well known "DCF formula" for the cost of capital:

$$\begin{aligned} k &= \frac{D_1}{P} + g \\ &= \frac{D_0 \times (1+g)}{P} + g \end{aligned} \tag{6}$$

where "D_0" is the current distribution, which investors expect to increase at rate g by the end of the next period, and the other symbols are defined as before. Equation (6) says that if equation (5) holds, the cost of capital equals the expected dividend yield plus the (perpetual) expected future (forever constant) growth rate of dividends. I often refer to this as the simple DCF model – both because it is simple to implement and because it relies on very strong assumptions.

Figure 2 above demonstrated that even a simple growth path at the MLP level as a whole is transformed into complex growth paths for distributions at the LP and GP level. In terms of DCF estimation, these complicated initial growth paths mean that estimating the costs of equity for the individual LP and GP components will be difficult for MLPs in their lower tiers. However, since growth assumptions are easier to make and compare at the entity level, a potentially simpler approach in this situation is to apply the DCF model to the MLP as a whole.[4] For example, given constant steady state growth, the cost of capital of the MLP could be estimated as in equation (6):

[4] This also allows for a common treatment across MLPs and Corporations, which makes comparisons easier.

$$k_{MLP} = \frac{D_1^{MLP}}{P_{MLP}} + g_{MLP}$$
$$= \frac{D_0^{MLP} \times (1 + g_{MLP})}{P_{MLP}} + g_{MLP} \quad (7)$$

This gives the identical result as applying the DCF model to each equity component and recognizing each component's more complex expected growth path. The rest of this appendix focuses exclusively on how the DCF model can be applied to the MLP as a whole. Specifically, the model in mind is that from equation (4) where prices and distributions are replaced by their MLP level counterparts:

$$P_{MLP} = \frac{D_0^{MLP}\left(1 + g_1^{MLP}\right)}{(1 + k_{MLP})} + \frac{D_1^{MLP}\left(1 + g_2^{MLP}\right)}{(1 + k_{MLP})^2} + \frac{D_2^{MLP}\left(1 + g_3^{MLP}\right)}{(1 + k_{MLP})^3} + \cdots \quad (8)$$

Since growth forecasts are made at the LP unit level, we will need to derive the implied growth at the MLP level. Similarly, prices are not generally observable for GP equity, and must too be derived based on the market-based LP unit price. The following sections describe this process and the reasoning behind each step.

B. DCF Growth Path at the Entity Level

1. Terminal Growth

It is always difficult to estimate the terminal growth rate needed to implement correctly the DCF model – this is not unique to MLPs. Terminal growth assumptions are difficult to make for any organizational form, including corporations. As noted in the text of the report, for the MLP as a whole this terminal growth rate is not likely to differ from that of an otherwise identical corporation – that is, organizational structure is not likely to affect the terminal growth rate possible at the entity level. On the other hand, terminal growth in LP distributions per unit is likely to fall short of the terminal growth rate for the entity as a whole because of the way in which MLPs (and C-corporations) finance their operations. If an industry is expected to remain a constant proportion of the overall economy, the terminal growth of the entity would equal the growth rate of GDP. As noted in the report, this is a common and reasonable assumption by the FERC for natural gas pipelines organized as a C-corporation. This assumption is preserved here as well for the MLP as a whole.

2. Path of Expected Growth Until Steady State

Even after agreeing upon a terminal growth rate for use in the DCF model, the path of growth over time is an equally important component in DCF pricing and cost of equity estimation. Distributions obtained

earlier are, on a dollar for dollar basis, more valuable than those obtained later. This is a simple consequence of the time-value of money. As a result, the path of distribution growth before reaching the terminal rate can substantially affect the results of the model. A common approach taken by practitioners at the entity level is to assume that the current forecast growth rate is maintained in the short-run (five years), and then gradually trends to its terminal growth rate. It also makes more sense than suggesting that growth suddenly drops abruptly to its terminal value at some point.

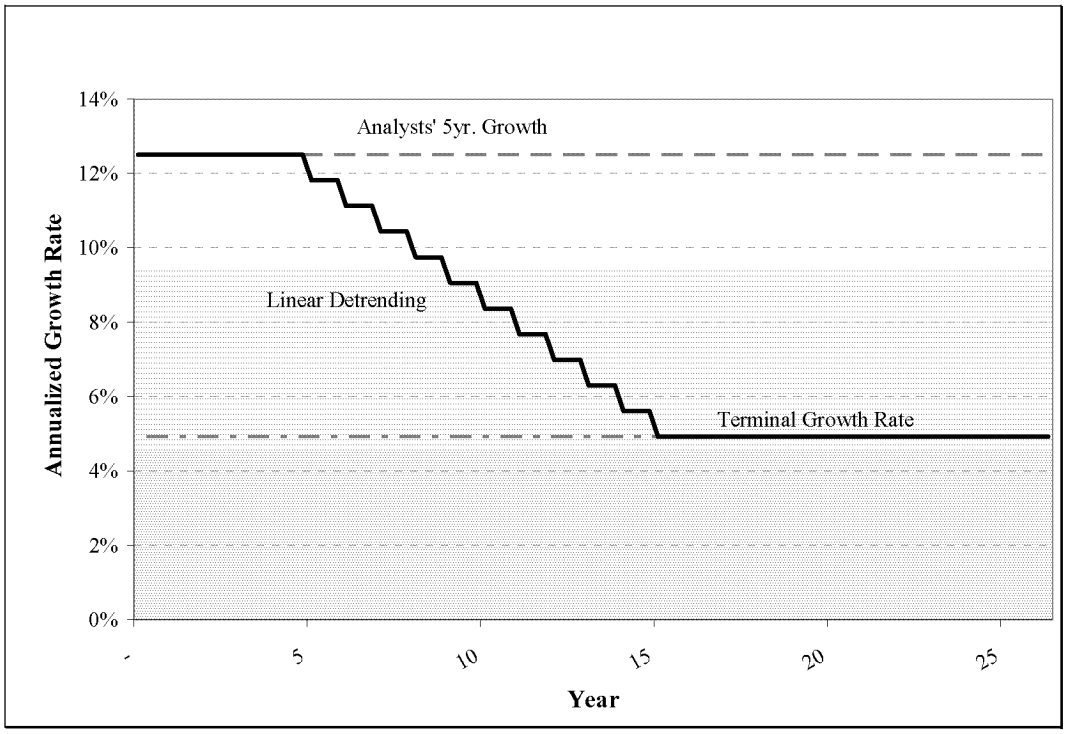

Figure 3: Linear Detrending of Multi-Stage DCF Model

In terms of specific numbers, a reasonable approach is to apply the current long-term annual forecast growth rate for the first five years, then de-trend this in a linear way to the terminal growth rate by the beginning of year sixteen. This is the approach that will be taken for the Benchmark DCF Model. The only difficulty for MLPs is that analyst growth rates are not provided at the entity level, but are forecasts for the LP units instead. As such, growth rates forecast for LP units must first be converted into growth rates for the MLP as a whole.

3. Transforming the LP Analyst Growth Forecasts into total MLP growth forecasts

A simple way to transform the LP distribution growth forecast into an entity level forecast is to back-out the total distribution growth needed to support the forecasted LP growth. Specifically, one: 1) first

computes the current total MLP distribution based on the current LP unit distribution; 2) computes the expected LP unit distribution at the end of the forecast period by applying the forecast growth rate to the current LP distribution per unit; 3) computes the future total distributions per unit implied by this forecasted LP distribution level; and 4) computes the implied growth at the entity level using these supporting MLP distributions. Annualizing this factor gives an estimate of the average annual entity level growth required to sustain the forecasted LP distribution growth. The procedure is illustrated below for MLP XYZ.

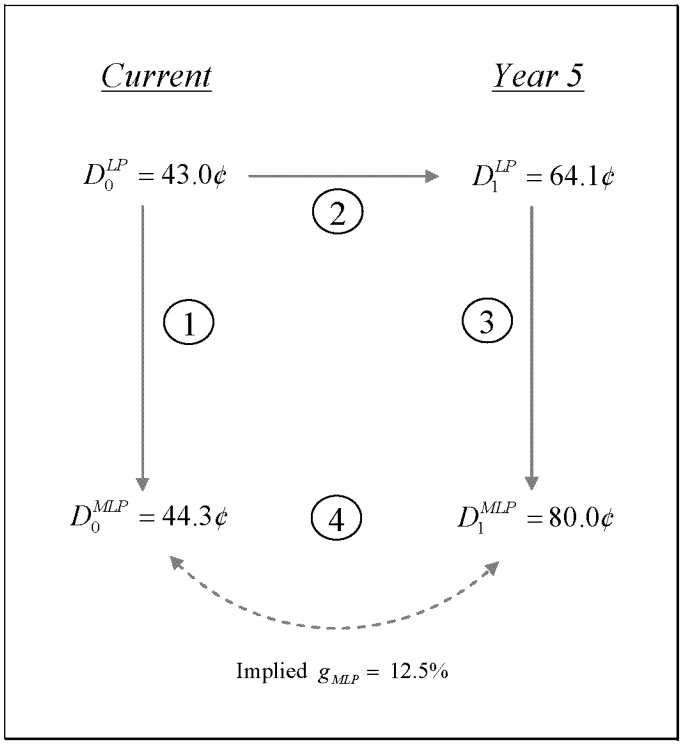

Figure 4: Transforming LP unit distribution growth forecasts into MLP growth forecasts.

Step 1. Compute the current total MLP distribution using D_{LP} and $s(D_{LP})$:

It was shown earlier that the current 43¢ LP distribution corresponds to a 44.31¢ total distribution.

$$D_0^{MLP} = \frac{D_0^{LP}}{1 - s(D_0^{LP})} = \frac{43¢}{1 - 2.96\%} = 44.31¢$$

Step 2. Derive the Forecasted LP unit distribution in five years using Analysts' five year forecasts:

In this example, MLP XYZ is forecast to have an average annual growth of 8.3 percent over the next five years. If realized, this would place LP distributions at 64.1¢ per unit by the end of year five.

$$\begin{aligned} D_1^{LP} &= (1+g_{LP})^5 \cdot D_0^{LP} \\ &= (1+8.3\%)^5 \cdot 43¢ \\ &= 64.1¢ \end{aligned}$$

Step 3. Compute the total MLP distribution in year 5 based on the year 5 LP distribution forecast:

To support this 64.1¢ LP distribution per unit, the MLP must flow a total of 80¢ per unit. This follows since at 64.1¢ per LP unit, the GP receives 19.9 percent of the total cash flow (based on the $s(D_{LP})$ function). Grossing up by 1/(1 - 19.9%) then gives the 80¢ amount.

$$\begin{aligned} D_1^{MLP} &= \frac{D_1^{LP}}{1-s(D_1^{LP})} \\ &= \frac{64.1¢}{1-19.9\%} \\ &= 80.0¢ \end{aligned}$$

Step 4. Compute the implied total MLP growth rate required to support the forecasted LP distribution growth:

In order for LP distributions to climb from 43¢ to 64.1¢ over five years, total distributions per unit must climb from 44.31¢ to 80¢. This represents an average annual MLP entity level growth of 12.5 percent over the five years.

$$\begin{aligned} g_{MLP} &= \left(\frac{D_1^{MLP}}{D_0^{MLP}}\right)^{1/5} - 1 \\ &= \left(\frac{80¢}{44.31¢}\right)^{1/5} - 1 \\ &= 12.5\% \end{aligned}$$

The 12.5 percent implied growth rate for MLP distributions is therefore a reasonable estimate of total entity level growth in the short-run.

C. THE TOTAL MARKET VALUE OF MLP EQUITY

The final component needed for the DCF model is the market value of MLP equity. While this is readily observed for LP equity using market data, it must be estimated for GP equity in general. Again, assumptions 1 and 2, together with the fact that the distributions flowing to the GP are a known function of LP distributions, provide a means to value GP equity as a function of the observable market value of LP equity. Specifically, if growth were ignored (for the moment), the relative value of LP and GP equity would be roughly the proportion of total distributions flowing to each:

$$D_{LP} = [1 - s(D_{LP})] \cdot D_{MLP}$$

$$\text{which implies} \quad V_{LP} \approx [1 - s(d_{LP})] \cdot V_{MLP}$$

$$\text{or} \qquad V_{MLP} = \frac{V_{LP}}{[1 - s(d_{LP})]} \tag{9}$$

where d_{LP} is the current LP distribution per unit. The fact that the GP is allocated proportionally more of the returns from growth, however, must be incorporated into its equity value. While IDRs allocate more growth risk to the GP, the increased expected growth makes the GP equity more valuable on net than LP equity (on a dollar for dollar basis).

Intuitively, GP equity begins as riskier than LP equity because of the fact that the distributions it receives are based upon the distribution tiers. As the MLP crosses each tier threshold, the GP receives a jump in its marginal share of total distributions, and some risk is transferred from the GP to the LP (see Figure 5 below). In other words, as the GP's share of distributions increases, the variability of its distributions decrease, reducing its risk.

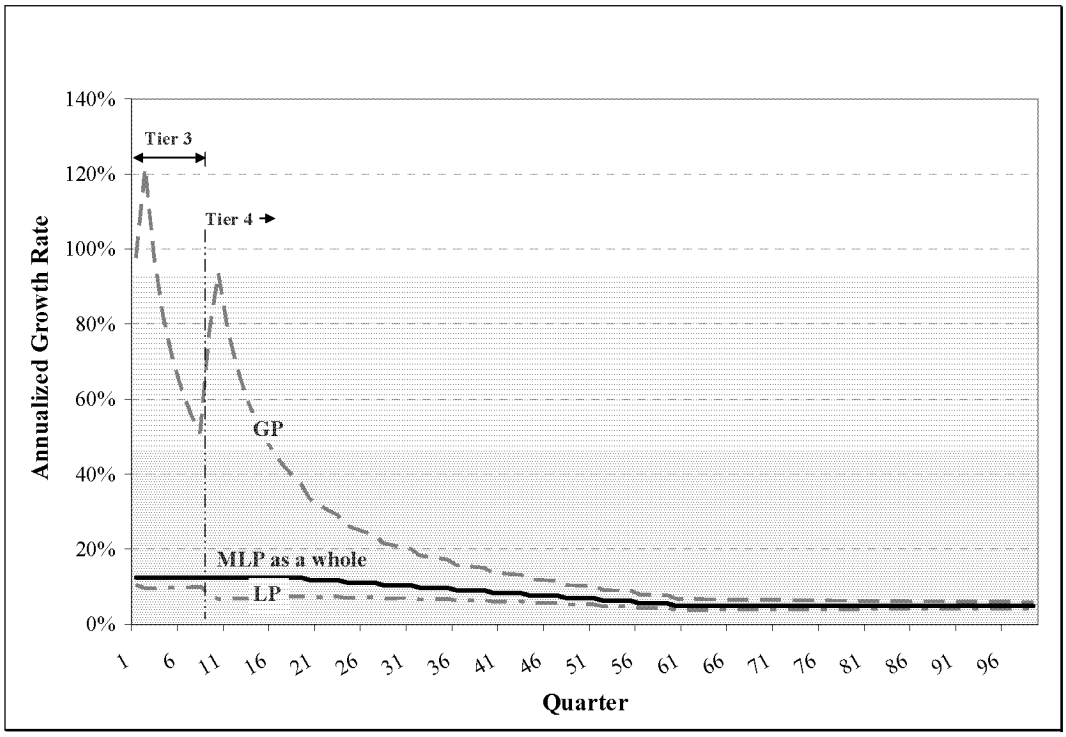

Figure 5: Multi-Stage DCF Growth Paths for GP and LP Distributions

At the same time, GP equity experiences much faster growth in distributions than LP equity because of the IDRs. These two effects (i.e., increased growth in distributions and increased risk) work against each other in terms of the market value of GP equity, but on net, the value of expected growth outweighs its added risk. As such, the proportionate market value of GP equity will be greater than its proportionate share of book equity (i.e., $(V_{GP} / V_{MLP}) > 2\%$).

How much more is a complex problem which requires advanced mathematical modeling to answer. As noted earlier, while the estimation problem is more manageable at the MLP level, one cannot escape the challenge of having to compute the market value of GP equity. What is certainly true is that the GP equity's proportionate value is no more than the upper limit of $s(D_{LP})$, which is 50 percent for MLP XYZ (see Figure 1).[5] At the same time, it is not generally going to be set by a sharing ratio less than the current sharing of $s(d_{LP})$ – that is, GP equity is generally worth at least its proportion of the current cash flow.[6] The true relative market value of GP to LP equity will typically be found at a sharing ratio somewhere in-

[5] The supremum is typically the marginal sharing rate of the top IDR tier.

[6] The exception could be if there is negative growth forecast – which would have a larger proportionate impact on GP value than LP value.

between. Although it can be pinned down precisely, a simple rule-of-thumb approach is to gross up the LP price by the midpoint of these two sharing extremes at $\bar{s}$.[7]

$$\bar{s}(d_{LP}) = \frac{s(d_{LP}) + \lim_{x \to \infty} s(x)}{2}$$

This is illustrated for MLP XYZ in the following figure.

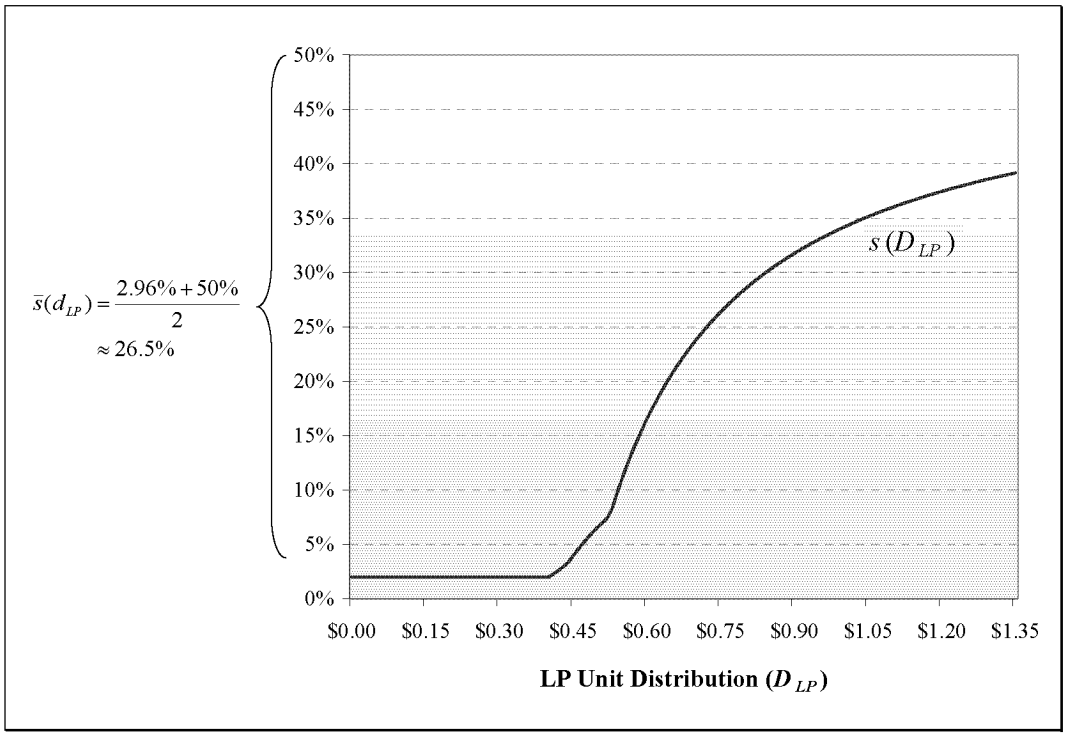

Figure 6: The rule-of-thumb adjustment used to gross up LP unit price in deriving MLP price.

If the current price of MLP XYZ's LP units is $32.95, the rule of thumb would estimate the market-based MLP price per share at:

$$\begin{aligned} P_{MLP} &= \frac{\$32.95}{1 - \bar{s}(43¢)} \\ &\approx \frac{\$32.95}{1 - 26.5\%} \\ &= \$44.83 \end{aligned}$$

The rule-of-thumb has several desirable characteristics, not the least of which is simplicity. It also generally provides for a more conservative cost of capital estimate since it has a tendency to overstate MLP entity value by a small amount. More interestingly, the rule is also self-adjusting as distributions

[7] This rule will generally overestimate MLP value, which means it generally errs by a small amount on the side of caution – overestimating MLP value will, all else equal, result in lower cost of capital estimates. An examination of market traded GP equity suggests that this is the case in general.

grow into the IDR tiers – the price gross up relative to current sharing becomes proportionately smaller as sharing approaches 50 percent. This makes sense since the benefits of additional growth become more evenly shared and reduces the additional value premium attached to GP equity. Stated another way, as sharing approaches 50 percent, the relative contribution of current distributions to the value of GP equity becomes more like that of LP equity.

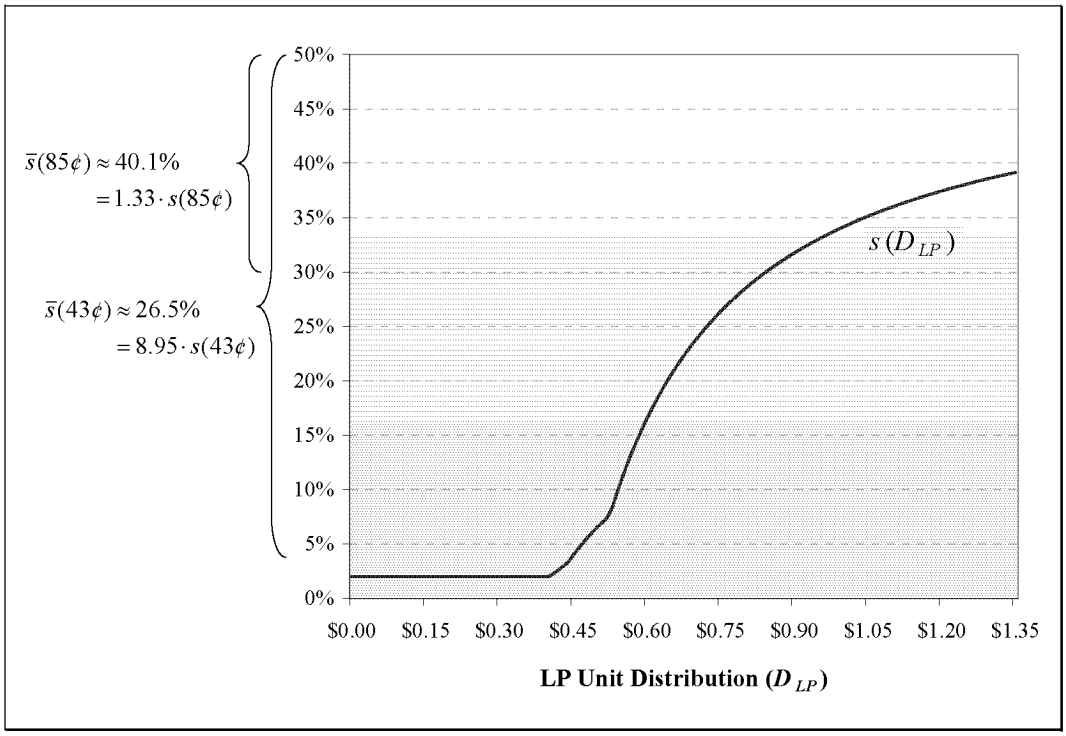

Figure 7: Self-adjustment by the rule-of-thumb.

Any reliable GP valuation must have the property that as sharing approaches 50 percent, the value of GP equity and LP equity converges to the same value – that is, GP and LP equity are valued at 50 percent of total MLP value in the limit. When $s(D_{LP})$ approaches close to 50 percent, the future cash flow per unit to the GP and LP are almost exactly the same in every state of the world.[8] As such, risk and growth become virtually the same and, by extension, value must also. Failure to do so in the limit would violate the "no free lunch" assumption.[9] The rule of thumb approximation becomes increasingly accurate as the distributions move up the tiers, and is likely to be a very good approximation once a MLP is operating within its highest tier.

[8] More precisely, the probability that they differ by a large amount becomes insignificantly small.

[9] This is a loosely stated comment that could be made rigorous in a more rigorous framework.

VII. PUTTING IT ALL TOGETHER

The DCF model estimated here is:

$$P_{MLP} = \frac{D_0^{MLP}\left(1+g_1^{MLP}\right)}{(1+k_{MLP})} + \frac{D_1^{MLP}\left(1+g_2^{MLP}\right)}{(1+k_{MLP})^2} + \frac{D_2^{MLP}\left(1+g_3^{MLP}\right)}{(1+k_{MLP})^3} + \cdots + \frac{D_{T-1}^{MLP}\left(1+g_T^{MLP}\right)+P_T^{MLP}}{(1+k_{MLP})^T} \quad (10)$$

where P_T^{MLP} is the terminal price reflecting the value, in time T dollars, of the entire future of distributions growing at the terminal rate:

$$P_T^{MLP} = \frac{D_{T+1}^{MLP}}{\left(k - g_{Terminal}^{MLP}\right)} \quad (11)$$

Below is a summary of the steps taken to estimate the Benchmark DCF Model using MLP XYZ as an example.

A. PATH OF DISTRIBUTIONS

1. Current total MLP Distribution

The current total MLP Distribution was derived from the current LP Distribution in Section V, part B-3:

$$D_0^{MLP} = 44.31¢ \quad (12)$$

2. Combining growth path with initial total Distribution

The expected total MLP Distributions for future periods are calculated by combining the current total MLP Distribution in (12) with the corresponding MLP distribution growth rates discussed in Section VI.B. Specifically, the five year growth forecast at the entity level was derived from LP distribution growth forecasts in Section VI.B.3 as:

$$g_{MLP} = 12.5\% \quad (13)$$

These are detrended as discussed earlier and Table 2 below demonstrates the resulting path of annualized growth rates for MLP XYZ distributions, along with the actual distributions themselves. The table shows the annualized growth rates from Quarter 1 to Quarter 20 remain unchanged. From Quarter 21 these rates start varying as the linear trend to the terminal GDP growth rate period begins. From Quarter 60 onward, the rate is constant as MLP XYZ reaches steady state.

Table 2: Excel snapshot of calculations used to derive the implied total distribution path and to solve for the implied cost of equity.

Distribution Stream for "MLP XYZ"

Year 60 Price / unit	$112.28	
Trial COE: Quarterly Rate*	2.91%	[a]
Annualized COE: Annual Rate	12.16%	[b]
Cost of Equity	12.16%	[c]
(Annualized COE - COE) x 100	0.00	[d]

Notes:
[a]: Quarterly rate of return.
[b]: ((1 + [a]) ^ 4) - 1.
[c]: ((1 + IRR) ^ 4) - 1.
[d]: [b] - [c].
* Solved using Goal Seek function.
- Set [d] equal to zero by changing [a].

The paths of LP, GP, and total distributions are graphed in Figure 8 below.

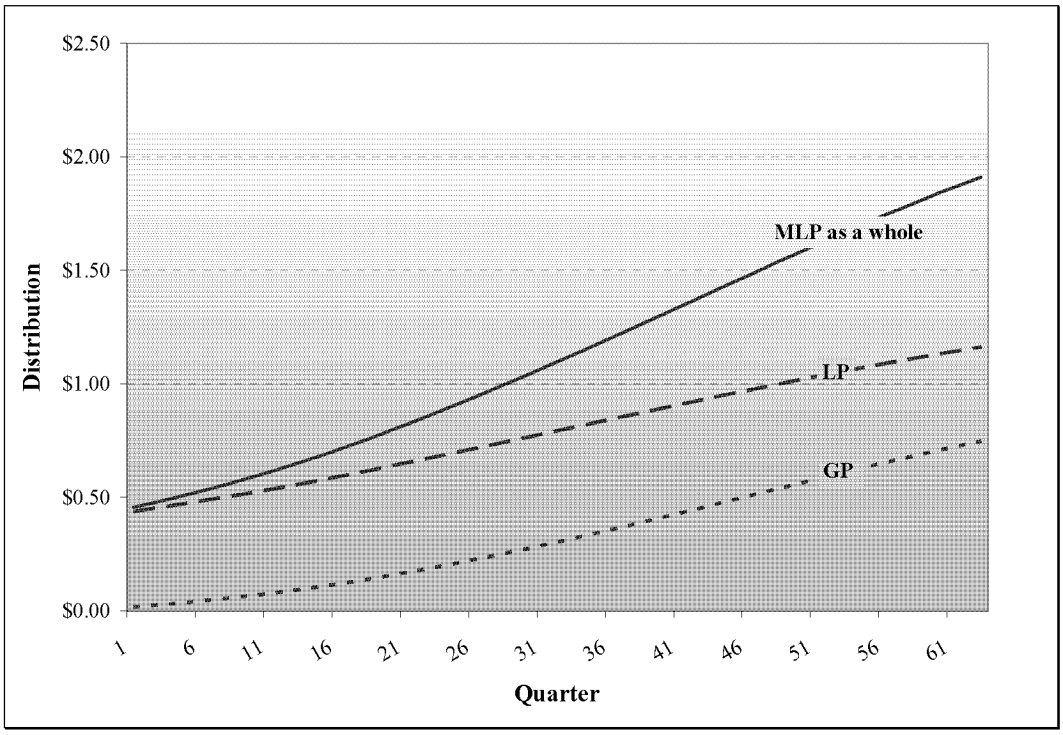

Figure 8: Paths of distributions implied by the forecasted growth paths for MLP XYZ.

3. Entity Level MLP Price

The current entity level MLP price is derived from the current LP price in Section VI.C above:

$$P_{MLP} = \$44.83 \tag{14}$$

4. Computing the Implied Cost of Equity

The implied cost of equity in equation (8) is estimated using the Goal Seek function in Excel:

$$\hat{k}_{MLP} = 12.16\% \tag{15}$$

VIII. FINAL COMMENTS

The model developed in this appendix is a simplification of reality, but one which attempts to provide a balance between ease of implementation and additional complexity in the DCF framework. As was stated at the outset, it captures many aspects of the MLP structure which make it a more accurate representation of the MLP's financial and growth characteristics. Notwithstanding its apparent complexity, there are elements which could be modeled more precisely and which, with further research, might yield even

better approximations. As mentioned above, a more precise modeling of the way risk is divided between the LP and GP over time would provide a more precise mapping of LP to MLP value. Moreover, additional research and precise modeling of how MLP's finance growth could lead to more accurate terminal growth rate forecasts and the time path of the growth estimates. These components of the DCF model continue to be difficult to estimate for both MLPs and C-corporations. Given our current understanding, however, I believe this model to be the most reasonable way of applying DCF to a sample of MLP companies.

Errata to the Appendix A of the Direct Testimony of
Michael J. Vilbert
On Behalf of Tennessee-American Water
Concerning Cost of Capital

In Appendix A, at page A-4, the fourth entry under "Presentations" was incorrectly listed as "**Current Issues in** Cost of Capital," *EEI Electric Rates Advanced Course*, Madison, WI, July 2004. The entry should read "**Utility Distribution** Cost of Capital," *EEI Electric Rates Advanced Course*, Madison, WI, July 2004.

In Appendix A, at page A-4, the last entry under "Articles" was incorrectly listed as "Understanding Debt Imputation Issues," by Michael J. Vilbert, Bente Villadsen and Joseph B. Wharton, *Edison Electric Institute*, forthcoming **Feb** 2008. The entry should read "Understanding Debt Imputation Issues," by Michael J. Vilbert, Bente Villadsen and Joseph B. Wharton, *Edison Electric Institute*, forthcoming **August** 2008.

In Appendix A, at page A-7, the third entry was incorrectly listed as Direct **and rebuttal** testimony before the Public Utilities Commission of the State of South Dakota, Docket No. NG-07-013, on behalf of NorthWestern Corporation, on the Cost of Capital for NorthWestern Energy Company's natural gas operations in South Dakota, June 2007 **and November 2007**. The entry should read Direct testimony before the Public Utilities Commission of the State of South Dakota, Docket No. NG-07-013, on behalf of NorthWestern Corporation, on the Cost of Capital for NorthWestern Energy Company's natural gas operations in South Dakota, June 2007.

2008					

BUSINESS: American States Water Co. operates as a holding company. Through its principal subsidiary, Golden State Water Company, it supplies water to more than 250,000 customers in 75 communities in 10 counties. Service areas include the greater metropolitan areas of Los Angeles and Orange Counties. The company also provides electric utility services to nearly 23,250 customers in the city of Big Bear Lake and in areas of San Bernardino County. Acquired Chaparral City Water of Arizona (10/00). Has roughly 555 employees. Officers & directors own 3.1% of common stock (4/07 Proxy). Chairman: Lloyd Ross. President & CEO: Floyd Wicks. Inc: CA. Addr.: 630 East Foothill Boulevard, San Dimas, CA 91773. Tele.: 909-394-3600. Internet: www.aswater.com.

We've raised our near-term expectations for American States Water. The California Public Utilities Commission (CPUC) recently announced that it approved the company's general rate case appeal for its Region II service area as well as the request to recover general office expenses. The decision, which is retroactive to January 1, 2007, and will be recorded in the company's fourth-quarter 2007 results (set to be released as we headed to press), ought to increase revenue by roughly $6.4 million and add more than a dime to share earnings for the quarter. We now look for the company to earn $0.46 a share in the final quarter of 2007. Note that our estimate would have been higher if not for the unfavorable weather conditions that have limited usage rates in recent months. There may be additional regulatory backing on the horizon. Although the regulatory climate is much improved from years ago, the CPUC is mulling over the idea of instituting a few of the proposals included in the Water Action Plan of 2005. Doing so would likely further streamline the decision making process, while removing some earnings volatility through the adoption of a weather normalization clause.

Even still, we advise investors to look elsewhere at this time. The aforementioned changes at the CPUC are still speculation and are not being factored into our estimates just yet. That said, earnings growth will probably slow considerably in 2008. Even if adopted, we suspect that a fair portion of the benefits coming from these changes would likely be offset by capital constraints. Indeed, American is highly leveraged and had only $3.6 million in cash on hand at the end of the most recent quarter. Infrastructure costs are expected to remain high, given aging systems and tighter EPA regulations, forcing management to look to outside financiers for help. The higher interest costs associated with taking on more debt and/or additional shares will likely limit shareholder gains, as well. Meanwhile, the once robust dividend yield pales in comparison to years past, despite the recent 6% hike. These shares offer limited 3- to 5-year total-return appeal, despite the 10% drop in price since our October review.

Andre J. Costanza January 25, 2008

(A) Primary earnings. Excludes nonrecurring gains: '91, 73¢; '92, 13¢; '04, 14¢; '05, 25¢; '06, 6¢. Next earnings report due early February.

BUSINESS: California Water Service Group provides regulated and nonregulated water service to over 2 million people (483,900 customers) in 83 communities in California, Washington, New Mexico, and Hawaii. Main service areas: San Francisco Bay area, Sacramento Valley, Salinas Valley, San Joaquin Valley & parts of Los Angeles. Acquired National Utility Company (5/04); Rio Grande Corp. (11/00). Revenue breakdown, '06: residential, 70%; business, 18%; public authorities, 5%; industrial, 5%; other, 2%. '06 reported deprec. rate: 3.3%. Has roughly 870 employees. Chairman: Robert W. Foy. President & CEO: Peter C. Nelson. Inc.: Delaware. Address: 1720 North First Street, San Jose, California 95112-4598. Telephone: 408-367-8200. Internet: www.calwatergroup.com.

We've softened our outlook for California Water Service Group a bit since our October report. The water utility provider ran into some unforeseen problems in the third quarter 2007, when unfavorable weather conditions, and lower usage rates, caused it to post earnings of $0.67 a share, a penny off the prior year's mark. Meanwhile, there has been an unexpected holdup on the regulatory front. The California Public Utilities Commission, which appeared to have turned over a new leaf and had been handing out more timely and favorable rulings in recent memory, has yet to rule on the company's 2006 general rate case. Also, approval of parts of the Water Action Plan, namely of a Water Revenue Adjustment Mechanism (WRAM) and modified cost-balancing accounting was postponed. As a result, we've reduced our fourth-quarter 2007 share-net estimate by a few pennies to $0.32 and our full-year 2008 figure by a dime to $1.65. Note, that our 2008 figure would receive a boost if any of the WRAM amendments are implemented before the third quarter.

The stock has given back most of the gains it enjoyed last year . . . Indeed, it has fallen from its $45-plus perch, trading down more than 10% since our October report. The issue is now ranked 4 (Below Average) for Timeliness based on our momentum-driven system.

. . . however, we still think it is richly valued according to current market conditions. The stock is currently trading at nearly 25 times 12-month earnings (through June), a premium compared to our 2010-2012 projections. Although we suspect that recent regulatory lag is just a hiccup, and that an improving landscape paints a favorable backdrop for the industry as a whole, we think that the current share price accounts for these potential changes. Meanwhile, capital constraints continue to concern us. Infrastructure costs are likely to continue rising as systems and pipelines age and EPA requirements grow tougher. However, California does not have the cash to fund these endeavors and will probably have to issue more shares and/or debt, thereby limiting shareholders' gains. Although the dividend provides some downside risk, income-minded investors have better options.

BUSINESS: Aqua America, Inc. is the holding company for water and wastewater utilities that serve approximately 2.8 million residents in Pennsylvania, Ohio, North Carolina, Illinois, Texas, New Jersey, Florida, Indiana, and five other states. Divested three of four non-water businesses in '91; telemarketing group in '93; and others. Acquired AquaSource, 7/03; Consumers Water, 4/99; and others. Water supply revenues '06: residential, 60%; commercial, 14%; industrial & other, 26%. Officers and directors own 1.2% of the common stock (4/07 Proxy). Chairman & Chief Executive Officer: Nicholas DeBenedictis. Incorporated: Pennsylvania. Address: 762 West Lancaster Avenue, Bryn Mawr, Pennsylvania 19010. Telephone: 610-525-1400. Internet: www.aquaamerica.com.

We have lowered our share-net estimate for Aqua America's recently completed fourth quarter. Due to the struggling housing market and the inability of the company to raise its rates in a few markets, we now believe that the company earned $0.22 a share during the December period, down from our previous estimate of $0.24 (WTR will release its fourth-quarter financial results within the next few weeks). On the bright side,

We expect a healthy share-net advance this year. Aqua's profits will likely be fueled by its recent acquisition activities. Over the last several months, it has purchased a number of water companies that have expanded its market reach to new areas in Florida, New Jersey, Indiana, Pennsylvania, and Texas. Moreover, management continues to implement rate hikes throughout the nation, which will help advance the operating margin and profits this year. In sum, Aqua will likely post share earnings of $0.90 this year, 20% better than our estimate for 2007.

The company's balance sheet should be able to support a few more purchases. Although Aqua does not have a huge stash of cash (only $15 million), and already possesses an ample amount of debt, it probably generates enough funds to complete a few more acquisitions this year. Aqua will likely seek opportunities to bolster its water utility businesses in Texas, Pennsylvania, and Virginia.

These shares are not particularly appealing at this time. Although recent acquisitions should help Aqua America register a solid share-earnings advance in 2008, our Timeliness Ranking System suggests that this issue will lag the year-ahead market. Furthermore, looking long term, this stock already trades at the low end of our projected Target Price Range for 2010–2012, limiting appreciation potential out to that time frame. That said, our share-net estimates would likely be raised if Aqua can complete a few additional acquisitions over the next few years. Lastly, Income-oriented accounts can probably find better options elsewhere. Although Aqua has raised its quarterly dividend every year over the past decade, its current yield of 2.5% is probably not a good enough reason to look here.

Ian Gendler January 25, 2008

(A) Primary shares outstanding through '96; diluted thereafter. Excl. nonrec. gains (losses): '91, (34¢); '92, (38¢); '99, (11¢); '00, 2¢; '01, 2¢; '02, 5¢; '03, 4¢. Excl. gain from disc. operations: '96, 2¢. Next earnings report due early Feb.

INDUSTRY: Water Utility

BUSINESS: Connecticut Water Service, Inc. primarily operates as a water utility company in Connecticut. It operates through three segments: Water Activities, Real Estate Transactions, and Services and Rentals. The Water Activities segment supplies public drinking water to its customers. The Real Estate Transactions segment involves in the sale of its limited excess real estate holdings. The Services and Rentals segment provides contracted services to water and wastewater utilities and other clients, as well as leases certain of its properties to third parties. This segment's services include contract operations of water and wastewater facilities; Linebacker, its service line protection plan for public drinking water customers; and provision of bulk deliveries of emergency drinking water to businesses and residences via tanker truck. As of November 7, 2007, Connecticut Water provided water to approximately 83,000 or 286,000 customers in 41 towns in Connecticut. Has about 200 employees. Chairman, C.E.O. & President: Eric W. Thornburg. Inc.: CT. Address: 93 West Main Street, Clinton, CT 06413. Tel.: (860) 669-8630. Internet: http://www.ctwater.com. *L.Y.*

INDUSTRY: Water Utility

BUSINESS: Middlesex Water Company engages in the ownership and operation of regulated water utility systems in New Jersey and Delaware, as well as a regulated wastewater utility in New Jersey. It offers contract operations services and a service line maintenance program through its nonregulated subsidiary, Utility Service Affiliates, Inc. The company's water utility system treats, stores, and distributes water for residential, commercial, industrial, and fire prevention purposes. Under a special contract, it also provides water treatment and pumping services to the Township of East Brunswick. Middlesex Water's other New Jersey subsidiaries offer water and wastewater services to residents in Southampton Township. The company's Delaware subsidiaries, Tidewater Utilities, Inc., Southern Shores Water Company, LLC, and Tidewater Environmental Services, Inc., offer water services to retail customers in New Castle, Kent, and Sussex counties. Has 243 employees. Chairman: J. Richard Tompkins. Inc.: NJ. Address: 1500 Ronson Road, P.O. BOX 1500, Iselin, NJ 08830. Tel.: (732) 634-1500. Internet: http://www.middlesexwater.com.

INDUSTRY: Water Utility

BUSINESS: SJW Corp. engages in the production, purchase, storage, purification, distribution, and retail sale of water. It provides water service to customers in Cupertino, San Jose, Campbell, Monte Sereno, Saratoga, and the Town of Los Gatos, as well as in the county of Santa Clara, CA. The company also offers nonregulated water related services, including water system operations, billings, and cash remittance services. SJW owns commercial buildings and other undeveloped land in the San Jose and California; some properties in the states of Florida, Texas, and Connecticut; and a 70% limited partnership interest in 444 West Santa Clara Street, L.P. As of September 30, 2007, SJW provided water service to a population of approximately one million people in the metropolitan San Jose, California area; and to approximately 7,800 connections that served approximately 22,000 residents in the region between San Antonio and Austin, Texas. Has 357 employees. Chairman: Charles J. Toeniskoetter. Inc.: CA. Address: 374 West Santa Clara Street, San Jose, CA 95113. Tel.: (408) 279-7800. Internet: http://www.sjwater.com.

MARKET CAP: $300 million (Small Cap)

BUSINESS: Southwest Water Company provides a broad range of services including water production, treatment and distribution; wastewater collection and treatment; utility billing and collection; utility infrastructure construction management; and public works services. It operates out of two groups, Utility (38% of 2006 revenues) and Services (62%). Utility owns and manages rate-regulated public water utilities in California, New Mexico, Oklahoma, and Texas. Services does mostly maintenance work on a contract basis. Off. & dir. own 6.3% of com. shs.; Stein Roe Investment Council, 9.7% (4/07 proxy). CEO and Chairman: Mark Swatek. Inc.: DE. Addr.: One Wilshire Building, 624 S. Grand Ave. Ste. 2900, Los Angeles, CA 90017. Tel.: 213-929-1800. Internet: www.swwc.com.

Southwest Water has struggled of late. A couple of months ago, it reported weak September-period financial results. For the quarter, due to record rainfall in Texas and the weak housing market, share net came in at just $0.08, well below our estimate of $0.15. In addition, for the recently completed fourth quarter, we have lowered our share-net estimate by $0.03 to $0.10. Along with the struggles of the housing market, which probably limited construction and repair opportunities for SWWC, profits were likely hampered by increased operating costs, stemming from its restructuring initiative. On the bright side, the situation should improve this year. Although the housing market has shown few signs of rebounding, Southwest will likely begin to benefit from the improvement of its operations. It recently introduced a new integrated operating system, which has helped improve its communication processes and should help lower operating expenses. Thus, we estimate that this new system will help widen the operating margin by about 50 basis points this year.

Profits will be fueled by Southwest's recent acquisition activity, as well. A few months ago, it purchased Diamond Water Company, which provides services to approximately 7,500 residents near San Antonio. This purchase helped SWWC expand its market reach and customer base in the Lone Star State. Moreover, the company is currently attempting to implement rate hikes in several of its markets. This action will help margins and profits this year. All told, we believe that 2008 share net will be $0.50, about 67% better than last year's 2007 probable results.

These shares do not stand out for the short or long term. Although its restructuring initiative and recent acquisitions may well help the company achieve a large share-net gain this year, our Timeliness Ranking System suggests that this issue will lag the year-ahead market. In addition, looking out to the 2010–2012 period, this stock offers below average appreciation potential to that timeframe. That said, Southwest will probably remain active on the acquisition front. Additional purchases would probably cause us to raise our earnings projections.

Ian Gendler January 25, 2008

(A) Diluted earnings. Excludes nonrecurring gains (losses): '00, (3¢); '01, (5¢); '02, 1¢; '05, (23¢). Next earnings report due mid-Mar.
(B) Dividends historically paid in late January, April, July, and October.
(C) In millions, adjusted for splits.
(D) Includes intangibles. In 2006: $36.0 million, $1.51/share.

INDUSTRY: Water Utility

BUSINESS: The York Water Company engages in the impounding, purification, and distribution of water in York County and Adams County, Pennsylvania. It supplies water for residential, commercial, industrial, and other customers. The company has two reservoirs, Lake Williams and Lake Redman, which together hold approximately 2.2 billion gallons of water. It also has a 15-mile pipeline from the Susquehanna River to Lake Redman that provides access to an additional supply of water. The company serves 34 municipalities in York County and four municipalities in Adams County. Has 106 employees. C.E.O. & President: Jeffrey S. Osman. Inc.: PA. Address: 130 East Market Street, York, PA 17401. Tel.: (717) 845-3601. Internet: http://www.yorkwater.com.

INDUSTRY TIMELINESS: 91 (of 98)

After a brief spurt late last year, water utility stocks, as a group, have recently given back most of the gains. Therefore, the industry ranks in the bottom rungs of our Survey for Timeliness. Although broad-market weakness, the result of a plunging housing market and lofty commodity prices, played a role, weaker-than-expected third-quarter results, due to industry-specific woes, namely unfavorable weather conditions and a hiccup in the regulatory process, was the primary reason for the decline. And, although conditions probably got a little better in the fourth quarter, we suspect that earnings growth remained weak for most of these stocks in the fourth-quarter 2007. (Results are likely to be released for most in the coming weeks.)

Earnings growth ought to get back on track this year, as more-normalized weather patterns and recent company initiatives (discussed further below) boost usage rates and act as a catalysts. However, long term, we worry that many water utilities lack the finances to keep up with the elevated infrastructure costs that should persist for years to come.

Regulatory Matters

Water utility companies are subject to comply with state regulatory boards, put in place to maintain a balance of power between the industry and consumers. Companies put in general rate cases claims every year in an attempt to recapture lost wages, due to a variety of circumstances, which are generally weather related. Unfortunately, many commissions have not been kind to utilities in recent memory, handing down decisions in an untimely and unfavorable manner. But that has all changed and regulatory panels are now more-business friendly. Nowhere is this more apparent than in California, where the California Public Utilities Commission (CPUC) has been, for the most part, handing down positive decisions. And there may be more help on the way. The CPUC is contemplating enacting some of the proposals of the Water Action Plan of 2005 that would likely further streamline the decision making process and remove some future earnings volatility, via the adoption of a weather normalization clause.

New Opportunities

Mergers and acquisitions activity has remained at a feverishly high pace. Companies with the financial flexibility to do so have been gobbling up smaller providers unable to deal with the rising costs of business. Aqua America, is a shining example, inking more than two dozen deals in 2007. The additions have been a good means for many to grow their customer base and even gain entry into previously untapped markets.

That said, some are taking an entirely different route. Instead of looking to the M&A market as a means to drive growth, American States Water has turned to the non-regulated sector, namely military bases to do so. Recent deals with the government to operate and maintain the water and wastewater systems at Fort Jackson, South Carolina and Fort Bragg, North Carolina ought to boost revenues for years to come.

Watershed of Costs

Water providers have seen maintenance costs jump considerably in recent years, as aging infrastructures required repairs and, in many cases, even rebuilding. However, we suspect that many systems are still outdated and require additional renovations. That, coupled, with more stringent water purification standards, due to greater fears of bioterrorism, ought to result in high costs for the foreseeable future. Unfortunately, many companies here do not have the finances to fund these endeavors and will be forced to look to outside financiers to help meet the costs.

Investment Advice

Appealing investment options are difficult to find here. Not a single stock in the group is ranked favorably for Timeliness or the 3- to 5-year pull, due to the capital constraints of the industry. Indeed, any gains we envision stemming from an improving regulatory landscape and/or penetration into new markets, will likely be offset by rising interest costs and higher sharecount. This affects the income component as well. The once lofty dividend yields are a thing of the past, and income-oriented investors have better investments options. That said, as always, we caution all potential investors to take a careful look at the individual reports on the following pages before making any financial commitments.

Andre J. Costanza

BUSINESS: AGL Resources, Inc. is a public utility holding company. Its distribution subsidiaries include Atlanta Gas Light, Chattanooga Gas, and Virginia Natural Gas. The utilities have more than 2.2 million customers in Georgia, Virginia, Tennessee, New Jersey, Florida, and Maryland. Engaged in nonregulated natural gas marketing and other allied services. Also wholesales and retails propane. Deregulated subsidiaries: Georgia Natural Gas markets natural gas at retail. Acquired Virginia Natural Gas, 10/00. Sold Utilipro, 3/01. Off./dir. own less than 1.0% of common; Barclays Global Investors, 5.0% (3/07 Proxy). Pres. & CEO: John W. Somerhalder II. Inc.: GA. Addr.: Ten Peachtree Place N.E., Atlanta, GA 30309. Tel.: 404-584-4000. Internet: www.aglresources.com.

AGL Resources turned in disappointing results for the third quarter. The top line declined roughly 15% in the recent interim. Despite lower operating costs, the earnings picture was also unimpressive. Share net came in at $0.17, considerably below the prior year's period. This was almost entirely due to weakness in the Wholesale Services segment. This business experienced reductions in storage hedge gains and transportation hedge gains. Also, the segment's commercial activity declined owing to lower volatility and narrowing spreads in the natural gas wholesale market. Overall, Wholesale Services reported operating income of $1 million in the recent period, compared to $40 million in the third quarter of 2006. On the bright side, the Distribution Operations segment provided some support, as operating income for this business increased 10%. Also, the Retail Energy business reported a lower operating loss, helped by improved retail price spreads.

We project a modest decline in share earnings for full-year 2007, due to unfavorable comparisons in the first and third quarters. However, moderate bottom-line growth ought to resume in 2008, assuming better performance from the Wholesale Services business, along with normal weather and average volatility in natural gas prices throughout the year.

AGL Resources has acquired Compass Energy Services, based in Richmond, Virginia. Prior to the deal, Compass Energy provided commercial and industrial customers with energy commodity supplies and energy procurement consulting services. This move enables AGL to serve a larger market in the commercial and industrial sector.

These shares are ranked to lag the overall market for the coming six to 12 months. Nevertheless, this issue offers a dividend yield of 4.4%, which may appeal to income-oriented investors. Looking forward, we anticipate steady bottom-line growth at AGL Resources from 2008 onward. Moreover, these shares earn high marks for Safety, Price Stability, and Earnings Predictability. Total return potential looks good on a risk-adjusted basis for the pull to 2010-2012, supported by modest dividend growth.

Atmos Energy's history dates back to 1906 in the Texas Panhandle. Over the years, through various mergers, it became part of Pioneer Corporation, and, in 1981, Pioneer named its gas distribution division Energas. In 1983, Pioneer organized Energas as a separate subsidiary and distributed the outstanding shares of Energas to Pioneer shareholders. Energas changed its name to Atmos in 1988. Atmos acquired Trans Louisiana Gas in 1986, Western Kentucky Gas Utility in 1987, Greeley Gas in 1993, United Cities Gas in 1997, and others.

BUSINESS: Atmos Energy Corporation is engaged primarily in the distribution and sale of natural gas to 3.2 million customers via six regulated natural gas utility operations: Louisiana Division, West Texas Division, Mid-Tex Division, Mississippi Division, Colorado-Kansas Division, and Kentucky/Mid-States Division. Combined 2006 gas volumes: 272 MMcf. Breakdown: 53%, residential; 32%, commercial; 10%, industrial; and 5% other. 2006 depreciation rate 3.6%. Has around 4,600 employees. Officers and directors own approximately 1.9% of common stock (12/06 Proxy). Chairman and Chief Executive Officer: Robert W. Best. Incorporated: Texas. Address: P.O. Box 650205, Dallas, Texas 75265. Telephone: 972-934-9227. Internet: www.atmosenergy.com.

Atmos Energy's bottom line may show only a 3% improvement in fiscal 2008, which began on October 1st. That's based partly on our assumption that margins for the natural gas marketing segment will be lower, if prices are less volatile (reflecting no major storm activity). But the utility operation ought to be aided by higher throughput, and we note that weather-normalization mechanisms are in place for most operations. Also, the pipeline business should continue to enjoy the benefits of the North Side Loop and other projects that were completed in 2006.

Share net may advance at a somewhat stronger 5% pace in fiscal 2009, supported by additional expansion in operating margins. We expect a similar steady, but unspectacular, rate of growth over the 2010-2012 timeframe.

Atmos is seeking new rate structures to help offset escalating operating costs. It filed for a $52 million increase in annual revenues for the Mid-Tex Division (covering some 1.5 million customers). Furthermore, a $5 million boost in annual revenues is being sought for the Kansas operations, which would affect about 124,000 customers. Note that we have not included the above amounts in our figures because of uncertainty as to when (or if) these measures will be approved by regulators.

The company tends to be aggressive on the acquisition front, as it has conducted a string of major business combinations over the past 20 years (the latest ones being Mississippi Valley Gas Company in 2002 and TXU Gas Company in 2004). Management will undoubtedly stick to its successful strategy of purchasing less-efficient utilities and shoring up their profitability through expense-reduction initiatives, rate relief, and dogged marketing efforts.

These good-quality shares offer an appealing dividend yield. Additional moderate hikes in the distribution seem achievable, too. Earnings coverage ought to remain adequate.

We see decent, risk-adjusted total-return potential here. But the equity is ranked to lag the market in the next six to 12 months.

BUSINESS: Laclede Group, Inc., is a holding company for Laclede Gas, which distributes natural gas in eastern Missouri, including the city of St. Louis, St. Louis County, and parts of 10 other counties. Has roughly 631,000 customers. Purchased SM&P for approximately $43 million (1/02). Therms sold and transported in fiscal 2006: 1.02 mill. Revenue mix for regulated operations: residential, 60%; commercial and industrial, 25%; transportation, 1%; other, 14%. Has around 3,880 employees. Officers and directors own approximately 7.0% of common shares (1/07 proxy). Chairman, Chief Executive Officer, and President: Douglas H. Yaeger. Incorporated: Missouri. Address: 720 Olive Street, St. Louis, Missouri 63101. Telephone: 314-342-0500. Internet: www.ladledegas.com.

We do not think Laclede Group's share net in fiscal 2008 (which began on October 1st) will reach last year's level, attributable largely to the difficult comparison. Margins for Laclede Energy Resources (LER) may not be spectacular if pricing volatility in Gulf Coast markets is fairly stable, assuming no repeat of the severe storms that occurred in 2005. Furthermore, SM&P Utility Resources' performance ought to be constrained, to a certain extent, by expenses from growth initiatives. But Laclede Gas, the core subsidiary, stands to benefit from higher volumes from entities within the service territory (if temperatures cooperate). A rate hike effective August 1st of 2007 should help here, as well. Nonetheless, consolidated share net may decline around 5%, to $2.20, in fiscal 2008. The bottom line for fiscal 2009 stands to advance to $2.30 a share, assuming expansion in operating margins.

Steady, if measured, earnings gains seem possible over the 2010-2012 horizon. Customer increases for the natural gas operation have been moderate for some time because the service area is in a mature stage. That being the case, internal growth here will likely remain a challenge. The non-regulated units have promising prospects, but they have contributed just a small portion to profits on a historical basis. A major acquisition could help to offset this, but it appears that management has no such plans in the works at this juncture. Consequently, annual share-net advances may only be in the mid-single-digit range over the 2010-2012 period.

These shares offer a decent amount of current dividend income, which is well covered by earnings. But additional increases in the payout could be slow in coming, since the long-term growth prospects for Laclede Gas are not exciting. Note, also, the 2 (Above Average) rank for Safety.

Total return possibilities are limited. That's because these shares are trading close to our 3- to 5-year Target Price Range, and we assume moderate hikes in the distribution. And for the next six to 12 months, the equity is expected to perform only in line with the broader market.

Frederick L. Harris, III December 14, 2007

(A) Fiscal year ends Sept. 30th.
(B) Based on average shares outstanding thru. '97, then diluted. Excludes nonrecurring loss: '06, 7¢. Next earnings report due late January.
(C) Dividends historically paid in early January, April, July, and October. ■ Dividend reinvestment plan available.
(D) Incl. deferred charges. In '06: $256.8 mill., $12.02/sh.
(E) In millions. Adjusted for stock split.
(F) Qtly. egs. may not sum due to change in shares outstanding.

BUSINESS: New Jersey Resources Corp. is a holding company providing retail/wholesale energy svcs. to customers in New Jersey, and in states from the Gulf Coast to New England, and Canada. New Jersey Natural Gas had about 471,000 customers at 9/30/06 in Monmouth and Ocean Counties, and other N.J. Counties. Fiscal 2006 volume: 102.8 bill. cu. ft. (56% firm, 7% interruptible industrial and electric utility, 37% off-system and capacity release). N.J. Natural Energy subsidiary provides unregulated retail/wholesale natural gas and related energy svcs. 2006 dep. rate: 2.7%. Has 766 empls. Off./dir. own about 2% of common (12/06 Proxy). Chrmn. and CEO: Laurence M. Downes. Inc.: N.J. Addr.: 1415 Wyckoff Road, Wall, NJ 07719. Tel.: 732-938-1480. Web: www.njresources.com.

New Jersey Resources was unable to submit its 10-K on time this year. As a result, only preliminary unaudited data are available for fiscal 2007 (ended September 30th). The reason for the delay relates to NJR's investigation regarding the assessment and treatment of its derivative instruments under SFAS 133. Given the compexity of this examination, no timetable has been set regarding the release of the document. However, at this time, the company has reported a 12.5% increase in earnings when compared with last year. The majority of this advance can be attributed to an almost 43% earnings increase for the New Jersey Resources division, the wholesale energy portion of NJR's business.

Share-net growth ought to moderate in 2008 and beyond. We look for the bottom line to advance 2%-5% in 2008. Driving this advance will likely be a 1.8% annual customer growth rate as the New Jersey Natural Gas unit attracts additional accounts and converts existing ones from other sources of energy.

Additional benefits ought to develop thanks to healthy capital spending. The Steckman Ridge project continues to move forward towards its projected in-service date of spring, 2009. The gas storage facility in Pennsylvania, with access to the Texas Eastern pipeline system, has received bids for storage services that totaled almost five times its proposed working capacity. NJR, though, is still awaiting approval by the FERC, as it filed back in November. And the board of directors recently approved a 5.3% dividend increase to $0.40 per share. Finally, the company increased its share-repurchase program, from 3.5 million shares to 4.5 million. This past year, the company bought back 340,000 shares.

All told, these shares are ranked to underperform the broader market for the year ahead. And based on the stock's quotation and our earnings projections, the equity currently sits above our Target Price Range. Thus, it offers below-average appreciation potential. However, the issue may still appeal to income-oriented investors with an eye on capital preservation, due to its solid dividend yield and top mark for Stock Price Stability.

Bryan Fong *December 14, 2007*

BUSINESS: Nicor Inc. is a holding company with gas distribution as its primary business. Serves over 2.1 million customers in northern and western Illinois. 2006 gas delivered: 438.7 Bcf, incl. 206.0 Bcf from transportation. 2006 gas sales (232.7 bcf): residential, 80%; commercial, 18%; industrial, 2%. Principal supplying pipelines: Natural Gas Pipeline, Horizon Pipeline, and TGPC. Current operations include Tropical Shipping subsidiary and several energy related ventures. Divested inland barging, 7/86; contract drilling, 9/86; oil and gas E&P, 6/93. Has about 3,900 employees. Off./dir. own about 1.7% of common stock (3/07 proxy). Chairman and CEO: Russ Strobel. Inc.: Illinois Address: 1844 Ferry Road, Naperville, Illinois 60563. Telephone: 630-305-9500. Internet: www.nicor.com.

Higher costs are hurting Nicor's earnings. Specifically, profits continue to be dragged down by bad debt and higher expenses in the gas distribution segment. Moreover, an investigation by the Environmental Protection Agency and the Illinois attorney general, regarding polychlorinated biphenyls in Nicor's distribution system, has weighed on share net. (The investigation is nearly complete and should not continue to affect results.) Because of the recent pressure on results, management has been focusing on cost control. All told, we believe the company will post an earnings decline in 2007 and just a modest increase in 2008 while these issues are a factor.

Nicor Gas might seek rate relief in 2008. Base rates have remained unchanged in 2007, and the company has not been earning its allowed return. Moreover, Nicor does not have any rate cases pending currently. Therefore, if cost-cutting doesn't enable the utility to earn an adequate return on equity, it might file a rate case in the near future. Additionally, management continues to look into rate mechanisms, such as one that decouples gas revenues from gas sales, to improve the company's ability to generate healthy returns.

The balance sheet is solid. Indeed, the company has a Financial Strength rating of A. Nicor's diverse business provides a steady stream of income that amply supports its capital structure.

The company's nonregulated operations have performed well. The wholesale natural gas marketing and the retail products and services businesses turned in strong results in the September period. Nicor's focus on developing these other opportunities has enabled it to better handle the volatility in natural gas prices.

This stock is currently trading within our 2010-2012 Target Price Range. Therefore, long-term investors may want to look elsewhere, especially since we project no dividend growth, even over the 3- to 5-year period. However, income-oriented investors may be interested in this stock's above-average yield. For now, these shares are ranked to mirror the market in the year ahead.

BUSINESS: Northwest Natural Gas Co. distributes natural gas to 90 communities, 639,500 customers, in Oregon (90% of customers) and in southwest Washington state. Principal cities served: Portland and Eugene, OR; Vancouver, WA. Service area population: 2.5 mill. (77% in OR). Company buys gas supply from Canadian and U.S. producers; has transportation rights on Northwest Pipeline system. Owns local underground storage. Rev. breakdown: residential, 55%; commercial, 28%; industrial, gas transportation, and other, 17%. Employs 1,150. Fidelity owns 14.9% of shares; Snyder Cap'l, 8.7%; off./dir., 2.0% (4/07 proxy). CEO: Mark S. Dodson. Inc.: Oregon. Address: 220 NW 2nd Ave., Portland, OR 97209. Telephone: 503-226-4211. Internet: www.nwnatural.com.

Northwest Natural remains on course to post record earnings in 2007. In the third quarter, the usual seasonal loss from gas distribution increased, but it was more than offset by a $0.04-a-share increase in gas storage profits, due, in part, to a recent 11% expansion of the gas storage field at Mist, OR. Operating expenses were up 6% in the latest period, compared with 3% year to date, due to unusual storm repair work and extra outlays for efficiency projects. Meanwhile, customer growth was 2.6% for the 12 months ended in September, down from over 3% annually for many years, though still about twice the national average.

We look for modest share-net gains in 2008. The large earnings increase in the first nine months of 2007 resulted largely from astute gas hedging in the first quarter, though gas storage profits are up, as well. With less volatile gas prices likely, Northwest will probably not book nearly as much in hedging profits in 2008. But we still look for steady customer growth, despite the national housing recession, and higher storage profits. And Northwest should begin to reap the benefits of its work reorientation program next year.

Oregon has renewed key tariff provisions. Northwest benefits from weather adjustment and conservation tariffs that protect the company's earnings from fluctuations due to unusually warm or cold weather and reduced gas usage due to conservation. The Oregon commission has renewed those clauses through October 2012, and the company has agreed not to file a rate case before late 2011. It can, however, seek higher rates for several kinds of projects, and it will continue to adjust rates to reflect actual gas costs.

Expansion of Portland's urban density boundaries and other projects will likely boost earnings by 2010-2012. Oregon has raised permitted population density in the southeastern suburbs of Portland, which should lead to substantial growth in that area. And two possible pipeline and storage projects, with a total of up to $500 million invested by Northwest, could come on stream by 2012.

These top quality, neutrally ranked, shares have decent risk-adjusted, long-term total return potential.

BUSINESS: Piedmont Natural Gas Company is primarily a regulated natural gas distributor, serving over 1,016,000 customers in North Carolina, South Carolina, and Tennessee. 2006 revenue mix: residential (44%), commercial (26%), industrial (11%), other (19%). Principal suppliers: Transco and Tennessee Pipeline. Gas costs: 72.8% of revenues. '06 deprec. rate: 3.5%. Estimated plant age: 8.7 years. Non-regulated operations: sale of gas-powered heating equipment; natural gas brokering; propane sales. Has about 2,051 employees. Officers & directors own less than 1% of common stock (1/07 proxy). Chairman, CEO, & President: Thomas E. Skains. Inc.: NC. Addr.: 4720 Piedmont Row Drive, Charlotte, NC 28210. Telephone: 704-364-3120. Internet: www.piedmontng.com.

Piedmont Natural Gas likely posted a 25% improvement in share net for the fourth quarter. This probably stemmed from the healthy growth of its customer base and good cost management. Expenses are down $5.4 million year to date. This reduction is partially due to the completion of the automated meter reading (AMR) project. Savings from AMR come in the form of less meter readers, trucks, fuel, accidents, and insurance risks, as well as the consolidation of billing. Regulatory mechanisms have also been protecting margins against the warmer-than-normal weather and customer conservation. And the use of these devices ought to continue to boost margins.

All told, we believe there was a full recovery in annual earnings in 2007. The bottom line seemed to have advanced about 14% year over year. PNY's joint ventures (JV) have been adding to earnings through higher nonutility income. JV earnings before taxes have increased 25% as Southstar continues to do well. Also, the Hardy Storage unit, which went into service in April, has been contributing nicely. Some difficulties arose from the North Carolina Utilities Commission's order to discontinue an accounting convention for the treatment of demand charges, as PNY moved gas in and out of storage. This practice, adopted in the 1980s, had a one-time negative impact on October-period earnings of $2.5 million.

Earnings gains should occur at a slower pace moving forward. In 2008, we look for share net to increase 3%-5%. We have likely already seen the majority of benefits from efficiency improvements. Therefore, most of this year's bottom-line boost ought to come from a projected 3% increase in customer additions and the benefit of having the Hardy Storage facility in use for the full year.

Indeed, the equity is ranked to perform in line with the broader market for the coming year. Based on its current quotation and our projections, the issue offers average appreciation potential out to 2011-2012. Too, the stock maintains a solid dividend yield. Conservative accounts should note the stock's Above-Average Safety rank (2), and its top score for Price Stability (100).

Bryan Fong *December 14, 2007*

(A) Fiscal year ends October 31st.
(B) Diluted earnings. Excl. extraordinary item: '00, 8¢. Excl. nonrecurring charge: '97, 2¢. Next earnings report due early Feb.
(C) Dividends historically paid mid-January, April, July, October.
■ Div'd reinvest. plan available; 5% discount.
(D) Includes deferred charges. At 10/31/06: $11.3 million, 15¢/share.
(E) In millions, adjusted for stock split.
(F) Quarters may not add to total due to change in shares outstanding.

BUSINESS: South Jersey Industries, Inc. is a holding company. Its subsidiary, South Jersey Gas Co., distributes natural gas to 330,049 customers in New Jersey's southern counties, which covers 2,500 square miles and includes Atlantic City. Gas revenue mix '06: residential, 43%; commercial, 24%; cogeneration and electric generation, 3%; industrial, 30%. Non-utility operations include: South Jersey Energy, South Jersey Resources Group, Marina Energy, and South Jersey Energy Service Plus. Has 611 employees. Off./dir. cntrl. 1.2% of com. shares; Dimensional Fund Advisors, 8.3%; Barclays, 6.0% (3/07 proxy). Chrmn. & CEO: Edward Graham. Incorp.: NJ. Address: 1 South Jersey Plaza, Folsom, NJ 08037. Tel.: 609-561-9000. Internet: www.sjindustries.com.

South Jersey Industries posted a small top-line advance for the third quarter. Solid growth in Utility revenues offset lower sales from nonutility operations. Share earnings declined, however, as the company experienced higher operating expenses, due to a greater cost of sales. We project a favorable revenue comparison for the fourth quarter, and a modest top-line advance for full-year 2007. Subscribers are advised that share net is now based on economic earnings, a non-GAAP measure that excludes unrealized gains and losses from commodity derivative transactions. Thus, share earnings from 2007 forward are not directly comparable with those from previous years.

We remain optimistic about long-term prospects for subsidiary South Jersey Gas. Customer growth at the utility has continued at a respectable clip, as this business has increased its customer base by roughly 1.9% during the past 12 months. This may ease somewhat going forward, due to the slowdown in the housing market. Nevertheless, natural gas should remain the fuel of choice within the utility's service territory. In addition, the Conservation Incentive Program (CIP) ought to continue to benefit South Jersey Gas. This initiative allows the utility to promote energy conservation, while insulating itself from the negative impact of lower customer usage. The CIP has benefited net income by $4.4 million during the first nine months of the year, offsetting the impact of lower customer utilization.

The board of directors has increased the dividend by 10%. The board has raised the quarterly dividend from $0.245 to $0.27, starting with the December payout. This comes as no surprise, considering SJI's track record of increasing its dividend in recent years. We find this trend encouraging, and expect it will continue.

These shares are ranked 4 (Below Average) for Timeliness. However, this stock earns high marks for Safety, Price Stability, and Earnings Predictability. Moreover, we expect steady growth in revenues and share earnings at South Jersey over the pull to 2010-2012. At the current quotation, the issue offers modest, but relatively well-defined, total return potential.

Michael Napoli, CPA *December 14, 2007*

(A) Based on GAAP EPS through 2006, economic earnings thereafter. GAAP EPS: Q1 2007, $0.92; Q2 2007, $0.37; Q3 2007, $0.29. Excl. nonrecur. gain: '01, $0.13. BUSINESS: Southwest Gas Corporation is a regulated gas distributor serving approximately 1.8 million customers in sections of Arizona, Nevada, and California. Comprised of two business segments: natural gas operations and construction services. 2006 margin mix: residential and small commercial, 85%; large commercial and industrial, 6%; transportation, 9%. Total throughput: 2.4 billion therms. Sold PriMerit Bank (acquired in 1986) in July of 1996. Has 4,902 employees. Officers & Directors own roughly 1.4% of common stock (3/07 Proxy). Chairman: LeRoy C. Hanneman, Jr. Chief Executive Officer: Jeffrey W. Shaw. Incorporated: California. Address: 5241 Spring Mountain Road, Las Vegas, Nevada 89193. Telephone: 702-876-7237. Internet: www.swgas.com.

Southwest Gas turned in a solid performance for the third quarter. The top line came in at $371.5 million, an advance of almost 6%. The company increased its customer base by about 48,000 over the past 12 months. This was somewhat lower than in recent times, but still healthy overall. The company reported a share loss of $0.22, a modest improvement from the prior year's period. Losses at Southwest are not unusual during the second and third quarters, due to the seasonal nature of its business. Looking forward, we anticipate slightly better results in the fourth quarter, also. For full-year 2007, we expect revenues and share earnings will increase roughly 7% and 5%, respectively. This pattern ought to continue in 2008, as well.

The company has filed a rate case in Arizona. Due to an increase in its fixed operating costs, Southwest Gas has requested the Arizona Corporation Commission increase its authorized operating revenues by $50.2 million (almost 5%). In addition, SWX has proposed a rate structure that would promote efficient energy usage, and eliminate weather-related volatility from customer bills. The company is seeking implementation of these new rates by October 1, 2008. This move is encouraging, and we expect SWX will continue to focus on obtaining rate relief and improving rate design. This issue is important, as Southwest depends upon such approved revenue increases to help it cope with higher expenses and to provide for a smoother income stream.

The stock is not without risk. Warmer-than-normal temperatures may hurt performance at Southwest Gas. Also, as the company continues to expand, it is likely to incur increased operating costs. The upfront expenses may keep dividend growth limited.

These shares have improved a notch in Timeliness, but remain unfavorably ranked for the coming six to 12 months. Nevertheless, we anticipate continued growth in revenues and share earnings at Southwest Gas over the pull to 2010-2012. At the current quotation, this issue has above-average total return potential for a utility. Patient, risk-tolerant investors may be rewarded.

BUSINESS: WGL Holdings, Inc. is the parent of Washington Gas Light, a natural gas distributor in Washington, D.C. and adjacent areas of VA and MD to resident'l and comm'l users (1,031,916 meters). Hampshire Gas, a federally regulated sub., operates an underground gas-storage facility in WV. Non-regulated subs.: Wash. Gas Energy Svcs. sells and delivers natural gas and provides energy related products in the D.C. metro area; Wash. Gas Energy Sys. designs/installs comm'l heating, ventilating, and air cond. systems. American Century Inv. own 9.6% of common stock; Off./dir. less than 1% (1/07 proxy). Chrmn. & CEO: J.H. DeGraffenreidt. Inc.: D.C. and VA. Addr.: 1100 H St., N.W., Washington, D.C. 20080. Tel.: 202-624-6410. Internet: www.wglholdings.com.

WGL Holdings continues to build its infrastructure through capital projects. The company completed the underground work for the Prince George County rehabilitation, at a cost of $89 million. The project involved the replacement of mains and service lines that experienced unusually high incidents of leaks associated with the Cove Point (CP) liquefied natural gas (LNG) terminal. Also, in an effort to prevent such a high level of leaks in the future, WGL is working on a gas conditioning facility in Rockville, Maryland, which should be operational shortly. And the company has recently received county approvals for a third facility in Brainesville, Virginia. These projects should enable WGL to manage safely through the final CP LNG terminal expansion, which is anticipated to be operational late in the fall of 2008. Furthermore, work has commenced on a peaking facility in Chillum, Maryland. At a cost of $149 million, this project should produce enough reserves to meet excess demand during the peak winter heating season by 2011-2012.

We look for the company to post low- to mid-single-digit earnings growth in the first quarter. Contributions to the bottom line should stem from cost reduction initiatives. WGL entered into a 10-year agreement with Accenture for the outsourcing of various tasks. So far, Accenture is handling WGL's human resources, purchasing, payroll, and parts of IT. Customer service should be transitioned by December 31st, while the final IT transition should be completed in the spring of 2009. This plan is expected to save $170 million in the next 10 years.

All told, we estimate share-net advances of approximately 5% in 2008. Pending rate cases in Maryland and the District of Columbia ought to contribute to the boost, as well as should the projected addition of 17,500 customers by yearend.

Shares of WGL Holdings are ranked to perform in line with the overall market for the coming year. And the issue offers a decent dividend yield, which may interest income investors. However, based on our earnings projections and the stock's current quotation, which already falls within our Target Price Range, it offers below-average appreciation potential.

Bryan Fong *December 14, 2007*

(A) Fiscal years end Sept. 30th.
(B) Based on diluted shares. Excludes nonrecurring losses: '01, (13¢); '02, (34¢); '07, (4¢) discontinued operations: '06, (15¢). Next earnings report due late Jan. (C) Dividends historically paid early February, May, August, and November. ■ Dividend reinvestment plan available. (D) Includes deferred charges and intangibles. '07: $322.2 million, $6.51/sh. (E) In millions, adjusted for stock split.

Long-Range Consensus U.S. Economic Projections

I. The table below shows the latest U.S. Blue Chip Consensus[1] projections by years for 2009 through 2013, an average for the five-year period 2009-2013, and an average for the next five-year period 2014-2018. There are also Top 10 and Bottom 10 averages for each variable. Apply these projections cautiously. For the most part economic and political forces cannot be evaluated over such long time spans.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Michael Miller

PART III: QUESTIONS & REQUESTS REGARDING COST OF CAPITAL & MISCELLANEOUS

Question:

2. Provide TAWC's current credit rating, with documentation, and identify the holders of any General Mortgage Bonds, any Capital Leases, any subordinated capital on TAWC's books, and provide copies of the terms and conditions of each.

Response:

TAWC does not have a stand alone credit rating. Please see the responses to TN-CMA-01-Q10 and TN-CMA-01-Q18 for information on credit ratings of AWW and AWCC. Please see the attached schedule, which indicates which bonds are subject to the General Mortgage Indenture and which are not, as well as the bondholders. Please note that this is the same schedule as provided in the testimony of Mr. Miller (Exhibit MAM-3), except for the additions mentioned in the previous sentence.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Michael Miller/Others

PART III: QUESTIONS & REQUESTS REGARDING COST OF CAPITAL & MISCELLANEOUS

Question:

3. In TRA Docket No. 06-00119, TAWC received the Tennessee Regulatory Authority's approval for a change of control. In that Docket, TAWC stated on p. 8 of the Petition for Approval of Change in Control filed on 4/21/2006 that "The Proposed Transaction will not impair the ability of the Petitioner to maintain a reasonable capital structure that is representative of other utilities."

   Also, on May 6, 2008 American Water Works filed with the SEC a Registration Statement stating that the Company may issue $750 million of debt. Included in the filing was Exhibit 23.1, a consent statement by Price Waterhouse Coopers:

   > Consent Of Independent Registered Public Accounting Firm. We hereby consent to the use in this Registration Statement on Amendment No. 1 to Form S-4 (No. 333-148284) of our report dated February 28, 2008 relating to the consolidated financial statements of American Water Works Company, Inc. and Subsidiary Companies (formerly Thames Water Aqua US Holdings, Inc. and Subsidiary Companies), which appears in such Registration Statement. We also consent to the reference to us under the heading "Experts" in such Registration Statement.

   a. Provide the consolidated financial statements prepared by Price Water House Coopers and all American Water Work's workpapers relied on by Price Water House Coopers to prepare the consolidated financial statements.

   b. Provide American Water Work's current credit rating.

c. Provide copies of all audited financial statements of American Water Works and Subsidiary Companies which were performed between April 28, 2007 and April 28, 2008.

d. Provide copies of all minutes taken between May 12, 2007, and May 12, 2008, for the Audit Committee of American Water Works.

e. Provide copies of all studies, working papers, and other documents issued by the Audit Committee or which the Audit Committee caused to be issued between May 12, 2007, and May 12, 2008.

f. Produce a record of those portions of American Water Work's Charter or Bylaws where the Charter or the Bylaws address capitalization;

g. Provide the book value of equity which AWW will have once the underwriters exercise their options.

Response:

a. The Company objects to this request on the grounds that it is overbroad, unduly burdensome, and seeks information that is not relevant to this proceeding, including information subject to attorney/client privilege and the work product doctrine, and containing highly confidential information.

Subject to and without waiving its objections, the Company states that public information about AWK can be found at the following web sites: www.sec.gov and www.amwater.com (investor relations). Furthermore, please see the response to TN-COC-01-Q002. The 2007-2005 AWW Audited Financial Statements can be found with the response to TN-TRA-01-Q5.

b. See responses to TN-CMA-01-Q10 and TN-CMA-01-Q118.

c. The Company objects to this question on the grounds that the requested is overbroad, unduly burdensome, and in large part not relevant to this proceeding.

Subject to and without waiving these objections, please refer to the responses to TN-TRA-01-Q5 for the AWW and TAWC 2007 Audited Financial Statements. Also refer to the web sites www.amwater.com (investor relations) and www.sec.gov for information on the first quarter 2008 reports for AWW.

d. The Company objects to this request on the grounds that it is overbroad, unduly burdensome, and seeks information that is not relevant to this proceeding, including information subject to the attorney/client privilege and work product doctrine, and containing highly confidential information.

e. The Company objects to this request on the grounds that it is overbroad, unduly burdensome, and seeks information that is not relevant to this proceeding, including information subject to the attorney/client privilege and work product doctrine, and containing highly confidential information.

f. Please see the attached documents, which are the charter and by-laws of AWW.

g. Please refer to the 10-Q report for March 2008, which can be obtained from the SEC website, www.sec.gov. The book value of AWW equity at March 31, 2008 per that report is $3.809 billion. The book value of AWW will not change based upon whether or not the underwriters exercise their options to purchase shares of AWW stock.

Delaware

The First State

I, HARRIET SMITH WINDSOR, SECRETARY OF STATE OF THE STATE OF DELAWARE, DO HEREBY CERTIFY THE ATTACHED IS A TRUE AND CORRECT COPY OF THE RESTATED CERTIFICATE OF "AMERICAN WATER WORKS COMPANY, INC.", FILED IN THIS OFFICE ON THE TWENTY-FOURTH DAY OF APRIL, A.D. 2008, AT 5:30 O'CLOCK P.M.

RESTATED

CERTIFICATE OF INCORPORATION

OF

AMERICAN WATER WORKS COMPANY, INC.

American Water Works Company, Inc., a corporation organized under the laws of the State of Delaware (the "Corporation"), hereby certifies as follows:

A. The name of the Corporation is "American Water Works Company, Inc." The Corporation was originally incorporated under the name "American Communities Company," and the original Certificate of Incorporation of the Corporation was filed with the Secretary of State of the State of Delaware on August 28, 1936.

B. This Restated Certificate of Incorporation, which amends the provisions of the Corporation's Certificate of Incorporation as heretofore amended, restated and supplemented, was duly adopted by the Board of Directors of the Corporation and by the sole stockholder of the Corporation in accordance with the provisions of Sections 228, 242 and 245 of the General Corporation Law of the State of Delaware.

C. The text of the Certificate of Incorporation of the Corporation, as heretofore amended, restated and supplemented, is hereby amended and restated to read in its entirety as follows:

ARTICLE I

The name of the corporation (hereinafter called the "Corporation") is American Water Works Company, Inc.

ARTICLE II

The address of the Corporation's registered office in the State of Delaware is 1209 Orange Street, in the City of Wilmington, County of New Castle, Delaware 19801. The name of the Corporation's registered agent at such address is The Corporation Trust Company.

ARTICLE III

The purpose of the Corporation is to engage in any lawful act or activity for which corporations may be organized under the General Corporation Law of the State of Delaware.

ARTICLE IV

A. Authorized Capital Stock. The total number of shares of all classes of stock that the Corporation shall have authority to issue is 550,000,000 shares, divided into two classes consisting of (i) 500,000,000 shares of common stock, par value $0.01 per share (the "Common Stock"), and (ii) 50,000,000 shares of preferred stock, par value $0.01 per share (the "Preferred Stock"). The following is a statement of the powers, preferences and rights, and the qualifications, limitations and restrictions thereof, in respect of each such class.

B. Preferred Stock. The Board of Directors is authorized to provide for the issuance from time to time of shares of Preferred Stock in one or more series and, by filing a certificate pursuant to the applicable provisions of the General Corporation Law of the State of Delaware (a "Preferred Stock Certificate of Designation"), to establish from time to time the number of shares to be included in each such series, with such powers, designations, preferences and relative, participating, optional or other rights, if any, and qualifications, limitations or restrictions thereof, if any, as are stated and expressed in the resolution or resolutions providing for the issuance thereof adopted by the Board of Directors (as such resolutions may be amended by a resolution or resolutions subsequently adopted by the Board of Directors), and as are not stated and expressed in this Restated Certificate of Incorporation, including, but not limited to, determination of any of the following:

(1) the distinctive designation of the series, whether by number, letter or title, and the number of shares which will constitute the series, which number may be increased or decreased (but not below the number of shares then outstanding and except to the extent otherwise provided in the applicable Preferred Stock Certificate of Designation) from time to time by action of the Board of Directors;

(2) the dividend rate, if any, and the times of payment of dividends, if any, on the shares of the series, whether such dividends will be cumulative and, if so, from what date or dates, and the relation which such dividends, if any, shall bear to the dividends payable on any other class or classes of stock;

(3) the price or prices at which, and the terms and conditions on which, the shares of the series may be redeemed at the option of the Corporation;

(4) whether or not the shares of the series will be entitled to the benefit of a retirement or sinking fund to be applied to the purchase or redemption of

such shares and, if so entitled, the amount of such fund and the terms and provisions relative to the operation thereof;

(5) the amounts payable on, and the preferences, if any, of the shares of the series in the event of any voluntary or involuntary liquidation, dissolution or winding up of the affairs of the Corporation;

(6) whether or not the shares of the series will be convertible into, or exchangeable for, any other shares of stock of the Corporation or other securities and, if so convertible or exchangeable, the conversion price or prices, or the rates of exchange, and any adjustments thereof, at which such conversion or exchange may be made, and any other terms and conditions of such conversion or exchange;

(7) whether or not the shares of the series will have priority over or be on a parity with or be junior to the shares of any other series or class of stock in any respect, or will be entitled to the benefit of limitations restricting the issuance of shares of any other series or class of stock, restricting the payment of dividends on or the making of other distributions in respect of shares of any other series or class of stock ranking junior to the shares of the series as to dividends or assets, or restricting the purchase or redemption of the shares of any such junior series or class, and the terms of any such restriction;

(8) whether or not the shares of the series will have voting rights in addition to any voting rights provided by law and, if so, the terms of such voting rights; and

(9) any other terms of the shares of the series.

C. Common Stock.

Except as otherwise required by applicable law, all shares of Common Stock shall be identical in all respects and shall entitle the holders thereof to the same rights, subject to the same qualifications, limitations and restrictions. The terms of the Common Stock set forth below shall be subject to the express terms of any series of Preferred Stock.

(1) Dividends. As, if and when dividends are declared or paid thereon, whether in cash, property or securities of the Corporation, the holders of Common Stock shall be entitled to participate in such dividends ratably on a per share basis.

(2) Voting Rights. Except as otherwise required by applicable law, the holders of Common Stock shall be entitled to one vote per share on all matters to be voted on by the Corporation's stockholders. No stockholder of the Corporation shall be entitled to exercise any right of cumulative voting.

(3) Liquidation Rights. The holders of Common Stock shall be entitled to participate ratably on a per share basis in all distributions to holders of Common Stock as a result of the liquidation, dissolution or winding up of the Corporation.

ARTICLE V

The number of directors of the Corporation shall be fixed from time to time in the manner provided in the Bylaws.

ARTICLE VI

In furtherance and not in limitation of the powers conferred upon it by law, the Board of Directors of the Corporation is expressly authorized to adopt, amend or repeal the Bylaws of the Corporation without the assent or vote of the stockholders of the Corporation. The stockholders may, at any annual or special meeting of the stockholders of the Corporation, duly called and upon proper notice thereof, make, alter, amend or repeal the Bylaws by the affirmative vote of the holders of not less than a majority of the then outstanding stock of the Corporation entitled to vote generally in the election of directors.

ARTICLE VII

Unless and except to the extent that the Bylaws of the Corporation so require, the election of directors of the Corporation need not be by written ballot.

ARTICLE VIII

No director of the Corporation shall be personally liable to the Corporation or its stockholders for monetary damages for breach of fiduciary duty as a director; provided, however, that the foregoing shall not eliminate or limit the liability of a director (A) for any breach of the director's duty of loyalty to the Corporation or its stockholders, (B) for acts or omissions not in good faith or which involve intentional misconduct or a knowing violation of law, (C) under Section 174 of the General Corporation Law of the State of Delaware, or (D) for any transaction from which the director derived an improper personal benefit.

Any repeal or modification of this Article by the stockholders of the Corporation shall be prospective only, and shall not affect, to the detriment of any director, any limitation on the personal liability of a director of the Corporation existing at the time of such repeal or modification.

ARTICLE IX

Each person who is or was or had agreed to become a director or officer of the Corporation, and each such person who is or was serving or who had agreed to serve

at the request of the Corporation as a director, officer, partner, member, trustee, employee or agent of another corporation, partnership, limited liability company, joint venture, trust or other enterprise (including the heirs, executor, administrators or estate of such person), shall be indemnified by the Corporation to the fullest extent permitted from time to time by applicable law.

ARTICLE X

Any action required or permitted to be taken by the stockholders of the Corporation must be effected at a duly called annual or special meeting of the stockholders of the Corporation, and the ability of the stockholders to consent in writing to the taking of any action is specifically denied.

IN WITNESS WHEREOF, this Restated Certificate of Incorporation of the Corporation has been executed by its duly authorized officer this 24th day of April, 2008.

ARTICLE XIII Amendments 25

AMENDED AND RESTATED
BYLAWS OF

AMERICAN WATER WORKS COMPANY, INC.
a Delaware corporation

As adopted on March 31, 2008

with effect from April 22, 2008

ARTICLE I

Offices

SECTION 1. Registered Office. The registered office of American Water Works Company, Inc. (the "Corporation") in the State of Delaware shall be located in the City of Wilmington.

SECTION 2. Other Offices. The Corporation may also have offices in such places, within or without the State of Delaware, as the Board of Directors of the Corporation (the "Board") may from time to time determine or the business of the Corporation may require.

ARTICLE II

Meetings of Stockholders

SECTION 1. Annual Meetings. The annual meeting of the stockholders for the election of directors and for such other business as may properly come before the meeting shall be held at such place (within or without the State of Delaware), date and hour as shall be designated by the Board or as shall be designated in the notice or waiver of notice thereof.

SECTION 2. Special Meetings. Special meetings of the stockholders may be held only upon call by the Board or the Chairman of the Board or President or a stockholder or stockholders holding at least 15% of the shares of stock of the Corporation issued and outstanding and entitled to be voted at the meeting, at such place and at such time and date as may be fixed by the body or person or persons giving such call, and as may be stated in the notice setting forth such call. Only business within the purpose or purposes described in the notice or waiver of notice required by these Bylaws may be conducted at a special meeting of the stockholders.

SECTION 3. Notice of Meetings. (a) Each stockholder of record of each class of stock of the Corporation then outstanding and entitled to vote at any meeting of stockholders shall be given written notice of such meeting, which notice shall state the place, date and hour of the meeting, and, in the case of a special meeting, the purpose or purposes for which the meeting is called. Each stockholder receiving such a notice shall be entitled to attend such meeting. Except as otherwise expressly required by law, notice of each meeting of stockholders shall be given not less than ten nor more than sixty days before the date of such meeting to each stockholder entitled to vote at such meeting.

(b) Attendance of a stockholder at a meeting shall constitute a waiver of notice of such meeting, except when the stockholder attends for the express purpose of objecting at the beginning of the meeting to the transaction of any business because the meeting is not lawfully called or convened

SECTION 4. Quorum. At each meeting of the stockholders, except as otherwise expressly required by law or the Corporation's Restated Certificate of Incorporation, stockholders holding a majority of the shares of stock of the Corporation issued and outstanding and entitled to be voted at the meeting shall be present in person or by proxy to constitute a quorum for the transaction of business. In the absence of a quorum at any such meeting or any adjournment or adjournments thereof, a majority in voting interest of those present in person or by proxy and entitled to vote thereat, or any officer entitled to preside at, or to act as secretary of, such meeting may adjourn such meeting until stockholders holding the amount of stock requisite for a quorum are present in person or by proxy. At any such adjourned meeting at which a quorum may be present, any business may be transacted which might have been transacted at the meeting as originally called.

SECTION 5. Organization. Meetings of stockholders shall be presided over by the Chairman of the Board, or in his or her absence by the President, or such other person as the Board may determine. The Secretary shall act as secretary of the meeting, and in his or her absence such other person as the person presiding over the meeting may appoint.

SECTION 6. Voting. When a quorum is present, the affirmative vote of the majority of shares present in person or represented by proxy at the meeting and entitled to vote on the subject matter shall be the act of the stockholders, unless the question is one upon which by express provisions of an applicable law, the rules and regulations of any stock exchange or quotation system applicable to the Corporation,

these Bylaws or the Corporation's Restated Certificate of Incorporation, a different vote is required, in which case such express provision shall govern and control the decision of such question.

SECTION 7. Notice of Stockholder Business and Nominations. (a) Annual Meetings of Stockholders.

(i) Nominations of persons for election to the Board and the proposal of business to be considered by the stockholders may be made at an annual meeting of stockholders (A) by or at the direction of the Chairman of the Board or the Board generally, (B) pursuant to the Corporation's notice of meeting (or any supplement thereto) or (C) by any stockholder of the Corporation who is entitled to vote at the meeting and who complies with the notice procedures set forth in clauses (ii) and (iii) of this paragraph and who was a stockholder of record at the time such notice is delivered to the Secretary.

(ii) For nominations or other business to be properly brought before an annual meeting by a stockholder, pursuant to clause (C) of paragraph (a)(i) of this Section 7 (or before a special meeting of stockholders pursuant to paragraph (b) of this Section 7), the stockholder must have given timely notice thereof in writing to the Secretary and any such proposed business other than the nominations of persons for election to the Board must constitute a proper matter for stockholder action. To be timely, a stockholder's notice shall be delivered to the Secretary at the principal executive offices of the Corporation not less than ninety days prior to the first anniversary of the date of the preceding year's annual

meeting; provided, however, that if the Corporation did not hold an annual meeting the preceding year or if the date of the annual meeting is changed by more than thirty days from the date of the preceding year's annual meeting, to be timely, notice by the stockholder must be delivered not later than the ninetieth day prior to the date of the annual meeting (or, if later, the tenth day following the day on which public announcement is first made of the date of the annual meeting and of the nominees proposed by the Board to be elected at such meeting). In no event shall the adjournment of an annual meeting commence a new time period for the giving of a stockholder's notice as described above. Such stockholder's notice shall set forth (A) as to each person whom the stockholder proposes to nominate for election or reelection as a director, all information relating to such person that is required to be disclosed in solicitations of proxies for election of directors, or is otherwise required, in each case pursuant to Regulation 14A under the Securities Exchange Act of 1934, as amended (the "Exchange Act"), in each case including any successor rule or regulation thereto, including such person's written consent to being named in the proxy statement as a nominee and to serving as a director if elected; (B) as to any other business that the stockholder proposes to bring before the meeting, a brief description of the business desired to be brought before the meeting, the reasons for conducting such business at the meeting and any material interest in such business of such stockholder and of any beneficial owner on whose behalf the proposal is made; and (C) as to the stockholder giving the notice and any beneficial owner on whose behalf the nomination or proposal is made (1) the name and address of such stockholder, as

they appear on the Corporation's books, and the name, address and phone number of such beneficial owner, (2) the number and class of shares of capital stock of the Corporation which are owned beneficially and of record by such stockholder and such beneficial owner, (3) a description of any and all arrangements or understandings between such stockholder and such beneficial owner, (4) a representation that the stockholder is a holder of record of stock of the Corporation entitled to vote at such meeting and intends to appear in person or by proxy at the meeting to propose such business or nomination and (5) a representation as to whether the stockholder or the beneficial owner, if any, intends or is part of a group which intends (x) to deliver a proxy statement and/or form of proxy to holders of at least the percentage of the Corporation's outstanding capital stock required to approve or adopt the proposal or elect the nominee and/or (y) otherwise to solicit proxies from stockholders in support of such proposal or nomination. The foregoing notice requirements shall be deemed satisfied by a stockholder if the stockholder has notified the Corporation of his or her intention to present a proposal at an annual meeting in compliance with Rule 14a-8 (or any successor thereto) promulgated under the Exchange Act and such stockholder's proposal has been included in a proxy statement that has been prepared by the Corporation to solicit proxies for such annual meeting. The Corporation may require any proposed nominee to furnish such other information as it may reasonably require to determine the eligibility of such proposed nominee to serve as a director of the Corporation.

(iii) Notwithstanding anything in the second sentence of paragraph (a)(ii) of this Section 7 to the contrary, in the event that the number of directors to be elected to the Board is increased and there is no public announcement made by the Corporation naming all of the nominees for director or specifying the size of the increased Board at least ninety days prior to the first anniversary of the date of the preceding year's annual meeting, a stockholder's notice under this paragraph shall also be considered timely, but only with respect to nominees for any new positions created by such increase, if it shall be delivered to the Secretary at the principal executive offices of the Corporation not later than the close of business on the tenth day following the day on which such public announcement is first made by the Corporation.

(b) Special Meetings of Stockholders. Only such business as shall have been brought before the special meeting of the stockholders pursuant to the notice or waiver of notice of the meeting shall be conducted at such meeting. Nominations of persons for election to the Board may be made at a special meeting of stockholders at which directors are to be elected pursuant to the notice or waiver of notice of the meeting (i) by or at the direction of the Board, (ii) by the stockholder or stockholders who called such meeting or (iii) by any other stockholder of the Corporation who is entitled to vote at such meeting, who complies with the notice procedures set forth in this Section 7 and who is a stockholder of record at the time such notice is delivered to the Secretary. Nominations by such other stockholders of persons for election to the Board may be made at such special meeting of stockholders if the stockholder's notice as required by paragraph (a)(ii) of this Section 7 shall be delivered to the Secretary at the principal

executive offices of the Corporation not later than the ninetieth day prior to the date of the special meeting (or, if later, the tenth day following the day on which public announcement is first made of the date of the special meeting and of the nominees proposed by the Board to be elected at such meeting). In no event shall the adjournment of a special meeting commence a new time period for the giving of a stockholder's notice as described above.

(c) General. Other than as set forth in Article III, Section 5 hereof, only persons who are nominated in accordance with the procedures set forth in this Section 7 shall be eligible to serve as directors and only such business shall be conducted at a meeting of stockholders as shall have been brought before the meeting in accordance with the procedures set forth in this Section 7. Except as otherwise provided by law, the chairman of the meeting shall have the power and duty to determine whether a nomination or any business proposed to be brought before the meeting was made in accordance with the procedures set forth in this Section 7 and, if any proposed nomination or business is not in compliance with this Section 7, to declare that such defective proposal or nomination shall be disregarded.

SECTION 8. Postponement and Cancellation of Meeting. Any previously scheduled annual or special meeting of the stockholders may be postponed, and any previously scheduled annual or special meeting of the stockholders called by the Board may be canceled, by resolution of the Board upon public notice given prior to the time previously scheduled for such meeting of stockholders.

ARTICLE III

Board of Directors

SECTION 1. General Powers. The property, business and affairs of the Corporation shall be managed by or under the direction of the Board, which may exercise all such powers of the Corporation and do all such lawful acts and things as are not by law or by the Restated Certificate of Incorporation directed or required to be exercised or done by the stockholders.

SECTION 2. Number and Term of Office. The number of directors which shall constitute the whole Board shall be fixed from time to time by the Board. Directors need not be stockholders or citizens or residents of the United States of America. Except as provided in Section 5 of this Article III, directors shall be elected at the annual meeting of the stockholders by a plurality of the votes of the shares present in person or represented by proxy at the meeting and entitled to vote in the election of directors. Each of the directors of the Corporation shall hold office until his or her successor shall be elected and shall qualify or until his or her earlier death or resignation or removal in the manner hereinafter provided.

SECTION 3. Resignations. Any director may resign at any time by giving written notice of his or her resignation to the Chairman of the Board, the President or the Secretary. Any such resignation shall take effect at the time specified therein or, if the time when it shall become effective shall not be specified therein, then it shall take effect when accepted by action of the Board. Except as aforesaid, the acceptance of such resignation shall not be necessary to make it effective.

SECTION 4. Removal of Directors. Any director or the entire Board may be removed, with or without cause, at any time upon the affirmative vote of holders of a majority of the shares then entitled to vote at an election of directors.

SECTION 5. Vacancies. Vacancies in the Board and newly created directorships resulting from any increase in the authorized number of directors may be filled by a majority of the directors then in office, although less than a quorum, or by a sole remaining director or by the stockholders of the Corporation at the next annual meeting or any special meeting called for the purpose. Each director so chosen shall hold office until his or her successor shall be elected and shall qualify or until his or her earlier death or resignation or removal in the manner as herein provided.

SECTION 6. Place of Meetings. The Board may hold its meetings at such place or places within or without the State of Delaware as the Board may from time to time determine or as shall be designated in the respective notices or waivers of notice thereof.

SECTION 7. Annual and Regular Meetings. The annual meeting of the Board for the purpose of electing officers and for the transaction of such other business as may come before the meeting shall be held as soon as possible following adjournment of the annual meeting of the stockholders at the place of such annual meeting of the stockholders. Notice of such annual meeting of the Board need not be given. The Board from time to time may by resolution provide for the holding of regular meetings and fix the place (which may be within or without the State of Delaware), date and time of such meetings. Notice of regular meetings need not be given; provided, however, that if the

Board shall fix or change the time or place of any regular meeting, notice of such action shall be mailed promptly, or sent by telephone, telegraph, facsimile, electronic mail or other electronic means to each director who shall not have been present at the meeting at which such action was taken, addressed to him or her at his or her usual place of business, or shall be delivered to him or her personally.

SECTION 8. Special Meetings. Special meetings of the Board shall be held whenever called by the Chairman of the Board, the President or at least two of the directors, at such place, date and time as may be specified in the respective notices or waivers of notice of such meetings. Special meetings of the Board may be called on at least twenty-four hours' notice to each director if notice is given to each director personally or by telephone, telegraph, facsimile, electronic mail or other electronic means, or on three days' notice from the official date of deposit in the mail if notice is sent by internationally recognized courier to each director, addressed to him or her at his or her usual place of business. Such notice need not state the purpose of, nor the business to be transacted at, that meeting, except as may otherwise be required by law. Notice need not be given to a director present at a meeting. A meeting may be held at any time without notice if all the directors are present or if those not present waive notice of the meeting in writing either before or after that meeting.

SECTION 9. Quorum and Manner of Acting. Except as provided by law, the Restated Certificate of Incorporation or these Bylaws, a majority of the total number of directors shall be present in person at any meeting of the Board in order to constitute a quorum for the transaction of business at such meeting, and the vote of a majority of

those directors present at any such meeting at which a quorum is present shall be necessary for the passage of any resolution or act of the Board. In the absence of a quorum for any such meeting, a majority of the directors present thereat may adjourn such meeting from time to time until a quorum shall be present thereat. Notice of any adjourned meeting need not be given.

SECTION 10. Organization. The Board shall elect a Chairman of the Board from among the directors. Meetings of the Board shall be presided over by the Chairman of the Board, or such other person as the Board may determine. The Secretary shall act as secretary of the meeting, and in his or her absence such other person as the person presiding over the meeting may appoint.

SECTION 11. Action by Written Consent. Any action required or permitted to be taken at any meeting of the Board or of any committee thereof may be taken without a meeting if all members of the Board or of such committee, as the case may be, consent thereto in writing, and such writing or writings are filed with the minutes of the proceedings of the Board or such committee.

SECTION 12. Meetings by Telephone, etc. Any one or more members of the Board, or any committee designated by the Board, may participate in a meeting of the Board, or such committee, by means of conference telephone or similar communications equipment by means of which all persons participating in the meeting can hear each other, and participation in a meeting pursuant to this Section shall constitute presence in person at such meeting.

SECTION 13. Compensation. Each director, in consideration of his or her serving as such, shall be entitled to receive from the Corporation such amount per annum or such fees for attendance at meetings of the Board or of any committee, or both, as the Board shall from time to time determine. The Board may likewise provide that the Corporation shall reimburse each director or member of a committee for any expenses incurred by him or her on account of his or her attendance at any such meeting. Nothing contained in this Section shall be construed to preclude any director from serving the Corporation in any other capacity and receiving compensation therefor.

ARTICLE IV

Committees

SECTION 1. Committees. The Board shall, by resolution passed by a majority of the directors, designate a compensation committee, a nominating and governance committee, an audit committee and, if so desired from time to time, other committees to serve at the pleasure of the Board. Each committee shall consist of two or more of the directors of the Corporation, which to the extent permitted by law and provided in such resolution or these Bylaws shall have and may exercise the powers of the Board in the management and affairs of the Corporation. Such committee(s) shall have such name(s) as may be determined from time to time by resolution adopted by the Board. Each committee shall keep regular minutes of its meetings and report the same to the Board when required. The Board may designate one or more directors as alternate members of any committee, who may replace any absent or disqualified member at any meeting of the committee. In the absence or disqualification of a member of the

committee, the member or members thereof present at any meeting and not disqualified from voting, whether or not he, she or they constitute a quorum, may unanimously appoint another member of the Board to act at the meeting in place of any such absent or disqualified member.

SECTION 2. Committee Rules. Each committee of the Board may fix its own rules of procedure and shall hold its meetings as provided by such rules, except as may otherwise be provided by the resolution of the Board designating such committee or the charter adopted by the Board for such committee. In the absence of such rules, each committee shall conduct its business in the same manner as the Board conducts its business pursuant to Article III of these Bylaws.

ARTICLE V

Officers

SECTION 1. Number. The principal officers of the Corporation shall be designated by the Board and shall consist of a President, such number of Vice Presidents as the Board may determine from time to time, a Treasurer, a Secretary and such number of Assistant Treasurers and Assistant Secretaries as the Board may determine from time to time. The Board may, in its discretion, create such offices and confer such titles as Chief Executive Officer, Chief Financial Officer or Chief Operating Officer and designate any Vice President by a number or numbers or a word or words (including, without limitation, the words "Executive" and "Senior") added before or after such title. The Board may appoint, and authorize the appointment of, such other officers of the Corporation as the Board deems necessary who shall have such authority and shall

perform such duties as these Bylaws or as the Board may prescribe. Any number of offices may be held by the same person, except that no person may simultaneously hold the offices of President and Secretary.

SECTION 2. Term of Office. Each officer shall hold office until his or her successor is duly elected and qualified or until his or her earlier death or resignation or removal in the manner hereinafter provided.

SECTION 3. Removal and Resignation. All officers and agents of the Corporation shall be subject to removal, with or without cause, at any time by the affirmative vote of a majority of the Board, or, except in the case of any officer elected by the Board, by any committee or superior officer upon whom such power may be conferred by the Board. Designation of an officer shall not itself create contract rights. Any officer may resign at any time by giving written notice of his or her resignation to the President or the Secretary, and such resignation shall take effect at the time specified therein or, if the time when it shall become effective shall not be specified therein, shall take effect when accepted by action of the Board. Except as aforesaid, the acceptance of such resignation shall not be necessary to make it effective.

SECTION 4. President. The President, subject to the direction of the Board, shall have such powers and perform such duties as pertain to the office of President and as the Board may from time to time prescribe, shall have the direction of all subordinate officers, agents and employees and may assign such duties to such other officers as he or she deems appropriate, and shall perform such other duties and exercise such other powers as may from time to time be prescribed by these Bylaws or the Board.

SECTION 5. Vice Presidents. Each Vice President shall have such powers and perform such duties as the Board or the President may from time to time prescribe and shall perform such other duties as may be prescribed by these Bylaws. At the request of the President, or in case of his or her absence or inability to act, any of the Vice Presidents shall perform the duties of the President and, when so acting, shall have all the powers of, and be subject to all the restrictions upon, the President.

SECTION 6. Treasurer. The Treasurer shall have charge and custody of, and be responsible for, all funds and securities of the Corporation, and shall deposit all such funds in the name of the Corporation in such banks, trust companies or other depositories as shall be selected in accordance with the provisions of these Bylaws. He or she shall disburse the funds of the Corporation as may be ordered by the Board, making proper vouchers for such disbursements, and shall render to the Board whenever required to do so, and shall present at the annual meeting of the stockholders, if called upon to do so, a statement of all his or her transactions as Treasurer. He or she shall have such powers and perform such duties as pertain to the office of Treasurer and shall perform such other duties as may from time to time be assigned to him or her by the Board.

SECTION 7. Secretary. The Secretary shall keep the records of the proceedings of all meetings of the stockholders and the Board or any committees thereof. He or she shall affix the seal of the Corporation to all deeds, contracts, bonds or other instruments requiring the corporate seal when the same shall have been signed on behalf of the Corporation by a duly authorized officer and shall be the custodian of all contracts,

deeds, documents and all other indicia of title to properties owned by the Corporation and of its other corporate records (except accounting records). He or she shall have such powers and perform such duties as pertain to the office of Secretary and shall perform such other duties as may from time to time be assigned to him or her by the Board.

SECTION 8. Other Officers, Assistant Officers and Agents. Officers, assistant officers and agents, if any, other than those whose duties are provided for in these Bylaws, shall have such authority and perform such duties as may from time to time be prescribed by resolution of the Board or by the person responsible for appointing such officers, assistant officers and agents, as the case may be.

SECTION 9. Execution of Contracts and Instruments. Notwithstanding the foregoing description of the duties and powers of corporate officers, the Board may from time to time limit or qualify such duties and powers by an instrument designated by the Board or pursuant to the Board's delegated authority as a corporate delegation of authority, and the duties and powers of the Corporation's officers shall be so limited. The Board may also from time to time specifically authorize one or more officers or agents of the Corporation to enter into such contracts, execute such instruments and take such other actions in the name of and on behalf of the Corporation for such specific purposes and in connection with such specific matters and transactions as the Board in its discretion may determine. Any instrument may be executed on behalf of and in the name of the Corporation: (a) by the Chairman of the Board, the President, the Chief Executive Officer (if any), the Chief Financial Officer (if any), the Chief Operating Officer (if any) or any Vice President, together with the Secretary, the Treasurer or any Assistant

Secretary, or any Assistant Treasurer, in each case, subject to any instrument that the Board or those authorized by it may designate as a "corporate delegation of authority", (b) by such officers specifically authorized to act by Board resolution for a specific purpose or (c) by any other person authorized to do so by, and subject to the limits stated in, the instrument that the Board or those authorized by it may designate as a "corporate delegation of authority", and such persons shall be deemed agents of the Corporation for such purposes. Except as otherwise designated or expressly authorized by these Bylaws, or an instrument properly designated as a "corporate delegation of authority" no officer, employee or agent shall have any power or authority to bind the Corporation by any contract or engagement or to pledge its credit or to render it liable pecuniarily for any purpose or to any amount.

SECTION 10. Security. The Board may require any officer, agent or employee of the Corporation to provide security for the faithful performance of his or her duties, in such amount and of such character as may be determined from time to time by the Board.

ARTICLE VI

Proxies, Checks, Drafts, Bank Accounts, Etc.

The President, or any other officer designated by the Board as having such authority, shall have authority from time to time to exercise in the name and on behalf of the Corporation the powers and rights which the Corporation may have as the holder of stock or other securities or interests in any other corporation or business entity and to vote or consent in respect of such stock, securities or interest; the President or such

designated officers may designate an agent or agents to perform such function and may instruct the person or persons so appointed as to the manner of exercising such powers and rights; and the President or such designated officers may execute or cause to be executed in the name and on behalf of the Corporation and under its corporate seal, or otherwise, such written proxies, powers of attorney or other instruments as they may deem necessary or proper in order that the Corporation may exercise its said powers and rights. All checks and drafts on the Corporation bank accounts and all bills of exchange and promissory notes, and all acceptances, obligations and other instruments for the payment of money, shall be signed by such officer or officers or agent or agents or other employee or employees as shall be thereunto authorized from time to time by the Board. Third parties shall be entitled to rely on the authority delegated by the Board or pursuant to its delegated authority in an instrument designated as a "corporate delegation of authority" as to all matters governed by this Article VI.

ARTICLE VII

Books and Records

The books and records of the Corporation may be kept at such places within or without the State of Delaware as the Board may from time to time determine.

ARTICLE VIII

Seal

The corporate seal shall have inscribed thereon the name of the Corporation and the words "Corporate Seal Delaware 1936." In lieu of the corporate

seal, when so authorized by the Board or a duly empowered committee thereof and permitted by law, a facsimile thereof may be impressed or affixed or reproduced.

ARTICLE IX

Fiscal Year

The fiscal year of the Corporation shall end on the 31st day of December in each year, unless changed by resolution of the Board.

ARTICLE X

Indemnification

SECTION 1. Right to Indemnification. The Corporation shall indemnify to the fullest extent authorized by the Delaware General Corporation Law, as the same exists or may hereafter be amended, each person who was or is a party or is threatened to be made a party to or is involved in any action, suit or proceeding, whether civil, criminal, administrative or investigative (a "Proceeding"), by reason of the fact that he or she is or was or had agreed to become a director or officer of the Corporation or an employee of the Corporation specifically designated by the Board as an indemnified employee, or is or was serving or had agreed to serve at the request of the Corporation as a director, officer, partner, member, trustee or agent, or such an employee, of another corporation, partnership, limited liability company, joint venture, trust or other enterprise (including the heirs, executor, administrators or estate of such person), whether the basis of such Proceeding is alleged action in an official capacity as a director, officer, partner, member, trustee, agent or employee, or in any other capacity while serving as a director,

officer, partner, member, trustee, agent or employee, against all expense, liability and loss (including attorneys' fees, judgments, fines, ERISA excise taxes, penalties and amounts paid or to be paid in settlement) reasonably incurred or suffered by such person in connection with such service; provided, however, that except as provided in Section 2 of this Article X the Corporation shall indemnify any such person seeking indemnification in connection with a Proceeding (or part thereof) initiated by such person only if such Proceeding was authorized by the Board, either generally or in the specific instance.

SECTION 2. Expenses. The right to indemnification shall include the advancement of expenses incurred by any person described in Section 1 of this Article X in defending any such Proceeding in advance of its final disposition in accordance with procedures established from time to time by the Board; provided, however, that the director, officer, partner, member, trustee, agent or employee shall deliver to the Corporation an undertaking to repay all amounts so advanced if it shall ultimately be determined by final judicial decision from which there is no further right to appeal that he or she is not entitled to be indemnified for such expenses under this Article X or otherwise, such undertaking to be in form and substance reasonably acceptable to the Corporation and which may further specify the conditions upon which indemnification for expenses is available given the facts and circumstances of such Proceeding.

SECTION 3. Continuation of Rights. The rights of indemnification provided in this Article X shall be in addition to any rights to which any person may otherwise be entitled by law or under any Bylaw, agreement, vote of stockholders or disinterested directors, or otherwise. Such rights shall continue as to any person who has

ceased to be a director, officer, partner, member, trustee, agent or employee and shall inure to the benefit of his or her heirs, executors and administrators, and shall be applicable to proceedings commenced after the adoption hereof, whether arising from acts or omissions occurring before or after the adoption hereof.

SECTION 4. Contract Rights. The obligations of the Corporation to indemnify a director, officer, partner, member, trustee, agent or employee under this Article X, including the duty to advance expenses, shall be considered a contract between the Corporation and such individual, and no modification or repeal of any provision of this Article X shall affect, to the detriment of the individual, such obligations of the Corporation in connection with a claim based on any act or failure to act occurring before such modification or repeal.

SECTION 5. Insurance and Funding. The Corporation may purchase and maintain insurance to protect any person against any liability or expense asserted against or incurred by such person in connection with any Proceeding, whether or not the Corporation would have the power to indemnify such person against such liability or expense by law or under this Article X or otherwise, provided that such insurance is available on acceptable terms, which determination shall be made by the Board. The Corporation may create a trust fund, grant a security interest or use other means (including, without limitation, a letter of credit) to insure the payment of such sums as may become necessary to effect indemnification as provided herein.

SECTION 6. Severability. If this Article X or any portion hereof shall be invalidated on any ground by any court of competent jurisdiction, then the Corporation

shall nevertheless indemnify and hold harmless each director and officer and any other person indemnified pursuant to this Article X as to all expense, liability and loss (including attorneys' fees, judgments, fines, ERISA excise taxes, penalties and amounts paid or to be paid in settlement) with respect to any Proceeding to the full extent permitted by any applicable portion of this Article X that shall not have been invalidated and to the fullest extent permitted by applicable law.

ARTICLE XI

Shares and Their Transfer

SECTION 1. Certificates for Shares. The shares of the Corporation shall be represented by certificates, or shall be uncertificated shares evidenced by a book-entry system, or a combination of both. Certificates shall be signed by, or in the name of the Corporation by, (i) the President or a Vice President and (ii) the Secretary or an Assistant Secretary, certifying the number and class of shares of the Corporation owned by the holder of such certificate. If such a certificate is countersigned (a) by a transfer agent or an assistant transfer agent other than the Corporation or its employee or (b) by a registrar other than the Corporation or its employee, the signature of any such President, Vice President, Secretary or Assistant Secretary may be a facsimile. In case any officer(s) who have signed, or whose facsimile signature(s) have been used on, any such certificate(s) shall cease to be such officer(s) of the Corporation, whether because of death, resignation or otherwise, before such certificate(s) have been delivered by the Corporation, such certificate(s) may nevertheless be issued and delivered as though the person or persons

who signed such certificate(s) or whose facsimile signature(s) have been used thereon had not ceased to be such officer(s) of the Corporation.

SECTION 2. Record. A record shall be kept of the name of the person, firm or corporation owning each share of stock of the Corporation, including, in the case of stock represented by each certificate for stock of the Corporation issued, the number of shares represented by each such certificate, and the date thereof, and, in the case of cancellation, the date of cancellation. Except as otherwise expressly required by law, the person in whose name shares of stock stand on the books of the Corporation shall be deemed the owner thereof for all purposes as regards the Corporation.

SECTION 3. Transfers of Stock. Transfers of stock shall be made only upon the transfer books of the Corporation kept at an office of the Corporation or by transfer agents designated to transfer shares of the stock of the Corporation. Except when a certificate is issued in accordance with Section 4 of this Article XI, in the case of stock represented by a certificate, an outstanding certificate for the number of shares involved shall be surrendered for cancellation before a new certificate is issued therefor.

SECTION 4. Lost, Destroyed or Mutilated Certificates. In the case of an alleged loss or destruction or the mutilation of a certificate representing stock of the Corporation, a new certificate may be issued in place thereof, in the manner and upon such terms as the Board may prescribe.

ARTICLE XII

General Provisions

SECTION 1. Section Headings. Section headings in these Bylaws are for convenience of reference only and shall not be given any substantive effect in limiting or otherwise construing any provision herein.

SECTION 2. Inconsistent Provisions. In the event that any provision of these Bylaws is or becomes inconsistent with any provision of the Corporation's Certificate of Incorporation, the General Corporation Law of the State of Delaware or any other applicable law, such provision of these Bylaws shall not be given any effect to the extent of such inconsistency but shall otherwise be given full force and effect.

ARTICLE XIII

Amendments

These Bylaws, or any of them, may be altered, amended or repealed by the Board, or by the stockholders of the Corporation as provided in the Corporation's Restated Certificate of Incorporation.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Michael Miller/Others

PART III: QUESTIONS & REQUESTS REGARDING COST OF CAPITAL & MISCELLANEOUS

Question:

4. In the Registration statement filed with the Securities and Exchange Commission ("SEC") on May 6, 2008, American Water Works made this statement: "In order to obtain the state PUC approvals to consummate the proposed RWE Divestiture we were required to accept certain conditions and restrictions that could increase our costs."

   a. Identify those costs, provide the amounts of each cost, and identify the "State PUC(s)" which imposed the costs.

Response:

The Company objects to this request on the grounds that it is overbroad, unduly burdensome, seeks information not readily available to TAWC, and seeks information that is not relevant to this proceeding.

Subject to and without waiving its objections, the Company states that public information about AWK can be found at the following web sites: www.sec.gov and www.amwater.com. AWW filed petitions in 13 states seeking approval for the change of control. Those states are: Arizona, New Mexico, California, Illinois, Pennsylvania, West Virginia, Kentucky, Tennessee, Virginia, Maryland, New Jersey, and New York. The orders issued regarding those petitions can be found on the Commission (including the TRA) websites.

There has been no tabulation or quantifications of any additional costs related to those conditions. Mr. Miller was a witness in both the West Virginia and Kentucky Change of Control proceedings. Below are examples of conditions in those two states that could result in increased costs.

1. WV – Pages 9-11 of the Commission Order addresses the conditions relating to the approval of the Petition.
2. WV - Conditions, B, H, M, S, W, and X impose reporting requirements that would not be required except for those conditions.
3. KY – Pages 19-29 of the Commission Order addresses the conditions relating to the approval of the Petition, those conditions are also listed in detail in Appendix A attached to the Order.
4. KY – Conditions 4, 10, 12, 14, 17, 20, 21, 22, 24, 26, and 38, impose reporting requirements that would not be required except for those conditions.

DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Michael Miller/Others

PART III: QUESTIONS & REQUESTS REGARDING COST OF CAPITAL & MISCELLANEOUS

Question:

5. In the Registration statement filed with the SEC on May 6, 2008, American Water Works made this statement:

   The RWE acquisition resulted in certain changes in our business. For example, our operations and management were managed through Thames Water. Also, we agreed not to file rate cases with some state PUCs for specified periods of time as a condition of the acquisition. As of December 31, 2007, all rate stay-out provisions associated with the RWE acquisition had expired.

   a. Identify those states where there were stay-out provisions, identify the terms and conditions of those provisions and provide copies of orders , decisions or other material to substantiate your reply.

Response:

The Company objects to this request on the grounds that it is overbroad, unduly burdensome, seeks information not readily available to TAWC, and seeks information that is not relevant to this proceeding.

Subject to and without waiving its objections, the Company states that public information about AWK can be found at the following web sites: www.sec.gov and www.amwater.com. In 2006, AWW filed petitions in 13 states seeking approval for the change of control. Those states are: Arizona, New Mexico,

California, Illinois, Pennsylvania, West Virginia, Kentucky, Tennessee, Virginia, Maryland, New Jersey, and New York. The orders issued regarding those petitions can be found on the Commission (including TRA) websites. In the 2006 Change of Control Proceedings, there were no rate case filing moratoriums (stay-outs) included in the Orders approving the Petitions.

In neither the 2002 nor 2006 Change of Control Proceedings regarding TAWC, were any rate filing moratorium conditions proposed by any party or approved by the TRA.

In the 2002 Change of Control proceedings, there were rate filing moratoriums (stay-outs) as part of the conditions attached to the Commission's approval of those petitions in Arizona, Kentucky, West Virginia, California, Maryland, New Jersey, and New York. The Commission (TRA) orders approving the 2002 Change of Control proceedings can be found at the Commission (TRA) websites referenced earlier in this response.

DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Michael Miller/Others

PART III: QUESTIONS & REQUESTS REGARDING COST OF CAPITAL & MISCELLANEOUS

Question:

6. If American Water Works' current amount of equity is subject to any claims or liability via capital assigned to AWW from RWE or its subsidiaries and where such capital may be withdrawn from AWW by RWE, its subsidiaries or assignees, identify by class of equity and amount any such claims, including common equity and all other equity classes, such as assigns or other items of value.

Response:

The Company objects to this request on the grounds that it does not make sense, is vague and ambiguous, overbroad, unduly burdensome, seeks information not readily available to TAWC, and seeks information that is not relevant to this proceeding.

Subject to and without waiving the foregoing objections, the Company provides the following response. Based upon the Company's interpretation of this request, the answer is none.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Michael Miller/Others

PART III: QUESTIONS & REQUESTS REGARDING COST OF CAPITAL & MISCELLANEOUS

Question:

7. In its S-1 Registration statement filed May 6 with the SEC, American Water Works stated: "RWE intends to fully divest its ownership of American Water through the consummation of one or more public offerings of common stock of American Water as soon as reasonably practicable, subject to market conditions." Provide any study, document, emails and all written material where RWE or RWE Aqua Holdings GmbH consider what circumstances financial, and otherwise, constitute conditions that "are reasonably practicable, subject to market conditions" for the public offerings of common stock.

Response:

The Company objects to this request on the grounds that it is overbroad, unduly burdensome, and seeks information that is not relevant to this proceeding, seeks information that may be subject to attorney/client privilege and work product, and seeks information that is highly confidential. Furthermore, this request seeks information that is not in the possession, custody or control of the TAWC.

Subject to and without waiving its objections, the Company states that public information about AWK can be found at the following web sites: www.sec.gov and www.amwater.com (investor relations).

PART III: QUESTIONS & REQUESTS REGARDING COST OF CAPITAL & MISCELLANEOUS

Question:

8. Provide any study, document, emails and all written material where RWE, RWE Aqua Holdings GmbH, or American Water Works has performed or caused to be performed a study of American Water Works' expected market value between now and 2010.

Response:

The Company objects to this request on the grounds that it is unduly burdensome, seeks information that is irrelevant to this proceeding now that TAWC's parent company's (AWK) initial public offering has closed, and seeks information that is not in the possession, custody or control of the TAWC. Furthermore, the Company objects to this request to the extent it seeks Highly Confidential Information. The Company objects to the production of highly confidential data without the entry of a protective order that includes heightened protections sufficient to protect highly confidential information from public disclosure. Subject to and without waiving these objections, please see the public information about AWK which can be found at the following web sites: www.sec.gov and amwater.com (investor relations). Please see the response to TN-COC-01-Q2 for the public road show information.

PART III: QUESTIONS & REQUESTS REGARDING COST OF CAPITAL & MISCELLANEOUS

Question:

9. Provide any study, document, emails and all written material where RWE, RWE Aqua Holdings GmbH, or American Water Works has performed or caused to be performed a study where a second class of stock is, has, would be or will be issued for American Water Works.

Response:

The Company objects to this request on the grounds that it is overbroad, unduly burdensome, seeks information that is not relevant to this proceeding, seeks information that is not in the possession, custody or control of TAWC, seeks information that may be subject to the attorney/client privilege and work product doctrine, and seeks information that is highly confidential in nature.

Subject to and without waiving its objections, the Company states that public information about AWK can be found at the following web sites: www.sec.gov and www.amwater.com (investor relations).

Please refer to the response to TN-CAPD-01-part III-Q3(f), to which is attached the By-laws of AWW, which addresses types of securities authorized for AWW.

PART III: QUESTIONS & REQUESTS REGARDING COST OF CAPITAL & MISCELLANEOUS

Question:

10. Provide any study, document, emails and all written material where RWE, RWE Aqua Holdings GmbH, or American Water Works has performed or caused to be performed a study of the dividends which American Water Works should, will or consider paying to its stockholders.

Response:

The Company objects to this request on the grounds that it is overbroad, unduly burdensome, seeks information that is not within the possession, custody or control of TAWC, seeks information that is not relevant to this proceeding, including information subject to the attorney/client privilege and work product doctrine, and containing highly confidential information.

Subject to and without waiving its objections, the Company states that public information about AWK can be found at the following web site: www.sec.gov. The Prospectus includes extensive discussion about AWW's dividend policy on page 27, and in the Management Discussion section beginning on page 63.

DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Michael Miller/Sheila Miller

PART IV: QUESTIONS & REQUESTS REGARDING REVENUES, EXPENSES, TAXES, RATE BASE & MISCELLANEOUS

Question:

1. Provide the "billing determinates" (billing determinates include all information needed to compute, but not confined to customer meters, customer volumes by rate class by location) as shown on Exhibit No. 4 Schedule 2 for the 12 months ended March 31, 2008. Provide all work papers, documentation, i.e. billing determinants, by customer class, by location supporting any normalization adjustments for the period.

Response:

The Company objects to this request on the grounds that it is unduly burdensome, in particular because the information requested is not readily available in the requested format and is very costly to gather and produce. The Company also objects to this request on the grounds that it detracts from the Company's ability to address and support its historical test-year data and the adjustments developed to arrive at a reasonable attrition year and is not required by the TRA's recognized rate case procedures.

The Company filed its petition, testimony, exhibits and workpapers fully supporting its case based on a test year ending November 30, 2007 all in compliance with TRA rules. Test year data and schedules were prepared specifically for the historical test year utilized in the Company's filing. This request seeks the compilation of data for the 12 months ended March 31, 2008,

a test year that the CAPD has stated it intends to propose. It is burdensome and fundamentally unfair to require the Company to respond to a data request that, in essence, requires the Company to completely redo the data collection and analysis required to file its petition based on a test year, or multiple test years, proposed by an Intervenor, particularly when that test year includes dates after the petition was filed. The re-creation of every aspect of its case for multiple historical test years is not required by TRA rules and is not necessary for the CAPD to assess the Company's petition.

With respect to this specific request, the Company objects on the basis specified above to the CAPD's request that the Company generate data for a new test year by creating an entire bill analysis, including normalization adjustments, for the twelve months ended March 31, 2008.

To compile the information set forth in Exhibit No. 4 Schedule 2, the Company requests from the IT group a bill analysis report for the historical test year, in this case the twelve months ended November 2007. The Company then must perform extensive analysis and calculations to tie the results of that bill analysis to the per books revenue numbers. This is an extremely time consuming and costly process.

Notwithstanding these objections, the monthly raw data of billing determinates for January-December 2007 were provided in response to TN-TRA-01-Q020. Please see the raw data monthly billing determinates for January-March 2008 included on the enclosed CD in a folder labeled as TN-CAPD-01-Part IV-Q001. Please note that Dr. Spitznagel's weather normalizations are specific to the twelve month ended November 2007. No weather normalization factors exist for the 12 months ended March 2008 or February 2008.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Michael Miller/Sheila Miller

PART IV: QUESTIONS & REQUESTS REGARDING REVENUES, EXPENSES, TAXES, RATE BASE & MISCELLANEOUS

Question:

2. Provide the billing determinates by customer class, by location for all normalization adjustments, corrections, and allowances for the **test year ended February 2008**. Include in your response the business reasons for each normalization adjustment, correction, and allowance.

Response:

In response to this question, the Company incorporates as if fully set forth here, its objections and response to Part IV, Question 1, except to the extent that this question refers to the twelve month period ended February 2008.

Notwithstanding the objections, please refer to the referenced raw data of billing determinates provided in the response to TN-CAPD-01-PART IV-Q001.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Michael Miller/Sheila Miller

PART IV: QUESTIONS & REQUESTS REGARDING REVENUES, EXPENSES, TAXES, RATE BASE & MISCELLANEOUS

Question:

3. Provide the number of meters by meter type, by customer class, by location and the volume usage by usage rate schedule, by customer class, by location for the years ended December 31, 2003-2007 and the twelve months ended March 31, 2008.

Response:

The Company objects to this question in part on the grounds that the requested information is not relevant or timely to this proceeding, is unduly burdensome, overbroad, and is not readily available in the format requested. Notwithstanding this objection, the Company provided this information for the last three fiscal years, 2005 – 2007 in response to TRA DR 1 Question 20. The information for 2003 – 2006 was provided to the CAPD in the last TAWC rate case filing, Docket No. 06-00290, TRA DR 1 Question 20. If the CAPD did not retain that information, it is publicly available on the official TRA file. Please see the response to TN-CAPD-01-Part IV-Q001 for reference to the raw data for January-March 2008.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: Sheila Miller

PART IV: QUESTIONS & REQUESTS REGARDING REVENUES, EXPENSES, TAXES, RATE BASE & MISCELLANEOUS

Question:

4. Provide a "mapping" (mapping means to reconcile or trace the data on the exhibits to its source or supporting calculations in the work papers) of each revenue adjustment of TN-TRA-Q013-REVENUES, on page 17 of 99 to the Company's Exhibit No. 4, Schedules 1 and 2 by customer class, by location, by test period, and by attrition year at present rates.

Response:

Please see the response to TRA DR 2 Question 2.

TENNESSEE AMERICAN WATER COMPANY
DOCKET NO. 08-00039
FIRST DISCOVERY REQUEST OF THE
CONSUMER ADVOCATE AND PROTECTION DIVISION

Responsible Witness: John Watson

PART IV: QUESTIONS & REQUESTS REGARDING REVENUES, EXPENSES, TAXES, RATE BASE & MISCELLANEOUS

Question:

5. Provide the name, the business address, the date on which service began and if applicable, the date on which the service was terminated, the billing determinates for each industrial customer for the years ended December 31, 2003-2007 by year and the twelve months ended March 31, 2008.

Response:

There are two files containing the information requested. The listing of industrial customers for the years ended December 31, 2003-2007 and from January-March 2008 detailing the usage, revenues, and business address is included on the enclosed CD and labeled as CAPD DR 1 Part 4 Question 5 attachment 1.xls. The second file details the service date and meter information and is included on the enclosed CD and labeled as CAPD DR 1 Part 4 Question 5 attachment 1.xls.
