National Grid's net plant balance as of October 1, 2016 (proximate to the date of this Order) is calculated at $2,307,263,848 (Exh. NG-RRP-2, at 30 (Rev. 3)). Application of the depreciation accrual rates approved in this Order to the respective plant investment account balances produces a depreciation expense of $125,244,314 (see Exh. NG-RRP-2, at 27 (Rev. 3); Section VIII.E.5.e above). Accordingly, we find that the remaining life of the Company's plant is 18.4 years.[175] The Department will calculate a five-year amortization period for the 15 percent of non-plant-related accumulated deferred income taxes, and an 18.4-year amortization period to the 85 percent of plant-related accumulated deferred income taxes, resulting in a total annual amortization period of 16.39 years.[176] Thus, the Department finds that the appropriate amortization period for the Company's ASC 740 regulatory asset is 16 years. Based on the foregoing, the Department approves the Company's recovery of its regulatory asset of $11,907,760 over a period of 16 years. Application of this amortization period to the approved balance produces an annual amortization of $744,235.

Regarding the Company's excess deferred income taxes resulting from MECO's balance sheet true-up, the Department has examined the Company's calculations (Exh. AG-2-36, Att. 2). Based on this review, we find that the Company has properly calculated the excess deferred taxes of $14,111,602. The Department also finds that five years represents a reasonable amortization period applicable to the deferred tax balance sheet true-up. Application of this amortization period to the approved balance produces an annual amortization of negative $2,822,320.

---

175 The $2,307,263,848 net plant balance divided by a depreciation expense of $125,244,314 results in a remaining life equal to 18.4 years.

176 (18.4 years x 0.85) + (5.0 years x 0.15) = 16.39 years.

The net effect of these two amortizations is a net unfunded deferred tax liability of negative $2,078,085. National Grid has included an amortization amount of negative $440,768 in its income tax calculation (Exh. NG-RRP-2, at 31 (Rev. 3)). Accordingly, the Department will reduce National Grid's proposed income tax adjustment by $1,637,317. The effect of this adjustment on the Company's income tax expense is presented in Schedule 8 of this Order.

L. FAS 112 Expense

1. Introduction

FAS 112[177] establishes standards of financial accounting and reporting for the estimated cost of benefits provided by an employer to former or inactive employees after employment but before retirement ("postemployment benefits") (see Exhs. NG-RRP-Rebuttal-1, at 31; DPU-30-3; FAS 112: Employers' Accounting for Postemployment Benefits, an amendment of FASB Statements No. 5 and 43, at 4, found at: http://www.fasb.org/jsp/FASB/Document_C/DocumentPage?cid=1218220123881&acceptedDisclaimer=true ("FAS 112")). Postemployment benefits are all types of benefits provided to former or inactive employees, their beneficiaries, and covered dependents (FAS 112, at 4-5).[178] This group includes employees who have been laid off and those on disability leave, regardless of whether they are expected to return to active status (FAS 112, at 5). National Grid states that

---

177 In 2009, as part of a general recodification of the Financial Accounting Standards Board's accounting rulings, FAS 112 became part of ASC 712 (see Exh. NG-RRP-Rebuttal-1, at 31).

178 More specifically, postemployment benefits include, but are not limited to, salary continuation, supplemental unemployment benefits, severance benefits, disability-related benefits (including workers' compensation), job training and counseling, and continuation of benefits such as health care benefits and life insurance coverage (FAS 112, at 5).

because these expenses are volatile and impacted by the actuarial assumptions used to arrive at the annual expense accrual, the Company normalizes the costs based on an historical average level (Exh. NG-RRP-1, at 22).

During the test year, National Grid booked a negative $2,258,474 in FAS 112 expense (Exh. NG-RRP-2, at 14).[179] However, the Company books annual FAS 112 expenses based on a five-year average expense (Exhs. NG-RRP-1, at 22; NG-RRP-2, at 14; NG-RRP-Rebuttal-1, at 31). In its initial filing, National Grid reported that the most recent five-year average expense charged to O&M was $495,065, which comprised the period commencing with the Company's fiscal year ended March 31, 2011 through its fiscal year ended March 31, 2015 (Exhs. NG-RRP-1, at 22; NG-RRP-2, at 14; NG-RRP-Rebuttal-1, at 31). As such, the Company proposed a normalizing adjustment of $2,753,539 (Exh. NG-RRP-2, at 14). As discussed further below, in response to issues raised by the Attorney General, the Company revised its five-year average FAS 112 expense to $78,733 (Exhs. NG-RRP-2, at 14 (Rev. 3); WP-NG-RRP-7 (Rev. 1)). This revised total represents a reduction of $416,331 from the $495,065 five-year average FAS 112 expense charged to O&M in the initial filing (Exh. NG-RRP-2, at 14 (Rev. 3)). Because its test year FAS 112 expense was a negative $2,258,474, the Company now proposes a revised normalization adjustment of $2,337,208 (Exh. NG-RRP-2, at 14 (Rev. 3)).

---

179 The Company attributes the negative FAS 112 expense to significant gains realized as a result of an increase in the discount rate, favorable claims experience, and a reduction in long-term disability income replacement claimants (Exh. DPU-30-6).

2. Positions of the Parties

a. Attorney General

The Attorney General argues that the Company should revise its FAS 112 expense in two ways: (1) update the average expense to include fiscal year 2016 expense; and (2) use a four-year expense average instead of a five-year average (Attorney General Brief at 36-38). Regarding the first revision, the Attorney General notes that including fiscal year 2016 expense in the FAS 112 calculation would capture a portion of the Company's test year expense (Attorney General Brief at 36). She points out that the Company agrees to this revision (Attorney General Brief at 36).

Regarding the second revision, the Attorney General argues that it is appropriate to exclude from the FAS 112 calculation the expense associated with fiscal year ended 2012 because the Company's external actuarial firm revised the method used in determining the FAS 112 expense beginning with the fiscal year ended March 2013 (Attorney General Brief at 37, citing Exhs. NG-RRP-7, at 12, 51; AG-DR-1, at 19). The Attorney General contends that the use of fiscal years prior to the change in methodology would produce results that are inconsistent with the current method used by the actuarial firm (Attorney General Brief at 37). Thus, she asserts that the normalized FAS 112 expense should be based on the most recent four-years of actuarially determined expense levels instead of a five-year average in order to exclude the effects of the prior method and allow for a more consistent comparison of expense levels (Attorney General Brief at 37-38, citing Exh. AG-DR-Rebuttal at 10).

According to the Attorney General, normalizing the FAS 112 expense based on the most recent four years of actuarial evaluations results in a FAS 112 expense of a negative $427,748

(Attorney General Brief at 38, citing Exhs. AG-DR-1, at 20: AG-DR-2, Sch. 5). The Attorney General asserts that, while this approach would result in a negative amount of FAS 112 expense in rates, the expense is representative of the Company's recent experience (Attorney General Brief at 38).

b. Company

The Company agrees that its FAS 112 expense should be revised to include the most recent financial information associated with fiscal year 2016 (Company Brief at 46, citing Exhs. NG-RRP-Rebuttal-1, at 32; NG-RRP-Rebuttal-5). However, the Company disagrees with the Attorney General's recommendation to exclude fiscal year 2012 FAS 112 expense data and to normalize the FAS 112 expense based on the most recent four years of actuarially determined expense levels (Company Brief at 46-49). In particular, the Company contends that the Attorney General misunderstands the impact of the change in method used to calculate the FAS 112 (Company Brief at 47-48). The Company notes that the changes in the method used to calculate FAS 112 expense only have the effect of increasing FAS 112 costs, and maintains that had these changes been incorporated in the fiscal year 2012 valuations, then the cost for that year could only be higher (Company Brief at 47-48, citing Exh. NG-RRP-Rebuttal-1, at 33). Further, according to the Company, adopting the Attorney General's recommendation would result in the inclusion of a negative FAS 112 expense in rates, and thus inappropriately would presume that the Company is earning revenues from its FAS 112 obligations that get passed back to customers (Company Brief at 49). The Company argues that, while FAS 112 expense can be negative from time to time, it is normally a positive expense (Company Brief at 49).

Instead, the Company maintains that the FAS 112 expense should be based on the most recent five years of actuarial data for fiscal years 2012 through 2016, which would result in a five-year average FAS 112 expense of $78,733 (Company Brief at 46, citing Exh. WP-NG-RRP-7 (Rev. 1)). The Company notes that this revised total represents a reduction of $416,331 from the $495,065 five-year average FAS 112 expense charged to O&M in the initial filing (Company Brief at 46, citing Exhs. NG-RRP-7 (Rev. 1); NG-RRP-2, at 14 (Rev. 2)). The Company asserts that because its test year FAS 112 expense was a negative $2,258,474, a revised normalization adjustment of $2,337,208 is appropriate (Company Brief at 46).

3. Analysis and Findings

The Company's FAS 112 expenses are volatile in nature, as they are affected by the actuarial assumptions employed to arrive at the annual expense level (Exhs. NG-RRP-1, at 22; DPU-30-5). These assumptions include the discount rate, mortality, termination rates, disablement rates for active employees, cost of medical coverage, and health care cost trend rates (Exh. DPU-30-4). Consequently, it is reasonable to normalize FAS 112 costs based on an historical average level. See, e.g., D.P.U. 09-39, at 146-149.

In evaluating the Company's proposed adjustment to its FAS 112 expense, we find that it is appropriate for the Company to include in the calculation actuarial data from the most recent fiscal year (i.e., 2016). Further, we are not persuaded by the Attorney General's arguments that it is necessary to revert to a four-year average expense by excluding fiscal year 2012. The Attorney General focuses on the following changes in the method used by the Company's external actuarial firm in determining the FAS 112 expense:

> A change in the accrual method for those groups with benefits that accumulate over a given period (i.e., those with benefits that vary based on a specific age/service criteria). Previously, liabilities for future disableds beyond the current fiscal year were not considered in the valuation for these groups. Our valuation now includes a liability for the expected future disableds for benefits that accumulate over the specific age/service period.
>
> A discount rate assumption that is specific to the shorter duration of the [FAS 112] obligations rather than using the same discount rate used for the company's pension and postretirement medical/life insurance plans.

(Exh. NG-RRP-7, at 12).

While we acknowledge the Attorney General's concerns regarding the change in the way FAS 112 expenses are calculated, we find that the change in accounting for future disabled employees and the use of a lower discount rate would generate a higher liability, and consequently result in higher FAS 112 costs (Exh. NG-RRP-Rebuttal-1, at 33-34). Thus, the exclusion of fiscal year 2012 FAS 112 expenses would skew the overall calculation and produce an average expense that is not representative of the Company's actual FAS 112-related activity.

We conclude that the Company's FAS 112 expense should be calculated based on a five-year average, taking into account fiscal year 2012 through fiscal year 2016. The five-year average expense charged to O&M during this period was $78,733 (Exhs. NG-RRP-2, at 14 (Rev. 3); WP-NG-RRP-7, at 1 (Rev. 1)). As noted above, the Company's test year FAS 112 expense was a negative $2,258,474 (Exh. NG-RRP-2, at 14 (Rev. 3)). Accordingly, we accept the Company's revised normalization adjustment of $2,337,208.

M. Corporate Aircraft Expense

1. Introduction

NGSC provides aviation operations support to its affiliates through its ownership of a 1999 Beechcraft Model 1900D aircraft ("airplane") (Exhs. AG-1-54; AG-1-92, Att. 1, at 15).[180] The Company is allocated a portion of the total expenses associated with the airplane, based on a general allocator consisting of equally weighted ratios of net plant, net margin, and net O&M expenses (Exh. AG-22-10, Att.).[181] During the test year, National Grid was allocated $254,348 in O&M expenses relative to the airplane and its hangar facility located in Syracuse, New York, $82,079 in depreciation expense for the airplane,[182] and $51,060 in airport property taxes, for a total expense of $387,487 (Exhs. AG-22-10; AG-25-19, Att.; AG-25-20, Att.). The Company proposes to decrease its test year cost of service by $7,138 to reconcile the difference between the booked depreciation expense of $82,079, and the calculated depreciation expense of $74,941, based on the allocation factors in use during the test year (Exhs. NG-RRP-2, at 5 (Rev. 3); AG-1-29, Att. at 1; AG-22-10; AG-25-20).

---

180 NGSC also owns a 1985 Bell 206L-3 helicopter and a 2014 Bell 429 helicopter (Exh. AG-1-54). Because these helicopters are used exclusively in support of National Grid USA's non-Massachusetts jurisdictional companies, the Company is not allocated any of their associated costs (Exh. AG-25-20).

181 MECo and Nantucket Electric were allocated a combined 18.37 percent of the total airplane-related expenses during the last half of 2014, and a combined 19.04 percent during the first half of 2015 (Exh. AG-22-10, Att.).

182 The Company records depreciation on assets held by the service company as rent expense (Exhs. AG-1-29, Att.; AG-1-92; AG-25-20).

2. Positions of the Parties

a. Attorney General

The Attorney General argues that the Company has failed to justify either the need for or the expenses associated with its airplane (Attorney General Brief at 60). She notes that the Department has previously excluded from a utility's cost of service expenses associated with aircraft and other vehicles that were found to be unreasonable (Attorney General Brief at 60, citing D.P.U. 13-75, at 225-226; Fall River Gas Company, D.P.U. 750, at 15 (1982); D.P.U. 18571/18572, at 12-13). The Attorney General recommends that the Department eliminate all test year costs relative to the airplane, and reduce the Company's test year cost of service by $387,486 (Attorney General Brief at 60).[183]

b. Company

National Grid defends its inclusion of airplane-related expenses in its proposed cost of service.[184] The Company notes that National Grid USA has operating companies in Massachusetts, New York, and Rhode Island, as well as a centralized service company providing services to these operating companies (Company Brief at 67-68). In this regard, National Grid maintains that employees providing service to multiple companies must travel to the various states for work-related reasons,[185] and that such out-of-state travel that directly or indirectly

---

183 The difference between the Attorney General's proposed reduction and National Grid's test year expense is due to rounding.

184 The Company emphasizes that costs related to the two helicopters have been excluded from the proposed revenue requirement (Company Brief at 67, citing Exhs. AG-1-54; AG-22-10).

185 For example, the Company notes that three of its witnesses in this proceeding are New York-based NGSC employees who had to travel to Massachusetts in order to perform

affects Company operations is undertaken for the benefit of ratepayers and, therefore, is a reasonable expense (Company Brief at 67-68, citing D.P.U. 13-75, at 225).

Further, the Company contends that the Department has recognized that the use of corporate aircraft provides a cost-effective means of traveling for entities that have operating companies in multiple jurisdictions, and that it is reasonable and appropriate to allocate some aircraft expenses to an operating company (Company Brief at 68, citing D.P.U. 13-75, at 225 (2014); D.P.U. 12-25, at 263; D.T.E. 05-27, at 232).[186] Consequently, National Grid concludes that the Department should reject the Attorney General's recommendation and include the full amount of the airplane costs in the Company's cost of service (Company Brief at 68).

3. Analysis and Findings

The Department recognizes that out-of-state travel for business meetings that directly or indirectly affect a utility's operations can be considered to have been made for the benefit of the Company's customers, and thus reasonable expenses associated with such travel are allowable for ratemaking purposes. D.P.U. 13-75, at 225; D.P.U. 12-25, at 263; D.T.E. 05-27, at 233; D.P.U. 92-111, at 154. Further, the Department has found that the use of lease and charter jets provide a cost-effective means of travelling throughout a utility's multi-state operating territory. D.P.U. 13-75, at 225; D.P.U. 12-25, at 263; D.T.E. 05-27, at 232. However, the Department has

---

their duties relative to this proceeding (Company Brief at 68, citing Exhs. NG-MPH-1, at 1; NG-DJD-Rebuttal-1, at 1).

186 National Grid analogizes the allocation to the Company of certain aircraft expenses to the allocation of a portion of NiSource Corporate Service Company's airplane costs to Bay State Gas Company which were previously reviewed and approved by the Department in D.P.U. 13-75, at 225; D.P.U. 12-25, at 263; and D.T.E. 05-27, at 232 (Company Brief at 68).

excluded from cost of service vehicles and vehicle-related expenses when use of those vehicles was found to be unreasonable. D.P.U. 750, at 15; D.P.U. 18571/18572, at 12-13.

In the instant case, National Grid shares in the costs associated with the airplane, which is used by employees conducting Company-related business (Exh. AG-1-54). Therefore, it is reasonable to allocate some of the airplane expenses to the Company.

The Department has examined both the airplane-related billings and the allocation formulas used to allocate airplane costs to the Company (Exhs. AG-1-92; AG-22-10; AG-25-20). Although other ways could be devised to allocate the airplane costs among National Grid USA's affiliates, the existence of other possible allocation outcomes does not render the Company's allocation method invalid. D.T.E. 03-40, at 204; Commonwealth Electric Company, D.P.U. 88-135/151, at 83 (1989). Based on our review, the Department finds that the method used to allocate the airplane expenses to National Grid is reasonable, is provided at cost, and produces both cost-effective and nondiscriminatory results for the use of the airplane by the Company.

N. NGSC Allocations

1. Introduction

NGSC provides services to National Grid in thirteen functional areas: audit, corporate affairs, customer, finance, human resources, information systems, legal, network strategy, operations, procurement, regulation and pricing, shared services, and strategy, business development and technology (Exh. DPU-25-18, Att.).[187] The Company incurs expenses from

[187] Some employees that provide services to National Grid affiliates are categorized as "other affiliate employees," but these employees provide services to National Grid affiliates akin to service company employees (Exh. DPU-28-7). For example, employees

NGSC in two ways: (1) through direct charges, which are billed to National Grid for costs incurred by NGSC employees directly related to the Company; and (2) through common costs, which are allocated among the affiliates that receive the services provided by NGSC, based on allocation factors and billing pools (Exh. NG-RRP-1, at 12). National Grid included in the test year NGSC charges in their respective expense categories included in the cost of service (e.g., salary and wages) (Exhs. NG-RRP-1, at 12; NG-RRP-2, at 6, 9 (Rev. 3)). Additionally, the Company included NGSC charges in the normalizing or known and measurable adjustments to the cost of service in their respective expense categories (e.g., the proposed adjustment of $3,456,591 to salary and wage expense for service company employees is included in the total proposed $8,966,172 adjustment to salary and wage expense) (Exhs. NG-RRP-1, at 12; NG-RRP-2, at 6, 9 (Rev. 3)). In the test year, the Company incurred $201,513,353 of O&M expenses originating from NGSC (Exh. DPU-4-4, Att.). National Grid proposes $15,437,187 in pro forma adjustments to NGSC-related test year expenses (Exh. DPU-4-7).

2. Positions of the Parties

a. Attorney General

The Attorney General argues that there is little management accountability regarding service company costs, including control of the costs, and the effect of those costs on customers

---

in National Grid's US Services Delivery Center ("SDC"), which supports human resources, procurement, customer, and finance processes, are employees of Niagara Mohawk Power Corporation ("Niagara Mohawk"), but allocate their time to other National Grid affiliates, including the Company, based on services the SDC employees provide to the various affiliates (Exh. DPU-28-7; RR-DPU-3). The SDC employees are primarily unionized workers, and their collective bargaining agreement is between their union and Niagara Mohawk (RR-DPU-3). Therefore, although these employees are not categorized as service company employees, their work time and associated costs are allocated in a similar manner as service company employees (Exhs. DPU-12-12; DPU-28-7; RR-DPU-3).

(Attorney General Brief at 2, citing RR-AG-1, Att.). According to the Attorney General's calculations, NGSC charges to the Company grew 71.26 percent, or 9.38 percent per year on average, from 2008 to 2014 (Attorney General Brief at 2, citing Exh. AG-KC-1, at 4). The Attorney General contends that this growth in costs is greater than the rate of inflation and the average growth rate of the median household income in Massachusetts over the same period (Attorney General Brief at 2, citing Exh. AG-KC-1, at 4-5). Further, the Attorney General claims that the increasing service company costs partially explain the increase in the Company's proposed cost of service (Attorney General Brief at 2). As a result, the Attorney General asserts that the Department should limit the costs allowed to be recovered from customers in this case[188] (Attorney General Brief at 3).

b. Company

National Grid argues that the NGSC charges are reasonable and properly allocated to the Company (Company Brief at 91). Therefore, National Grid recommends that the Department approve the NGSC charges included in the Company's cost of service (Company Brief at 91-92).

3. Analysis and Findings

a. Introduction

The Department permits rate recovery of payments to affiliates where these payments are: (1) for services that specifically benefit the regulated utility and that do not duplicate services already provided by the utility; (2) made at a competitive and reasonable price; and

---

188 The Attorney General suggests that one solution is modifying National Grid's rate recovery mechanisms to incentivize the Company to minimize costs (Attorney General Brief at 3). The Attorney General claims that the Company's current reconciling rate mechanisms provide a perverse incentive for the Company to earn more as spending increases (Attorney General Brief at 3). The Department addresses National Grid's rate recovery mechanisms in Sections V and VI.

(3) allocated to the utility by a method that is both cost-effective in application and nondiscriminatory for those services specifically rendered to the utility by the affiliate and for general services that may be allocated by the affiliate to all operating affiliates. D.P.U. 13-75, at 184; D.P.U. 12-25, at 231; D.P.U. 89-114/90-331/91-80 (Phase I) at 79-80; Hingham Water Company, D.P.U. 88-170, at 21-22 (1989); AT&T Communications of New England, Inc., D.P.U. 85-137, at 51-52 (1985). In addition, 220 C.M.R. § 12.04(3) provides that an affiliated company may sell, lease, or otherwise transfer an asset to a distribution company, and may also provide services to a distribution company, provided that the price charged to the distribution company is no greater than the market value of the asset or service provided.

b. Services

In determining whether the services rendered by an affiliate specifically benefit a regulated utility and do not duplicate services already provided by the utility, it is necessary to examine whether there is any overlap between the services rendered by an affiliate and the operating company's functions. D.P.U. 13-75, at 184; D.P.U. 08-27, at 80-81; Oxford Water Company, D.P.U. 1699, at 11-12 (1984). Within the 13 functional groups, services provided by NGSC to the Company include: accounting, payroll, auditing, finance/business planning, business continuity and emergency response, communications, human resources, engineering, transmission construction, corporate and corporate records, risk management, and management, environmental, insurance, tax, legal, treasury, regulatory, energy efficiency services, facilities, information technology, customer relations, and other various functions (Exh. DPU-1-25, at 1-2; see Exh. DPU-25-18, Att.). The Company does not have employees who perform these tasks

(Exh. DPU-1-25, at 2). Therefore, these activities specifically benefit National Grid, and there is no overlap between the services rendered by NGSC and the Company's functions.

c. Price

Next, we evaluate whether NGSC charges to National Grid were at a competitive and reasonable price. In prior cases, when determining whether services were charged at a competitive and reasonable price, the Department has accepted a review of employer compensation structures, compared to the market, because service company charges tend to be primarily labor-related.[189] D.P.U. 13-75, at 186; D.P.U. 12-25, at 233; D.P.U. 09-39, at 260. Regarding a review of National Grid's compensation structures, the Company's proposal shows that it established a salary range for each band of non-union employees that is competitive with the median market rate (Exhs. NG-MPH-1, at 12; NG-MPH-1; DPU-8-24). Moreover, NGSC labor is charged to the Company at cost and does not include a profit that would be charged by an outside vendor (Exhs. DPU-1-25, at 2; DPU-25-13, at 1).

In addition to comparing service company compensation to that of the market, National Grid provided additional evidence of the competitiveness and reasonableness of NGSC costs. In particular, the Company developed external cost comparisons to demonstrate that NGSC costs are reasonable relative to the corresponding market alternatives (Exh. DPU-25-13, at 2). For two-thirds of service company functions, external cost comparisons show that the services provided by NGSC compare favorably to third-party rates obtained through the market

---

189 The Company acknowledges that the primary costs (i.e., more than 50 percent of total costs) allocated to the Company from NGSC are labor and labor-related costs associated with employees performing the functions that are provided on a shared basis (Exh. DPU-1-25, at 2). NGSC allocated or directly charged $73,393,666 in test year salary and wages to the Company (Exh. NG-RRP-2, at 9 (Rev. 3)).

(Exhs. DPU-25-13, at 2; DPU-25-19, Att. & Att. (Supp.)).[190] National Grid's analysis also shows that the vast majority of services performed by NGSC for the Company are provided at a lower cost than an outside vendor (Exhs. DPU-25-13, at 2; DPU-25-19, Att. & Att. (Supp.)).

The Department has previously noted that, in order for reimbursed costs associated with overseas employees of National Grid plc to be recovered through rates, such costs must benefit Massachusetts customers, be reasonable, and be prudently incurred. D.P.U. 10-55, at 455-456 (2010).[191] Since its last rate case, the Company modified its accounting of non-business related expatriate expenses (Exh. DPU-1-25, at 3). Specifically, a third-party vendor in the United Kingdom now manages non-business related expenses incurred by expatriate employees (Exh. DPU-1-25, at 3). All non-business related expenses are: (1) reviewed and approved before the expatriate employee is reimbursed by the third-party vendor; (2) charged to the parent company; and (3) borne by shareholders (Exh. DPU-1-25, at 3). Business-related expatriate expenses are charged through the normal employee expense reimbursement system

---

190 Pursuant to a settlement agreement between the Company and the Attorney General in Boston Gas Company/Essex Gas Company/Colonial Gas Company, D.P.U. 10-155-A (2014), one-third of external cost comparisons (i.e., corporate affairs; human resources; network strategy; safety, health, and wellness; and shared services), were developed as of March 31, 2015 (Exh. DPU-25-19, Att.). D.P.U. 10-155, Settlement Agreement at § 5. One-third (i.e., customer; information services; operations (including operations support, emergency planning, project management & complex construction, and process excellence); and strategy, business development and technology) were developed as of March 31, 2016 (Exh. DPU-25-19, Att. (Supp.)). The final third of remaining functions (i.e., audit, finance, legal, procurement, and regulation and pricing) will be developed by March 31, 2017 (Exh. DPU-25-19).

191 Reimbursed costs include moving costs, house rentals, annual vacations to the employee's home country, and health insurance costs that exceed those covered by the employee's home country health insurance.

(Exh. DPU-1-25, at 3). Based on the foregoing, the Department finds that the NGSC expenses charged to National Grid were charged at a competitive and reasonable price.

d. Allocation

Finally, we evaluate the method of allocating costs from NGSC to National Grid. When allocating costs among affiliates, it is preferable that costs associated with a specific utility are directly assigned to that utility. In the absence of a clear relationship between the cost and the affiliate, or when costs cannot be directly assigned, these costs are preferably allocated using cost-causative allocation factors to the extent such allocation factors can be applied, with general allocation factors used to allocate any remaining costs. D.P.U. 13-75, at 188; D.P.U. 11-01/D.P.U. 11-02, at 318-321; D.P.U. 10-114, at 271-274.

As previously stated, NGSC charges are charged directly to the Company, or when direct assignment is not possible, through allocation factors (Exh. NG-RRP-1, at 12). To ensure accuracy of the allocations, the Company requires employees to attend an in-depth enterprise-wide training program so that they charge their time and expenses appropriately (Exh. DPU-1-25, at 2). Further, all service company employees are required to take computer-based allocation training, and refresher training annually, developed and maintained by the Cost Allocations Compliance ("CACP") team (Exh. DPU-1-25, at 2). The CACP team also maintains and updates National Grid's cost allocation manual ("CAM"), which is stored on the Company's intranet and is readily accessible to all employees (Exh. DPU-1-25, at 3). The CAM explains the methods of allocating service company costs (Exh. AG-1-92). National Grid provided detailed information on all allocation codes and the metrics used to calculate them

during the test year (see Exh. AG-1-92, Atts. 2 & 3).[192] The Department has reviewed these allocation codes and metrics and finds them to be cost-effective and nondiscriminatory.

It is the Company's policy to review all new service company internal requisitions for the appropriateness of the allocations prior to it being set up in SAP (Exh. DPU-1-25, at 3). Moreover, the service company accounting and finance employees circulate monthly reports of service company costs to each of the jurisdiction (e.g., Massachusetts) finance teams, who will review the appropriateness of those costs allocated or direct charged to each individual company within their jurisdiction (Exh. DPU-1-25, at 3). Additionally, the Company investigates variances greater than ten percent of the prior year's monthly bill (Exh. DPU-1-25, at 3). Further, National Grid reviews invoices from the service company that are greater than $10,000 to determine that the costs benefit the Company, and that the allocation is appropriate (Exh. DPU-1-25, at 3).

Additionally, as noted above in Section III, the Company retained PwC, an independent public accounting firm, to assist with the review of the costs charged from NGSC to National Grid in the test year (Exh. NG-RRP-1, at 7). PwC concluded that the costs were recorded accurately, and, on a net basis, that the costs were allocated appropriately pursuant to the Company's CAM (Exh. NG-RRP-1, at 10; NG-RRP-3).

4. Conclusion

Based on the foregoing, we find that National Grid has sufficiently demonstrated that the service company allocations are: (1) for activities that specifically benefit the Company and that

---

192 These codes are updated at the beginning of each fiscal year (or when there is a significant change in the business) based on the prior calendar year numbers (Exh. AG-1-92).

do not duplicate services already provided by National Grid; (2) made at a competitive and reasonable price; and (3) allocated to the Company by a method that is both cost-effective and nondiscriminatory. Other sections of this Order address issues related to NGSC costs specific to those categories of costs.

O. Information Systems and Facilities Lease Expense

1. Introduction

a. Overview

National Grid's information systems ("IS") and facilities rent expenses represent charges billed to the Company for computer and information systems and leased facilities provided by NGSC (Exh. NG-RRP-1, at 20, 31-32).[193] NGSC owns the IS assets and bills its affiliated companies, including MECo and Nantucket Electric, their respective pro-rated share of costs including depreciation and a return component (Exhs. NG-RRP-1, at 31-32; NG-RRP-2, at 15). Additionally, NGSC bills the Company for use of facilities in Northborough[194] and Waltham, along with other Massachusetts locations, as well as for facilities in New York, Rhode Island, and Washington, D.C. (Exhs. NG-RRP-2, at 15; AG-2-24; DPU-31-23; DPU-31-24).[195] NGSC

---

193 The Company refers to capital recovery-type charges associated with leased facilities and NCSC's IS investments as "asset recovery charges" (Exh. NG-RRP-2, at 15 (Rev. 3)). In this Order, we use the term "rent" for ease of reference.

194 Although MECo owns the Northborough facility, the facility is shared with other affiliates. Thus, the total costs related to the site are initially billed to NGSC, which then allocates those total costs to the operating entities sharing use of the facility (Exh. DPU-31-24).

195 There are corporate offices, government relations offices, and operations centers located in New York, Rhode Island, and Washington, D.C. (Exh. AG-2-24). The Company has removed $49,780 in costs associated with the Washington, D.C. office on the basis that

allocates both IS and facilities costs using a coding system that apportions the costs by an affiliate's percentage share of expenses or use of space measured in square feet (Exhs. NG-RRP-4, at 4; WP-NG-RRP-8; DPU-31-19; DPU-31-20; DPU-31-23; AG-1-92; AG-15-18; Tr. 5, at 603).

NGSC uses various methods for calculating rental charges for various facilities and information systems (Exh. AG-11-2, Att. at 1-17). Depending upon the particular facility and information system, NGSC will allocate their associated costs among its affiliates based on: (1) direct assignment; (2) a three-point allocation system; (3) customer counts; (4) cost causation; and (5) in the case of the Sutton warehouse,[196] a weighted average cost calculation of historical inventory (Exhs. NG-RRP-4, at 3-5; DPU-14-6; DPU-31-16; DPU-31-19; DPU-31-20; DPU-31-23; DPU-31-24; AG-1-92, Att. 1, at 29; AG-11-2; AG-11-3).[197]

b. SAP Consolidation Program

IS rent in the instant case is associated with new and enhanced information technology ("IT") assets upgraded as part of a larger IS consolidation and modernization conducted by National Grid USA starting in 2010 and affecting all National Grid USA affiliates

---

this facility is primarily used for government relations, including lobbying activities (Exh. WP-NG-RRP-8, at 1).

196 The Sutton warehouse is National Grid's New England Distribution Center on the Sutton/Northbridge town line (Exh. DPU-14-6). See also, Massachusetts Electric Company and Nantucket Electric Company d/b/a National Grid, D.P.U. 10-112-A at 2 (2013).

197 The Company's three-point allocation method employs data on net margin, net plant, and O&M expense to apportion expenses to the various operating companies (Exhs. AG-1-92, Att. 1, at 29; AG-11-2; AG-11-3; DPU-31-16; DPU-31-19; DPU-31-20).

(Exhs. NG-MLR-1, at 26-27; NG-RRP-1, at 32; Tr.1 at 46-49; Tr. 5, at 577-578).[198] Under the project name U.S. Foundations Program ("USFP") and employing an SAP Enterprise Resource Planning platform, NGSC sought to consolidate multiple legacy technology platforms brought together by the acquisition of KeySpan in August 2007 (Exhs. NG-MLR-1, at 26-27; AG-4-4; Tr. 5, at 577-578).[199] Both capital project costs and ongoing maintenance costs for new and enhanced data management systems deployed for outage management, finance, performance reporting, and other business processes such as payroll, supply chain, and IT delivery are included in the rent charge (Exh. NG-RRP-4, at 1-2; Tr. 5, at 597).

2. Company Proposal

a. Introduction

During the test year, National Grid booked $31,651,504 in facilities and IS lease expense, consisting of $9,031,383 in facilities rent expense, $1,357,905 in NGSC charges associated with depreciation and a return on facilities, and $21,262,215 in IS rent and operating charges (Exh. NG-RRP-2, at 15 (Rev. 3)).[200] The Company proposes to recover a total of $38,519,355 for facilities and IS expenses incurred during the test year and through the end of the rate year, September 30, 2017 (Exh. NG-RRP-2, at 15 (Rev. 3)).[201] The Company's proposal to increase

198 The IS consolidation project required approval from the board of directors of National Grid plc but was managed by National Grid USA (Exhs. AG-4-4; Tr. 5, at 571-572).

199 The Company launched the initial USFP modules in November 2012, but problems with implementation prompted a corrective stabilization program that ran until September 2014 (Exhs. NG-MLR-1, at 27-28; AG-4-20).

200 Minor discrepancies in any of the amounts appearing in this section are due to rounding.

201 Of this amount, $29,732,078 represents IS lease expenses and $8,787,277 is associated with facilities lease expense (Exh. NG-RRP-2, at 15 (Rev. 3)).

facilities and IS lease expense is based on what the Company represents are known and measurable adjustments of $10,127,504, as discussed below (Exh. NG-RRP-2, at 15 (Rev. 3)).

b. Normalizing Adjustments

The facilities and IS adjustments include normalizing adjustments of $3,259,652, consisting of: (1) a decrease of $1,602,011 for restated test year facilities rental expense; and (2) a decrease of $1,657,641 from the Company's test year share of IS rent billed for NGSC-owned systems in service as of June 30, 2015 and restated to an annual asset recovery amount (depreciation and return) for the rate year ending September 30, 2017 (Exhs. NG-RRP-1, at 20; NG-RRP-2, at 15 (Rev. 3); WP-NG-RRP-8, at 1).[202] These adjustments produced a normalized test year facilities and IS expense total of $28,391,851, consisting of $8,787,277 in facilities lease and depreciation and return expense and $19,604,574 in IS rent expense (Exh. NG-RRP-2, at 15 (Rev. 3)).

c. Post-Test Year IS Adjustments

Along with its proposed test year normalization adjustments, the Company proposed an increase of $10,127,504 for post-test year IS rent charged by NGSC related to the implementation of new data management systems placed into service by May 31, 2016, and their associated ongoing support and maintenance costs (Exhs. NG-RRP-1, at 31-32; NG-RRP-2, at 15 (Rev. 3); Tr. 5, at 596). Of the proposed $10,127,504 increase, $9,026,666 in IS rent expense involves NGSC capital additions and enhancements for the rate year ending September 30, 2017 (Exhs. NG-RRP-1, at 32; NG-RRP-2, at 15 (Rev. 3); NG-RRP-4, at 1-2 (Rev. 1)).

---

202 The Company bases its test year normalization adjustment for both facilities and IS rents on a projected average NGSC depreciation balance for a twelve-month period between October 1, 2016 and September 30, 2017 (Exhs. NG-RRP-4, at 3-5; WP-NG-RRP-8, at 2-4; AG-ADR-1, at 25, lines 18-19).

These new systems and enhancements include $5,619,623 associated with a new outage management system ("OMS") placed into service on December 4, 2015; $2,504,315 for the USFP SAP Enhancement One ("EHR1") project, most of which went into service in November 2015; and $902,728 for other IS investments placed into service between October 2015 and May 2016 (Exhs. NG-RRP-4, at 1-2 (Rev. 1); NG-RRP-Rebuttal-1, at 20; NG-RRP-Rebuttal-4, at 1, 6; AG-DR-1, at 22).[203] Additional incremental ongoing operation costs of $574,716 for OMS and $526,122 for the energy management system ("EMS") complete the $10,127,504 total proposed adjustment (Exh. NG-RRP-2, at 15 (Rev. 3); NG-RRP-4, at 1-2 (Rev. 1)).

d. Facilities Lease Expense

As noted above, along with the IS increases, National Grid proposed to recover $9,031,383 in test year facilities rent expense and $1,357,905 in test year NGSC charges associated with depreciation and a return on facilities (Exh. NG-RRP-2, at 15 (Rev. 3)). These expenses are related to office space, control centers, training facilities, and warehouses (Exhs. NG-RRP-2, at 15 (Rev. 3); WP-NG-RRP-8, at 1). The Company leases space for corporate offices, government relations, operations, training, and warehousing at facilities in Boston, Gardner, Monson, Sutton, Uxbridge, and Waltham (Exhs. NG-RRP-2, at 15 (Rev. 3);

---

[203] In rebuttal testimony, the Company agreed to exclude from its calculation of rate year IS rental expense the costs for any delayed projects not placed into service by May 31, 2016 (Exh. NG-RRP-Rebuttal-1, at 20). The Company subsequently reduced the rate year IS rental expense by $679,371 for delayed projects, while subtracting an additional $62,834 for costs related to updated USFP EHR1 investment information (Exhs. NG-RRP-Rebuttal-1, at 20 n.8; NG-RRP-Rebuttal-4, at 1; DPU-31-21, Att., at 2).

WP-NG-RRP-8, at 1; DPU-31-23; DPU-31-24; AG-2-24, Att.).[204] The Company also owns a facility in Northborough (Exhs. NG-WP-RRP-8, at 1; DPU-31-24). For the test year ending June 30, 2015, the Company made $1,602,011 in normalizing adjustments, consisting of corrections to various allocations, inflation, and test year true ups of prior year rent expenses (Exhs. NG-RRP-1, at 20; NG-RRP-2, at 15 (Rev. 3); WP-NG-RRP-8, at 1 and 8; DPU-31-24). Therefore, the Company's adjusted test year amount of facilities lease expense and associated expense is $8,787,277 (Exh. NG-RRP-2, at 15 (Rev. 3)). The Company proposed no post-test year adjustments related to facilities rent (Exh. NG-RRP-2, at 15 (Rev. 3)).

3. Positions of the Parties

a. Attorney General

i. Overview

The Attorney General argues that the Department should: (1) reject the Company's proposal to include post-test year IS adjustments through September 30, 2017; (2) exclude the IS rent expense on NGSC's books associated with IT systems closed to plant in service after the end of the test year; (3) remove incremental expenses associated with post-test year IS additions; (4) remove non-recurring test year EHR1 implementation expenses; (5) reduce the equity return applied to the NGSC IS assets to 7.80 percent; (6) reduce the return on USFP SAP assets to 3.7 percent; and, if the Department ultimately finds it appropriate to include those post-test year additions, (7) incorporate anticipated savings from post-test year IS additions into the Company's cost of service (Attorney General Brief at 40, 126; Attorney General Reply Brief

---

204 The Company breaks down the total facilities cost as follows: $3,308,931 for Reservoir Woods in Waltham; $1,462,878 for Northborough; and $4,015,468 for all other facilities (Exh. NG-RRP-2, at 15 (Rev. 3)).

at 71).[205] The Attorney General did not comment on brief about the Company's facilities expense.

ii. Test Year IS Expenses

The Attorney General argues that it is inappropriate to include IS rent expense charges associated with NGSC's net plant in service and associated accumulated deferred income taxes balances for the post-test year period ending September 30, 2017, as proposed by the Company (Attorney General Brief at 41). She argues that no compelling reason exists in the instant case to calculate the charges to the Company from NGSC for NGSC's recovery of and return on its assets based on a period that extends 15 months beyond the end of the test year (Attorney General Brief at 41).

The Attorney General rejects any notion that excluding the post-test year IS rent expense will create a significant shortfall in the Company's rate recovery and cause the potential loss of more than half of its IS investment (Attorney General Reply Brief at 19). According to the Attorney General, the Department's denial of recovery of post-test year investments would not be unreasonable or unfair because after the end of the test year, the investments in service during the test year continue to be depreciated while the post-test year increase in the accumulated depreciation would not be subtracted from rate base (Attorney General Reply Brief at 19). Additionally, the Attorney General contends that even though some projects may be retired from service after the test year end, they would remain in rate base (Attorney General Reply Brief

---

[205] In her original brief, the Attorney General proposed reducing the ROE associated with IS assets from the 10.5 percent ROE incorporated in the Company's original filing to 8.50 percent (Attorney General Brief at 40). Subsequently, the Attorney General recommended setting the allowed ROE at 7.80 percent (Attorney General Brief at 126, citing Exhs. AG-JRW-1, at 51 and 60–61; Attorney General Reply Brief at 71).

at 19). Therefore, the Attorney General recommends that the Department reject the Company's proposal to extend the net balance of NGSC IT assets in place at the end of the test year through the twelve-month period ending September 30, 2017 (Attorney General Brief at 42).

iii. Post-Test Year IS Additions

The Attorney General also opposes the inclusion of any post-test year IS plant in the computation of National Grid's IS expense (Attorney General Brief at 41-42). The Attorney General notes that the Department generally does not recognize post-test year additions to rate base, unless the utility demonstrates that the additions are significant relative to the test year-end rate base (Attorney General Brief at 41, citing D.P.U. 14-150, at 43-44). The Attorney General contends that the Company presents no argument or evidence supporting a change to the cited precedent (Attorney General Brief at 42).

The Attorney General argues that the Company's post-test year IS plant additions represent only a small fraction of NGSC's total IS investment used by the Company (Attorney General Brief at 42; Attorney General Reply Brief at 16-18). In support of her contention, the Attorney General notes that MECo was allocated 18.58 percent and Nantucket Electric was allocated 0.27 percent for their respective portions in the majority of projects included in NGSC's total $145.67 million post-test year IS investment (Attorney General Brief at 42; Attorney General Reply Brief at 18). Thus, she claims that the amount ultimately allocated to the Company through the NGSC IS rental expense is insignificant when compared to the Company's $2.3 billion of net plant and $1.79 billion requested rate base in the instant case (Attorney General Brief at 43; Attorney General Reply Brief at 18). The Attorney General maintains that when determining the significance of a post-test year adjustment, a company's

rate base, not the amount of rate base or investment held by an affiliated entity, is the relevant factor (Attorney General Reply Brief at 17).[206]

Moreover, the Attorney General argues that the 13 separate projects comprising the relevant plant additions are individually insignificant when compared to the Company's rate base (Attorney General Brief at 43). The Attorney General notes that Department precedent considers individual plant investments and not combined plant additions in determining substantive impact on rate base (Attorney General Reply Brief at 17). She asserts that the Department should not allow the Company to obscure the purity of the test year by introducing post-test year investments of an affiliated entity against well-established Department precedent for the limited consideration of post-test year plant additions in rates (Attorney General Reply Brief at 18).

Consequently, the Attorney General recommends that the Department exclude the entire $9,026,666 in post-test year NGSC IT plant additions placed into service between October 2015 and May 2016 from the calculation of IT expenses (Attorney General Brief at 42).[207]

iv. Incremental OMS Expense

The Attorney General notes that National Grid seeks to include $574,716 in projected operating expenses associated with the OMS implemented by NGSC after the end of the test year (Attorney General Brief at 44, citing Exh. NG-RRP-2, at 15). Consistent with her proposed

---

206 The Attorney General notes that the Company instead limits its comparison of the post-test year IS plant additions to NGSC's total net investment in IS systems (Attorney General Reply Brief at 17).

207 During the proceedings, the Attorney General offered an alternative set of adjustments in the event that the Department allowed post-test year NGSC plant additions (Exhs. AG-DR-1, at 41-48; AG-DR-3, Schs. 1-4). On brief, the Attorney General discussed some of the alternative adjustments proposed by her witness (Attorney General Brief at 48-50).

removal of post-test year NGSC plant additions, the Attorney General argues that $574,716 in incremental expenses associated with projected OMS operating costs should be removed from the Company's cost of service (Attorney General Brief at 44).

v. SAP Enhancement Release 1 Expenses

Fourth, the Attorney General argues that $2.7 million in costs associated with EHR1 should be removed from the adjusted test year rent cost as a non-recurring item (Attorney General Brief at 48). She argues that the EHR1 represents another step and update in the overall SAP system that was included in the post-test year NGSC IS plant additions, and that while the Company agreed in rebuttal to reduce the $2.7 million expense to $2.3 million through amortization over seven years, the entire $2.7 million should be excluded from cost of service (Attorney General Brief at 49, citing Exh. NG--RRP-Rebuttal-1, at 28).

vi. Return on USFP SAP System Assets

The Attorney General argues that the return on USFP SAP system assets should be reduced because of (1) the extent of the problems the Company experienced with the USFP SAP implementation, (2) the Company's imprudence, and (3) the effect of these implementation problems on the Company's operations, including cost overruns and the need for subsequent system stabilization efforts (Attorney General Brief at 45-47, citing Exhs. NGRRP-9, at 3; AG-DR-1, at 31-32, 33-35; AG-4-4; AG-23-9, Att. 1; Tr. 5, at 586, 607-608; Attorney General Reply Brief at 20). The Attorney General claims that the Company attempts to gloss over the serious USFP SAP problems (Attorney General Brief at 21). She maintains that the Company itself identified the problems in USFP post-implementation review documents that reflect actions that were not reasonable or prudent (Attorney General Reply Brief at 21-22,

citing Exhs. AG-4-6, Att. 66; AG-23-9, Att. 1).[208] Additionally, the Attorney General challenges the inclusion of certain USFP SAP Release 3 ("R3") stabilization costs in the IS rent expense that further drive up costs to ratepayers, and despite the Company's claim that all SAP stabilization costs were charged to the parent (Attorney General Brief at 47).

In light of what the Attorney General considers to be the severity of the implementation problems and imprudence of the root causes, she recommends that the return component be limited to NCSC's 3.70 percent long-term debt rate (Attorney General Brief at 47-48; Attorney General Reply Brief at 20, 22). The Attorney General avers that the combination of the lower 3.70 percent return and limiting the inclusion of NGSC's IS net assets to the test year-end balance as discussed above would further reduce IS rent expense by $2,271,485 (Attorney General Brief at 48).

vii. Rate of Return on IS Assets

The Attorney General challenges the Company's proposed use of a 10.63 percent overall pre-tax return to the NGSC IS assets in determining the rent expense, arguing that the ROE component of the 10.63 percent rate should be revised to the allowed ROE approved by the Department in this case (Attorney General Brief at 43). She states that the Company agreed in its rebuttal that the NGSC rent expense should be based on the ROE approved by the Department (Attorney General Brief at 43, citing Exh. NG-RRP-Rebuttal-1, at 20). Based on her recommended ROE of 7.80 percent, the Attorney General states that the revised return results in

---

208 Exhibit AG-23-29, Attachment 1 is a copy of an October 2013 presentation to members of the New York State Public Service Commission as part of the Comprehensive Management and Operations Audit of National Grid USA's New York Gas Companies (Case No. 13-G-0009). Exhibit AG-4-6, Attachment 66 is a confidential report titled "USFP R1 Review: Lessons Learned" that was prepared by a consultant and dated November 29, 2014.

a reduction to the Company's proposed IS rent expense (Attorney General Brief at 43-44, citing Exh. AG-DR-2, Sch. 7, at 1 and 2).[209] Therefore, the Attorney General recommends reducing the equity return applied to NGSC IS assets from the 10.50 percent ROE incorporated in the Company's original filing to the 7.80 percent recommended by the Attorney General in this case (Attorney General Brief at 40; Attorney General Reply Brief at 71).

viii. Imputed EHR1 Savings

The Attorney General argues that if the Department allows the inclusion of post-test year EHR1 system plant additions in the determination of NGSC rent expenses, the Company also should net out the associated cost savings that the enhancements generate (Attorney General Brief at 49; Attorney General Reply Brief at 23). In support of her position, the Attorney General states that the Company had identified potential estimated cost savings associated with the EHR1 projects that would begin accruing by the middle of 2016 (Attorney General Brief at 49; Attorney General Reply Brief at 23). Citing the Company's figure of $6.46 million in potential savings at the service company level and applying an 18.85 percent[210] allocation factor used to determine MECo and Nantucket Electric's combined portion of expenses and adjustments, the Attorney General recommends reducing the IS rent expense by $1,217,710 to incorporate projected costs savings (Attorney General Brief at 49-50, citing Exhs. AG-DR-1,

---

209 The Attorney General notes that her calculation of the reduction to IS rent expense using a pre-tax return of 8.96 percent offered on brief does not include any potential additional disallowances or ROE reductions associated with the USFP SAP systems implementation (Attorney General Brief at 44). She addresses these proposed adjustments elsewhere in her brief (Attorney General Brief at 44-48).

210 The 18.85 percent allocation factor represents the combined allocations of 18.58 percent for Massachusetts Electric and 0.27 percent for Nantucket Electric (Exh.WP-NG-RRP-9, at 5-8).

at 48; AG-DR-3, Sch. 4; AG-23-11; Attorney General Reply Brief at 23). Excluding these cost savings, the Attorney General maintains, will further hinder efforts to match revenues, expense, and investments in a revenue requirement equation already distorted by the inclusion of the post-test year rent expense (Attorney General Reply Brief at 23).

b. Company

i. Overview

National Grid maintains that the $38,519,355 in total IS and facilities rental expenses, comprising normalized test year expenses of $28,391,851 and an additional $10,127,504 in post-test year adjustments, are reasonable and prudently incurred, and therefore should be included in the cost of service (Company Brief at 31; Company Reply Brief at 33, citing Exh. NG-RRP-2, at 15 (Rev. 3)). The Company argues that the Attorney General's recommendations to eliminate certain IS rental expenses from cost of service are without merit and should be rejected by the Department (Company Brief at 31).

In support of its IS rental proposals and in opposition to the Attorney General's recommendations, the Company emphasizes that: (1) the post-test year IS adjustments are significant and prudent; (2) there is no basis for a reduced return on USFP; (3) the EHR1 implementation expense should be allowed; and (4) savings should not be imputed (Company Brief at 32-44; Company Reply Brief at 24-33). Noting that the Attorney General did not contest the proposed facilities rental expenses, the Company states that the Department should approve recovery of the facilities rental costs without modification (Company Brief at 31 n.10, 37).

ii. Post-Test Year IS Additions

The Company dismisses the Attorney General's recommendation to remove $9,026,666 in incremental IS rental charges from NGSC, related to post-test year NGSC IS plant additions (Company Brief at 31-32, citing Attorney General Brief at 41-42). The Company also contests the Attorney General's opposition to post-test year plant additions as the basis for normalization adjustments associated with NGSC rate base balances (Company Brief at 32-33).

The Company asserts that the IS projects at issue represent significant NGSC investments (Company Brief at 33-34; Company Reply Brief at 29). In particular, the Company notes that approximately $9.0 million in post-test year rent expense associated with the NGSC IS rental charges is greater than two percent of the Company's total distribution O&M expense portion of its cost of service (Company Brief at 34). The Company argues that the Attorney General obscures the facts of the investment by referring to the Company's allocated portion of the rental fees instead of the actual dollar amounts associated with the NGSC IS investments (Company Brief at 34). According to the Company, the total NGSC investment associated with the IS projects in question is $145,672,554, and represents over 41 percent of the NGSC's total net IS investment of $350,629,068, thereby reinforcing the significance of the amounts both for the Company and for NGSC (Company Brief at 34, citing Tr. 6, at 948, 951-952; Company Reply Brief at 26).[211]

[211] National Grid's witness stated that the Company proposed to recover the post-test year IS rental expenses as operating expenses rather than as a rate base item, which would earn a return for the Company (Tr. 6, at 948, 951). The same witness, however, also stated that the NGSC calculation of the IS rental expense allocated to MECo and Nantucket Electric included a return on capital at the service company level (Tr. 6, at 948-949).

The Company presents alternative interpretations of the significance standard in opposition to the Attorney General's arguments (Company Reply Brief at 25-27). First, the Company disputes the Attorney General's contention that significance should be determined on an individual project basis and not on a collective basis (Company Reply Brief at 25-26). According to the Company, there is no rule or practice set by the Department that precludes consideration of the IS investments as a group (Company Reply Brief at 26). Additionally, the Company avers that the IS projects in question are part of an interrelated series of improvements to information systems necessary to serve customers (Company Reply Brief at 28).

Second, the Company maintains that there is no requirement that a capital investment must be significant in relation to the Company's own rate base and not the amount of rate base or investment held by an affiliated entity, even if the investment is made by the affiliated entity (Company Reply Brief at 26). Nor would such a rule make sense, the Company contends, when the investments will be recorded on the Company's books as expense and not as capital (Company Reply Brief at 26). On a related matter, the Company disagrees with the Attorney General's discounting of IS project cost comparisons to total net investments in IS systems, arguing that the Attorney General overlooks the fact that as a service company, the bulk of NGSC's assets would be IS rather than distribution plant or other booked rate base items (Company Reply Brief at 26). The Company notes that NGSC's total net investment in IS at the end of the test year (i.e., June 30, 2015) represented 36 percent of the service company's total rate base of $862,881,567 (Company Reply Brief at 26, citing NGSC's 2015 FERC Form 60).

Third, the Company takes issue with the Attorney General's claim that MECo and Nantucket Electric's shared 18.85 percent allocated portion of the $145.67 million IS rental

expense disqualifies the significance of the Company's stake in the total (Company Reply Brief at 26-27). Such an argument, the Company maintains, ignores the rationale of a holding company structure, which is to provide benefits to each operating company in relation to shared services, particularly in the area of IS where operating affiliates can obtain access to systems they could not afford on their own (Company Reply Brief at 27). It will always be the case, the Company argues, that the share of costs paid by individual operating companies may not be significant relative to the whole (Company Reply Brief at 27). Therefore, the Company adds, if all the smaller allocated portions of operating company IS rental expenses are deemed to be insignificant, then it is not possible for NGSC to recover its costs (Company Reply Brief at 27).

For these reasons, the Company contends that the Department cannot reasonably rely on a comparison of the allocated share of expense to the whole expense when determining whether the post-test year IS rent charges in the instant case are significant and therefore eligible for cost recovery (Company Reply Brief at 27). Rather, it recommends that the Department consider the comparison provided by the Company as the signal for whether cost recovery is warranted, i.e., a comparison of NGSC's $145.67 million of plant additions to $350,629,068 total net IS investment (Company Reply Brief at 27).

Additionally, the Company argues that excluding the post-test year change in IS rental expense associated with post-test year NGSC IS investments would cause the Company to experience a significant shortfall in its rate recovery, since all of the IS projects requested for inclusion in rates have seven-year amortization periods, which are far shorter than depreciation periods for typical utility plant and amount to nearly $40 million in amortized asset recovery

(Company Brief at 36; Company Reply Brief at 29, citing Exh. NG-RRP-Rebuttal-4, at 5).[212] The Company contends that if the Department accepted the Attorney General's recommendation to deny inclusion of post-test year IS rental expenses, the decision could potentially cause the Company to lose more than half of its IS investment even with a short period between base-rate cases (Company Brief at 36; Company Reply Brief at 29). The decision, according to the Company, would be tantamount to disallowing a substantial portion of the investment without any finding of imprudence, and despite the fact that the investments in question are in service and benefitting customers (Company Brief at 37; Company Reply Brief at 29).

Based on the foregoing analysis, National Grid concludes that the Department should reject the Attorney General's recommendation and instead authorize the inclusion of IS rental expense associated with the post-test year NGSC IS investments (Company Brief at 37). Consistent with this treatment, the Company urges the Department to allow the inclusion of incremental OMS operating expenses in the Company's cost of service (Company Brief at 37).

iii. SAP EHR1 Expenses

In response to the Attorney General's recommendation to remove $2.7 million in EHR1 system expenses as a non-recurring item, the Company argues that the appropriate treatment of this expense is to amortize it, as supported by Department precedent (Company Brief at 42). The Company contends that the Attorney General's recommendation of complete disallowance has no basis insofar as she fails to support any claim that the IS rental expense associated with the

---

212 The Company cites to $38,216,613 in projected accumulated amortization, derived from subtracting a balance of $107,455,613 representing the total value of NGSC IS project investments at September 30, 2017 from the forecast total NGSC IS expense of $145,672,554 incurred between June 30, 2015 and May 31, 2016 (Exhs. NG-RRP-Rebuttal-1, at 20; NG-RRP-Rebuttal-4, at 5).

EHR1 system is indeterminate, unreasonable, or imprudent, and that she fails to demonstrate that the seven-year amortization period is inappropriate (Company Brief at 42-43).

National Grid argues that IT expenses, such as the EHR1 expenditures, are amortized over time in a way that strikes a balance between the need to continue improvements in service technology and the need to maintain intergenerational integrity (Company Brief at 42, citing D.P.U. 13-75, at 217; D.T.E. 02-24/25, at 153; Boston Gas Company, D.P.U. 93-60-D at 4 (1994)). Because the EHR1 system is being amortized over seven years, the Company reasons that the related EHR1 implementation expenses should be amortized as well (Company Brief at 42, citing Exhs. NG-RRP-Rebuttal-4, at 1; NG-RRP-2 (REV-2), at 15). Accordingly, the Company recommends that the Department reject the Attorney General's argument and authorize the proposed amortization of EHR1 expense (Company Brief at 43).

iv. Return on USFP SAP Assets

National Grid contests the Attorney General's argument for reducing NGSC's return to the 3.70 percent long-term debt rate based on problems and imprudence associated with the USFP system implementation (Company Brief at 37; Company Reply Brief at 30-32). The Company asserts that the Attorney General's recommended penalty of a reduced return on the USFP system is unwarranted because the implementation issues were caused by factors the Company already explained, factors that did not include the types of unreasonable decisions made during project development that meet the requirements for a finding of imprudence

(Company Brief at 38-39, citing Exh. NG-RRP-Rebuttal-1, at 27; Attorney General v. Department of Public Utilities, 390 Mass. 208, 229-230 (1983)).[213]

The Company specifically challenges the testimony of the Attorney General's witness, who argued that the Company should have anticipated the problems with the USFP implementation given difficulties with roll outs of SAP systems at other companies (Company Reply Brief at 30-31). The witness, according to the Company, readily admitted no technical or practical experience with SAP implementation (Company Reply Brief at 30, citing Tr. 15, at 1593-1594, 1599; Attorney General Reply Brief at 20). Conversely, the Company asserts that it demonstrated that complex, multi-layered IS investments such as USFP SAP cannot simply be compared to other companies' SAP implementation experiences, whether utilities or not (Company Reply Brief at 31, citing Tr. 5, at 600).[214]

The Company also challenges the Attorney General's reliance on a report to the NYPSC expounding on issues encountered in the USFP SAP implementation and lessons learned as the basis for an imprudence finding on the equity return component of the USFP rental expense (Company Reply Brief at 31-32, citing Attorney General Reply Brief at 22;

---

213 The Company notes that a review of the prudence of a company's actions is not dependent on whether budget estimates later proved to be accurate, but rather upon whether the assumptions made were reasonable given the facts known at the time (Company Brief at 39, citing D.P.U. 95-118, at 39-40; D.P.U. 93-60, at 35; D.P.U. 84-145-A at 26).

214 The Company's witness testified that it is difficult to compare large, complex software projects across utilities or across companies in general since the systems, which are generally located at the center of a company's operations and interface with a number of other systems, are designed specifically in recognition of the environment in which they must function (Company Reply Brief at 31, citing Tr. 5, at 600).

Exh. AG-4-6, Att. 66).[215] According to the Company, the Attorney General misses the fact that the report's findings helped propel National Grid USA to write off $552 million in shareholder value associated with the USFP SAP implementation to shield customers from the financial impact of the implementation problems (Company Reply Brief at 32). The Company also notes that the NYPSC determined that the remaining costs were recoverable through customer rates, and, therefore, authorized Niagara Mohawk Power Corporation and Brooklyn Union Gas Company, both National Grid operating companies in New York, to recover the same category of USFP SAP costs included in the instant case (Company Reply Brief at 32, citing Exh. NG-ISP-Rebuttal-1, at 18). The Company avers that if the remaining costs were subject to disallowance on the basis of the report findings, the NYPSC would have come to that conclusion (Company Reply Brief at 32).

Further, the Company contests the Attorney General's claim that R3 stabilization costs were inappropriately included in its proposed revenue requirement (Company Brief at 38). The Company asserts that it included only the portion of R3 investment attributable to system enhancements to add functionality to the SAP system and not to stabilize it (Company Brief at 38).

In sum, the Company argues that the Attorney General provided no justification to meet the imprudence standard, and that National Grid was forthcoming in voluntarily excluding all capital and O&M costs associated with system stabilization made necessary by implementation issues (Company Brief at 39). Further, the Company maintains that the Attorney General's recommended ROE adjustment is not based on any specific cost element or showing that the

---

215 See n.208 above.

costs were not actually incurred or are computed incorrectly, or any other substantive basis (Company Brief at 40).[216] Therefore, the Company recommends the Department reject the Attorney General's adjusted ROE (Company Brief at 42).

v. Imputed EHR1 Savings

National Grid opposes the Attorney General's recommendation to impute $1.2 million in projected EHR1 project savings to the Company's revenue requirement (Company Brief at 43). The Company argues that the Attorney General's reliance on potential estimated cost savings ignores record evidence showing no basis for making such an adjustment (Company Brief at 43).[217] National Grid maintains that although it provides some quantitative analysis for prospective savings, this savings estimate was preliminary in nature, because (1) the estimates were made during the conceptual design phase of EHR1; (2) the majority of the quantitative benefits were associated with avoiding costs, the extent of which would not have been known until the actual execution of the projects; and (3) after four years of SAP implementation, stabilization and enhancement work, National Grid ultimately recognized that identifiable benefits were qualitative and not quantitative (Company Brief at 43, citing Exh. AG-23-11; Company Reply Brief at 33). The Company further claims that while the Attorney General acknowledged that potential savings were associated with avoided future costs rather than

---

216 The Company explained that the difference between pre-implementation estimates and final costs should not be viewed as the terminus of a one-dimensional systems replacement project, but rather the outcome of a complex, iterative design and planning effort integrating multiple business processes into the final scope of USFP SAP (Company Brief at 40-41, citing Exh. NG-ISP-Rebuttal-1, at 14-15).

217 The Company identified $6.46 million of potential cost savings, as discussed above, in response to an information request from the Attorney General asking for any updated quantifications of savings associated with SAP implementation (Exh. AG-23-11).

reduced existing costs, she chose to ignore the information when making her recommendation (Company Brief at 44, citing, Exh. AG-DR-1, at 47). Moreover, the Company maintains that the Attorney General did not reference any evidence showing either any realized net savings as a result of the EHR1 implementation or demonstrating that net savings are routinely expected from such system enhancements (Company Brief at 44; Company Reply Brief at 33).[218] The Company further asserts that the Attorney General failed to respond to evidence that the benefits of potential savings are qualitative and that achieving estimated savings depends on a multitude of factors that make realization difficult (Company Reply Brief at 33, citing Company Brief at 43; Exh. AG-23-11). Accordingly, the Company contends that the Department should disregard the Attorney General's recommendation to impute $1.2 million in projected EHR1 implementation savings to the revenue request (Company Brief at 44; Company Reply Brief at 33).

4. Analysis and Findings

a. Introduction

The Department first will review the Company's proposal for test year adjustments to rental expenses for leased facilities. The Company proposed adjustments to expenses for facilities in Northborough and Waltham, among other Massachusetts locations, and in New York, Rhode Island, and Washington, D.C. No intervenors commented on facilities lease expenses.

---

218 The Company noted a similar recommendation of the Attorney General's in D.P.U. 13-75 when she sought to offset costs of a NiSource financial platform, NIFIT, with purported savings from implementation of the platform (Company Brief at 44). The Company further noted that the Department rejected the Attorney General's recommendation, finding that the benefits of the NIFIT system were not necessarily quantifiable in monetary terms (Company Brief at 44, citing D.P.U. 13-75, at 114).

The Department will then examine evidence supporting National Grid's proposed revenue requests for post-test year IS rent additions. Specifically, the Department will decide whether the Company should: (1) recover costs related to post-test year IS rent adjustments, including the proposed $9,026,666 post-test year plant additions and associated incremental OMS operating expenses; (2) reduce NGSC's return on IS assets in general and on USFP SAP implementation costs in particular; (3) remove $2.7 million in EHR1 implementation costs; and (4) impute $1.2 million in projected savings to the revenue requirement.

In arriving at the findings, the Department will examine the following issues central to the Attorney General's opposition arguments: (1) use of the Company's rate base as the basis for measuring the significance of IS rent charges to MECo and Nantucket Electric; (2) the prudence of the USFP SAP implementation given problems with its roll-out; and (3) characterization of the non-recurring test year EHR1 implementation expense as a stabilization cost.

b. Facilities Lease Expense

A company's lease expense represents an allowable cost qualified for inclusion in its overall cost of service. D.P.U. 10-55, at 268; D.P.U. 09-39, at 155; D.T.E. 03-40, at 171; Nantucket Electric Company, D.P.U. 88-161/168, at 123-125 (1989). The standard for inclusion of lease expense is one of reasonableness. D.P.U. 89-114/90-331/91-80 (Phase I) at 96. Known and measurable increases in rental expense based on executed lease agreements with unaffiliated landlords are recognized in cost of service as are operating costs (e.g., maintenance, property taxes) covered by the lessee. D.P.U. 95-118, at 42 n.24; D.P.U. 88-67 (Phase I) at 95-97.

During the test year, National Grid booked lease-related expenses totaling $8,787,277 for facilities, including $3,308,931 for Reservoir Woods, Waltham; $1,462,878 for Northborough;

and $4,015,468 for all other facilities (Exhs. NG-RRP-2 (REV-3), at 15; WP NG-RRP-8).[219] No intervenors commented on the Company's proposed facilities rental expense adjustments. The Department finds that the proposed adjustments to the Company's facilities lease expenses are reasonable and represent a known and measurable change to the Company's test year cost of service (Exhs. NG-RRP-2, at 15 (Rev. 3); WP-NG-RRP-8; DPU-31-24; AG-1-64; AG-1-92). D.P.U. 10-55, at 260-268; D.P.U. 09-39, at 156-158; D.P.U. 95-118, at 42 n.24; D.P.U. 89-114/90-331/91-80 (Phase I) at 153. Accordingly, the Department accepts National Grid's proposed expense adjustments for its facilities.

c. Post-Test Year IS Additions

As noted above, the Attorney General opposes the Company's inclusion of $9,026,666 in post-test year IS rent expense, stating that these adjustments break with Department precedent requiring the utility to demonstrate that post-test year additions are significant relative to the operating company's test year end rate base. In turn, National Grid maintains that there is no basis for applying the Department's post-test year rate base standard to costs that are treated as expenses on a company's books.

In the instant case, the associated costs are not recorded as plant investment, but instead are recorded as expenses (Exhs. NG-RRP-1, at 12; NG-RRP-Rebuttal-1, at 22; Tr. 6, at 946-952). The Department has found that because lease expenses do not represent a capital improvement to the Company, such expenses should not constitute a rate base item. D.P.U. 09-39, at 155; D.P.U. 95-118, at 41-46; NYNEX Price Cap, D.P.U. 94-50, at 436 (1995);

---

219 As noted above in Section VIII.O.2.b, these lease-related expenses reflect normalizing adjustments totaling $1,602,011, representing a decrease to the total test year end amount (Exhs. NG-RRP-2, at 15 (Rev. 3); WP-NG-RRP-8; DPU-31-24).

D.P.U. 84-94, at 18. The Department finds that rental expense is a component of a company's operating and maintenance expense, not a component of its capital structure. NGSC owns the IS assets in question and therefore its rate base applies to those assets. While the lease arrangements provide the Company with benefits from the IT system, they do not give the Company an ownership interest in the assets or permit the Company to include associated capital expenditures in rate base. D.P.U. 09-39, at 155; D.P.U. 85-270, at 186; D.P.U. 84-94, at 18. We also find that these IS rent expenses are known and measurable (Exhs. NG-RRP-2, at 15 (Rev. 3); NG-RRP-4 (Rev. 1); WP NG-RRP-9 at 4, 8, 12 (Rev. 1); AG-DR-1, at 39-40). Accordingly, the Department declines to accept the Attorney General's recommendation to exclude the Company's $9,026,666 in IS rent expense normalization from the adjusted test year expenses. However, as discussed below, the Department will adjust this amount based on NGSC's return on rate base.

Consistent with our disposition of this issue, the Department declines to adopt the Attorney General's recommendation to remove incremental OMS expenses of $574,716. Further, we find that incremental EMS expenses of $526,122 are appropriate for recovery. Therefore, the Department includes these expenses in the Company's cost of service.

d. Reduced NGSC Returns

The Department permits rate recovery of payments to affiliates where those payments are: (1) for activities that specifically benefit the regulated utility and that do not duplicate services already provided by the utility; (2) made at a competitive and reasonable price; and (3) allocated to the utility by a formula that is both cost-effective in application and non-discriminatory for those services specifically rendered to the utility by the affiliate and for

general services that may be allocated by the affiliate to all operating affiliates. Aquarion Water Company of Massachusetts, D.P.U. 11-43, at 143-146 (2012); D.P.U. 95-118, at 41; Milford Water Company, D.P.U. 92-101, at 43-46 (1992); D.P.U. 89-114/90-331/91-80 (Phase I) at 79-80 (1991); D.P.U. 85-137, at 51-52.

The Attorney General has recommended that the Department reduce the return portion of the IS rent expense on two levels. First, the Attorney General recommends that the return specifically associated with USFP SAP implementation costs be reduced to 3.70 percent, representing NGSC's long-term-debt rate. Second, the Attorney General recommends that the return on all NGSC IS asset-related costs be based on the ROE ultimately allowed by the Department; National Grid concurs with this second recommendation (Exh. NG-RRP-Rebuttal-1, at 20).

Regarding her recommendation to reduce the return on USFP SAP implementation to NGSC's long-term debt rate of 3.70 percent, the Attorney General draws on the extensive record evidence detailing USFP SAP implementation problems and subsequent corrective stabilization efforts to argue that Company denial of unreasonable decision making is an attempt to gloss over her legitimate claims of imprudence. The extent of the problems associated with USFP SAP implementation is acknowledged by the Company and is well-documented in the instant case (Exhs. NG-MLR-1, at 27-28; AG-4-6; AG-16-12; AG-23-9, Att. 1; Tr. 1, at 45-54; Tr. 5, at 598-600, 605-608).[220] NGSC executives explained details of the root causes, which the Attorney General cited as evidence of imprudence behind the decisions underpinning the USFP

[220] In particular, Exhibit AG-4-6 includes 72 attachments, covering USFP SAP implementation audits and update reports on system improvements resulting from NGSC's responses to identified problems and lessons learned (Exhs. AG-4-6; AG-23-9).

SAP development and roll-out (Exhs. AG-23-9, Att. 1; Tr. 1, at 45-54, 56-57; Tr. 5, at 607-608). The Attorney General focuses on increases in total projected costs throughout the project's development to attach a financial consequence to the problems experienced at implementation (Exhs. AG-DR-1, at 33-35; AG-4-4; AG-4-21). The Department, however, disagrees with the Attorney General's suggestion that the implementation problems and cost increases are linked and based on unreasonable and imprudent decisions.

Regarding increases in project costs, a prudence review of a company's actions is not dependent upon whether budget estimates later prove to be accurate, but rather upon whether the assumptions made were reasonable, given the facts that were known or that should have been known at the time. D.P.U. 93-60, at 35; D.P.U. 85-270, at 23-24. Documents recording details of the early project scoping efforts indicate that the Company was aware that only final detailed design phases closer to project implementation would prove the accuracy and validity of preliminary project scoping and cost estimates (Exh. AG-4-4, Atts. 2-5). Overall, the record shows that NGSC embarked on a necessary update of critical but inadequate information systems, employing an organized planning and development process that explored alternative strategies and vendors in an attempt to improve the systems at a competitive and reasonable price (Exhs. WP-NG-RRP-9; AG-2-25; AG-4-1; AG-4-2; AG-4-4 through AG-4-18; AG-11-14; Tr. 5, at 568-580). We note that among those improvements is the OMS, an IS asset developed and implemented in direct response to a Department Order mandating the Company to improve emergency management procedures related to outages and wires-down response and reporting. D.P.U. 11-85-A/D.P.U. 11-119-A at 151-153.

The record also shows that the IS rental expenses charged by NGSC were allocated to the utility by a cost-effective and non-discriminatory formula (Exhs. WP-NG-RRP-9; DPU-31-16; DPU-31-19; DPU-31-20; AG-1-92; AG-11-2; AG-11-3; AG-11-4). The Department acknowledges that the USFP SAP implementation in 2012 suffered from defects in system construction as well as from an initial lack of understanding by those employees running it (Tr. 5, at 607). The record makes abundantly clear that the NGSC strove to correct those defects at no cost to ratepayers through a $552,228,831 stabilization program subsidized by shareholders (Exhs. NG-MLR-1, at 29; AG-4-10; AG-4-13; AG-4-20; AG-15-11; AG-23-1; Tr. 1, at 41-43, 46-48, 50-57; Tr. 5, at 585-586, 598, 608). What is not clear is whether the Company could have avoided similar problems had NGSC chosen a different system vendor and development path (Exhs. NG-AG-1-6; AG-4-15; NG-11; Tr. 11, at 1595-1600, 1686-1687). Because the utility's actions, based on all that it knew or should have known at the time, were reasonable and prudent, and because the parent company absorbed the stabilization costs, we decline to accept the Attorney General's recommendation of reducing the return on USFP SAP expenses to 3.70 percent.

Regarding the Attorney General's second recommendation, the Department has found a ROE of 9.90 percent is appropriate for the Company (see Section XII.E below). On that basis, the Department finds that application of the Company's proposed capital structure, including a proposed ROE of 10.5 percent, to determine the Company's allocated share of the IS investment would result in Massachusetts ratepayers inappropriately subsidizing the operations of NGSC. To guard against Massachusetts ratepayers inappropriately subsidizing the operations of NGSC, the Department will recalculate the return on NGSC assets using NGSC's capital structure and

the 9.90 percent ROE authorized in the instant case. D.P.U. 10-55, at 266-267; D.P.U. 11-43, at 145; D.P.U. 08-27, at 82. Application of the 9.90 percent ROE approved in this order to NGSC's capital structure produces an overall weighted cost of capital of 6.80 percent, and a pretax weighted cost of capital of 10.13 percent (see Exh. NG-RRP-4, at 6 (Rev. 1)). Application of the pretax weighted cost of capital to NGSC's allocation of IT services to the Company yields $19,409,402 in adjusted test year IS rent expense and $8,891,752 in adjusted post-test year IS rent expense (see Exhs. NG-RRP-2, at 15 (Rev. 3)). These amounts when added to the post-test year OMS and EMS operating costs produce a revised IS rent expense of $29,401,991 versus the Company's proposed IS rent expense of $29,732,078 (see Exh. NG-RRP-2, at 15 (Rev. 3); n.201 above). Accordingly, the Department reduces the Company's proposed IS rent expense by $330,087. [221]

e. EHR1 Implementation Costs

The Attorney General's recommendation for eliminating $2.7 million in non-recurring implementation costs associated with EHR1 hinges on an interpretation of this particular project phase as an element of SAP stabilization, for which the associated expenses were charged to the parent company (Exhs. AG-DR-1, at 40-41; AG-4-19; AG-4-20; AG-15-11). Without directly naming the relevant EHR1 project costs as stabilization expenses, the Attorney General nevertheless suggests that they could be construed as such, describing them as SAP systems that were above and beyond NGSC's IS rent expense and with the effect of completing SAP

[221] The $330,087 adjustment consists of (1) a decrease of $195,172 from the Company's proposed adjusted test year amount of $19,604,574 in IS rent, and (2) a decrease of $134,915 from the Company's proposed post-test year amount of $9,026,666 in IS rent (Exh. NG-RRP-2, at 15 (Rev. 3)).

stabilization (Exh. AG-DR-1, at 41).[222] Notably, the expenses involve fees to Deloitte Consulting LLP, the firm that provided much of the stabilization services (Exh. AG-15-11). The Attorney General's challenge to the Company's inclusion of R3-labeled costs booked in the test year exposes a conflict between the Company's claims on stabilization versus non-stabilization costs (Exhs. AG-4-19; AG-4-21; Tr. 5, at 583-592). The Company states that it charged all stabilization costs to the parent company, yet R3 costs that a Company witness clearly identifies as meant for stabilizing the system are included in the revenue request (Exhs. NG-MLR-1, at 29; NG-RRP-2, at 5; WP-NG-RRP-9, at 3, 7; AG-4-19; AG-4-21; Tr. 5, at 585-586). The Company's response that the R3 costs in question included only investments in system enhancements not equivalent to stabilization measures leaves us with a semantics question for which we must look to the record to answer (Exhs. AG-4-10; AG-4-20; AG-23-2).

In the extensive confidential EHR1 project update and review reports submitted to National Grid parent executives, R3 project status reports detail a USFP stabilization phase that ends in September 2014 (Exhs. AG-4-6, Atts. 65 and 72). The Company draws a clear line at September 30, 2014 as the divide separating stabilization and EHR1 implementation projects (Exhs. AG-4-6, Atts. 49, 61 and 65). The post-stabilization USFP EHR1 implementation went live in December 2014 with a second phase rolling out in January 2015, which corroborates with the Company's listing of the various USFP EHR1 components among test year charges challenged by the Attorney General, such as supply chain, finance, IT-delivery, and payroll

---

222 In reference to the $2.7 million, the Attorney General witness states, "[H]opefully now that the EHR1 upgrade and enhancements have been implemented, the Company will be past the need to stabilize the USFP SAP systems and these significant SAP implementation expenses will not be an annually recurring event" (Exh. AG-DR-1, at 41).

(Exhs. AG-4-6, Att. 61; AG-4-19). The Company's labeling of these charges as R3 is confusing, even if its witness described them as enhancements (after associating them with stabilization) (Exh. Tr. 5, at 585-591). We accept the Company's documentation of these different project phases and the vendor fees to identify them clearly as post-stabilization enhancements to the EHR1 implementation intended to finish the core SAP system roll-out (Exhs. AG-4-6, Atts. 49, 61, 65 and 72; AG-15-11).[223]

The evidence on the record points to such expenses supporting the core project and not stabilization, with contracts, invoices, and consultant reports describing shortcomings of the Company's base line manual work processes, regulatory reporting, and outdated IT systems requiring large-scale and long-term resolution (Exhs. AG-4-19; AG-15-11; Tr. 5, at 583). The expenses support IS assets fundamental to the routine operation of the Company's business processes related to financial management, regulatory reporting, supply chain, payroll, work order cycles, among other essential functions going forward (Exhs. AG-4-6, Att. 65, 72). The Department views these costs as known and measurable elements of the core project and not among the remedial work the NGSC employed for stabilization. Accordingly, we decline to adopt the Attorney General's recommendation to remove the $2.7 million in EHR1 implementation costs from the cost of service.

f. Savings From EHR1 Implementation

The Attorney General contends that if the Department allows the post-test year EHR1 system plant additions in the determination of NGSC rent expenses, the Company's revenue request should reflect a commensurate savings from IS enhancements designed to improve

223 The Company provides 58 invoices from consultants helping to develop and implement post-stabilization EHR1 projects (Exh. 15-11).

business processes. The Company maintains that it never anticipated quantifying savings, although it prepared estimates in response to the Attorney General's request for them (Exhs. AG-23-10; AG-23-11). The Company has emphasized the qualitative nature of anticipated savings, and maintains there is no evidence showing realized net savings as a result of the EHR1 implementation, or that net savings are routinely expected from such system enhancements (Exhs. AG-2-25; AG-23-11).

The Department has previously rejected proposed adjustments for savings achieved by projects when the record showed that the savings are speculative or there was uncertainty that savings would be achieved in the rate year. D.P.U. 13-75, at 114; D.P.U. 05-27, at 129-131; D.T.E. 03-40, at 11; D.T.E. 02-24/25, at 76; D.P.U. 95-118, at 130-131; D.P.U. 92-111, at 142; D.P.U. 92-78, at 50-51. While National Grid identified a five-year savings estimate of $74.35 million during the conceptual phase of the project, the Company ultimately determined that savings were difficult to quantify, and that the benefits of the project were more qualitative in nature through the implementation of reliable and stable IT platforms, enhanced controls, additional data transparency and sustainable technical solutions (Exhs. AG-4-4, Att. 3; AG-23-10; AG-23-11). The Company identifies potential and expected savings in confidential reports to parent company executives, attaching specific dollar amounts to individual project areas (Exh. AG-4-6 , Atts. 61 and 65).[224] It is clear that the Company and its affiliate expect some savings from the IS enhancements, but these are not yet calculable to the degree required by our precedent. Therefore, the Attorney General's proposed adjustment does not meet the

[224] For instance, the Company is tracking 16 quantitative benefits to improvements in supply chain management expected to achieve $3 million in savings annually, and has identified $10 million in estimated annual savings or avoided costs across SAP-related projects (Exh. AG-4-6, Att. 61).

Department's known and measurable standard. D.T.E. 03-40, at 11; D.T.E. 02-24/25, at 76; D.P.U. 95-118, at 130-131; D.P.U. 92-111, at 142; D.P.U. 92-78, at 50-51. Accordingly, the Department will not adopt the Attorney General's recommendation.

g. Conclusion

As noted above, the Company proposes to recover $29,732,078 in IS expenses incurred during the test year and through the end of the rate year, September 30, 2017 (Exh. NG-RRP-2, at 15 (Rev. 3)). Based on our findings above, the Department concludes that the appropriate level of IS expense is $29,401,991. Accordingly, the Department will reduce the Company's proposed cost of service by $330,087.

P. Environmental Response Costs

1. Introduction

During the test year, National Grid booked $9,120,244 in environmental remediation expenses associated with its electric operations and former manufactured gas plant ("MGP") sites operated by its corporate predecessors (Exh. AG-1-59, Att.).[225] The Company funds its environmental remediation activities through its Environmental Hazardous Waste Fund ("Environmental Response Fund") (Exh. AG-1-59). The Environmental Response Fund was created as part of a settlement agreement ("1993 Settlement") in Massachusetts Electric Company, D.P.U. 93-194 (1993), and is intended to provide for National Grid's environmental remediation activities at both its former MGP sites and electric operation sites where remediation

225 Many of National Grid's corporate predecessors operated as combination gas and electric utilities, and the Company retains responsibilities for environmental liabilities arising from the operation of these entities (Exh. DPU-25-3). The Company has been engaged in remediation activities at 31 electric operations sites and 27 former MGP sites (Exh. DPU-25-8, Att. 6, at 5-6).

of pre-1980 contamination was underway (Exhs. DPU-25-8, Att. 6, at 3 n.1; AG-1-59; 1993 Settlement, § B).[226] The Environmental Response Fund was initially financed through a one-time shareholder contribution of $30 million, and the Company is authorized to increase the fund balance through annual ratepayer contributions indexed to the Gross Domestic Product Implicit Price Deflator ("GDPIPD") as of October 1 of each year (Exhs. DPU-25-3; DPU-25-4; AG-1-59; 1993 Settlement, § B.2).[227]

National Grid booked $4,017,471 in contributions to the Environmental Response Fund during the test year (Exh. NG-RRP-2, at 25 (Rev. 3)). The Company proposes to increase its contributions to $4,168,528, based on the application of an anticipated increase in the GDPIPD to 3.76 percent for the period from the midpoint of the test year (i.e., December 31, 2014) to the midpoint of the rate year (i.e., April 1, 2017) (Exhs. NG-RPP-1, at 36-37; NG-RPP-2, at 25 (Rev. 3)).[228] Consequently, the Company proposes to increase its test year cost of service by $151,057 (Exh. NG-RPP-2, 25 (Rev. 3)).

---

226 The 1993 Settlement incorporates amendments by the settling parties, and was stamp approved by the Commission on November 30, 1993. Pursuant to 220 C.M.R. § 1.10(3), the Department incorporates by reference in this proceeding the stamp approved version of the 1993 Settlement.

227 The Company draws from the Environmental Response Fund to provide for remediation activities, including property purchases and claims settlements (Exh. DPU-25-8, Att. 6, at 8). Rental income associated with several MGP sites, third party recoveries, and interest income on the Environmental Response Fund are treated as offsets against the fund (Exh. DPU-25-8, Att. 6, at 2; 1993 Settlement, § 2(c)). Legal and consultant fees associated with defending or prosecuting environmental remediation claims or liabilities are not recovered through the Environmental Response Fund, but are charged instead to various O&M expense accounts (Exh. DPU-25-7).

228 National Grid uses the same method to compute its proposed inflation allowance (see Section VIII.Q below).

2. Positions of the Parties

National Grid contends that it has appropriately calculated its proposed Environmental Response Fund adjustment based on the increase in the GDPIPD from the mid-point of the test year to the mid-point of the rate year applied to its test year fund contribution (Company Brief at 93, citing Exhs. NG-RPP-1, at 36; NG-RPP-2, at 25 (Rev. 3)). Consequently, the Company argues that the Department should accept the proposed adjustment without modification (Company Brief at 93). No other party addressed this issue on brief.

3. Analysis and Findings

The ratemaking treatment of National Grid's environmental remediation expenses was approved as part of the 1993 Settlement. The Department's authority to consider and approve distribution rates through agreed settlements derives from statute. See G.L. c. 164, §§ 76, 93, 94. Rates approved under this broad discretionary authority must conform to the requirements of statute, i.e., they must be "just and reasonable" and "in the public interest" in order to warrant Department approval. Boston Edison Company/Cambridge Electric Light Company/Commonwealth Electric Company/NSTAR Gas Company, D.T.E. 05-85, at 28 (2005). While the Department neither would nor should disturb matters established by an approved settlement, the public interest requirement of Chapter 164 remains paramount. D.T.E. 05-85, at 29. The Department has no authority to impair or ignore its own statutory authority or obligations, whether by adjudication or by settlement-approval. D.T.E. 05-85, at 29; see also D.T.E. 99-47, at 21 n.20.

National Grid's environmental remediation expenditures involve a wide range of activities, and include consulting fees, contractor costs, regulatory expenses, and legal fees

(Exh. DPU-25-8, Att. 6, at 11-70). No issues have been raised regarding the prudence of the Company's environmental remediation expenditures.[229] Based on the Company's activities and the Department's familiarity with site remediation, particularly remediation efforts related to former MGP sites, we are satisfied that the Company's environmental remediation activities have been prudently incurred and are reasonable in amount. D.P.U. 10-70, at 183-184; Manufactured Gas Plants, D.P.U. 89-161, at 6-29 (1990). Therefore, the Department finds that these expenditures are eligible for recovery through the Environmental Response Fund.[230]

Pursuant to the terms of the 1993 Settlement, National Grid is permitted to increase its annual contribution to the Environmental Response Fund on October 1 of each year, using the GDPIPD (Exh. AG-1-59; 1993 Settlement, § B.2(b)). The annual inflation-indexed increases in the Environmental Response Fund contributions take effect in October of each year, with one-twelfth of the annual contribution credited to the fund each month (Exh. DPU-25-5; 1993 Settlement, § B.2(b)). National Grid, however, applied an inflation factor of 3.76 percent representing inflation between December 31, 2014 (the midpoint of the test year) and April 1, 2017 (the midpoint of the rate year) (Exhs. NG-RRP-2, at 23, 25 (Rev. 3); WP-NG-RRP-16, at 1-4). The Company's calculation incorrectly presumes that the monthly accrual to its

---

229 The 1993 Settlement specifies that nothing in the settlement preludes any party from raising issues related to the prudency of National Grid's environmental remediation expenditures (1993 Settlement, § B.3).

230 The Department also has examined the history of contributions to and payments from the Environmental Response Fund (Exh. DPU-25-8, Atts. 1-6). Based on our review, we are satisfied that the Environmental Response Fund remains an appropriate vehicle by which to fund National Grid's environmental remediation activities. In reaching this finding, we recognize that at some point in the future the Company's MGP and pre-1980 electric sites will be fully remediated, thus eliminating the need for an Environmental Response Fund, but also acknowledge that that time has not yet arrived.

Environmental Response Fund increases monthly based on inflation. Because the Company's monthly contributions are determined in October of each year and remain unchanged until the following October, the next inflation-related adjustment to the monthly contribution would not occur until October of 2017, about a year after the issuance of this Order. This error is partially offset by the Company's use of an unadjusted test year contribution that does not fully account for the increased contribution that became effective on October 1, 2014. Based on these considerations, the Department finds that National Grid has incorrectly calculated its Environmental Response Fund contribution.

The Department will calculate a revised contribution based on the most recent inflation rates provided in the record (RR-DPU-10, Att.).[231] The Department finds that a calculation using inflation rates from the midpoint of the period prior to the October 2015 inflation adjustment (i.e., April 30, 2014) and the date of this Order reliably accounts for the inflation-indexed contributions to the Environmental Response Fund that have occurred since the end of the test year. Based on inflation-related data provided in the record, the inflation factor from the midpoint of the test year to the date of this Order is 3.32 percent (see RR-DPU-10, Att. at 3).[232] The Department finds that an inflation factor of 3.32 percent is an appropriate proxy for the annual inflation-indexed adjustments to the Company's contributions to the Environmental Response Fund permitted by the 1993 Settlement.

---

231 These rates are current through April 4, 2016 (RR-DPU-10, Att. at 1).

232 The 3.32 percent inflation allowance represents the difference between an interpolated inflation index of 108.23 as of April 30, 2014 and an interpolated inflation index of 111.55 as of September 30, 2016 (see RR-DPU-10, at 2).

Application of an inflation factor of 3.32 percent to the Company's test year end Environmental Remediation Fund balance of $4,017,471 produces an adjusted balance of $4,150,851, representing an increase of $133,380. National Grid has proposed an increase of $151,057. Therefore, the Department reduces the Company's proposed cost of service by $17,677.

Q. Inflation Allowance

1. Introduction

In its initial filing, National Grid proposed an inflation adjustment of $6,311,460 (Exhs. NG-RRP-1, at 35; NG-RRP-2, at 23). The Company then revised its inflation adjustment to $5,312,904 to account for updated expense reporting (Exh. NG-RRP-2, at 23 (Rev. 3)). The Company calculated its inflation allowance using the GDP-PI or "GDP Deflator" as sourced from the U.S. Bureau of Economic Analysis and Moody's Analytics (Exhs. NG-RRP-2, at 23 (Rev. 3); WP-NG-RRP-16 (Rev. 3)). In its initial filing, National Grid calculated the projected change in the GDP-PI from the midpoint of the test year to the midpoint of the rate year as 4.39 percent (Exh. NG-RRP-2, at 23). During the proceedings, the GDP-PI was updated, and the Company revised the inflation factor to 3.76 percent (Exhs. NG-RRP-2, at 23 (Rev. 3); DPU-25-10).

2. Positions of the Parties

a. Attorney General

The Attorney General argues that the Company's inflation adjustment should be calculated by applying an inflation factor of 3.76 percent and not 4.39 percent, which was originally proposed at the time of the Company's filing (Attorney General Brief at 27-28).

According to the Attorney General, the lower inflation factor reflects the most recently available GDP-PI information (Attorney General Brief at 27, citing Exh. AG-DJE-1, at 11).

b. Company

National Grid acknowledges the Attorney General's recommendation to apply the most up-to-date inflation factor of 3.76 percent to the residual test year O&M expense, and the Company notes that it has updated its proposed inflation adjustment accordingly (Company Brief at 73-74). However, the Company contends that if it is appropriate to update the revenue requirement to capture changes in the inflation rate with the goal of achieving rates that are representative of actual costs going forward, then it also should be appropriate to capture post-test year changes in the cost of service that are even more significant, such as changes to the Company's IS rent expense (Company Brief at 74).

3. Analysis and Findings

The inflation allowance recognizes that known and inflationary pressures tend to affect a company's expenses in a manner that can be measured reasonably. D.T.E. 02-24/25, at 184; D.T.E. 01-56, at 71; D.T.E. 98-51, at 100-101; D.P.U. 96-50 (Phase I) at 112-113; D.P.U. 95-40, at 64. The inflation allowance is intended to adjust certain O&M expenses for inflation where the expenses are heterogeneous in nature and include no single expense large enough to warrant specific focus and effort in adjusting. D.P.U. 1720, at 19-21; Commonwealth Electric Company, D.P.U. 956, at 40 (1982). The Department permits utilities to increase their test year residual O&M expense by an independently published price index from the midpoint of the test year to the midpoint of the rate year. D.P.U. 08-35, at 154-155; D.T.E. 02-24/25, at 184; D.P.U. 95-40, at 64; D.P.U. 92-250, at 97-98. In order for the Department to allow a utility to recover an

inflation adjustment, the utility must demonstrate that it has implemented cost-containment measures. D.P.U. 09-30, at 285; D.P.U. 08-35, at 154; D.T.E. 02-24/25, at 184; D.T.E. 01-56, at 71-72.

National Grid calculated its inflation allowance from the midpoint of the test year to the midpoint of the rate year, using GDP-PI information as an inflation measure (Exhs. NG-RRP-2, at 23 (Rev. 3); WP-NG-RRP-16; DPU-25-10). We find this method to be consistent with Department precedent. D.P.U. 08-35, at 154-155; D.T.E. 02-24/25, at 184; D.P.U. 95-40, at 64; D.P.U. 92-250, at 97-98. However, we do not accept the Company's proposed inflation factor of 3.76 percent. Instead, the Department concludes that an inflation adjustment of 3.18 percent based on the most recent forecast of GDP-PI from the midpoint of the test year to the midpoint of the rate year, applied to the Company's approved level of residual O&M expense less the Department's adjustments, is proper in this case (RR-DPU-10, Att. at 3).

With respect to cost containment, National Grid provides that the residual O&M expenses subject to inflation include, but are not limited to, items such as transportation, contractors/consultants, employee expenses and materials (Exh. DPU-1-23, at 1). The majority of these categories of O&M expenses are subject to a competitive procurement process (Exh. DPU-23-1, at 1). For example, the Company utilizes a competitive procurement process in procuring contractors and outside services and has adopted a vigorous RFP process for goods and services to ensure that it obtains the best prices available (Exh. DPU-1-23, at 1). Further, the Company has developed unit pricing for its distribution and civil construction services in order to

minimize costs (Exh. DPU-1-23, at 2).[233] In addition, transmission line, substation, and larger distribution jobs are competitively bid, with each project undergoing the formal procurement process with proposals and pricing stringently chosen and evaluated (Exh. DPU-1-23, at 2). Finally, the Company has instituted a competitive process for vegetation management contractors, allowing long-term contractors to maintain their existing work on the condition that pricing remains within the pre-determined range (Exh. DPU-23-1, at 2).[234] Based on these considerations, the Department finds that the Company has demonstrated and implemented cost control measures that provide direct ratepayer benefits to warrant the allowance of an inflation adjustment.[235]

If an O&M expense has been adjusted or disallowed for ratemaking purposes, such that the adjusted expense is representative of costs to be incurred in the year following new rates, the test year expense is also removed in its entirety from the inflation allowance. D.P.U. 09-39, at 322-323; D.T.E. 05-27, at 204-205; D.T.E. 02-24/25, at 184-185; Blackstone Gas Company, D.T.E. 01-50, at 19 (2001); D.P.U. 88-67 (Phase I) at 141; Commonwealth Gas Company, D.P.U. 87-122, at 82 (1987). National Grid has removed test year expenses associated with

---

233 Unit prices are established through a complex process of negotiations and are intended to be inclusive of all aspects of the scope of work, such as labor, equipment, fuel, administration, safety, environmental compliance, permitting, travel and delays in order to reduce National Grid's exposure to additional charges (Exh. DPU-1-23, at 2).

234 National Grid notes that other contractors are allowed to maintain 90 percent of their previous year share of work if the Company determines that they have maintained a competitive price and a satisfactory safety and performance record (Exh. DPU-1-23, at 2). National Grid reserves ten percent of work for new vendors with the objective of maintaining a competitive platform (Exh. DPU-1-23, at 2).

235 The Company also provided examples of cost containment measures in other areas, such as with medical and dental expenses (see Section VIII.C above).

various O&M expense items that have either been separately adjusted for ratemaking purposes or are not subject to inflationary pressures, such as salaries and wages, medical and dental expense, and group insurance expense (Exhs. NG-RRP-2, at 23 (Rev. 3); DPU-1-23, at 1). The test year expense associated with these items, totaling $210,633,751, has been removed from National Grid's residual O&M expense calculation (Exh. NG-RRP-2, at 23 (Rev. 3)). In addition, the Department has excluded from the residual O&M expense the test year costs associated with the Company's postage expense. Therefore, the test year expenses associated with this item, totaling $6,595,462 will be removed from National Grid's residual O&M expense calculations, as shown in Table 1.

The Company proposes an inflation adjustment of $5,312,904 (Exh. NG-RRP-2 (Rev-3), at 23). As shown in Table 1, the inflation adjustment for National Grid including Department adjustments, and based on an inflation factor of 3.18 percent, is $4,283,625. Accordingly, the Department will reduce the Company's proposed cost of service by $1,029,279.

Table 1:

Test Year O&M Expense Per Books:		$351,934,387
Less Normalizing Adjustments:		
Salaries & Wages:		
MECO / Nantucket Employees		$64,876,622

Inflation Allowance per DPU:	$4,283,625	
Reduction to Cost of Service:	$1,029,279	

IX. PROPERTY TAX RECOVERY MECHANISM

A. Introduction

On December 16, 2009, the Massachusetts Appellate Tax Board ("Appellate Tax Board") issued a ruling approving the City of Boston Board of Assessors' change in valuation method for assessing utility property. Boston Gas Company d/b/a KeySpan Energy Delivery New England v. The Board of Assessors of Boston, Docket No. F275055, F275056 (December 16, 2009)). Pursuant to that ruling, the Appellate Tax Board approved Boston's change in method from assessing utility property based on net book value (i.e., original cost less depreciation) to assessing utility property based on weighing net book value equally with "reproduction cost new less depreciation" ("RCNLD").[236] Boston Gas Company appealed the ruling to the Supreme Judicial Court ("SJC"), which upheld the Appellate Tax Board's decision and determined that the valuation method used by Boston was reasonable. Boston Gas Company v. Board of Assessors, 458 Mass. 715, 729, 739-740 (2011). The SJC then remanded the matter to the Appellate Tax Board for further findings. On April 21, 2011, the Appellate Tax Board issued a final ruling in the matter denying Boston Gas Company's appeal of the property tax valuation of the City of Boston Board of Assessors. Boston Gas Company d/b/a KeySpan Energy Delivery New England v. The Board of Assessors of Boston, Docket No. F275055, F275056 (April 21, 2011).

---

236 "Reproduction cost new less depreciation" applies a cost-inflationary factor to age the property in question, with a 20 percent floor on the value of the asset. See Boston Gas Company d/b/a KeySpan Energy Delivery New England v. The Board of Assessors of Boston, Docket No. F275055, F275056, at Appellate Tax Board 2009-1232 (December 16, 2009).

The Company states that nine municipalities in its service territory have adopted the RCNLD method (Exhs. NG-RRP-1, at 90; DPU-22-5, at 2; Tr. 6, at 896).[237] According to the Company, property tax increases attributable to the RCNLD method in these nine communities amount to $6,304,272 annually (Exhs. NG-RRP-1, at 90; NG-RRP-7).[238] The Company has appealed the use of RCNLD method to the Appellate Tax Board, and it has sought abatements related to the assessments levied by six of the nine municipalities (Exhs. NG-RRP-1, at 90; DPU-22-5, at 2-4; Tr. 6, at 896).[239] The appeals and abatement requests still are pending (Exh. DPU-22-5, at 2-4). National Grid states that if the appeals are denied and all 235 municipalities in its service territory adopt the RCNLD method, the Company would experience an additional annual increase in property tax expense of $28.3 million (Exhs. NG-RRP-1, at 91; NG-RRP-7, at 2).[240]

B. Company Proposal

The Company proposes a Property Tax Provision ("PTP") tariff to address the aforementioned pending abatements and the potential impact of additional communities adopting

---

237 These municipalities are: Billerica, Boston, Everett, Lynn, Somerset, Warwick, Westborough, Westminster, and Worcester (Exh. DPU-22-5, at 2).

238 The Company states that it has not withheld payment of any of the incremental property taxes assessed by any of the nine municipalities (Exh. DPU-22-6).

239 The Company has filed appeals and sought abatements relative to the RCNLD method adopted by the following six communities: Billerica, Everett, Lynn, Somerset, Westborough, and Worcester (Exh. DPU-22-5, at 2-4). National Grid states that the incremental taxes assessed by the City of Boston and the Town of Warwick were nominal and not worth the cost of pursuing (RR-DPU-23). Further, National Grid notes that the Town of Westminster accepted the Company's net book value for the 2015-2016 tax year, so there is no tax dispute (RR-DPU-23).

240 National Grid states that if its pending appeals are denied by the Appellate Tax Board, the Company will pursue relief in court (Exh. DPU-22-10).

the RCNLD method (Exhs. NG-RRP-1, at 91; NG-PP-23, at 199-200 (proposed M.D.P.U. No. 1282)). Specifically, the PTP is designed to refund to customers any abatements received by the Company from municipalities as a result of the Company's challenges to the RCNLD method (Exhs. NG-RRP-1, at 91; NG-PP-23, at 199 (proposed M.D.P.U. No. 1282)). Pursuant to the PTP, the Company would allocate the net credit from the abatement to rate classes by applying a rate base allocator derived from the Company's most recent general rate case to determine the amount of the credit allocable to each rate class (Exh. NG-PP-23, at 199-200 (proposed M.D.P.U. No. 1282)). Further, the PTP would permit the Company to recover from customers costs incurred in pursuing the abatements and appeals (Exhs. NG-RRP-1, at 92; NG-PP-23, at 199 (proposed M.D.P.U. No. 1282); DPU-22-7, at 2; DPU-33-9; Tr. 6, at 899-902).[241]

The PTP also would permit the Company to measure and recover any increases in annual property tax expense should additional municipalities adopt the RCNLD method (Exhs. NG-RRP-1, at 91; NG-PP-23, at 199-200 (proposed M.D.P.U. No. 1282)). The Company proposes to calculate the incremental difference in taxes assessed and to accrue that amount until the end of the calendar year preceding a July 1 filing (Exh. NG-PP-23, at 199-200 (proposed M.D.P.U. No. 1282)). Interest would accrue monthly on unrecovered balances at the customer deposit rate (Exh. NG-PP-23, at 199-200 (proposed M.D.P.U. No. 1282)). National Grid proposes that on July 1 of each year, the Company would make a filing with the Department to

---

241 The Company reported legal fees and other costs (e.g., filing fees, independent valuation expert or appraisal fees) associated with the pending appeals of $68,546 (Exhs. DPU-22-5, at 4; DPU-31-9, Atts.). The Company states that if it is unsuccessful in challenging the RCNLD valuation method, it would not seek to recover through the PTP costs related to requests for appeals or abatements (Exhs. DPU-22-8; DPU-31-10). Rather, the Company notes that such costs, to the extent that they are incurred during a test year of a general rate case, would be recovered through base distribution rates resulting from that general rate case (Exh. DPU-31-10).

collect from each rate class the incremental tax and associated carrying costs through a property tax factor ("factor") (Exh. NG-PP-23, at 199-200 (proposed M.D.P.U. No. 1282)). For each rate class, the factor used to recover the incremental costs would be based on the same rate base allocator used to credit any abatements (Exh. NG-PP-23, at 199-200 (proposed M.D.P.U. No. 1282)). Further, net abatements, if any, would be used to offset the incremental property taxes (Exh. NG-PP-23, at 199-200 (proposed M.D.P.U. No. 1282)). Pursuant to the Company's proposal, the factor would be effective on the following November 1, for a period of twelve months (Exh. NG-PP-23, at 199-200 (proposed M.D.P.U. No. 1282)). The Company's proposed PTP does not have a specific expiration date (Exh. DPU-22-7, at 3).

C. Positions of the Parties

1. Attorney General

The Attorney General argues that the Company's proposed PTP should be rejected because it: (1) is speculative in nature; and (2) does not satisfy the Department's long-standing requirements for establishing a new reconciling mechanism (Attorney General Brief at 100; Attorney General Reply Brief at 59). Regarding the first argument, the Attorney General contends that there is no evidence that any other municipality has a pending proposal to adopt the RCNLD (Attorney General Brief at 101; Attorney General Reply Brief at 59). Further, she claims that it is unknown whether the RCNLD method will actually result in an increase in property taxes, that the RCNLD method produced only nominal property tax differences in some communities, and that one municipality reverted back to the net book value method after using the RCNLD method (Attorney General Brief at 101 citing RR-DPU-23; Attorney General Reply Brief at 59). The Attorney General also points out that the Department previously rejected a

similar proposal because it was deemed speculative, and she recommends that the Department do the same in this case (Attorney General Brief at 100-101, citing D.P.U. 12-25).

The Attorney General also argues that the Company has failed to show that the proposed PTP meets the requirements of a new reconciling mechanism (Attorney General Brief at 101 citing NSTAR Gas Company Pension, D.T.E. 03-47-A at 17-18 (2003); Worcester Gas Light Company, D.P.U. 11209, at 8-10 (1946)). In particular, the Attorney General argues, while the property tax amounts may be out of the Company's control, National Grid failed to demonstrate that the RCNLD method results in a significant increase in property taxes relative to the annual expense and its earnings (Attorney General Brief at 101, citing RR-DPU-23; Attorney General Reply Brief at 59).

2. PowerOptions

PowerOptions argues that the Company's proposed property tax recovery mechanism should be rejected (PowerOptions Reply Brief at 3, 12). According to PowerOptions, the proposed PTP is "speculative, theoretical and nonconcrete," and such a prospective charge is not just and reasonable or in the best interest of ratepayers (PowerOptions Reply Brief at 12).

3. Company

According to National Grid, its proposal seeks to treat the recovery of any incremental amount of property tax attributable to the RCNLD method as an "exogenous" event, where recovery would be allowed only where the cost is actually incurred (Company Brief at 194; Company Reply Brief at 78). Thus, the Company contends that there is no speculation involved because "[i]f there is no cost, there is no recovery" (Company Brief at 194). Further, the Company maintains that when a municipality adopts the RCNLD valuation method, experience

has shown that the increase in property taxes is substantial (Company Brief at 194-195 citing Exh. DPU-22-5; Company Reply Brief at 78). In this regard, although National Grid disagrees with the Attorney General's characterization of the proposal as a new reconciling mechanism, the Company asserts that the PTP is warranted because incremental expenses are beyond the Company's control and significant in amount (Company Brief at 195; Company Reply Brief at 78-79).

D. Analysis and Findings

National Grid seeks a new tariff provision that is designed primarily for the potential impact of additional communities adopting the RCNLD method (Exhs. NG-RRP-1, at 91; NG-PP-23, at 199-200 (proposed M.D.P.U. No. 1282)). National Grid's proposal is based, in large part, on its concern that other municipalities will adopt the RCNLD method if it is upheld on appeal, which the Company claims will result in a significant annual increase in property tax expense (Exhs. NG-RRP-1, at 90-91; NG-RRP-7). The Company seeks to treat the recovery of any incremental property tax as an exogenous event, while the Attorney General claims that the proposal is akin to a request for a new reconciling mechanism (Company Brief at 194; Company Reply Brief at 78; Attorney General Brief at 101; Attorney General Reply Brief at 59). We need not reach the merits of either argument.

We find that the Company's proposal is premature, speculative, and rests on such a high degree of uncertainty that it fails to warrant establishment of a new, separate charge. See D.P.U. 12-25, at 333. At the close of the record in this case, only nine of the total 235 communities in National Grid's service territory had adopted the RCNLD method (Exhs. NG-RRP-1, at 90; DPU-22-5, at 2; Tr. 6, at 896). Further, the Company considered that

the incremental tax increase in two of these communities was so immaterial that it chose not choose to pursue abatements or appeals of the respective municipality's decision to adopt the method (RR-DPU-23). In addition, one municipality that had announced adoption of the RCNLD method used the net book value method for the 2015-2016 tax year, rather than the RCNLD method (RR-DPU-23). Moreover, there is no evidence that any other municipality in the Company's service territory had a pending proposal to adopt the RCNLD.

Additionally, uncertainty exists in the appeals process. At the close of the record, the Company's appeals still were pending (see Exh. DPU-22-5, at 3; Tr. 6, at 897).[242] Further, the Company concedes that if the appeals are denied, it will continue to challenge the RCNLD method in court (Exh. DPU-22-10). Therefore, any final decision on the Company's appeals may be years away.

Based on these considerations, the Department is not persuaded that there is a reasonable certainty that a significant number or, in fact, any additional municipalities will adopt the RCNLD method in the near future.[243] Therefore, we find that the proposed PTP is not warranted

---

242 Similarly, the record does not disclose any timeline for resolution to the Company's pending abatement requests (see Exh. DPU-22-5, at 3-4).

243 Further, we note that while net book value is a reliable and traditional method for calculating property taxes, we have found that the RCNLD method requires far more intricate calculations and that many smaller municipalities may not have the resources or expertise to easily calculate the new values. D.P.U. 12-25, at 332 n.194. For example, reproduction cost new less depreciation depends on an understanding of current material and labor costs, which can vary widely from region to region. D.P.U. 12-25, at 332 n.194. Smaller municipalities may be forced to hire outside consultants whose fees may exceed the additional tax revenue that a municipality is able to collect through any valuation change. D.P.U. 12-25, at 332 n.194.

at this time.[244] Accordingly, we deny the Company's proposal.[245] Further, we note that in determining the Company's property tax expense (see Section VII.G above), the Department accepted property tax bills from those municipalities that used the RCNLD method of assessment (see Exh. DPU-22-4 & Atts.). Therefore, the higher tax expense for these municipalities is reflected in the Company's representative level of property tax expense.

E. Conclusion

Based on the foregoing, the Department denies the Company's proposal to implement a new tariff to address the pending RCNLD-related abatements and the potential impact of additional communities' adopting the RCNLD method. In its compliance filing, the Company shall revise its tariffs accordingly.

X. ENHANCED VEGETATION MANAGEMENT PILOT

A. Introduction

National Grid's vegetation management program consists of two primary activities – cycle pruning and enhanced hazard tree mitigation ("EHTM") (Exh. DPU-35-1, at 1). Currently, all of the Company's circuits are on a five-year trimming cycle, designed to prune every circuit once every five years (Exh. DPU-35-1, at 1-2). The Company's pruning specifications, which are used by all National Grid contractors, provide for certain minimum distances between all

---

244 As provided in Section VIII.G.3 above, the Department will consider, in future base rate proceedings, alternative ratemaking proposals to address property tax changes between base rate cases.

245 To the extent that additional municipalities adopt the RCNLD method and incremental property tax increases to a level that National Grid believes is significant, the Company may petition the Department for appropriate rate making treatment, including a deferral of cost recovery. See, e.g., North Attleboro Gas Company, D.P.U. 93-229 (1994).

vegetation and power lines (Exh. DPU-35-1, at 2).[246] The Company's cycle pruning program is designed to maintain an acceptable clearance between overhead conductors and vegetation to minimize the risk to the public and utility workforce (Exh. DPU-35-1, at 2). Further, the Company notes that it is best-practice to maintain a stable and consistently funded circuit pruning program because it minimizes the risk of public and worker electrocution as well as wild fire events (Exh. DPU-35-1, at 2). In addition, the Company states that consistent cycle pruning also helps maintain service reliability, avoiding potential interruptions from phase-to-phase tree contact (Exh. DPU-35-1, at 2).

National Grid's EHTM program has been in place since 2008 and seeks to identify hazard trees that are diseased, dying, or dead along the Company's circuits and that are susceptible to falling onto power lines and causing power outages and public safety hazards (Tr. 8, at 1308, 1310). The Company states that the ETHM focuses on improving reliability on selected circuits (Exh. DPU-35-1, at 2). National Grid selects circuits for improved reliability based on three-year reliability performance, miles of three-phase bare overhead wire that are most susceptible to tree-related interruptions, tree stocking density, and customer count on the circuit (Exh. DPU-35-1, at 2). The Company reports that over the last three years, it has experienced an average reduction in non-storm customer interruptions of 48 percent on circuits receiving EHTM work when compared to the three-year average prior to the implementation of the EHTM (Exh. DPU-35-1, at 2; Tr. 8, at 1309).

---

[246] Specifically, the minimum trimming clearance distances are: (1) ten feet below the wire; (2) six feet to the side; and (3) ten feet above the wire in maintained yard areas, or 15 feet above the wire in unmaintained properties (Exh. DPU-35-1, at 2). These clearance distances were established using expected growth rates for vegetation during the five-year cycle (Exh. DPU-35-1, at 2).

B. Analysis and Findings

Neither the Company nor any intervenors made any proposals regarding the Company's vegetation management program. The Department supports preventative actions undertaken by the Company that seek to improve resiliency, reduce storm restoration costs, preserve critical municipal infrastructure during emergency events, and increase circuit reliability during blue sky days and storm events. In this regard, we acknowledge the Company's efforts to improve reliability and safety on its circuits through its cycle pruning program and EHTM (see Exhs. DPU-35-1, at 2; AG-6-2; AG-6-3).[247] We expect that these efforts will continue to produce appreciable results in the context of reducing customer interruptions outside of storm events.

However, the Department has recognized that a more aggressive storm resiliency program may represent a worthwhile step towards strengthening the Company's distribution system, thus mitigating a portion of the physical damage and financial impacts of future storm events, and thereby benefiting ratepayers. D.P.U. 13-90, at 19. As such, the Department will consider the implementation of a pilot program for National Grid with the goal of further reducing tree-related incidents, customer interruptions, and impact on municipalities along worst performing circuits caused by major weather events.[248]

The Department expects that the pilot program would take place over an established period of time (e.g., five years), and would be designed to target trees that are outside of the

---

247 With respect to cycle pruning, we note that the Company is considering moving from a five-year cycle to a four-year cycle, thereby further improving reliability and safety (Tr. 8, at 1313).

248 The Department recently approved a storm resiliency pilot program for Fitchburg Gas and Electric Light Company. See D.P.U. 13-90, at 15-23.

scope of the Company's current vegetation management program. In particular, the scope of work would include extensive hazard tree inspections and removals and the clearing of all overhead and under hanging branches (i.e., ground-to-sky clearing) associated with the worst performing three-phase circuits, based upon a consideration of: (1) tree-related field conditions; (2) customer count; (3) miles of each circuit; and (4) presence of scenic roads or other vegetation management restrictions. The scope of work also would take into account critical infrastructure needs for affected cities and towns, and the locations of critical facilities such as police and fire departments, schools, emergency shelters, other critical business centers, and critical electric company infrastructure.

Based on these considerations, the Department directs National Grid to submit, no later than six months from the date of this Order, a filing for Department review that proposes a specific course of action with respect to implementing the above-described pilot program. In addition to providing specific information regarding the timeframe of the program and the scope of work, the Company also shall identify the anticipated costs necessary to implement the pilot program, as well as any recommended cost recovery mechanism. As part of our review of the filing, the Department may seek additional information from the Company.

XI. RECOVERY OF BASIC SERVICE COSTS

A. Introduction

The Company currently recovers, through its basic service rates, supply-related bad debt, as well as certain administrative costs incurred by the Company in arranging basic service that were transferred from base distribution rates to basic service (M.D.P.U. No. 1262;

Exh. NG-PP-23, at 168 (proposed M.D.P.U. No. 1276)). D.P.U. 09-39, at 314.[249] These costs are recovered from customers through a Basic Service Administrative Cost Factor set forth in the Basic Service Adjustment Provision ("BSAP") that is added to the basic service rate for billing purposes (M.D.P.U. No. 1262; Exh. NG-PP-23, at 168 (proposed M.D.P.U. No. 1276)).

National Grid proposes to recover $24,146,875 in test year basic service-related costs through the BSAP (Exh. NG-PP-17, at 1). These costs are segregated into three categories: (1) wholesale costs, which include electric procurement, procurement support, and letter of credit; (2) direct retail costs, which include customer communication, rate change processing, environmental disclosure label, and bad debt expense; and (3) cash working capital (Exh. NG-PP-17, at 2). The costs associated with the letter of credit, bad debt, and cash working capital comprise approximately $23.6 million of the total costs proposed for recovery through the BSAP (Exh. NG-PP-17, at 2). The remaining costs (approximately $580,000) are attributable to administering basic service (Exhs. NG-PP-17, at 2; NG-PP-Rebuttal at 60).[250]

---

249 Basic service (formerly referred to as "default service") is electric generation service that is provided by a distribution company to a customer who chooses not to obtain or is unable to obtain electricity from a supplier, or whose supplier fails to provide generation service. The Department changed the name from default service to basic service in Procurement of Default Service Power Supply for Residential and Small Commercial and Industrial Customers, D.T.E. 04-115-A (2005) and adopted that term in Order Adopting Regulations, D.P.U. 07-105 (2008); see also, G.L. c. 164, § 1.

250 In addition to some of the activities identified above, administering basic service also includes activities such as: (1) coordinating and conducting the competitive solicitation; (2) reviewing and selecting bids; (3) negotiating purchase power agreements; (4) calculating and filing rates; and (5) general monitoring of the program along with the costs associated with the procurement and the related retail costs (Exhs. NG-PP-17, at 2; NG-PP-Rebuttal at 60).

B. Positions of the Parties

1. Direct Energy

According to Direct Energy, the proper allocation of costs to basic service is a fundamental issue for electric suppliers that compete against other suppliers and the Company (Direct Energy Brief at 1). Thus, Direct Energy contends that electric suppliers will not be able to compete fully and fairly with basic service until all costs are properly allocated, so that customers served by a competitive supplier are not forced to pay those costs twice (i.e., once in the rate they pay to their supplier and again in the distribution rates that are recovered by the Company as basic service related costs) (Direct Energy Brief at 1). Direct Energy raises several issues with respect to the Company's assignment of costs to the BSAP.

First, Direct Energy argues that the amount of costs assigned to the BSAP for some cost categories is significantly understated (Direct Energy Brief at 7). In particular, Direct Energy argues that of the $24.1 million in costs that National Grid proposes to recover through the BSAP, only $308,000 of direct labor costs are included in the BSAP (Direct Energy Brief at 6-8). Direct Energy asserts that this amount is too small for the size of the Company (Direct Energy Brief at 8-9). In particular, Direct Energy contends that the Company's assignment to the BSAP of costs associated with the legal and regulatory groups fails to reflect the time and effort expended by these individuals on basic service dockets (Direct Energy Brief at 14). As such, Direct Energy asserts that the Company should allocate at least ten percent of all legal and regulatory costs to the BSAP (Direct Energy Brief at 14 & n.5). Similarly, Direct Energy argues that the Company fails to assign to the BSAP a reasonable amount of personnel costs (Direct

Energy Brief at 13-14). In this regard, Direct Energy asserts that at least 2.5 percent of executive costs should be allocated to BSAP (Direct Energy Brief at 14).

Second, Direct Energy argues that additional cost components should be subject to recovery through the BSAP (Direct Energy Brief at 12). In particular, Direct Energy contends that in addition to the costs that National Grid includes for recovery through the BSAP, the Company also should include all direct and indirect wholesale power procurement costs, as opposed to only a portion of these costs; billing system and related costs (e.g., metering) costs; and customer care costs (Direct Energy Brief at 12-14). More specifically, Direct Energy asserts that the Company should allocate to the BCAP at least 57 percent of billing system and related costs, and at least ten percent of customer care costs (Direct Energy Brief at 12-14, citing Exhs. DE-FL-1, at 20-21; NG-RRP-2).

Next, Direct Energy argues that the Company failed to use an appropriate allocated cost of service study, or to properly follow internal cost allocation procedures, in determining the allocation of BSAP costs (Direct Energy Brief at 9-10). According to Direct Energy, the cost allocation study employed in this proceeding failed to allocate a significant amount of properly allocable costs to the BSAP (Direct Energy Brief at 10). Further, Direct Energy asserts that evidence provided by the Company in response to several record requests demonstrates that the Company is inappropriately assigning costs to the BSAP (Direct Energy Brief at 17-21, citing RR-DPU-30; RR-DPU-34; RR-DPU-35).

Further, Direct Energy contends that the Company's assignment of costs to the BSAP is inconsistent with the Department's Standards of Conduct (Direct Energy Brief at 10-12, citing 220 C.M.R. §§ 12.02, 12.03(17)). In this regard, Direct Energy contends that the

Company's basic service business is a competitive energy affiliate of the distribution company (Direct Energy Brief at 10, citing 220 C.M.R. § 12.02). Thus, according to Direct Energy, the Company must fully and accurately assign costs to the basic service business because that business is functionally separate from the distribution business (Direct Energy Brief at 10). Direct Energy argues that the Company has failed to do so and, consequently, the BSAP is under-charged and "heavily subsidized" by distribution operations (Direct Energy Brief at 12). As such, Direct Energy asserts that basic service is not only provided on a competitive basis, it is unfairly competing with other suppliers in the retail market by offering a product that is priced below its true cost (Direct Energy Brief at 12).

Given these purported allocation deficiencies, Direct Energy argues that the Department should require National Grid to provide a "revamped" allocated cost of service study that reasonably allocates to both distribution and basic service the aforementioned costs, as well as any other costs identified by the Company that relate to the provision of both services (Direct Energy Brief at 15). Further, Direct Energy recommends that a revised BSAP charge should be included in the basic service rate and a corresponding amount returned to all distribution customers as a credit to their distribution rates (Direct Energy Brief at 15). Direct Energy asserts that the charge should be reviewed periodically and adjusted as needed, and that such reconciliation would not be disruptive to customers because, in particular, any changes would apply to only a small portion of the bill (Direct Energy Brief at 15-16).

Finally, Direct Energy argues that its proposed BSAP should be implemented in this case and, in addition, the Department should commence a statewide proceeding in order to implement this approach for the remaining electric distribution companies in Massachusetts (Direct Energy

Brief at 15, 24; Direct Energy Reply Brief at 3-4). In this regard, Direct Energy asserts that a state-wide proceeding should only commence after the Department directs National Grid to move forward with a full unbundling of costs (Direct Energy Brief at 24).[251]

2. Company

The Company argues that pursuant to Department precedent, the only costs that should be included in basic service rates are: (1) wholesale-related costs (i.e., the cost of the generation supply, plus ongoing direct procurement-related costs incurred to competitively purchase the supply); and (2) direct retail costs (i.e., commodity-related bad debt, cash working capital, and certain regulatory costs) (Company Brief at 204, citing Provision of Default Service, D.T.E. 02-40-B at 15-18 (2003)). According to the Company, the Department specifically considered, and rejected, the inclusion of indirect retail costs (e.g., customer service and billing) in basic service rates, finding those costs to be related to the provision of distribution service, and not basic service (Company Brief at 204 & n.33, citing D.T.E. 02-40-B at 17). Thus, the Company argues that Direct Energy's recommendations are inconsistent with Department precedent and that no adjustment to the Company's BSAP is warranted (Company Brief at 205-207, citing Exh. DPU-PP-17; D.T.E. 02-40-B at 18; G.L. c. 164, § 1B). Further, the Company asserts that because all electric distribution companies and their customers would be affected by any change in Department policy concerning basic service costs, any consideration of

---

[251] Direct Energy rejects any notion that its recommendations are (1) inconsistent with Department precedent; (2) unnecessary given the current level of customers receiving competitive supply service in the Company's service area; and (3) unnecessary due to the Company's Purchase Receivables Program (Direct Energy Brief at 21-24, citing Provision of Default Service, D.T.E. 02-40-B (2003); Direct Energy Reply Brief at 1-3). Direct Energy argues that there is no evidence that its recommendations would have any negative impact on the Company's business, pricing, customers, or otherwise (Direct Energy Reply Brief at 4).

implementing Direct Energy's recommendations should be conducted in a generic proceeding in which all stakeholders can participate (Company Brief at 207).

C. Analysis and Findings

1. Introduction

In D.T.E. 02-40-B at 15, the Department recognized that basic service may act as a barrier to the development of competition so long as retail competitive suppliers must recover all of their costs through the prices they charge customers, while distribution companies are able to recover some of their basic service related costs through their distribution rates. Thus, the Department found that basic service rates should include all costs of providing basic service to allow competitive suppliers a fair and reasonable opportunity to compete for basic service customers. D.T.E. 02-40-B at 14.

Specifically, the Department found that because basic service prices collect the supply component of wholesale costs, all supplier-related wholesale costs should be included in basic service prices. D.T.E. 02-40-B at 16. Further, the Department found that procurement-related wholesale costs should be included in basic service rates. D.T.E. 02-40-B at 16. Procurement-related wholesale costs are associated with (1) the design and implementation of the competitive bidding process, including the evaluation of supplier bids and contract negotiations, and (2) the ongoing administration and execution of contracts with suppliers, including accounting activities necessary to track payments made to suppliers. D.T.E. 02-40-B at 16. The Department reasoned that distribution companies incur these costs solely because of their obligation to provide basic service to their customers, and they would not incur these costs if they no longer had the obligation to provide basic service. D.T.E. 02-40-B at 16. Thus,

consistent with the policy goals of cost causation, the Department concluded that procurement-related wholesale costs should be included in the calculation of basic service prices. D.T.E. 02-40-B at 16.

The Department also found that direct retail costs should be included in basic service prices, as distribution companies incur these costs strictly on behalf of its basic service customers. D.T.E. 02-40-B at 17. These costs are associated with (1) supply-related bad debt; (2) complying with the Department's basic service regulatory requirements, including required communications with its basic service customers; and (3) compliance with the Massachusetts renewable portfolio standards. D.T.E. 02-40-B at 17. The Department found that similar to wholesale-related costs, a distribution company would not incur these costs if it no longer had the obligation to provide basic service to its customers. D.T.E. 02-40-B at 17.

Finally, the Department distinguished direct retail costs from indirect retail costs, which are associated with services and activities that a distribution company provides to all of its customers alike (i.e., basic service and competitive supply). D.T.E. 02-40-B at 17. In particular, indirect retail costs are associated with the provision of customer service and billing to basic service customers, and the reporting of basic service customers' load to ISO-NE. D.T.E. 02-40-B at 17. The Department found that a distribution company would continue to provide these services, and incur these costs if it no longer had the obligation to provide basic service to its customers. D.T.E. 02-40-B at 17.[252] Thus, the Department determined that these

[252] Viewed from a different perspective, if a basic service customer were to switch to a competitive supplier, the customer would continue to receive the same level of customer service, billing, and load reporting services from the distribution company. D.T.E. 02-40-B at 17.

services are distribution related, rather than basic service related. D.T.E. 02-40-B at 17. Accordingly, the Department concluded that indirect retail costs should not be included in the calculation of basic service prices. D.T.E. 02-40-B at 17-18.

2. Allocation of Basic Service Costs

The Department has reviewed the voluminous record concerning the Company's proposed assignment of costs to the BSAP and Direct Energy's recommendations that we discuss below (Exhs. DE-FL-1, at 17-22; DE-FL-Rebuttal-1, at 4-12; NG-PP-Rebuttal-1, at 57-62; DPU-3-14; DE-1-1; DE-1-2; DE-1-3; DE-2-2; DE-2-3 & Att.; DPU-DE-1-1 through DPU-DE-1-10 (Revised); NG-DE-1-1; Tr. 8, at 1225-1262; Tr. 11, at 1611-1676; NG-5; RR-DPU-30 through RR-DPU-40).

First, we address the Company's proposed assignment of costs to the BSAP. The Company proposes to collect approximately $580,000 through the BSAP, which represents a variety of costs associated with administering basic service (Exh. NG-PP-17). Direct Energy states that this amount translates into about two or three mid-level utility employees to manage the basic service business, which is unreasonable for a company the size of National Grid (Exh. DE-FL-1, at 9-10). According to Direct Energy, it is more reasonable to expect 75 or more employees to administer basic service (Exh. DE-FL-1, at 11). Direct Energy also states that the assignment of these costs is inconsistent with the Company's internal policies and the Department's Standard of Conduct (Exh. DE-FL-1, at 11-16).

Upon review of the record and consideration of the arguments of the parties, we find that National Grid provided persuasive evidence to demonstrate that the costs attributable to administrating basic service are commensurate with the scope of work performed by Company

personnel (Exh. NG-PP-17; RR-DPU-31 & Atts.; RR-DPU-32; RR-DPU-33 & Atts.; RR-DPU-34 & Att.; RR-DPU-35 & Att.).[253] Therefore, we are not convinced that the amounts assigned to the BSAP, particularly for legal and regulatory or executive functions, need to be modified.[254] Further, we conclude that Direct Energy's recommended allocation percentages for legal and regulatory costs and executive costs are not appropriate because they are based on questionable assumptions and simplifications (Exh. DE-FL-1, at 20-21). Based on these considerations, we are not persuaded by Direct Energy's arguments that the costs associated with administering basic service are understated.

Next, we address Direct Energy's arguments regarding allocating additional costs to the BSAP. With respect to wholesale procurement costs, Direct Energy argues that National Grid assigns only "a portion" of costs to the BSAP, and fails to indicate what portion it allocated to the BSAP (Direct Energy Brief at 12, citing Exh. DE-2-2; see also Exhs. DE-FL-1, at 17; DE-FL-Rebuttal-1, at 6; DPU-DE-1-2). We disagree with this characterization. Rather, the record shows that National Grid assigns to the BSAP "the portion" attributable to the Company, as opposed to the portion attributable to its affiliate, Narragansett Electric Company (Exh. DE-2-2; see also RR-DPU-30, Att.) (emphasis added). Further, National Grid provided the percentage breakdown between the costs allocated to the Company and its affiliate (RR-DPU-30,

253 For example, we note that a core function associated with administering basic service – the quarterly solicitation process for basic service procurement – is relatively perfunctory in nature, as the Company uses standardized documents that require little if any updating or modifying from one issuance to the next (RR-DPU-32).

254 The Company indicates that executive time associated with basic service functions does not occur on a filing-to-filing basis, but on an annual basis (RR-DPU-40, at 2).

Att.). Thus, we are not persuaded that the Company improperly assigned wholesale procurement costs to the BSAP.

Additionally, Direct Energy recommends an allocation to the BSAP of at least 57 percent of the billing system and related billing costs and 25 percent of customer care costs (Direct Energy Brief at 12, 14; Exh. DE-FL-1, at 17-21). The Department has clearly set forth the types of costs that are included for recovery through the BSAP and those that should be excluded. D.T.E. 02-40-B at 16-18. In particular, indirect retail costs, such as costs "associated with the provision of customer service and billing to [basic] service customers," are not included in the calculation of BSAP prices. D.T.E. 02-40-B at 17. Therefore, based on Department precedent, the Company is not required to allocate billing and billing-related costs and customer care costs to the BSAP.

Given that the Company properly assigned costs to the BSAP, we find that the Company's allocation process was not inconsistent with any of its internal cost allocation policies. Further, we find that the Company's assignment of costs does not violate the Department's Standards of Conduct. In this regard, we are not persuaded that administrating basic service results in an affiliate arrangement with the Company in the context of 220 C.M.R. § 12.00. In particular, we note that electric distribution companies are mandated to provide a basic service offering to customers. G.L. c. 164, § 1B(d). Moreover, basic service is not sold or marketed on a competitive basis, and no profit is earned by the Company.

3. Conclusion

Based on the record and all of the above considerations, we find that the Company's proposed assignment of costs to the BSAP is reasonable and appropriate. As such, we accept

National Grid's proposal to collect $24,146,875 in test year basic service-related costs through the BSAP, and we direct the Company to revise its BSAP tariff accordingly. Regardless of the specific outcome offered here, however, the Department reemphasizes its commitment to developing the competitive supply market in order to offer customers more diverse products, price certainty, and lower prices. In this regard, we recognize the importance of fully identifying and accounting for all of the direct costs incurred in the procurement, administration, and billing of basic service. The Department looks forward to future opportunities to work with suppliers and the supplier industry groups to learn from other markets, adopt best practices, and continue to develop a fair and competitive market in the commonwealth.

XII. CAPITAL STRUCTURE AND RATE OF RETURN

A. Introduction

National Grid calculates its overall cost of capital, or WACC, at 8.13 percent, representing the rate of return to be applied on rate base to determine the Company's total return on its investment (Exhs. NG-RRP-2, at 33 (Rev. 3); NG-RRP-8, at 5 (Rev.3)). This rate is based on: (1) a proposed capital structure that consists of 47.93 percent long-term debt, 0.09 percent preferred stock and 51.98 percent common equity; (2) a proposed cost of long-term debt of 5.56 percent; (3) a proposed cost of preferred cost of 4.44 percent; and (4) a proposed ROE of 10.50 percent (Exhs. NG-RBH-1, at 2-3; NG-RRP-2, at 33 (Rev. 3); NG-RRP-8, at 5 (Rev.3)).

The Attorney General calculates a combined WACC of 7.09 percent developed using an ROE of 8.50 percent (Exh. AG-JRW-1, at 4). Below, we examine: (1) the Company's capital structure and cost of debt; (2) the respective proxy group selections used by the parties in supporting their proposed ROEs; and (3) the appropriate ROE.

B. Capital Structure and Cost of Debt

1. Company Proposal

National Grid relies on a consolidated MECo and Nantucket Electric capital structure (Exhs. NG-RBH-1, at 57-58; NG-RBH-10). As of June 30, 2015, the end of the test year, MECo's capital structure consisted of $797,828,000 in long-term debt, $2,259,000 in preferred stock, and $2,231,018,000 in common equity (Exh. NG-RBH-10). These balances produce a capital structure consisting of 26.32 percent long-term debt, 0.07 percent preferred stock, and 73.6 percent common equity (Exh. NG-RBH-10). As of that same date, Nantucket Electric's capital structure consisted of $51,665,000 in long-term debt and $47,239,000 in common equity (Exh. NG-RBH-10). These balances produce a capital structure consisting of 52.24 percent long-term debt and 47.76 percent common equity (Exh. NG-RBH-10).

National Grid has incorporated proposed changes to the test year-end capitalization balances for both MECo and Nantucket Electric. MECo's proposed long-term debt balance of $1,235,000,000 incorporates the removal of unamortized debt issuance expenses of $2,171,945, as well as the issuance of $435,000,000 in long-term debt associated with the Department's approval in Massachusetts Electric Company, D.P.U. 15-144 (2016) of the issuance of up to $784,000,000 from time to time through March 31, 2018 (Exhs. NG-RBH-1, at 57-58; NG-RBH-10; AG-5-23, Att.; at 3; Tr. 4, at 498-499). MECo's pro forma common equity balance of $1,339,156,000 incorporates the removal of $1,008,243,998 in goodwill and $5,061,963 in accumulated other comprehensive income, along with the infusion of $90,000,000 in equity capital from National Grid's parent company (Exhs. NG-RBH-1, at 57-58; NG-RBH-10; AG-5-23, Att.; Tr. 4, at 498-499). The Company attributes the simultaneous debt

issuance and addition of equity capital as part of its effort to keep the Company's capital structure reasonably balanced (Exhs. NG-RBH-10; AG-5-20; Tr. 4, at 498-499).

Nantucket Electric's adjusted long-term debt balance of zero incorporates the removal of $13,300,000 in debt dedicated to the financing of the first undersea cable project, $38,000,000 in debt dedicated to the second undersea cable project, and $360,000 principal amount outstanding as of June 30, 2015, associated with the Massachusetts Development Finance Agency's Electric Utility Revenue Bonds Series 2004 that matured on March 1, 2016 (Exh. NG-RBH-10). Nantucket Electric's adjusted common equity balance of $31,444,000 incorporates the removal of $15,705,556 in goodwill and $89,414 in accumulated other comprehensive income (Exhs. NG-RBH-1, at 58; NG-RBH-10; AG-5-23, Att. at 3).

Based on these adjustments, National Grid proposes a capital structure for the combined MECo and Nantucket Electric operations consisting of $1,235,000,000 in long-term debt, $2,259,000 in preferred stock, and $1,339,156,000 in common equity, for a total capitalization of $2,576,414,000 (Exhs. NG-RBH1, at 3; NG-RBH-10; NG-RRP-8, at 5 (Rev. 3)). These balances produce a capital structure consisting of 47.93 percent long-term debt, 0.09 percent preferred stock, and 51.98 percent common equity (Exhs. NG-RBH1, at 3; NG-RBH-10; NG-RRP-8, at 5 (Rev. 3)). The Company proposes a rate of 5.56 percent for its long-term debt and 4.44 percent for its preferred stock (Exhs. NG-RRP-2, at 33 (Rev. 3); NG-RRP-8, at 5 (Rev. 3)).

The Attorney General accepted the Company's proposed capital structure and cost of long-term debt, but noted that the Company's proposed capitalization has more equity, and, therefore, less financial risk than the capitalization ratios of the companies in the Attorney

General's proxy group (Exhs. AG-JRW 1, at 27-28; AG-JRW-4, at 1). No other party commented on the Company's capital structure and cost of debt.

2. Analysis and Findings

a. Capital Structure

A company's capital structure typically consists of long-term debt, preferred stock, and common equity. D.P.U. 07-71, at 122; D.T.E. 03-40, at 319; D.T.E. 01-56, at 97; Pinehills Water Company, D.T.E. 01-42, at 17-18 (2001). The ratio of each capital structure component to the total capital structure is used to weight the cost (or return) of each capital structure component to derive a WACC. The WACC is used to calculate the return on rate base for calculating the appropriate debt service and return on investment for the company to be included in its revenue requirement. D.P.U. 07-71, at 122; D.T.E. 03-40, at 319; D.T.E. 01-42, at 17-18; South Egremont Water Company, D.P.U. 86-149, at 5 (1986).

The Department normally will accept a company's test year end capital structure, allowing for known and measurable changes. D.T.E. 03-40, at 323-324; D.P.U. 88-67 (Phase I) at 174; D.P.U. 84-94, at 50. Within a broad range, the Department will defer to the management of a utility in decisions regarding the appropriate capital structure and normally will accept the utility's test year end capital structure, unless the capital structure deviates substantially from sound utility practice. Mystic Valley Gas Company v. Department of Public Utilities, 359 Mass. 420, 428 429 (1971); D.P.U. 1360, at 26 27; Blackstone Gas Company, D.P.U. 1135, at 4 (1982); see also Cambridge Electric Light Company, D.P.U. 20104, at 42 (1979).

Regarding the Company's exclusion of $2,171,945 in unamortized debt issuance expenses, no party contested this adjustment. The Department has found that the appropriate

ratemaking treatment of issuance costs is to include them in the effective cost of debt by amortizing the issuance costs over the life of the issue without providing a return on the unrecovered portion of the issuance costs. D.P.U. 92-78, at 91-92; D.P.U. 86-71, at 12. The Company's treatment of unamortized debt issuance costs is consistent with Department precedent. D.T.E. 05-27, at 269-272; D.T.E. 03-40, at 319-324; D.P.U. 84-94, at 51-52. Therefore, the Department accepts the Company's proposed exclusion of unamortized debt issuance costs.

Regarding the Company's proposed exclusion of $1,029,101,931in goodwill and accumulated other comprehensive income from capitalization, no party contested these adjustments. The Department finds that the proposed removal of goodwill is consistent with Department precedent. D.P.U. 10-55, at 473-475; D.P.U. 09-39, at 338; D.P.U. 08-35, at 189; D.T.E. 05-27, at 269-272; D.T.E. 03-40, at 319-324. In the case of accumulated other comprehensive income, this balance sheet item does not represent "outstanding stock" as used in G.L. c. 164, § 16. Nantucket Electric Company/Massachusetts Electric Company, D.T.E. 04-74, at 21-22 (2004). Therefore, the Department accepts the Company's proposed exclusion of accumulated other comprehensive income from capitalization. D.P.U. 09-39, at 338-339.

Pursuant to the Department's approval in D.P.U. 15-144, the Company closed on the sale of $500,000,000 in 30-year long-term debt on August 5, 2016. (D.P.U. 15-144, Compliance Filing (August 31, 2016). Therefore, the Department finds that the debt issuance represents a known and measurable change to test year-end capitalization. D.P.U. 11-43, at 204-205; D.P.U. 07-71, at 122-123; D.T.E. 05-27, at 272; D.P.U. 84-94, at 52-53. Accordingly, the Department increases the Company's proposed long-term debt balance by

$65,000,000, representing the difference between the proposed inclusion of $435,000,000 approved in D.P.U. 15-155 and the actual issuance of $500,000,000.

National Grid has excluded all of Nantucket Electric's outstanding debt from capitalization (Exh. NG-RBH-10). The $360,000 in MDFA bonds matured on March 1, 2016, and, therefore, they no longer are on Nantucket Electric's balance sheet (Exhs. NG-RBH-10; AG-5-23, Att. at 3). The Department finds that the redemption of the MDFA bonds is a known and measurable change to the Company's test year-end capitalization. D.P.U. 11-43, at 204-205; D.P.U. 10-114, at 289; D.P.U. 90-121, at 157. Turning to the exclusion of $51,300,000 in bonds used to finance Nantucket Electric's underwater cables, the costs of these underwater cables, including financing costs, are being recovered through a separate mechanism. Nantucket Electric Company, D.T.E./D.P.U. 06-106-A (2007). Therefore, the Department accepts the proposed elimination of Nantucket Electric's test year-end long-term debt balance from the Company's capitalization.

Turning to the $90,000,000 capital contribution to MECo, the Department finds that National Grid USA capital contribution was intended to fund the Company's operations and to create a more balanced capital structure after the issuance of MECo's long-term debt, planned at that time to be $435,000,000 (Tr. 4, at 498-499). The Department finds that the $90,000,000 capital contribution is a known and measurable change to test year-end capitalization. D.P.U. 15-80/D.P.U. 15-81, at 252; D.P.U. 14-150, at 316-317; D.P.U. 10-70, at 241; D.P.U. 07-71, at 122. Therefore, the Department accepts this proposed adjustment to the Company's capital structure.

Notwithstanding our acceptance here, the Department recognizes that a parent company capital contribution is not subject to regulatory review under a discernible standard. For example, stock issuances by the Company would be subject to the test under G.L. c. 164, § 14, as to whether the contributions were reasonably necessary to accomplish some legitimate purpose in meeting a company's service obligations. See Fitchburg Gas and Electric Light Company v. Department of Public Utilities, 395 Mass. 836, 841 842 (1985), citing Fitchburg Gas and Electric Light Company v. Department of Public Utilities, 394 Mass. 671, 678 (1985). Although parent holding companies can be a source of financial strength to subsidiaries, capital contributions to a subsidiary outside of the regulatory review process could have consequences where the adjustment to the subsidiary's capital structure results in a higher rate of return. We will, however, continue to examine parent holding company capital contributions for potential adverse rate effects.[255] D.P.U. 10-70, at 242.

Based on the foregoing analysis, the Department shall use a long-term debt balance of $1,300,000,000, a preferred stock balance of $2,259,000, and a common equity balance of $1,339,156,000 to determine National Grid's capital structure. As shown on Schedule 5 of this Order in Section XV below, the use of these balances produces a capital structure consisting of 49.22 percent long-term debt, 0.09 percent preferred stock, and 50.70 percent common equity.

---

255 The capital contributions are not stock issuances as defined in G.L. c. 164, § 14 and, therefore, they are not subject to a determination under G.L. c. 164, § 14 that the contributions were reasonably necessary to accomplish some legitimate purpose in meeting a company's public service obligations. D.P.U. 10-70, at 241-242, citing Fitchburg Gas and Electric Light Company v. Department of Public Utilities, 395 Mass. 836, 842 (1985), Fitchburg Gas and Electric Light Co. v. Department of Public Utilities, 394 Mass. 671, 678 (1985).

b. Cost of Debt and Preferred Stock

Regarding the Company's proposed costs of long-term debt and preferred stock, no party commented on the proposed rates. Costs associated with the issuance of long-term debt, such as issuance costs, debt discounts, and other related expenses, are necessary operating expenses and are expected to occur from time to time as long-term debt is issued by a company. D.P.U. 10-114, at 294; D.T.E. 01-56, at 99; D.P.U. 90-121, at 160. The appropriate ratemaking treatment of issuance costs is to include them in the effective cost of debt by amortizing the issuance costs over the life of the issue without providing a return on the unrecovered portion of the issuance costs. See D.P.U. 92-78, at 91-92; D.P.U. 90-121, at 160-161.

National Grid provided the calculations supporting the cost of its long-term debt and preferred stock (Exh. AG-5-23, Att.). We find that the Company calculated the cost of its 5.90 Percent Senior Notes and preferred stock in a manner consistent with Department precedent. D.T.E. 01-56, at 97-100. For the debt issued pursuant to D.P.U. 15-144, the Company assumed a nominal interest rate of 4.74 percent, and an effective rate of 4.77 percent (Exhs. NG-RBH-12; AG-5-2, Att. at 2). Based on the actual issuance of $500,000,000 in long-term debt associated with D.P.U. 15-144 at a nominal interest rate of 4.004 percent, the Department has recalculated the Company's cost of long-term debt provided in Exhibit AG-5-23 using the $500,000,000 principal balance, the 4.004 percent nominal interest rate, and $136,000 representing the annual amortization of issuance costs. Based on this recalculation, the effective interest rate associated with the debt issued in D.P.U. 15-144 is 4.031 percent,[256] which when combined with Massachusetts Electric's 5.90 Percent Senior Notes, produces an overall

[256] (($500,000,000 x 4.004 percent) + $136,000) / $500,000,000 = 4.031 percent.

weighted average cost of debt of 5.21 percent.[257] Accordingly, the Department finds that the Company's effective cost of long-term debt is 5.21 percent. The Department also finds that the effective cost of preferred stock is 4.44 percent. We address the Company's proposed 10.50 percent cost of equity in the following sections.

C. Proxy Groups

1. Company Proxy Group

National Grid is a wholly owned subsidiary of National Grid plc. and is not publicly traded (Exh. NG-RBH-1, at 10). Therefore, the Company has no public market for its stock. Accordingly, National Grid presents its ROE analysis using the capitalization and financial statistics of a proxy group of 25 electric companies (Exhs. NG-RBH-1, at 10-15; NG-RBH-11).[258] The Company selected its proxy group from a group of 46 companies classified as "electric utilities" by Value Line Investment Survey ("Value Line") (Exh. NG-RBH-1, at 12). From that group, National Grid chose companies that: (1) have consistently paid quarterly dividends; (2) have been covered by at least two utility industry equity analysts; (3) have investment grade senior unsecured bond and/or corporate credit ratings from Standard & Poor's Financial Services, LLC ("S&P"); (4) received at least 60 percent of their operating income from regulated electric utility operations over the past three fiscal years;

---

257 (($800,000,000/$1,300,000,000) x 5.94 percent) + (($500,000,000/$1,300,000,000) x 4.031 percent) = 5.21 percent.

258 The Company removed three companies from its initial group of 25 companies: (1) Dominion Resources, (2) Duke Energy Corp., and (3) Empire District Electric Company (Exhs. NG-RBH-Rebuttal-1, at 18 n.41; Tr. 4, at 501-503; NG-RBH-Rebuttal-9). National Grid explained that these companies entered into significant corporate transactions following National Grid's initial filing, thus deviating from the Company's filing criteria used to select its proxy group (Exhs. NG-RBH-Rebuttal-1, at 18 n.41; Tr. 4, at 501-503; NG-RBH-Rebuttal-9).

(5) have reported operating income over the three most recent fiscal years representing at least 60 percent of total regulated operating income; and (6) are not currently known to be a party to a merger or other significant transaction (Exh. NG-RBH-1, at 12-13).

2. Attorney General Proxy Groups

In order to develop her rate of return recommendation for the Company, the Attorney General evaluated the return requirements of investors on the common stock of a proxy group of 26 publicly-held electric utility companies (Exhs. AG-JRW-1, at 25; AG-JRW-4, at 1). In selecting those 26 companies, the Attorney General chose companies that: (1) have at least 50 percent of revenues from regulated electric operations as reported by AUS Utilities Report; (2) are listed as an electric utility by Value Line and listed as an electric utility or combination electric and gas utility in AUS Utilities Report; (3) have an investment grade issuer credit rating by Moody's Investors Service, Inc. ("Moody's") and S&P; (4) have paid a cash dividend in the past six months, with no reductions or omissions; (5) have not been involved in an acquisition of another utility, the target of an acquisition, or in the sale or spin-off of utility assets, in the past six months; and (6) have analysts' five-year earnings per share ("EPS") growth rate forecasts available from Yahoo! Inc. ("Yahoo"), Thomson Reuters First Call ("First Call"), and/or Zacks Investment Research, Inc. ("Zacks") (Exh. AG-JRW-1, at 24-25). On an overall basis, the Attorney General's resulting proxy group (1) receive 82 percent of their revenues from regulated electric operations; (2) have an BBB+ bond rating from S&P,[259] and Baa1 Moody's bond

[259] Bonds rated "BBB+" by S&P exhibit adequate protection parameters. However, adverse economic conditions or changing circumstances are more likely to lead to a weakened capacity of the obligor to meet its financial commitment on the obligation. The ratings from "AA" to "CCC" may be modified by the addition of a plus (+) or minus (-) sign to

rating;[260] (3) have a current median common equity ratio of 48.8 percent; and (4) have an earned ROE of 9.3 percent (Exhs. AG-JRW-1, at 26; AG-JRW-4, at 1).

The Attorney General developed financial and market data for her proxy group and the Company's proxy group[261] and applied the DCF model to arrive at a common equity recommendation for National Grid of 8.8 percent (Exh. AG-JRW-1, at 61; AG-JRW-10, AG-JRW-12). From this result, the Attorney General deducted 30 basis points to arrive at her recommended ROE of 8.50 percent for National Grid (Exhs. AG-JRW-1, at 63; JRW-10, at 1; AG-JRW-12).[262]

3. Positions of the Parties

a. Attorney General

The Attorney General states that she has evaluated the return requirements of investors on the common stock of both her proxy group and the Company's proxy group of publicly held electric utility distribution companies (Attorney General Brief at 105, citing Exhs. AG-JRW-1,

---

show relative standing within the major rating categories. S&P Global Ratings available at www.standardandpoors.com.

260 Bonds rated "Baa1" by Moody's are judged to be medium-grade and are subject to moderate credit risk, and thus may possess certain speculative characteristics. The modifier "1" indicates that the obligation ranks in the higher end of its generic rating category. Moody's Investor available at www.moodys.com/Pages/amr002002.aspx.

261 The Attorney General applied her own financial inputs to the Company's proxy group, and removed four companies from the Company's initial proxy group (i.e., Dominion Resources, Duke Energy Corp., Empire District Electric Company, and Southern Company) in light of recent merger and acquisition activities undertaken by these companies (Exhs. AG-JRW-1, at 25; AG-JRW-4; Attorney General Brief at 105).

262 The Attorney General's 30-basis points risk adjustment proposal is based on the difference between the average yields for long-term utility bonds of A3 (the Company's rating) and the lower rating of Baa1 (the average rating of the Company's proxy groups) (Exhs. AG-JRW-1, at 6, 63; AG-JRW-12).

at 22-26; AG-JRW 4).[263] According to the Attorney General, the issuer credit ratings for the Company are A- according to S&P and A3 according to Moody's, while the average issuer credit ratings for both her proxy group and the Company's proxy group are BBB+ and Baa1 according to S&P and Moody's, respectively (Attorney General Brief at 106). The Attorney General contends that National Grid's credit ratings are thus one notch above the S&P and Moody's issuer credit rating of BBB+ and Baa1 assigned to the proxy groups (Attorney General Brief at 105; Tr. 4, at 1564). Therefore, the Attorney General concludes that the Company's investment risk is below that of the proxy groups (see Attorney General Brief at 107).

b. Company

National Grid argues that in determining its ROE, it has used an appropriate proxy group that includes companies that: (1) are based on valid selection criteria; (2) have sufficient financial and operating data to discern the investment risk of the Company versus the comparison group; and (3) derive at least 60 percent of operating income from regulated electric utility operations (Company Brief at 135-136, citing Exhs. NG-RBH-1, at 13-14; AG-5-15; D.P.U. 09-39, at 347-349; D.P.U. 08-35, at 176. In addition, the Company maintains that 13 of its 25 proxy companies have a capital investment cost recovery mechanism in place for at least one operating subsidiary,[264] and that all 25 proxy group companies have a revenue stabilization mechanism in place in at least one jurisdiction (Company Brief at 135-136,

---

263 The Attorney General argues that when her proxy group is examined in conjunction with the Company's own proxy group, any concern as to her selection of companies is eliminated as an issue (Attorney General Reply Brief at 62-63).

264 National Grid's reference to 25 companies in its proxy group includes the three companies that were subsequently removed because of recent merger activities, as noted above.

citing Exhs. NG-RBH-1, at 41; NG-RBH-9; NG-Rebuttal-1, at 70-71; RR-DPU-19) Further, National Grid notes that the Company's proxy group selected from Value Line consist of companies that have been found comparable by the Department to other Massachusetts electric distribution companies in recent years (Company Brief at 135-136, citing D.P.U. 10-70, at 246-247, 249, 511; D.P.U. 11-01/D.P.U. 11-02, at 379-380, 384; D.P.U. 13-90 at 203, 205, 207).

4. Analysis and Findings

The use of a proxy group of companies is standard practice in setting an ROE that is comparable to returns on investments of similar risk. See D.P.U. 08-35, at 176-177; D.T.E. 99-118, at 80-82; D.P.U. 92-78, at 109-110; D.P.U. 1300, at 97. The use of a proxy group is especially relevant for evaluation of a cost of equity analysis when a distribution company does not have common stock that is publicly traded. See D.P.U. 08-35, at 176-177; D.T.E. 99-118, at 80-82; D.P.U. 92-78, at 109-110. The Department has stated that companies in the proxy group must have common stock that is publicly traded, and must be generally comparable in investment risk. D.P.U. 1300, at 97.

In our evaluation of the proxy groups used by the Company and the Attorney General, we recognize that it is neither necessary nor possible to find a group in which the companies match National Grid in every detail. D.T.E. 99-118, at 80; D.P.U. 87-59, at 68; Boston Gas Company, D.P.U. 1100, at 135-136 (1982). Rather, we may rely on an analysis that employs valid criteria to determine which companies will be in the proxy group, and that provides sufficient financial and operating data to discern the investment risk of the Company versus the proxy group. D.T.E. 99-118, at 80; D.P.U. 87-59, at 68; D.P.U. 1100, at 135-136.

The Department expects diligence by parties in assembling proxy groups that will produce statistically reliable analyses required to determine a fair rate of return for the Company. See D.P.U. 10-55, at 480-482. Overly exclusive selection criteria may affect the statistical reliability of a proxy group, especially if such screening criteria result in a limited number of companies in the proxy group. D.P.U. 10-55, at 480-482. The Department expects parties to limit criteria to the extent necessary to develop a broader as opposed to a narrower proxy group. D.P.U. 10-114, at 299; see also D.P.U. 10-55, at 481-482. To the extent that a particular company's characteristics differ from those of the others in a proxy group, those differences should be identified in sufficient detail to enable a reviewer to discern any effects on investment risk. D.P.U. 10-114, at 299; D.P.U. 10-55, at 480-482.

We find that National Grid and the Attorney General each employed a set of valid criteria to select their respective proxy groups, and that they each provided sufficient information about the proxy groups to allow the Department to draw conclusions about the relative risk characteristics of the Company versus the members of the proxy groups. D.P.U. 12-25, at 402; D.P.U. 09-30, at 307. Therefore, the Department will accept those proxy groups to assist the Department in determining the Company's fair and reasonable cost of equity.

Our acceptance of these groups notwithstanding, we identify several factors that the Department will take into consideration in determining the appropriate ROE for the Company. First, as discussed below, both National Grid and the proxy group members have a number of reconciling mechanisms. The extent to which these particular reconciling mechanisms affect a company's cash flow will affect the evaluation of the Company's comparability to the proxy groups. Second, some of the holding companies in the proxy groups also are involved in

non-regulated businesses beyond energy distribution activities (Exhs. AG-JRW 4, at 1; AG-5-15; AG-JRW-4, at 1; AUS Utilities Reports, passim). All else being equal, these business activities potentially make these companies more risky and potentially more profitable than the Company. D.P.U. 11-01/D.P.U. 11-02, at 385; D.P.U. 10-114, at 300; D.P.U. 09-30, at 309; D.P.U. 07-71, at 135. Therefore, while we accept National Grid's and the Attorney General's proxy groups as a basis for evaluating their ROE proposals, we also will consider the particular characteristics of the Company as compared to members of the proxy groups when determining the appropriate ROE.

D. Return on Equity

1. Company Proposal

In determining its proposed ROE, the Company relied on the discounted cash flow ("DCF") model (including the constant growth and multi stage models), capital asset pricing model ("CAPM"), and the bond yield plus risk premium approach ("risk premium model") (Exhs. NG-RBH 1, at 3; NG-RBH-3; NG-RBH-4; NG-RBH-5; NG-RBH-7; NG-RBH-8). These models were applied to market and financial data developed from its proxy group (Exh. NG-RBH-1, at 10-15). Based on the results of these models and the Company's evaluation of its business risks relative to its proxy group, National Grid determined that its ROE is in the range of ten percent to 10.50 percent (Exh. NG-RBH-1, at 3).

The Company stated that its proposed ROE takes into account the implementation of decoupling and a capital investment cost recovery mechanism, the Company's particular business risks, and additional qualitative considerations to which the Department precedent has given weight in establishing authorized returns (Exh. NG-RBH-1, at 40-45, 62;

NG-RBH-Rebuttal-1, at 70-71). In this regard, the Company states that its proposed ROE of 10.50 percent is based, in part, on a proxy group of electric distribution companies that, in general, already have implemented revenue stabilization mechanisms (Exh. NG-RBH-1, at 12-14, 40-42). Thus, according to National Grid, any reduction in the ROE because the Company has implemented decoupling or capital-cost recovery mechanisms is a matter of speculation and conjecture and would ignore established legal standards requiring a return commensurate with the return for enterprises with corresponding risks (Exh. NG-RBH-1, at 7-9, 12-14, 40-42, citing Federal Power Commission v. Hope Natural Gas Co., 320 U.S. 591, 603 (1944) ("Hope"); Bluefield Waterworks & Improvement Co., v. Public Service Commission of West Virginia, 262 U.S. 679, 692-93 (1923) ("Bluefield")).

2. Attorney General Proposal

In determining her proposed ROE, the Attorney General applied the DCF model, including the constant growth model, and the CAPM to her proxy group and she applied the same models to the Company's proxy group (Exhs. AG-JRW-1, at 4, 36-51, 52-61; AG-JRW-10; AG-JRW-11). The Attorney General initially calculated an ROE for National Grid of 8.80 percent based on an evaluation of her CAPM result of 8.10 percent and her DCF results of 8.77 percent and 8.82 percent, and then reduced the 8.80 percent by 30 basis points to recognize what she deemed to be the Company's lower risk profile as compared to the proxy groups, resulting in a proposed ROE of 8.50 percent (Exhs. AG-JRW-1, at 4, 61-63; AG-JRW-10; AG-JRW-11).

On brief, the Attorney General recommends setting the Company's ROE at 7.80 percent, which she considers to be the lowest end of her range of reasonable ROE results (Attorney

General Brief at 125-126, citing Exh. AG-JRW-1, at 61-62).[265] She proposes this ROE to account for what she identifies as a number of Company shortcomings, including its failures to: (1) conform to the Department's explicit instructions regarding the use of a split test year; (2) appropriately account for salvage value, thereby overstating the revenue requirement both in this case and the Company's previous rate case, as well as in the capital tracker mechanism; and (3) remove retired plant from plant in service accounts, resulting in an overstated depreciation expense requirement (Attorney General Brief at 125-126, citing D.T.E. 02-24/25, at 231). Further, the Attorney General notes that interest rates and capital costs remain at historically low levels and are likely to remain so for some time (Attorney General Brief at 123). The Attorney General also points out that authorized ROEs authorized by state regulators for companies under their jurisdiction have declined from 9.94 percent in 2012, to 9.68 percent in 2013, to 9.78 percent in 2014, to 9.58 percent in 2015, and to 9.68 percent in the first quarter of 2016 (Attorney General Reply Brief at 65-66, citing Exh. AG-JRW-Rebuttal-1, at 17-18).

3. Discounted Cash Flow Model

a. Company Proposal

The DCF model is based on the premise that a stock's current price is equal to the present value of the expected future cash flows that investors expect to receive (Exh. NG-RBH-1, at 17). The Company used both a constant growth and a multi-stage DCF model (Exhs. NG-RBH-1, at 17, 24; NG-RBH-3; NG-RBH-4).

---

[265] The Attorney General's ROE range includes her CAPM result of 7.80 percent (8.10 percent minus the relative risk factor of 30 basis points) and the Company's DCF result of 8.52 (8.82 percent minus the relative risk factor of 30 basis points) (Attorney General Brief at 126, citing Exh. AG-JRW-1, at 61-62).

The constant growth DCF model comprises a forward looking dividend yield component and an expected dividend growth rate into perpetuity as represented by the following formula:

$$P0 = D1 / (1+k) + D2 / (1+k)2 + ... + D\infty / (1+k)\infty.$$

Where "P0" is today's stock price; "D1," "D2," etc., are all expected future dividends; and "k" is the discount rate (i.e., the investor's required ROE) (Exh. NG-RBH-1, at 17). The Company calculated the dividend yield component based on the current annualized dividends of its proxy group (Exh. NG-RBH-1, at 18). For the expected growth rate, the Company used a consensus of the Zacks, First Call, and Value Line surveys to estimate a long-term earnings growth rate (Exhs. NG-RBH-1, at 22-23; NG-RBH-Rebuttal-2).

To address what it contends are certain simplifying assumptions underlying the constant growth model, the Company also used a multi-stage DCF model (Exh. NG-RBH-1, at 24). This model employs multiple earnings growth rate and payout rate assumptions (Exh. NG-RBH-1, at 24-29). Earnings growth and payout ratio assumptions change throughout the three stages of this model (Exh. NG-RBH-1, at 24-29). In particular, the Company employed a long-term Gross Domestic Product ("GDP") growth rate of 5.23 percent (Exh. NG-RBH-1, at 29).[266]

The Company's constant growth DCF model as initially filed by the Company produced a cost of equity mean range of 9.08 to 9.27 percent (Exhs. NG-RBH-1, at 23, 63; NG-RBH-3; NG-RBH-4). National's Grid multi-stage DCF model produced a cost of equity range of 9.54 percent to 9.74 percent (Exh. NG-RBH-1, at 63). With data updated through February 29,

---

266 The 5.23 percent represents the implied Nominal GDP growth rate that is derived from the following formula: ((1+ Historical Real GDP Growth) * (1+Implied Forward Inflation)) – 1 or ((1+3.25 percent) * (1+1.92 percent)) -1 (Exh. NG-RBH-Rebuttal-1, at 44 n.95). In its rebuttal testimony, the Company revised the Implied Forward Inflation rate to 2.0 percent, resulting in a GDP growth rate of 5.30 percent (Exhs. NG-RBH-Rebuttal-1, at 73; NG-RBH-Rebuttal-3; NG-RBH-Rebuttal-4)

2016, the results of the cost of common equity DCF models were as follows: a constant growth DCF model mean range of 9.13 percent to 9.37 percent and a multi-stage DCF model mean range of 9.47 percent to 9.73 percent (Exhs. NG-RBH-Rebuttal-1, at 75; NG-RBH-Rebuttal-3; NG-RBH-Rebuttal-4).

b. Attorney General Proposal

The Attorney General relies on a constant growth DCF model, reasoning that the public utility business is in the steady state (or constant growth) stage of a three-stage DCF model (Exh. AG-JRW-1, at 38). To determine the cost of equity using her constant growth DCF model, the Attorney General summed the estimated dividend yield and growth rates of her proxy group (Exh. AG-JRW-1, at 51). The Attorney General calculated the DCF dividend yield for the proxy group using the current annual dividend and the 30-day, 90-day, and 180-day average stock prices based on data supplied by Yahoo (Exhs. AG-JRW-1, at 40; AG-JRW-10, at 2). Using this method, the median dividend yields for the Attorney General's proxy group range from 3.6 percent to 4.0 percent (Exhs. AG-JRW-1, at 40; AG-JRW-10, at 2). Within this range, the Attorney General chose the average of the medians of 3.80 percent as the dividend yield for her electric proxy group (Exhs. AG-JRW-1, at 40; AG-JRW-10, at 2). The corresponding dividend yield for the Company's comparison group as calculated by the Attorney General is 3.85 percent, which is the average of the median dividend yields ranging from 3.7 percent to 4.0 percent (Exhs. AG-JRW-1, at 40; AG-JRW-10, at 2).

The dividend yield is obtained by dividing the annualized expected dividend in the coming quarter by the current stock price (Exh. AG-JRW-1, at 41). To annualize the expected

dividend, the Attorney General multiplied the expected dividend for the coming quarter by four and multiplied the result by one half of the expected growth rate (Exh. AG-JRW-1, at 41-42).

In developing the expected growth rate, the Attorney General relies on the historic and projected growth rates of EPS, dividends per share, and book value per share provided by Value Line and the EPS growth forecasts of Wall Street analysts provided by Yahoo, First Call, and Zacks (Exhs. AG-JRW-1, at 42; AG-JRW-10, at 3-6). Although the Attorney General assumes that EPS and dividends per share will exhibit similar growth rates over the very long term, she relies on historic and projected dividends per share and book value per share as well as internal growth to balance what she states are the shortcomings of relying solely on EPS as a proxy (i.e., an upward bias among Wall Street analysts) (Exhs. AG-JRW-1, at 46-47; AG-JRW-10, at 3-6). The DCF projected growth rate for her proxy and the Company's proxy group is 4.75 percent and 5.0 percent, respectively (Exhs. AG-JRW-1, at 50-51; AG-JRW-10, at 1, 3-6). The Attorney General chose the midpoint of this range or 4.875 percent as the DCF growth rate for her proxy group and the Company's proxy group (Exhs. AG-JRW-1, at 51; AG-JRW-10, at 1, 3-6)

The Attorney General added the adjusted dividend yields and the estimated growth rates to determine a cost of equity for both her proxy group and the Company's proxy group (Exhs. AG-JRW-1, at 51; AG-JRW-10, at 1). The DCF analysis performed by the Attorney General yields a cost of equity of 8.77 percent and 8.82 percent for her proxy group and the Company's proxy group, respectively (Exhs. AG-JRW-1, at 51; AG-JRW-10, at 1).

c. Positions of the Parties

i. Attorney General

The Attorney General argues that her DCF-estimated cost of equity at the lowest end of her range of 7.8 percent appropriately supports her proposed ROE for National Grid (Attorney General Brief at 126, citing D.T.E. 02-24/25 at 231; Attorney General Reply Brief at 60). The Attorney General contends that her proposal takes into account the Company's issues associated with a split test year and depreciation accounting (Attorney General Brief at 126; Attorney General Reply Brief at 60).

The Attorney General asserts that the Department should reject National Grid's DCF analysis for several reasons. First, the Attorney General argues that the Company's analysis has given little weight to its constant growth DCF results, claiming that utility price-earnings ("P/E") ratios have increased, and are now high on both on an absolute and relative level (Attorney General Brief at 110; Attorney General Reply Brief at 62).

Second, the Attorney General contends that the Company's GDP growth rate of 5.23 percent used in its multi-stage DCF model is excessive, unsupported by theoretical or empirical evidence, not reflective of economic growth in the United States, and about 100 basis points above projections of long-term GDP growth (Attorney General Brief at 109-110, citing Exh. AG-JRW-1, at 68). The Attorney General claims that despite some fluctuations, nominal GDP growth rates have declined over the years and have been in the 3.50 percent to four percent range over the past five years (Attorney General Brief at 112, citing Exh. AG-JRW-1, at 73). Further, she argues that the compounded GDP growth rate of 6.63 percent over the 50 years since the mid-1960s belies a "monotonic and significant" decline in nominal GDP growth

rates in recent decades (Attorney General Brief at 112, citing Exh. AG-JRW-1, at 73). Therefore, the Attorney General concludes that a more appropriate nominal GDP growth rate figure for today's economy is in the range of four to five percent (Attorney General Brief at 112-113).

Finally, the Attorney General argues that the Company's DCF analyses are inconsistent in their use of historic versus projected data (Attorney General Brief at 114, citing Exh. AG-JRW-1, at 75-77). In particular, the Attorney General contends that in developing its constant growth DCF analysis, the Company ignored data on historical EPS, dividends per share, and book value per share, relying solely on what she considers to be inflated long-term EPS growth rate projections of Wall Street analysts and Value Line (Attorney General Brief at 114, citing Exh. AG-JRW-1, at 75-77; Attorney General Reply Brief at 63). In addition, the Attorney General claims that, in developing a terminal DCF growth rate for its multi-stage growth DCF analysis, the Company ignored well known, long-term real GDP growth rate forecasts (Attorney General Brief at 112, citing Exh. AG-JRW-1, at 75-77; Attorney General Reply Brief at 63).

ii. Company

National Grid argues that the Attorney General's DCF calculation is subjective and incapable of replication (Company Brief at 142, citing Exh. NG-RBH-Rebuttal-1, at 24, 38; Company Reply Brief at 48). In addition, the Company contends that Attorney General's DCF recommendation improperly relies on dividend per share and book value per share growth rates, which it contends are merely derivative of earnings growth (Company Brief at 142, citing Exh. NG-RBH-Rebuttal-1, at 34-38).

The Company disputes the Attorney General's claim that it gave insufficient weight to the results of its constant-growth DCF analysis (Company Brief at 142). Instead, the Company claims that what appears to be the issue is the Attorney General's refusal to even consider a multi-stage DCF model in setting a ROE, despite the limiting assumptions underlying the constant-growth DCF model such as the assumption that the P/E ratio stays constant in perpetuity (Company Brief at 142-143, citing Exh. NG-RBH-1, at 24). The Company adds that with P/E ratios for utilities currently at unusually high levels, it is necessary to give consideration to the result of the multi-stage DCF model when determining an appropriate level of ROE (Company Brief at 143, citing Exh. RBH-1-Rebuttal-1, at 23).

In addition, National Grid dismisses the Attorney General's contention that the EPS growth rate estimates relied on by the Company were biased (Company Brief at 143). First, the Company asserts that litigation and new financial regulations in 2003 helped neutralize analysts' conflicts of interest while removing bias in the median forecast errors (Company Brief at 143, citing Exh. NG-RBH-Rebuttal-1, at 30-31). Second, the Company maintains that the Department also has noted a lack of pronounced bias in the EPS forecasts for utilities (Company Brief at 143, citing Exh. NG-RBH-Rebuttal-1, at 30-31; D.P.U. 13-75, at 302). Third, the Company maintains that regardless of analysts' forecasts, investor expectations are more important when applying the DCF model, and the DCF-estimated ROE must recognize and reflect that it is the EPS growth rate expectations of investors that drive stock prices, even if influenced by analysts' forecasts (Company Brief at 143, citing Exh. NG-RBH-Rebuttal-1, at 20-22). Further, the Company notes that the Attorney General conceded that any bias that

may exist for utilities is at most in the range of 20 basis points (Company Brief at 143, citing Tr. 14, at 1562).

National Grid also disputes the Attorney General's assertion that the Company's proposed multi-stage DCF growth rate of 5.23 percent, based on GDP growth rate, is inappropriate because such a growth rate does not take into consideration the more recent lower trends in GDP growth or the current forecasts by economists and some federal agencies (Company Brief at 144, citing Attorney General Brief at 111-114). To support its position that its GDP-derived growth rate is appropriate, National Grid notes that the annual nominal GDP growth rate has remained relatively stable since 1990 and was greater than five percent in twelve of the last 26 years (Company Brief at 144).

Further, the Company argues that its proposed long-term growth rate is consistent with other respected economic forecasts on long-term growth (Company Brief at 144). In support of its position, National Grid asserts that a 2010 report issued by McKinsey & Company ("McKinsey Report"), relied upon by the Attorney General in developing her testimony, states that "…long-term earnings growth for the market as a whole is unlikely to differ significantly from growth in GDP" (Company Brief at 144; Company Reply Brief at 52). In the same report, according to the Company, it also is noted that "'[r]eal GDP has averaged 3 to 4 percent over [the] past seven or eight decades, which would indeed be consistent with nominal growth of 5 to 7 percent given current inflation of 2 to 3 percent" (Company Brief at 144; Company Reply Brief at 52). Therefore, the Company maintains that its proposed growth rate of 5.23 percent is supported by the McKinsey Report because its selected growth rate represents a combination of historical real GDP growth rate and a corresponding level of expected inflation, and falls within

the lower end of the five to seven percent range noted by the McKinsey Report (Company Brief at 144; Company Reply Brief at 52). Further, the Company argues that the Attorney General has not shown that the forecasts she cites are actually relied upon by investors, nor has she explained why she considers economists' near-term interest rate projections are improper while at the same time accepting their long-term real GDP growth rate projections (Company Brief at 144).

Finally, the Company maintains that it has addressed the Attorney General's concerns regarding the appropriate P/E ratio to be used in the DCF analysis by providing an additional set of multi-stage DCF scenarios that calculate the terminal values of the stocks of the companies in the proxy group using a constant average P/E ratio of 18.56 percent (Company Brief at 144-145; Exh. NG-RBH-Rebuttal-4). According to the Company, using a range of multi-stage DCF scenarios with a constant average P/E ratio fully support the Company's proposed 10.50 percent ROE (Company Brief at 145, citing Exh. NG-RBH-Rebuttal-4).

d. Analysis and Findings

In developing their proposed ROEs, both the Company and the Attorney General use a form of the DCF model that assumes an infinite investment horizon and a constant growth rate (Exhs. NG-RBH-1, at 18, 20; AG-JRW-1, at 38). This model has a number of very strict assumptions (e.g., the infinite investment horizon and dividend growth at a constant rate in perpetuity) (Exh. NG-RBH-1, at 20). These assumptions affect the estimates of the cost of equity. D.P.U. 10-114, at 312; D.P.U. 09-39, at 387.

Because regulation establishes a level of authorized earnings for a utility that, in turn, implicitly influences dividends per share, estimation of the growth rate from such data is an inherently circular process. D.P.U. 10-114, at 312; D.P.U. 10-55, at 512; D.P.U. 09-30,

at 357-358. Specifically, the DCF model includes an element of circularity when applied in a rate case because investors' expectations depend upon regulatory decisions. D.P.U. 10-70, at 253; D.P.U. 09-30, at 357-358. Consequently, this circularity affects the results of both the Company's and the Attorney General's DCF models. The Attorney General's DCF model places less emphasis on analyst forecasts of EPS growth rates which, to some extent, compensates for this circularity (see Exh. AG-JRW-1, at 46-47).

The Company and Attorney General use different data sources to estimate the dividend yield and growth rates (Exhs. NG-RBH-1, at 18-19; AG-JRW-1, at 36-46). The Company uses the Bloomberg Professional ("Bloomberg") dividend estimates, adjusting them by one-half of the growth rate, while the Attorney General calculates the dividend yield by applying one-half of the growth rate to a six-month average dividend yield (Exhs. NG-RBH-1, at 19; NG-RBH-3; AG-JRW-1, at 42, 51; AG-JRW-10, at 1). The Department finds that both the Company's and the Attorney General's approaches are logical and reasonable. Further, there is no evidence to establish that investors rely overwhelmingly on one approach over the other. Therefore, we find that both approaches provide a credible basis for evaluating a determination of the Company's allowed ROE.

In addition, the Company and the Attorney General use different growth rates in their respective DCF analyses (Exhs. NG-RBH-1, at 29-30; NG-RBH-4; NG-RBH-Rebuttal 4; AG-JRW-1, at 50-51; AG-JRW-10, at 1). Determining the appropriate long-term growth expectations of investors in a DCF analysis can be difficult and controversial (see Exhs. NG-RBH-1, at 20; AG-JRW-1, at 39). The Company relies on a forward looking growth analysis using EPS, based on the assumption that investors form their investment

decisions based on expectations of growth in earnings and not dividends (Exhs. NG-RBH-1, at 22; NG-RBH-Rebuttal-1, at 38; NG-RBH-Rebuttal-2). Conversely, the Attorney General bases her growth rate on a historical and forward looking growth analysis using EPS, dividends per share, book value per share, and retention growth rates (Exh. AG-JRW-1, at 42-44). The Attorney General emphasizes dividend growth over earnings growth because of the alleged upward bias of forecasts by financial analysts (Exhs. AG-JRW-1, at 46-47; AG-JRW-10, at 3, 4, 5). The Department has found that investors' heavy reliance on EPS forecasts give credence to the Attorney General's argument that investors are aware of upward biases. D.P.U. 13-75, at 302. Accordingly, the Department will take these biases into consideration in evaluating the Company's DCF analysis.

4. Capital Asset Pricing Model

a. Company Proposal

The Company used the CAPM to estimate the cost of equity for its proxy group (Exhs. NG-RBH-1, at 31; NG-RBH-5; NG-RBH-6; NG-RBH-7). The application of the Company's CAPM resulted in eight individual costs of equity estimates, ranging from 9.46 percent to 11.17 percent (Exhs. NG-RBH-1, at 34, 63; NG-RBH Rebuttal-1, at 76; NG-RBH- Rebuttal-7). National Grid considered these results when determining its proposed ROE (Exhs. NG-RBH-1, at 6; NG-RBH-Rebuttal-7).

The CAPM is a market-based investment model based on capital markets theory and modern portfolio theory. In the CAPM, the required rate of return on common equity is equal to the expected risk free rate of return plus a premium for the implicit systematic risk of the security (Exh. NG-RBH-1, at 31). There are three necessary components to calculate the cost of equity in

the CAPM: (1) an expected risk free rate of return; (2) the market risk premium; and (3) the beta, a measure of systematic risk (Exhs. NG-RBH-1, at 31; NG-RBH-5; NG-RBH-6; NG-RBH-7).

The Company used the current and forecasted 30-year Treasury bond yields to arrive at current, near-term, and long-term risk free rates (Exhs. NG-RBH-1, at 32; NG-RBH-5; NG-RBH-6; NG-RBH-7). The CAPM market risk premium is derived from the total return on the overall market minus the risk free rate of return. The Company developed ex ante market risk premiums based on data from both Bloomberg and Value Line by calculating their respective estimated market required returns less the Treasury bond yield (Exhs. NG-RBH 1, at 32-33; NG-RBH-5; NG-RBH-7).

The Company obtained beta coefficients for its proxy group from Bloomberg (0.653) and Value Line (0.75) (Exhs. NG-RBH-1, at 33; NG-RBH-6). Using these beta coefficients in combination with separate Bloomberg and Value Line data and current, near term, and long-term risk free rates, National Grid calculated four Bloomberg market DCF derived CAPM results and four Value Line market DCF derived CAPM results (Exhs. NG-RBH-1, at 34; NG-RBH-7).

b. Attorney General Proposal

The Attorney General used a traditional CAPM approach in which the cost of equity is equal to the sum of the interest rate on risk free bonds and an equity risk premium (i.e., the excess return that an investor expects to receive above the risk-free rate for investing in stocks) (Exhs. AG-JRW-1, at 52; AG-JRW-11, at 1). The Attorney General's CAPM analysis resulted in a cost of equity of 8.10 percent (Exhs. AG-JRW-1, at 58; AG-JRW-11, at 1).

In her analysis, the Attorney General used the upper bound of the six-month average yield on 30-year Treasury bonds (i.e., four percent) as the risk free rate (Exhs. AG-JRW-1, at 54; AG-JRW-11). The Attorney General then calculated an estimated market risk premium of 5.5 percent, based on the midpoint of a range of market risk premiums of four percent to six percent (Exhs. AG JRW-1, at 59; AG-JRW-11, at 1, 5 6). To calculate the beta coefficient, the Attorney General performed a regression analysis of the returns of the companies in her proxy group against the return of the S&P 500 representing the market, resulting in a median beta coefficient of 0.75 percent (Exhs. AG-JRW-1, at 61; AG-JRW-11, at 1, 3). The Attorney General multiplied the estimated market risk premium of 5.5 percent by the beta coefficients of 0.75 percent to produce an expected equity risk premium of 4.10 percent (see Exhs. AG-JRW-1, at 61; AG-JRW-11, at 1). The risk free rate of four percent added to the expected risk premiums of 4.10 percent results in a cost of equity of 8.10 percent (see Exhs. AG-JRW-1, at 58; AG-JRW-11, at 1).

c. Positions of the Parties

i. Attorney General

The Attorney General argues that the Company's CAPM analysis produces results that vastly overstate long-term growth projections (Attorney General Brief at 119). According to the Attorney General, the Company's primary errors are with its use of inflated market risk premiums of 10.05 percent and 10.59 percent (Attorney General Brief at 120). Further, the Attorney General contends that the Company's long-term EPS growth rates of 11.12 percent and 10.80 percent are based on overly optimistic and upwardly biased Wall Street analysts' forecasts (Attorney General Brief at 117-119 citing Exh. AG-JRW-1, at 79-80).

In contrast, the Attorney General maintains that long-term economic, earnings, and dividend growth rates in the United States indicate that historical long-term growth rates are in the five percent to seven percent range (Attorney General Brief at 118). Moreover, the Attorney General asserts that more recent trends suggest lower future economic growth than the long-term historic GDP growth, in the range of four percent to five percent for today's economy, and notes that the projected long-term GDP growth rate forecasts by economists and government agencies are currently in the four percent to five range as well (Attorney General Brief at 118, citing Exh. AG-JRW-1, at 73-75).

Finally, the Attorney General argues that given current low inflation and limited economic growth, the Company's projected earnings growth rates, implied expected stock market returns, and equity risk premiums are not indicative of the realities of the economy (Attorney General Brief at 119, citing Exh. AG-JRW-1, at 80). Based on the above, the Attorney General asserts that the Department should reject the Company's proposed CAPM analysis and recommendations (Attorney General Brief at 120).

ii. Company

The Company argues that the Attorney General's CAPM calculation must be rejected because the equity risk premium she relied on assumes market returns that do not make theoretical or practical sense (Company Brief at 145, citing Exh. NG-RBH-Rebuttal-1, at 54). Further, the Company contends that the Attorney General's CAPM analyses do not reflect fundamental risk-return relationships (Company Brief at 145).

Finally, the Company dismisses the Attorney General's claim that reliance on analysts' forecasts invalidates the Company's CAPM approach (Company Brief at 168). Using the same

analysis as discussed above regarding the DCF model, the Company maintains that recent evidence does not support any upward bias in analysts' forecasts in particular for electric utilities (Company Brief at 145, citing Exh. NG-RBH-Rebuttal-1, at 34).

d. Analysis and Findings

The Department has previously found that the traditional CAPM as a basis for determining a utility's cost of equity has limited value because of a number of questionable assumptions that underlie the model. D.P.U. 10-114, at 318; D.P.U. 10-70, at 270; D.P.U. 08-35, at 207; D.T.E. 03-40, at 359-360; D.P.U. 956, at 54. For example, the Department has not been persuaded that long-term government bonds are the appropriate proxy for the risk free rate and has found that the coefficient of determination for beta is generally so low that the statistical reliability of the results is questionable. D.T.E. 01-56, at 113; D.P.U. 93-60, at 256-257; D.P.U. 92-78, at 113; D.P.U. 88-67 (Phase I) at 182-184.

The Attorney General's CAPM analysis employs a risk free rate of four percent, using the upper bound of the prior six months' 30-year Treasury bond rates as a proxy (Exh. AG-JRW-1, at 54, 60-61). Current federal monetary policy that is intended to stimulate the economy has pushed treasury yields to near historic lows (Exh. AG-JRW 1, at 21-22). Consequently, the Department has found that a CAPM analysis based on current treasury yields may tend to underestimate the risk free rate over the long term and, thereby, understate the required ROE. D.P.U. 14-150, at 350; D.P.U. 12-25, at 427; D.P.U. 11 01/D.P.U. 11-02, at 416.

The Company develops a range of risk free rates from 2.68 percent to 3.35 percent, relying on the current 30-year Treasury bond rates as published in Bloomberg, as well as the near- and long-term projected 30-year Treasury bond rates based on interest rate forecasts

published in Blue Chip Financial Forecasts (Exhs. NG-RBH-Rebuttal-1, at 75; NG-RBH-Rebuttal-7). The CAPM is based on investor expectations and, therefore, it is appropriate to use a prospective measure for the risk-free rate component. The Department has found that Blue Chip Financial Forecasts is widely relied on by investors and provides a useful proxy for investor expectations for the risk-free rate. D.P.U. 13-75, at 314.

The Attorney General calculated a market risk premium of 5.5 percent, based on her analysis of numerous surveys of financial professionals, including financial forecasters, chief financial officers, and academics (Exhs. AG-JRW-1, at 59-60; AG-JRW-11, at 1). Alternatively, the Company calculates a revised market risk premium range of 8.46 percent to 11.62 percent based on DCF analyses (Exhs. NG-RBH-Rebuttal-1, at 76; Sch. NG-RBH-Rebuttal-7). Because the CAPM is considered an ex-ante, forward looking model that recognizes that investors are generally risk averse and will demand higher returns in exchange for assuming higher levels of investment risk, the Department finds that the Company's approach based on DCF analyses is less reliable than the survey results of financial professionals. D.P.U. 13-90, at 225-226; D.P.U. 13-75, at 314.

The Company asserts that because investors rely on financial analysts' forecasts in making investment decisions EPS forecasts are superior to other measures of growth in predicting stock prices (see Exh. NG-RBH-1, at 21). The Department notes that a 2015 survey of over 8,000 academics, financial analysts, and companies estimates a market risk premium of 5.5 percent, which is far lower than the 8.46 percent to 11.62 percent range used in National Grid's analysis (Exhs. NG-RBH-Rebuttal-1, at 76; NG-RBH-Rebuttal-7; AG-JRW-1, at 58;

AG-JRW-11, at 6). Accordingly, the Department places more weight on the Attorney General's approach to developing a market risk premium.

Based on the above considerations, the Department will place limited weight on the results of the respective CAPM estimates in determining the appropriate ROE. Based on the above considerations, to the limited extent that we rely on CAPM estimates, the Department gives more weight to the Attorney General's proposed CAPM.

5. Risk Premium Model

a. Company Proposal

The risk premium model is based on the concept that investing in common stock is riskier than investing in debt and, therefore, investors require a higher rate of return for equity (Exh. NG-RBH-1, at 34).[267] In the bond yield plus risk premium model used by the Company, the cost of equity is derived by calculating a risk premium over the returns available to bondholders (Exh. NG-RBH-1, at 34). Based on data from 1,456 electric utility proceedings between January 1, 1980 and September 30, 2015, the Company derived a risk premium analysis producing a cost of equity range of 10.05 percent to 10.59 percent applicable to its proxy group (Exh. NG-RBH-8).

National Grid calculated the risk premium as the difference between: (1) actual authorized returns using data from 1,456 electric utility rate proceedings between January 1,

---

267 The equity risk premium is defined as the incremental return that an equity investment provides over the risk-free rate (Exhs. NG-RBH-1, at 34; NG-RBH-8). The risk premium method of determining the cost of equity recognizes that common equity capital is more risky than debt from an investor's standpoint, and that investors require higher returns on stocks than on bonds to compensate for the additional risk. The general approach is relatively straightforward: (1) determine the historical spread between the return on debt and the ROE; and (2) add this spread to the current debt yield to derive an estimate of current equity return requirements. D.P.U. 13-75, at 316 n.201.

1980, and September 30, 2015; and (2) the then prevailing long-term Treasury yield (i.e., 30-year bonds) (Exhs. NG-RBH-1, at 35; NG-RBH-8). To account for the forward looking return and interest rates, National Grid calculated the average return period between the filing of this case and the approval of rates, as well as the level of interest rates during the pendency of the proceedings (Exh. NG-RBH-1, at 35). To assess the relationship between the 30-year Treasury yield and the equity risk premium, the Company relied on a statistical analysis that concluded there was a statistically significant inverse relationship between the 30-year Treasury yield and the equity risk premium (Exhs. NG-RBH-1, at 36-37; NG-RBH-8).

b. Positions of the Parties

i. Attorney General

The Attorney General asserts that the Company's application of the bond yield plus risk premium model is flawed for three reasons (Attorney General Brief at 120). First, the Attorney General argues that the Company's method produces an inflated measure of the risk premium because it is based on historic authorized ROEs less Treasury yields, and then is applied to projected Treasury yields that always are forecasted to increase (Attorney General Brief at 121). Second, the Attorney General contends that the Company's overall approach improperly uses authorized ROEs as an input to the model, and that such an approach is more of a gauge of public utility commission behavior than a consideration of investor behavior (Attorney General Brief at 121, citing Exh. AG-JRW-1, at 83-84). In this regard, the Attorney General claims that in setting ROEs, regulatory commissions evaluate capital market data such as dividend yields, expected growth rates, interest rates, as well as rate case specific regulatory information (Attorney General Brief at 121, citing Exh. AG-JRW-1, at 83-84). Further, the Attorney General

argues that the Company's analysis overstates the risk premium because National Grid estimates the risk premium using historical interest rate data, and then applies this data to forecasted interest rates (Attorney General Brief at 121, citing Exh. AG-JRW-1, at 82).

Finally, the Attorney General argues that a comparison of the Company's risk premium results to actual authorized ROEs for electric utility companies confirms the errors in the Company's approach (Attorney General Brief at 122, citing Exh. JRW-Rebuttal-1, at 16-20). The Attorney General notes that authorized ROEs for electric distribution companies have decreased in recent years, from 10.01 percent in 2012, to 9.8 percent in 2013, to 9.76 percent in 2014, and 9.58 percent in 2015 (Attorney General Brief at 122, citing Exh. JRW-Rebuttal-1, at 16-20). Moreover, the Attorney General asserts that National Grid's long-term projected Treasury bond yield of 4.9 percent is 200 basis points above current yields and, therefore, is not reasonable (Attorney General Brief at 121, citing Exh. JRW-1, at 82).

ii. Company

National Grid disputes the Attorney General's argument that the Company's bond yield plus risk premium approach gauges regulatory commission behavior rather than investor behavior (Company Brief at 146-147). The Company argues that regulatory decisions reflect market based analyses (Company Brief at 147, citing Exh. NG-RBH-Rebuttal-1, at 57). Further, the Company contends that because authorized returns are publicly available, such data are to some degree reflected in investors' return expectations and requirements. For these reasons, the Company asserts that authorized returns are a reasonable measure of investor required returns (Company Brief at 147, citing Exh. NG-RBH-Rebuttal-1, at 57).

The Company notes that in the past the Department has viewed the risk premium approach as a "supplemental approach" in determining the level of ROE (Company Brief at 147, citing D.P.U. 07-71, at 137). Based on the above, National Grid argues that the Department should at least supplement its calculation of the Company's ROE with the risk premium approach (Company Brief at 147).

c. Analysis and Findings

The Department has repeatedly found that an equity risk premium analysis can overstate the amount of company-specific risk and, therefore, the cost of equity. See D.P.U. 10-114, at 322; D.P.U. 88-67 (Phase I) at 182-184. More specifically, the Department has found that the return on long-term corporate or public utility bonds may have risks that could be diversified with the addition of common stock in investors' portfolios and, therefore, the risk premium model overstates the risk accounted for in the resulting cost of equity. D.P.U. 10-114, at 322; D.P.U. 90-121, at 171; D.P.U. 88-67 (Phase I) at 182-183. Nonetheless, the Department has acknowledged the value of the risk premium model as a supplemental approach to other ROE models. D.P.U. 10-114, at 322; D.P.U. 07-71, at 137; D.T.E. 99-118, at 85-86.

In the instant case, the Company's risk premium analysis is flawed. First, the Department has recognized the circularity inherent in the use of authorized utility returns to derive the risk premium. D.P.U. 13-75, at 319; D.P.U. 90-121, at 171; D.P.U. 88-67 (Phase I) at 182-183. In addition, the Department has criticized the use of corporate bond yields in determining the base component of the risk premium analysis, and we are not convinced that the Company's substitution of projected Treasury debt yields provides a better approach. D.P.U. 09-39, at 388-389; D.P.U. 08-35, at 202; D.P.U. 90-121, at 171. The Company continues

to use projected cost of Treasury debt in this model, suggesting that the risk premium approach is forward-looking and, therefore, using the forward-looking approach is appropriate (see Exh. NG-RBH-8). The Department disagrees. The risk premium model is not a forward looking approach, and is, instead, based on current market conditions. See D.P.U. 13-75, at 319; D.P.U.12-25, at 433. Accordingly, the Department finds that current treasury yields are more appropriate than projected yields for use in a risk premium analysis. For these reasons, the Department finds that National Grid's risk premium model overstates the required ROE for the Company.

E. Conclusion

The standard for determining the allowed ROE is set forth in Bluefield at 692-693 and Hope at 603. The allowed ROE should preserve a company's financial integrity, allow it to attract capital on reasonable terms, and be comparable to returns on investments of similar risk. See Bluefield at 692-693; Hope at 603, 605. The allowed ROE should be determined "having regard to all relevant facts." Bluefield at 692.

The Company recommends that the Department approve an ROE of 10.50 percent (Exhs. NG-RBH-1, at 3; NG-RBH-Rebuttal-1, at 77). The Attorney General recommends an ROE of 7.80 percent (Attorney General Brief at 125-126, citing Exh. JRW-1, at 61-62). The Department has found that both quantitative and qualitative factors must be taken into account in determining an allowed ROE. D.P.U. 11-01/D.P.U. 11-02, at 424; D.P.U. 08-27, at 134-138; D.T.E. 02-24/25, at 229-231; D.P.U. 92-78, at 115; D.P.U. 89-114/90-331/91-80 (Phase I) at 224-225.; see also Boston Edison Company v. Department of Public Utilities, 375 Mass. 1, 11, cert. denied, 439 U.S. 921 (1978); Boston Gas Company v. Department of Public Utilities, 359

Mass. 292, 305-306 (1971).[268] Thus, in determining an appropriate ROE for National Grid, the Department first evaluates the quantitative factors presented in this case.

In support of its recommended ROE, National Grid has presented quantitative analyses using the DCF model, the CAPM, and a bond yield plus risk premium approach, each incorporating the financial data of its proxy group. The Attorney General has presented her analyses using the DCF model and the CAPM, incorporating the financial data of both her proxy group and the Company's proxy group (Exh. AG-JRW-4, Panels A and B). The use of empirical analyses in this context is not an exact science. A number of judgments are required in conducting a model based rate of return analysis. Even in studies that purport to be mathematically sound and highly objective, crucial subjective judgments are made along the way and necessarily influence the end result. D.P.U 18731, at 59. Each level of judgment to be made in these models contains the possibility of inherent bias and other limitations. D.T.E. 01-56, at 117; D.P.U. 18731, at 59.

As discussed above, the evidence demonstrates that each equity cost model used by the Company and the Attorney General suffers from a number of simplifying and restrictive assumptions. Applying them to the financial data of a proxy group of companies could provide results that may not be reliable for the purpose of setting the Company's ROE. For example, we

---

[268] As noted above, the Attorney General proposes a ROE of 7.80 percent to account for what she identifies as a number of Company shortcomings, including its failures to: (1) conform to the Department's explicit instructions regarding the use of a split test year; (2) appropriately account for salvage value, thereby overstating the revenue requirement both in this case and the Company's previous rate case, as well as in the capital tracker mechanism; and (3) remove retired plant from plant in service accounts, resulting in an overstated depreciation expense requirement (Attorney General Brief at 125-126, citing D.T.E. 02-24/25, at 231). As discussed in Sections III and VIII.E, we decline to adjust the ROE based on these specific recommendations.

note the limitations of the DCF models used by both the Company and the Attorney General, including the simplifying assumptions that underlie the constant growth form of the model, and its element of circularity, as well as the inherent limitations in comparing the Company to publicly traded companies. In particular, we find that the Company's DCF analysis overestimates the cost of equity by minimizing the low-outlier estimates. We also find that the Attorney General's DCF model retains some elements of circularity because investor expectations depend upon regulatory decisions.

The Department further finds that the CAPM analyses relied upon by the Company and the Attorney General also are flawed because of the simplifying assumptions underlying CAPM theory and the subjectivity inevitable in estimating market risk premiums. To the extent we rely on the CAPM estimates, we give more weight to the Attorney General's analysis because the magnitude of the deficiencies within the Company's proposed CAPM, including the estimate of a market risk premium, is greater. Finally, we find that the Company's risk premium approach suffers from a number of limitations and tends to overstate National Grid's required ROE.

While the results of analytical models are useful, the Department must ultimately apply its own judgment to the evidence to determine an appropriate rate of return. We must apply to the record evidence and argument considerable judgment and agency expertise to determine the appropriate use of the empirical results. Our task is not a mechanical or model driven exercise.[269] D.P.U. 08-35, at 219-220; D.P.U. 07-71, at 139; D.T.E. 01-56, at 118;

---

[269] As the Department stated in New England Telephone and Telegraph Company, D.P.U. 17441, at 9 (1973):

> Advances in data gathering and statistical theory have yet to achieve precise prediction of future events or elimination of the bias of the

D.P.U. 18731, at 59; see also 375 Mass. 1, 15. The Department must account for additional factors specific to a company that may not be reflected in the results of the models.

We note that a portion of the revenues of the companies in both proxy groups is derived from unregulated and competitive lines of business (Exhs. AG-5-15; AG-JRW-4, at 1; AUS Utilities Reports, passim). All else equal, this mix of regulated and unregulated operations would tend to overstate the proxy groups' risk profiles relative to that of the Company. Therefore, in applying this comparability standard, we will consider such risk differentials when weighing the results of the models used to estimate the Company's allowed ROE.

In addition, the Department granted in this Order revisions to National Grid's CIRM (formerly CapEx), which allows the Company to implement an annual rate adjustment to support the net increase in rate base arising from the annual capital additions that the Company makes to upgrade its distribution system (see Section V.D above). National Grid's CIRM, which now accounts for property tax expense, serves to reduce the Company's risks and its investors' return requirement. Although many companies in both proxy groups employ some form of infrastructure recovery mechanism, these infrastructure recovery mechanisms vary among the companies, particularly insofar as the scope of eligible investments and the timing of cost recovery (Exhs. NG-RBH-1, at 40; NG-RBH-9; AG-JRW-4). On the whole, the infrastructure recovery mechanisms for these companies are less comprehensive than the CIRM (Exhs. NG-RBH-9; AG-JRW-4).

---

witnesses in their selection of data. Thus, there is no irrefutable testimony, no witness who has not made significant subjective judgments along the way to his conclusion, and no number that emerges from the welter of evidence as an indisputable "cost" of equity.

The Department also recognizes that the Company's decoupling mechanism reduces the variability of the Company's revenues and, accordingly, reduces its risks and its investors' return requirement. See D.P.U. 09-39, at 398; D.P.U. 09-30, at 371-372; D.P.U. 07-50-A at 72-73. Although many companies in both proxy groups employ some form of revenue stabilization or decoupling mechanism, the Department finds that the degree of revenue stabilization varies among the companies and, on the whole, is not as comprehensive as the Company's decoupling mechanism (Exhs. NG-RBH-9; AG-JRW-4).

The Company argues that the pertinent analysis in assessing the impact of decoupling or CIRM on the Company's ROE is not to analyze whether the Company is "less risky" but rather to ascertain whether (1) the effect of the mechanism was to reduce risk below the levels faced by the Company's peers; and (2) investors knowingly reduced their return requirements as a direct consequence of the mechanism (Exh. NG-RBH-1, at 40-42; Company Brief at 139-141). We disagree. While the issue of decoupling and its overall effect on a company's ROE is not a new factor for consideration for the first time in this proceeding, and independent of whether or not investors are keen to compare National Grid's decoupling level of risk vis-à-vis the Company's peers decoupling mechanisms, the fact remains that these mechanisms reduce the variability of the Company's revenues and, accordingly, reduce its risks and its investors' return requirement. D.P.U. 09-30, at 371-372; D.P.U. 07-50-A at 72-73.

In considering National Grid's allowed ROE, the Department also takes into account the modifications to the Company's storm fund mechanism. In particular, the Department has raised the cost-per-storm threshold, excluded from storm fund eligibility any single storm event with incremental costs that exceed $30 million, and modified the carrying charge component of the

storm fund (see Section VI.D). These modifications are intended to prevent a significant storm fund deficit, provide necessary rate stability for customers, more appropriately reflect the costs associated with the storm fund balance, and help ensure that the storm fund works as intended. The Department recognizes that, on balance, these modifications tend to increase the Company's risk associated with the recovery for storm costs when compared to the storm fund approved in D.P.U. 09-39. In addition, the Department takes into account our allowance of National Grid's recovery of its test year balance of protected hardship account receivables (see Section VIII.J.3). In allowing this recovery, the Department provides for the probability of recovery to avoid an impairment of loss by National Grid through a charge to its income statement that could be required by generally accepted accounting principles. We find that this ratemaking treatment of protected hardship account balances reduces the Company's risks.

Finally, there are other qualitative factors that the Department will consider in determining a company's allowed ROE. It is both the Department's long-standing precedent[270]

---

[270] For example, the Department has set a utility's ROE at the low end of a range of reasonableness upon a showing that a utility's management performance was deficient. D.P.U. 12-86, at 257-258 (deficiencies regarding affiliate transactions and selection of rate case consultants warranted ROE at lower end of reasonable range); D.P.U. 11-43, at 218-222 (company's improper handling of a billing error, failure to provide acceptable unaccounted for water report, improper flushing practices, and insufficient communication with customers warranted ROE at lower end of reasonable range); D.P.U. 11-01/D.P.U. 11-02, at 424-426 (company shortcomings in storm response warranted ROE at lower end of reasonable range); D.P.U. 10-114, at 339-340 (company activities related to Department-ordered audit warranted ROE at lower end of reasonable range); D.P.U. 08-35, at 220 (customer service deficiencies warranted ROE at lower end of reasonable range); D.P.U. 08-27, at 136, 137 (failure to conduct competitive bidding for outside consultants and provide detailed rate case expense invoices warranted ROE at lower end of reasonable range); see also D.P.U. 85-266-A/271-A at 172 (failure to fulfill public service obligations warranted ROE at lower end of reasonable range).

and accepted regulatory practice[271] to consider qualitative factors such as management performance and customer service in setting a fair and reasonable ROE. With respect to a company's performance, the Department has determined that where a company's actions have had the potential to affect ratepayers or have actually done so, the Department may take such actions into consideration in setting the ROE. D.P.U. 11-01/D.P.U. 11-02, at 424; D.T.E. 02-24/25, at 231; D.P.U. 85-266-A/271 A at 6-14. Thus, the Department may set ROEs that are at the higher end or lower end of the reasonable range based on above average or subpar management performance and customer service. See, e.g., D.P.U. 12-86, at 274-276 & n.181 (deficiencies regarding affiliate transactions and selection of rate case consultants warranted ROE at lower end of reasonable range); D.P.U. 11-01/D.P.U. 11-02, at 424, 427 (company shortcomings in storm response warranted ROE at lower end of reasonable range).

Based on a review of the evidence presented in this case, the arguments of the parties, and the considerations set forth above, the Department finds that an allowed ROE of 9.90 percent is within a reasonable range of rates that will preserve the Company's financial integrity, will allow it to attract capital on reasonable terms and for the proper discharge of its public duties, will be comparable to earnings of companies of similar risk and, therefore, is appropriate in this

---

271 See, e.g., In re Citizens Utilities Company, 171 Vt. 447, 453 (2000) (general principle that rates may be adjusted depending on the adequacy of the utility's service and the efficiency of its management); US West Commc'ns, Inc. v. Washington Utils. and Transp. Comm'n, 134 Wash.2d 74, 121 (1998) (a utility commission may consider the quality of service and the inefficiency of management in setting a fair and reasonable rate of return); North Carolina ex rel. Utils. Comm'n v. Gen. Tel. Company of the Southeast, 285 N.C. 671, 681 (1974) (the quality of the service rendered is, necessarily, a factor to be considered in fixing the just and reasonable rate therefore); Gulf Power Company v. Wilson, 597 So.2d 270, 273 (1992) (regulator was authorized to adjust rate of return within reasonable range to adjust for mismanagement); Wisconsin Pub. Serv. Corp. v. Citizens' Util. Bd., Inc., 156 Wis.2d 611, 616 (1990) (prudence is a factor regulator considers in setting utility rates and can affect the allowed ROE).

case.[272] In making these findings, the Department has considered both qualitative and quantitative aspects of the parties' various methods for determining the Company's proposed ROE, as well as the arguments of and evidence presented by the parties in this proceeding.

XIII. RATE STRUCTURE

A. Rate Structure Goals

Rate structure defines the level and pattern of prices charged to each customer class for its use of utility service. The rate structure for each rate class is a function of the cost of serving that rate class and how rates are designed to recover the cost to serve that rate class. The Department has determined that the goals of designing utility rate structures are to achieve efficiency and simplicity as well as to ensure continuity of rates, fairness between rate classes, and corporate earnings stability. D.P.U. 15-80/D.P.U. 15-81, at 294; D.P.U. 13-75, at 330; D.P.U. 12-25, at 444; D.P.U. 10-114, at 341; D.P.U. 09-39, at 401.

Efficiency means that the rate structure should allow a company to recover the cost of providing the service and should provide an accurate basis for consumers' decisions about how to best fulfill their needs. The lowest-cost method of fulfilling consumers' needs should also be the lowest cost means for society as a whole. Thus, efficiency in rate structure means that it is cost based and recovers the cost to society of the consumption of resources to produce the utility service. D.P.U. 15-80/D.P.U. 15-81, at 295; D.P.U. 13-75, at 330; D.P.U. 12-25, at 445; D.P.U. 10-114, at 342; D.P.U. 09-39, at 401. In practice, meeting the goal of efficiency should involve rate structures that provide strong signals to consumers to decrease energy consumption

---

[272] In setting this ROE, the Department took into consideration the amount of the storm fund assessment paid by National Grid pursuant to G.L. c. 25, § 18. See Fitchburg Gas and Electric light Company at al. v. Department of Public Utilities, 467 Mass. 768 (2014).

in consideration of price and non-price social, resource, and environmental factors. D.P.U. 15-80/D.P.U. 15-81, at 295; D.P.U. 12-25, at 445.[273]

The Department has determined that a rate structure achieves the goal of simplicity if it is easily understood by consumers. Rate continuity means that changes to rate structure should be gradual to allow consumers to adjust their consumption patterns in response to a change in structure. Fairness means that no class of consumers should pay more than the costs of serving that class. Earnings stability means that the amount a company earns from its rates should not vary significantly over a period of one or two years. D.P.U. 15-80/D.P.U. 15-81, at 295; D.P.U. 13-75, at 331; D.P.U. 12-25, at 444-445; D.P.U. 10-114, at 342; D.P.U. 09-39, at 402.

There are two steps in determining rate structure: cost allocation and rate design. Cost allocation assigns a portion of a company's total costs to each rate class through an embedded allocated cost of service study ("COSS"). The allocated cost of service represents the cost of serving each rate class at equalized rates of return given the company's level of total costs. D.P.U. 15-80/D.P.U. 15-81, at 296; D.P.U. 13-75, at 331; D.P.U. 12-25, at 446; D.P.U. 10-114, at 342; D.P.U. 09-39, at 402-403.

There are four steps to develop an allocated COSS. The first step is to functionalize costs. In this step, costs are associated with the production, transmission, or distribution function of providing service. The second step is to classify expenses in each functional category according to the factors underlying their causation. Thus, the expenses are classified as

---

[273] Effective use of energy resources means reducing the total amount of energy consumed without compromising service reliability through the use of more efficient technologies and practices, with clear and timely pricing information, as part of a sustainable energy policy. See An Act Relative to Green Communities, St. 2008, c. 169; An Act Establishing the Global Warming Solutions Act, St. 2008, c. 298.

demand-, energy-, or customer-related. The third step is to identify an allocator that is most appropriate for costs in each classification within each function. The fourth step is to allocate all of a company's costs to each rate class based on the cost groupings and allocators chosen and then to sum for each rate class the costs allocated in order to determine the total costs of serving each rate class at equalized rates of return. D.P.U. 15-80/D.P.U. 15-81, at 296; D.P.U. 13-75, at 332; D.P.U. 12-25, at 446-447; D.P.U. 09-39, at 402-403.

The results of the allocated COSS are compared to the revenues collected from each rate class in the test year. If these amounts are reasonably comparable, then the revenue increase or decrease may be allocated among the rate classes so as to equalize the rates of the return and ensure that each rate class pays the cost of serving it. If, however, the differences between the allocated costs and the test year revenues are significant, then, for reasons of continuity, the revenue increase or decrease may be allocated so as to reduce the difference in rates of return, but not to equalize the rates of return in a single step. D.P.U. 15-80/D.P.U. 15-81, at 297; D.P.U. 13-75, at 332; D.P.U. 12-25, at 446; D.P.U. 09-39, at 403.

As the previous discussion indicates, the Department does not determine rates based solely on the results of an allocated COSS, but also explicitly considers the effect of its rate structure decisions on the amount customers are billed. For instance, the pace at which fully cost-based rates are implemented depends, in part, on the effect of the changes on customers. In addition, considering the goals of efficiency and fairness, the Department has also ordered the establishment of special rate classes for certain low-income customers and considers the effect of such rates and rate changes on low-income customers. D.P.U. 15-80/D.P.U. 15-81, at 297; D.P.U. 13-75, at 332; D.P.U. 12-25, at 447; D.P.U. 09-39, at 403-404. To reach fair decisions

that encourage efficient utility and consumer actions, the Department's rate structure goals must balance the often divergent interests of various customer classes and prevent any class from subsidizing another class unless a clear record exists to support such subsidies — or unless such subsidies are required by statute, e.g., G.L. c. 164, § 1F(4)(i). In addition, G.L. c. 164, § 94I ("§ 94I") requires the Department, in each base distribution rate proceeding, to design rates based on equalized rates of return by customer class as long as the resulting impact for any one customer class is not more than ten percent.[274] The Department reaffirms its rate structure goals that are designed to result in rates that are fair and cost-based and enable customers to adjust to changes. D.P.U. 15-80/D.P.U. 15-81, at 298; D.P.U. 13-75, at 333; D.P.U. 12-25, at 447; D.P.U. 09-39, at 404.

The second step in determining the rate structure is rate design. The level of the revenues to be generated by a given rate structure is governed by the cost allocated to each rate class in the cost allocation process. The pattern of prices in the rate structure, which produces the given level of revenues, is a function of the rate design. The overarching requirement for rate design is that a given rate class should produce sufficient revenues to cover the cost of serving the given rate class and, to the extent possible, meet the Department's rate structure goals discussed above.

---

[274] An Act Relative to Competitively Priced Electricity in the Commonwealth, St. 2012, c. 209, Section 20, inserted G.L. c. 164, § 94I:

> In each base distribution rate proceeding conducted by the [D]epartment under Section 94, the [D]epartment shall design base distribution rates using a cost-allocation method that is based on equalized rates of return for each customer class; provided, however, that if the resulting impact of employing this cost-allocation method for any [one] customer class would be more than [ten] percent, the [D]epartment shall phase in the elimination of any cross subsidies between rate classes on a revenue neutral basis phased in over a reasonable period as determined by the [D]epartment.

D.P.U. 15-80/D.P.U. 15-81, at 298; D.P.U. 13-75, at 333; D.P.U. 12-25, at 447; D.P.U. 09-39, at 404.

B. Cost Allocation

1. Introduction

National Grid performed an allocated COSS that directly assigns or allocates, based on cost-causation principles, the Company's total cost of service to each rate class (Exh. NG-PP-1, at 9). There are three steps to the Company's allocated COSS.

First, the Company functionalizes costs by its basic function, such as primary distribution, secondary distribution, and customer (Exh. NG-PP-1, at 13-14).[275] The primary distribution function includes costs related to substations, conductors rated 4 kilovolt ("kV") and higher, transmission, and production assets (Exh. NG-PP-1, at 10). The secondary distribution function includes costs related to conductors and other assets that move electricity from the primary system to customers' premises (Exh. NG-PP-1, at 10). The customer function includes costs related to meters, service drops, billing and collection, and any assets and activities that enable the distribution of electricity to the customer (Exh. NG-PP-1, at 10).

Second, the Company classifies each functionalized cost as demand-, energy-, or customer-related according to the system design or operating characteristics that cause them to be incurred (Exh. NG-PP-1, at 9, 15). Demand-related costs are associated with plant that is designed, constructed, and operated to meet system peak demand or non-coincident class peak demand (Exh. NG-PP-1, at 16). Energy-related costs vary with the electricity delivered to customers (Exh. NG-PP-1, at 16). Customer-related costs are incurred to attach a customer to

[275] There are separate functions for primary distribution and secondary distribution because some customers take service at primary voltages (Exh. NG-PP-1, at 14).

the distribution system, to meter and read usage, and to maintain the meter, service drop, and the customer's account (Exh. NG-PP-1, at 15). Customer-related costs are a function of the number of customers the Company serves, are incurred whether or not a particular customer uses any electricity, and typically do not vary with usage or load profile (Exh. NG-PP-1, at 15).

The third step is the allocation of each functionalized and classified cost element to each rate class based on cost-causation principles (Exh. NG-PP-1, at 9, 16).[276] Costs are either directly assigned or allocated to rate classes (Exh. NG-PP-1, at 16).

In allocating costs to rate classes, the Company used external and internal allocators (Exh. NG-PP-1, at 12). External allocators are developed in special studies derived from the Company's accounting, operating, and other records (Exh. NG-PP-1, at 12). Examples of external allocators are: (1) the numbers of customers in each rate class; (2) class non-coincident peak demands; and (3) historical bad debt experience for each rate class (Exh. NG-PP-1, at 13). Internal allocators are developed within the allocated COSS using a combination of external allocators and other internal allocators (Exh. NG-PP-1, at 13). The Company explains that the internal allocator for property insurance costs is based on plant investment, and therefore, plant investment must be allocated to each rate class before property insurance costs can be assigned to each rate class (Exh. NG-PP-1, at 13).

National Grid set its initial revenue requirement target for each rate class to generate equalized rates of return (Exh. NG-PP-1, at 19). This step resulted in an overall average percentage increase to existing base rates of 5.11 percent (Exh. NG-PP-1, at 21). National Grid

---

276 Inherent in this third step, as discussed in the Rate Structure section, is the process of identifying an allocator that is most appropriate for costs in each classification within each function.

proposed to limit the rate increases for Rate R-4 and the street lighting rate classes to ten percent of total revenue (Exh. NG-PP-1, at 21). The Company proposed to allocate the revenue shortfall to all other rate classes based on each rate class's share of base distribution revenue (Exh. NG-PP-1, at 21).

2. Positions of the Parties

a. Attorney General

According to the Attorney General, the Company's "unit cost analysis"[277] does not accurately reflect how costs are allocated in the allocated COSS (Exh. AG-SJR-1, at 8, citing Exh. DPU-33-8, at 35). The Attorney General maintains that in the allocated COSS, the Company allocates costs for production plant, power supply expenses, demonstration and selling expense, miscellaneous expenses, and depreciation expense related to production plant using a rate class's energy consumption (Exh. AG-SJR-1, at 9 citing Exh. DPU-33-8, at 14, 16, 18, 22, 24, 25). However, the Attorney General argues that energy consumption does not appear in the Company's unit cost analysis (Exh. AG-SJR-1, at 8). The Attorney General points out that the Company incorrectly states: "the Company has classified all assets and costs as either [d]emand or [c]ustomer. The Company did not classify any asset or cost as [e]nergy" (Exh. AG-SJR-1, at 8, citing Exh. DPU-1-14).[278]

---

277 The unitized cost is the cost associated with a utility function divided by the number of units of service for that function (Exh. AG-SJR-1, at 7). It also is referred to as an embedded cost analysis.

278 According to the Attorney General's analysis, the unitized demand-related cost for the residential rate class decreases from $12.90 per kW per month to $12.72 per kW per month, the customer-related costs decreases from $9.42 per month to $9.31 per month, and the unitized energy-related cost is 0.006 cents per kWh (Exh. AG-SJR-1, at 9).

Further, the Attorney General argues that the Company relies on unitized costs to estimate the cost to serve a customer (Exh. AG-SJR-1, at 9). However, the Attorney General contends that the unitized cost for the rate class will likely be different from the actual cost to serve any particular residential customer (Exh. AG-SJR-1, at 9). Therefore, the Attorney General asserts that the average cost to serve a typical customer is fair to all customers, at a given point in time, "because each customer has a fairly equal chance of being served by facilities that are more expensive or less expensive than average" (Exh. AG-SJR-1, 10).[279]

b. Acadia Center

Acadia Center argues that the economic analysis used in an allocated COSS has evolved since the electric industry was created in the United States (Acadia Center Brief at 11). According to Acacia Center, an allocated COSS misses a significant part of the overall picture for system costs (Acadia Center Brief at 11). Specifically, Acadia Center maintains that the traditional allocated COSS is no longer sufficient in rate design because the shift to cost-effective distributed energy resources is not included in the analysis (Acadia Center Brief at 11). Acadia Center contends that the impact on rates from the incorporation of distributed energy resources into a distribution system is a cutting edge topic and is worthy of consideration by the Department, as well as discussion among stakeholders (Acadia Center Brief at 11). Thus,

[279] In the Attorney General's example, she explains that if a pole is replaced on a customer's street, the customer is likely paying, in sequence: (1) less than the actual cost of service for a few initial years; (2) equal to the cost of service; and (3) less than the actual cost of service towards the end of the useful life of the pole (Exh. AG-SJR-1, at 10).

Acadia Center asserts that the value of distributed energy resources should be a part of the next evolutionary phase in the economic analysis for ratemaking (Acadia Center Brief at 11).[280]

c. Direct Energy

Direct Energy supports reform to the allocated COSS (Direct Energy Brief at 15). In particular, Direct Energy argues that the Department should require the Company to provide a new allocated COSS that allocates costs to both distribution service and basic service (Direct Energy Brief at 15).[281] Direct Energy recommends that the new allocated COSS be reflected in rates at or close in time to the point at which the Company's proposed rate increases are allowed to take effect (Direct Energy Brief at 15). Further, Direct Energy suggests that the Company should participate in a stakeholder process to review the new allocated COSS, and collectively present an agreed upon allocated COSS to the Department for approval (Direct Energy Brief at 15). Finally, Direct Energy argues that the Company should explain its experiences in allocated COSS reform in a statewide investigation on this issue (Direct Energy Brief at 15).

d. Company

According to the Company, its rate proposals are based on its allocated COSS (Company Brief at 198). National Grid asserts that its allocated COSS directly assigns or allocates each element of its revenue requirement among the rate classes in order to determine the costs of providing service to each rate class (Company Brief at 198, citing Exh. NG-PP-1, at 9). The Company notes that results from its allocated COSS at present rates show that the Company is

---

280 Acadia Center contends that the benefits include capacity savings, transmission savings, reduced energy prices, and the avoided cost of compliance with greenhouse gas emission requirements (Acadia Center Brief at 11).

281 Direct Energy also raises specific issues related to the Company's recovery of basic service costs in Section XI above.

earning an overall return of 1.18 percent, with class returns varying from negative 7.86 percent to 9.86 percent (Company Brief at 200, citing Exh. NG-PP-2(a)).

3. Analysis and Findings

Pursuant to § 94I, the Department in each base distribution rate proceeding is required to design rates based on equalized rates of return by customer class as long as the resulting impact for any one customer class is not more than ten percent. The Department finds that National Grid's proposal to cap the rate increase for Rate R-4 and the street lighting rate classes at ten percent of total revenue complies with § 94I (Exhs. NG-PP-4, at 2; NG-PP-1, at 21; DPU-33-8, Att. at 38 (PDF)).

The Company proposed to allocate the revenue increase above the ten percent cap using the uncapped rate classes' share of test year base distribution revenues (i.e., distribution revenues at present rates) (Exhs. NG-PP-1, at 21; NG-PP-4, at 2; DPU-33-8, Att. at 38 (PDF)). The Department's long-standing policy regarding the allocation of class revenue requirements that exceed a cap is that they should be allocated to those rate classes that do not exceed the cap on the basis of their distribution revenue requirements at equalized rates of return. D.T.E. 03-40, at 384; D.T.E. 02-24/25, at 256; D.T.E. 01-56, at 139; D.P.U. 92-210, at 214. Moreover, the Department recently directed Fitchburg Gas and Electric Light Company to allocate the revenue requirement in excess of the ten-percent rate cap to those rate classes that did not exceed the cap on the basis of their distribution revenue requirements at equalized rates of return instead of test year distribution revenues. D.P.U. 15-80/D.P.U. 15-81, at 302. For these reasons, and to advance the rate goals of fairness and efficiency, the Department directs the Company to allocate

the revenue requirement that exceeds the ten-percent rate cap to those rate classes that did not exceed the cap on the basis of their distribution revenue requirements at equalized rates of return.

The Department notes that allocating the revenue requirement that exceeds the ten-percent rate cap based on revenue requirements at equalized rates of return still results in a significant rate increase for Rate R-4 that violates our continuity goal. Consequently, the Department directs the Company to limit the distribution rate increase for Rate R-4 to 200 percent of the overall distribution rate increase, and to allocate the remaining revenue requirement to the uncapped rate classes based on the ratio of their class revenue requirement at equalized rates of return to the sum of the class revenue requirement at equalized rates of return for all uncapped rate classes.[282]

The Department declines to adopt the Attorney General's recommended modifications to the allocated COSS. The Company functionalized all of its costs as primary distribution, secondary distribution, or customer (Exh. NG-PP-1, at 13). Costs are then classified based on system design or operating characteristics (Exh. NG-PP-1, at 15). When classifying the functionalized costs, costs classified as energy-related vary with the electricity sold to or delivered to customers (Exh. NG-PP-1, at 16). All of the assets and costs in the Company's primary and secondary distribution functions are classified as demand-related, and all of the assets and costs in the Company's customer function are classified as customer-related (Exh. NG-PP-1, at 16). Thus, none of the Company's functionalized costs were classified as

---

[282] The Department makes this directive based on the allocated COSS and revenue requirement in the Company's response to information request DPU-33-8 (Exh. DPU-33-8, Att. at 22). The Department, therefore, directs the Company to apply the 200-percent cap using the allocated COSS and revenue requirements that result from our findings in this Order.

energy-related. In the class allocation step, functionalized and classified costs are then allocated among the rate classes based on causal relationships (Exh. NG-PP-1, at 16). For example, production plant and production O&M were allocated among the rate classes based on each class's test year megawatt-hour deliveries because of the causal relationship (Exh. NG-PP-1, at 16). If customers use more energy, then production plant and O&M costs will increase. Additionally, the Department notes that the Company did not change this classification and allocation method from its allocated COSS that was approved in its last rate case (Exh. DPU-1-7, Att. at 2).

Further, Acadia Center and Direct Energy allege deficiencies in the Company's allocated COSS (Acadia Center Brief at 11; Direct Energy Brief at 15). Having reviewed their arguments, we are not persuaded that the Company's allocated COSS requires any further modification. Therefore, the Department declines to adopt Acadia Center's and Direct Energy's recommendations.[283]

The Department has reviewed National Grid's allocated COSS and, apart from the change to the ten-percent rate cap allocation method and requiring a 200-percent of the overall rate increase cap on the increase to each rate class' distribution revenues, the Department finds that it is reasonable and consistent with Department precedent. D.P.U. 15-80/D.P.U. 15-81, at 303, 309; D.P.U. 13-90, at 240-241; D.P.U. 11-01/D.P.U. 11-02, at 434-437. Accordingly, we accept National Grid's allocated COSS as proposed and with the aforementioned changes. The Department directs the Company to rerun its allocated COSS for submission in its compliance filing to allocate its costs and expenses in excess of the ten-percent cap and 200 percent cap as

[283] In Section XI above, we address in further detail Direct Energy's arguments regarding basic service costs allocated to the Company's Basic Service Adjustment Provision.

approved in this Order. In addition, consistent with D.P.U. 15-80/D.P.U. 15-81, at 339-340, the Company shall update the class-based allocators approved in the instant case for the reconciling mechanism tariffs at the time of each tariff's next scheduled rate change.

C. Marginal Cost Study

1. Introduction

The use of a marginal cost study facilitates the development of rates that provide consumers with price signals that accurately represent the costs associated with consumption decisions. D.P.U. 11-01/D.P.U. 11-02, at 438; D.P.U. 10-55, at 524; D.P.U. 09-30, at 377; D.P.U. 08-35, at 227; D.T.E. 03-40, at 372. Rates based on a marginal cost study allow consumers to make informed decisions regarding their use of utility services, promoting efficient allocation of societal resources. D.P.U. 11-10/D.P.U. 11-02, at 438; D.P.U. 10-55, at 524; D.T.E. 03-40, at 372.

2. Company Proposal

National Grid's marginal cost of service study ("MCOSS") follows the same methodology that was used in its last rate case, with minor updates (Exh. NG-HSG-1, at 3).[284] To develop the MCOSS, National Grid first identified the costs for plant additions that are

[284] The Company's MCOSS uses peak electricity use plus energy efficiency reductions as the independent variable in its regression analysis. By contrast, the MCOSS approved in D.P.U. 09-39 did not account for energy efficiency reductions (Exh. NG-HSG-1, at 13). Additionally, two un-essential variables included in the MCOSS approved in D.P.U. 09-39 were omitted from the most recent analysis due to their lack of statistical significance (Exh. NG-HSG-1, at 14). Finally, the Company updated the percentages used to allocate primary from secondary system distribution costs (Exh. NG-HSG-1, at 120).

exclusively demand-related (Exhs. NG-HSG-1, at 7; NG-HSG-2).[285] The Company then adjusted these historical costs to 2014 values using the Handy-Whitman Index (Exhs. NG-HSG-1, at 7; NG-HSG-2). Following this adjustment, National Grid multiplied total demand-related plant addition costs by the percentage of total plant addition costs associated with primary distribution service to separate plant addition costs attributable to primary versus secondary distribution systems (Exhs. NG-HSG-1, at 7; NG-HSG-2). Finally, as the MCOSS is only concerned with plant additions that are made to support load growth, the Company removed from primary and secondary distribution plant costs all plant additions made for replacement (Exhs. NG-HSG-1, at 7; NG-HSG-2; NG-HSG-3; NG-NSG-4; NG-HSG-4A).

By regressing primary distribution plant costs on electricity demand,[286] and a number of other explanatory variables, the Company determined that the marginal plant cost per kilowatt ("kW") of demand for the primary distribution sector was $495.29 (Exhs. NG-HSG-6; NG-HSG-7). Using these results,[287] the Company found that the marginal plant cost per kW of demand for the secondary distribution sector was $160.52 (Exhs. NG-HSG-6; NG-HSG-7). The Company then added general plant costs to the marginal

---

285 The following variables were considered to be exclusively demand-related: (1) station equipment; (2) overhead conductors; (3) underground conductors; and (4) line transformers (Exhs. NG-HSG-1, at 7; NG-HSG-2).

286 Electricity demand is defined as system peak electricity use plus energy efficiency savings (Exh. NG-HSG-1, at 10).

287 To discern marginal plant cost in the secondary distribution system, the Company calculated the marginal plant cost for the total distribution system ($655.81), and then subtracted from it the marginal plant cost in the secondary distribution system ($495.29). The Company was not able to establish a relationship between marginal plant costs in the secondary distribution system directly because regression analysis did not lead to significant results (Exh. NG-HSG-1, at 11).

capital cost calculations in each sector and multiplied the resulting figures by the economic carrying charge rate (Exhs NG-HSG-1, at 14-15; NG-HSG-8; NG-HSG-8A).[288] The Company adjusted these amounts for O&M expenses, administrative and general expenses, and working capital (Exhs. NG-HSG-1, at 15; NG-HSG-3; NG-HSG-6; NG-HSG-9; NG-HSG-10). It then adjusted the marginal cost estimates for peak demand, 2016 price-levels, and electricity line losses (Exhs. NG-HSG-1, at 17-18; NG-HSG-10; NG-HSG-11).

National Grid calculated an annual marginal cost of $69.65 per kW of demand for the primary distribution system, and an additional $22.77 per kW of demand for the secondary distribution system (Exhs. NG-HSG-1, at 17; NG-HSG-10). After adjusting for electricity line losses, these marginal cost estimates increase to $71.15 per kW for service taken at the primary voltage level and $97.85 per kW for service taken at the secondary voltage level (Exhs. NG-HSG-1, at 17-18; NG-HSG-11).[289] Finally, the Company calculated the marginal cost for each rate class by multiplying the marginal cost per kW by the demand in the test year for each rate class, and then grossed up these amounts by the uncollectable costs for each rate class (Exhs. NG-HSG-1, at 18; NG-HSG-12).

3. Positions of the Parties

a. Attorney General

The Attorney General raises two concerns with the results of the MCOSS (Exh. AG-SJR-1, at 5-7). First, the Attorney General argues that the model used fails to take into

---

288 The economic carrying charge rate is the percentage of capital cost that provides a return on rate base (Exh. NG-HSG-1, at 15).

289 Service taken at the secondary voltage level includes use of both the primary and secondary distribution system.

account important demand-related costs (Exh. AG-SJR-1, at 6). In this regard, she points specifically to the absence of structures (Account 361), poles (Account 364), and underground conduits (Account 366) in the Company's MCOSS calculation (Exhs. AG-SJR-1, at 6; AG-10-6). According to the Attorney General, including these costs would increase marginal cost by approximately 25 percent, which suggests that the current MCOSS results significantly underestimate marginal cost (Exhs. AG-SJR-1, at 6; AG-10-6).

Second, the Attorney General questions the relevance of MCOSS to the ratemaking process, particularly in designing rates (Exh. AG-SJR-1, at 6-7). In particular, she argues that marginal cost pricing does not allow companies to recover embedded costs, which would prevent companies from collecting the full price of providing its service through rates (Exh. AG-SJR-1, at 6-7). According to the Attorney General, the MCOSS is not particularly useful beyond confirming economic theory on the relationship between marginal cost and average cost (Exh. AG-SJR-1, at 6-7).

b. Company

National Grid reiterates the specifics of its MCOSS on brief (Company Brief at 200-201). The Company submits that its MCOSS is based on the same methodology that was approved in D.P.U. 09-39 (Company Brief at 201).

4. Analysis and Findings

The Department has evaluated National Grid's proposed MCOSS and finds that it incorporates sufficient detail to fully understand the methods used to determine the marginal cost estimates. Consistent with the directives in D.T.E. 05-27, at 322 & n.170, the Company

excluded from the MCOSS all production, transmission, and customer costs,[290] as they are irrelevant to the design of distribution rates under the Department's current rate design (Exh. NG-HSG-1, at 2). Further, we conclude that the Company followed all computational guidelines set forth by the Department in developing its MCOSS (Exhs. NG-HSG-1, at 9-14; NG-HSG-6; NG-HSG-7; NG-HSG-8).[291]

The Department has evaluated the Attorney General's concern regarding the Company's decision to omit certain variables, but we find that their omission is not inconsistent with Department directives. The Company's analysis is consistent with the MCOSS approved in D.P.U. 09-39. Further, while more recent MCOSS studies approved by the Department have included structures, poles, and underground conduits in their analyses,[292] we find that the nature of these accounts suggests that they might not be necessary for the purpose of the Company's MCOSS. The record shows that the Company omitted Accounts 361, 364 and 366 from the MCOSS because these plant assets have no load-carrying capacity (Exh. AG-10-6). Depending on the circumstances of the load increase, the Company may or may not be correct in this assertion. However, because the directives set forth in D.T.E. 05-27 seek to eliminate the customer component in the MCOSS, the Department finds it appropriate to treat these assets as non-load-carrying because further investment in these assets would not be required to support a

---

290 Costs associated with expanding the Company's customer base.

291 These guidelines include: (1) the use of historical data sets no less than 30 years; (2) tests and remedial procedures for issues such as multicollinearity, heteroscedasticity, and autocorrelation; (3) multiple variable regression analysis; (4) consistency check against economic theory concerning marginal cost modeling; and (5) minimal dummy variable and autoregressive term use. See D.T.E. 05-27, at 317-322; D.T.E. 02-24/25, at 243-245.

292 See D.P.U. 13-90, at 241.

marginal increase in load assuming the increase is not the result of an increase in the numbers of customers. Accordingly, based on our review of the Company's MCOSS and the aforementioned considerations, the Department approves the Company's MCOSS.[293]

D. Rate Design

1. Introduction

The Company designed rates to produce a revenue requirement for distribution service of $799.1 million, and proposed to implement its rate design in two phases for Rates R-1, R-2, and G-1 (Exh. NG-PP-1, at 8-9).[294] The Company proposed its rate design with the stated goal of designing fair and equitable distribution rates across all rate classes to reflect the actual cost to serve each customer (Exh. NG-PP-1, at 23).

2. Phase I

In Phase I, the Company proposed several modifications and increases to the charges under its current rate structure (Exh. NG-PP-1, at 8). National Grid proposed a flat rate structure for Rates R-1, R-2, and G-1, and the elimination of its current inclining block rate design implemented in its last base distribution rate case (Exh. NG-PP-1, at 50, 66, 69). Further, the Company proposes to eliminate Rate S-20 (street & area lighting, Company-owned equipment, HPS conversion) and Rate E (limited residential electric space heating) (Exhs. NG-PP-1, at 22;

---

293 We acknowledge the Attorney General's position regarding the relevance of the MCOSS in the context of designing rates, and we recognize that rate design is intended to recover embedded costs, which are typically higher than marginal costs. The Department's findings with respect to the Company's rate design proposals are set forth in greater detail below.

294 In Phase II, the Company has not proposed any changes to rate structure for Rates R-4, G-2, G-3, or the street lighting rate classes (Exh. NG-PP-1, at 64).

DPU-23-4). Additionally, National Grid proposes a new light emitting diode ("LED")[295] option on Rate S-1 (Company-owned street lighting rate) (Exhs. NG-PP-1, at 22; NG-PP-23, at 24, 87 (proposed M.D.P.U. Nos. 1270 (MECo) and 528 (Nantucket Electric))). For Rate G-3, the Company proposes to remove the volumetric rate and bill customers only a customer charge and demand charge (Exh. NG-PP-1, at 57-58).

Finally, for both Rates G-2 and G-3, the Company proposes to revise the definition of billing demand to include a demand ratchet (Exh. NG-PP-1, at 22, 54). Currently, a Rate G-2 or G-3 customer's billing demand is based upon the customer's maximum metered use during a 15-minute interval during all hours (Rate G-2) or peak hours (Rate G-3) of the billing month (Exh. NG-PP-1, at 56). A demand ratchet modifies the definition of a Rate G-2 or G-3 customer's billing demand to be the greater of: (1) the maximum metered kW; (2) 90 percent of the maximum metered kilovolt-amperes ("kVA"); or (3) a value based upon 75 percent of the greater of maximum metered kW or 90 percent of kVA during the prior eleven months (Exh. NG-PP-1, at 56).

3. Phase II - Tiered Customer Charges

For residential and small commercial customers and industrial ("C&I") (i.e., Rates R-1, R-2, and G-1), the Company proposes to shift cost recovery from the kWh charge to tiered customer charges in Phase II of its proposal (Exh. NG-PP-1, at 8, 22). The Company's proposed Phase II rate design is to take effect no earlier than six months after the implementation of Phase I rates, or approximately May 1, 2017 (Exhs. NG-PP-1, at 8; DPU-9-16).

---

295 LED lights are energy efficient, have long lives, and do not contain hazardous chemicals like the mercury that is contained in mercury-vapor lamps. See D.P.U. 11-01/D.P.U. 11-02, at 471.

National Grid's Phase II rate design proposal implements a four-tiered customer charge (Exh. NG-PP-1, at 32). The Company defines each tier by a kWh range, or a proxy for customer size, intended to represent a customer's monthly maximum demand (Exh. NG-PP-1, at 32, 36, 41). The Company proposes to assign a customer to a tier based on his or her maximum kWh usage in a billing month, over the last twelve billing months (Exh. NG-PP-1, at 36, 41). The customer charge for each succeeding tier is higher relative to the prior tier, and the tiers are intended to approximate a rate design with a customer charge and a demand charge (Exhs. NG-PP-1, at 35-36; NG-PP-Rebuttal-1, at 11). The Company proposes to recover most, if not all, of the customer-related revenue requirement and a portion of the demand-related revenue requirement based upon the billing determinants of the applicably-sized customers in each tier (Exh. NG-PP-1, at 33).

The proposed tiers and customer charges for Rates R-1 and R-2 are listed below.

	Phase II	
Tier	**kWh**	**Charge per Month**
Tier 1	0 – 250	$6.00
Tier 2	251 – 600	$9.00
Tier 3	601 – 1,200	$15.00
Tier 4	> 1,200	$20.00

(Exh. NG-PP-1, at 65).

According to the Company's billing data, approximately twelve percent of residential customers have a monthly maximum use within the range of the first tier (Exh. NG-PP-1, at 66). Approximately 27 percent of the residential customer bills will fall into the second tier (Exh. NG-PP-1, at 66). The remaining 61 percent of the customers will fall into the third and fourth tiers (Exh. NG-PP-1, at 66). The Company proposes to recover approximately 42 percent of the Rate R-1 and R-2 revenue requirement through the four proposed customer charges,

compared to 17 percent of the revenue requirement through the proposed Phase I rate design (Exh. NG-PP-1, at 68).

The proposed tiers and customer charges for Rate G-1 are listed below.

	Phase II	
Tier	**kWh**	**Charge per Month**
Tier 1	0 – 75	$10.00
Tier 2	75 – 500	$11.00
Tier 3	501 – 2,000	$15.00
Tier 4	> 2,000	$30.00

(Exh. NG-PP-1, at 69).

According to the Company's billing data, approximately 15 percent of G-1 customers have a monthly maximum use within the range of the first tier (Exh. NG-PP-1, at 69). Approximately 29 percent of customer bills will fall into the second tier (Exh. NG-PP-1, at 69). The remaining 56 percent of the customers will fall into the third and fourth tiers (Exh. NG-PP-1, at 69). The Company proposed to recover approximately 31 percent of the Rate G-1 revenue requirement through the four proposed customer charges, compared to 18 percent of the revenue requirement through the proposed Phase I rate design (Exh. NG-PP-1, at 70).

4. Attorney General's Seasonal Rate Design Proposal

The Attorney General proposes an alternative rate design for Rates R-1 and R-2 with a higher volumetric rate during July, August, and September (Exh. AG-SJR-1, at 29). She proposes a $5.50 customer charge, a base distribution rate of $0.04180 per kWh during October through June, and a base distribution rate of $0.04809 during July through September (Exhs. AG-SJR-1, at 29; AG-SJR-11). This rate design was based on the Attorney General's comparison of the summer energy use and the customer's contribution to class non-coincident peak demand, information that was provided by the Company (Exh. AG-SJR-1, at 17). The

Attorney General states that she put forth this proposal as a better proxy for demand related-costs than was instituted in either the Company's Phase I or Phase II rate design proposals (Exh. AG-SJR-1, at 18).

5. Positions of the Parties

a. Attorney General

i. Phase I

The Attorney General argues that the Company's proposed Phase I rate design is not as efficient or fair as it should be (Attorney General Brief at 130). For example, according to the Attorney General's analysis, revenues collected from a customer would only increase by 57 cents for each dollar increase in the cost of serving the customer (Attorney General Brief at 129-130, citing Exh. AG-SJR-1, at 22). Moreover, the Attorney General contends that low-use customers will experience higher bill increases (i.e., a 28.6-percent increase for consumption less than 600 kWh) than high-use customers (i.e., 11.3-percent increase for consumption greater than 600 kWh) (Attorney General Brief at 129, citing Exh. AG-SJR-1, at 12). Therefore, the Attorney General asserts that the Company's Phase I rate design would collect too much revenue from low-use customers and not enough revenues from high-use customers (Attorney General Brief at 129-130).

ii. Phase II – Tiered Customer Charges

The Attorney General argues that the Company's tiered customer charge proposal is "radically" different than any other rate design in effect in Massachusetts or elsewhere in the United States (Attorney General Brief at 131, citing Exh. DPU-12-2; Attorney General Reply Brief at 71-72). According to the Attorney General, the Company's tiered customer charge

proposal does a poor job of reflecting the cost of serving different customers and results in unfavorable bill impacts compared to alternative rate designs (Attorney General Brief at 134; Attorney General Reply Brief at 71-72, 76). Moreover, the Attorney General contends that tiered customer charges are inconsistent with the Department's rate design principles and goals (Attorney General Brief at 127). According to the Attorney General, when developing rates, the Department must balance rate design principles, giving the appropriate weight to each principle based on the importance of different policy goals (Attorney General Brief at 128). As discussed in greater detail below, the Attorney General argues that the Company's Phase II rate design proposal: (1) results in arbitrary and incorrect rate changes, violating the rate design goal of fairness; (2) results in large bill impacts, violating the rate design goal of continuity; and (3) fails to recover the appropriate costs from high-use customers, violating the rate design goal of efficiency (Attorney General Brief at 127,132). Therefore, the Attorney General asserts that the Department should reject the Company's tiered customer charge proposal (Attorney General Reply Brief at 76).

(A) Fairness

According to the Attorney General, the Company's tiered customer charge proposal violates the rate design principle of fairness (Attorney General Brief at 133). More specifically, the Attorney General asserts that customers will experience: (1) arbitrary rate changes based on the day of week when the meter is read; and (2) the potential for incorrect rate changes from estimated billing procedures (Attorney General Brief at 132, citing Exh. AG-SJR-1, at 25). As an example, the Attorney General notes that a customer may use more electricity by doing laundry and watching the television at the same time during off-peak, low demand weekend

hours, and she contends that it is unfair for a customer to be charged a higher tiered customer charge for a year based on one weekend in one billing cycle (Attorney General Brief at 132, citing Exh. AG-SJR-1, at 25).[296] The Attorney General claims that the Company acknowledged this issue but did not modify its proposal (Attorney General Brief at 132, citing Exh. AG-12-9; AG-12-11). Moreover, the Attorney General assert that the Company did not address the concern that estimated meter reads could place customers into a higher tier customer charge for a year (Attorney General Brief at 133, citing Exh. AG-12-10).

(B) Continuity

The Attorney General argues that the Company's tiered customer charge proposal violates the rate design principle of rate continuity (Attorney General Brief at 132). Based on the Attorney General's analysis of approximately 854,000 customers on Rates R-1 and R-2, she calculated bill impacts ranging from a 14-percent decrease to a 182-percent increase (Attorney General Brief at 133, citing Exhs. AG-SRJ-1, at 27-28; AG-SJR-10; Attorney General Reply Brief at 75, citing Exh. AG-SJR-1, at 27-28). Therefore, the Attorney General contends that the Company's Phase II proposal results in extraordinary and unacceptable impacts on customers'

---

296 The Attorney General cites to testimony from her witness to support her argument:

> Some customers use substantially more electricity on the weekends when they (and their children) are home from work or school, doing laundry, watching the television more hours per day, and heating or cooling the home to a more comfortable temperature all day. If a billing period has five Saturdays and Sundays instead of four, such a customer could be placed into a higher tier just because of the quirks of the billing cycle.

(Attorney General Brief at 132, citing Exh. AG-SJR-1, at 25).

bills (Attorney General Brief at 132; Attorney General Reply Brief at 75, citing Exh. AG-SJR-1, at 29).

(C) Efficiency

The Attorney General argues that the Company's tiered customer charge proposal violates the rate design principle of efficiency (Attorney General Brief at 132). According to the Attorney General, the Company's proposal does not better reflect the cost of serving customers because a customer's bill will increase by only 54.1 cents for each dollar increase in costs (Attorney General Brief at 134, citing Exhs. AG-SJR-1, at 23; AG-SJR-8; Attorney General Reply Brief 72, citing Exh. AG-SJR-1, at 23). Moreover, she contends that the tiered customer charges fail to recover the appropriate costs from high-use customers (Attorney General Brief at 132). Therefore, the Attorney General claims that the Company has not supported its claim that tiered customer charges are more reflective of cost-based rates (Attorney General Reply Brief at 72).

Moreover, the Attorney General argues that the Company has not supported its position that the Phase II rate design proposal is a reasonable proxy for a residential rate structure, where the customer charge is designed to recover customer-related costs and a demand charge recovers capacity-related costs (Attorney General Reply Brief at 72, citing Company Brief at 217). In this regard, the Attorney General maintains that there is a weak correlation between a residential customer's annual energy consumption and its contribution to the class's non-coincident peak demand and its contribution to coincident peak demand (Attorney General Brief at 130; Attorney General Reply Brief at 72). As such, she claims that the Phase II rate design is statistically different than a rate design that includes an actual demand charge for residential customers

(Attorney General Brief at 130; Attorney General Reply Brief at 72-73). Further, according to the Attorney General's analysis of more than 12,000 residential customers with demand meters, the Company's Phase II proposal showed the worst results as a proxy demand charge rate compared to rate design alternatives (Attorney General Reply Brief at 72, citing Exh. AG-SJR-1, at 15-17). Therefore, the Attorney General asserts that the Company's tiered customer charge proposal does not meet the rate design principle of efficiency (Attorney General Brief at 129-130).

iii. Seasonal Rate Design

The Attorney General argues that her seasonal rate design proposal is consistent with the Department's rate design goals because it avoids extreme bill impacts, sends appropriate price signal, and is easy for customers to understand (Attorney General Brief at 134-135, 138). According to the Attorney General, a seasonal rate design sets cost-based rates and balances cost causation concerns with customer bill impacts (Attorney General Brief at 134-135; Attorney General Reply Brief at 72).

The Attorney General argues that with a residential customer charge of $5.50 per month and base distribution rates 15 percent higher during the months of July through September, as she recommends, the Company's residential rate design will be closer to the cost of service (Attorney General Brief at 136, citing Exh. AG-SJR-1, at 29). For example, the Attorney General asserts that her proposed seasonal rate design would recover 57.4 cents for each dollar of the cost increase, compared to National Grid's Phase I and Phase II rate design proposals, which would recover 57 cents per dollar increase and 54.1 cents per dollar increase, respectively (Attorney General Brief at 136, citing Exhs. AG-SJR-1, at 30; AG-SJR-12).

Moreover, the Attorney General argues that the 15-percent differential between summer and winter rates is less than the full difference in the cost of serving in these periods, but represents a transitional measure that takes into account customer bill impacts for all customers, including those with largely seasonal consumption (Attorney General Reply Brief at 75, citing Exh. AG-SJR-1, at 29). According to the Attorney General, her proposed seasonal rate design results in bill increases of 10 percent to 38 percent, compared to the Company's tiered customer charge proposal, which she claims results in bill impacts of negative 14 percent to 182 percent (Attorney General Brief at 137, citing Exh. SJR-1, at 30). Thus, the Attorney General asserts that her proposal results in bill impacts that are more reasonable than the Company's (Attorney General Reply Brief at 75, 76).

The Attorney General rejects any notion that there is no cost basis for the 15-percent differential between summer and winter base distribution rates, and she notes that the Company's own cost of service supports her recommendation (Attorney General Reply Brief at 73-74, citing Company Brief at 224). In particular, the Attorney General notes that the Company concluded from its marginal cost of service study that summer coincident peak demand was the major driver of demand-related costs on the Company's system (Attorney General Reply Brief at 74, citing Tr. 8, at 1284-1286). Moreover, the Attorney General contends that even if the Company's system peaks in the winter in a hypothetical year, the system still would be designed to serve summer peaking loads because "one of the critical factors in designing an electric distribution system is the heat associated with peak loads" and the higher ambient temperatures in the summer (Attorney General Reply Brief at 74, citing Exh. AG-SJR-Rebuttal-1, at 16-17). The Attorney General reasons that the carrying capacity of distribution system equipment is

higher in the winter than in the summer because of the temperature (Attorney General Reply Brief at 74, citing Exh. AG-SJR-Rebuttal-1, at 16-17). Further, the Attorney General maintains that the Company did not rebut this evidence (Attorney General Reply Brief at 74).

Additionally, the Attorney General argues that system and class peak demands are the primary drivers of demand costs in the allocated COSS (Attorney General Brief at 135). According to the Attorney General's analysis, she claims that there is a stronger correlation between peak-season energy consumption (versus annual energy use) and peak demand because of the significant relationship between a residential customer's energy consumption during the months of July through September and the contribution to system and class peak demands (Attorney General Brief at 135). For example, the Attorney General contends that 48 percent of the variation in customer's contribution to the peak demand is explained by energy consumption during July through September (Attorney General Brief at 135, citing Exhs. AG-SJR-1, at 17; AG-SJR-4). Conversely, she claims that only 27 percent of the variation in peak demand is explained by annual energy use (Attorney General Brief at 135, citing Exhs. AG-SJR-1, at 17; AG-SJR-4). Therefore, the Attorney General asserts that residential customers' consumption during July through September is a better proxy for demand than annual consumption, and, therefore, her proposed seasonal rate design serves as a better proxy for a demand-charge rate because it produces bills that are most similar to demand-based bills (Attorney General Brief at 135, citing Exh. AG-SJR-1, at 19; Attorney General Reply Brief at 73, citing Exh. AG-SJR-Rebuttal-1, at 7-8; Attorney General Reply Brief at 76). Moreover, the Attorney General claims that she and the Company agree that summer peak demands are a critically important factor in determining the cost to serve residential customers (Attorney

General Reply Brief at 74). Thus, she asserts that this fact, and her statistical analyses, prove that the seasonal rate design proposal has merit and the Department should adopt it (Attorney General Reply Brief at 75, 76).

In sum, the Attorney General argues that a seasonal rate design is consistent with the Department's rate design goals because it is fair, promotes rate continuity, is efficient, and is simple (Attorney General Brief at 137-138). The Attorney General recommends that after revenue requirement adjustments, the Department should adopt a $5.50 customer charge for Rates R-1 and R-2, and reduce the volumetric charges by an equal percentage to achieve the seasonal rate design for the residential class's share of the revenue requirement (Attorney General Brief at 138, citing Exh. AG-SJR-1, at 31; Attorney General Reply Brief at 76).

b. DOER

i. Demand Ratchets

DOER argues that the Company's demand ratchet proposal does not provide strong price signals to customers to reduce peak demand, and, therefore, violates the Department's goal of efficiency (DOER Brief at 5, citing D.P.U. 09-39, at 401; DOER Reply Brief at 3, citing D.P.U. 09-39, at 401). DOER contends that under the Company's proposal if a customer reaches a new monthly peak demand in a twelve month period, a demand ratchet increases the customer's demand charge immediately (DOER Brief at 4). DOER claims, however, that a customer would have to maintain a lower level demand for a year before that customer sees a lower demand charge because the charge is only reduced after a customer maintains lower peak monthly demand for eleven consecutive months (DOER Brief at 4-5). DOER argues that the eleven month lag in savings from a lower level demand reduces a customer's incentive to invest

in technology that reduces peak demand, making those projects harder to justify because of the longer payback period for capital expenditure (DOER Brief at 5; DOER Reply Brief at 2-3). DOER maintains that it is common industry practice to justify capital investments for commercial customers with short payback periods (DOER Brief at 3). According to DOER, a project is considered more risky if the payback period is longer than one to three years (DOER Brief at 3).

Further, DOER argues that National Grid's analysis purporting to show that a hypothetical customer's energy efficiency savings is minimally impacted by the Company's proposed demand ratchet shows an incomplete picture (DOER Reply Brief at 1-2, citing Company Brief at 227-228; Exh. DPU-15-16). DOER contends that the Company's example uses a customer with a very flat load profile implementing energy efficiency measures (DOER Reply Brief at 1). DOER claims that the Company's example fails to consider the impacts on customers with a load that varies significantly month-to-month (i.e., customers that are more likely to implement peak demand reduction measures) (DOER Reply Brief at 2, citing Exh. DPU-15-16).

In this regard, DOER demonstrates the impact of the demand ratchet on a hypothetical customer with a high peak load implementing a project to reduce peak demand (kW), as opposed to an energy efficiency project reducing kWhs (DOER Reply Brief at 2). According to DOER, a Rate G-3 customer installing a solar plus storage project could reduce its summer peak demand from 400 kW to 250 kW and non-peak demand from 350 kW to 200 kW (DOER Reply Brief at 2). Further, DOER claims that this hypothetical customer expects an immediate reduction to its demand charge based on the new peak demand of 250 kW (DOER Reply Brief at 2). DOER

asserts, however, that with a demand ratchet, the customer only sees a reduction to 300 kW (or 75 percent of the existing 400 kW summer peak demand) (DOER Reply Brief at 2). DOER notes that it is not until the investment has been in place for eleven months that the demand charges are assessed at the new demand and the full benefit of the demand reduction project is realized (DOER Reply Brief at 3). Thus, DOER asserts that because of the eleven month lag, a demand ratchet will increase the probability that a customer with a load that varies significantly month-to-month will not invest in demand reduction technologies (DOER Brief at 5; DOER Reply Brief at 2-3).

Finally, DOER argues that the high peak load to total load ratio customers are the exact type of Rate G-2 or Rate G-3 customers that should be incentivized to reduce their peak load, but are the most negatively impacted customers by the proposed demand ratchet (DOER Reply Brief at 3). Thus, DOER recommends that the Department direct the Company in its compliance filing to re-file Rate G-2 and Rate G-3 tariffs without demand ratchets, and to allow DOER an opportunity to evaluate these revised tariffs (DOER Brief at 5; DOER Reply Brief at 3).

ii. Tiered Customer Charges

DOER does not object to the Company's proposed Phase I customer charge proposal, but opposes its Phase II rate design proposal for Rates R-1, R-2, and G-1 (DOER Brief at 6). DOER argues that the Department should reject the tiered customer charge proposal because it: (1) delays the benefits of, and thereby discourages customer investment in, energy savings measures; (2) disproportionately affects lower usage customers; and (3) does not serve as an appropriate proxy for a demand charge (DOER Brief at 7-8). Further, as described in more detail below, DOER contends that the Company did not demonstrate that its Phase II rate design

proposal is consistent with the Department's rate structure goals and objectives (DOER Reply Brief at 4). DOER recommends that the Department reject the Company's Phase II proposal and direct the Company in its compliance filing to revise its tariffs to reflect a flat rate structure, and to allow DOER an opportunity to evaluate these revised tariffs (DOER Brief at 6; DOER Reply Brief at 4).

Further, DOER argues that under the Company's Phase II rate design proposal, a customer will pay a higher customer charge based on the previous summer's usage even if the customer installs energy efficiency investments (e.g., efficient heating and cooling) to save money in the upcoming summer (DOER Brief at 7). According to DOER, a delay in savings discourages investment and affects the Commonwealth's goal to reduce energy costs (DOER Brief at 7). Moreover, DOER maintains that the Company did not analyze its Phase II rate design impacts on customer incentives to reduce consumption, including achievement of the Company's three-year energy efficiency plan (DOER Brief at 7, citing DOER 2-18(c); Tr. 5, at 634. Tr. 11, at 1-5, 16-20). Therefore, DOER asserts that the Company's tiered customer charge proposal should not be approved because it risks undermining the Commonwealth's energy policy goal of maximum deployment of energy efficiency (DOER Brief at 7).

(A) Fairness/Continuity

Regarding the rate design goals of fairness and continuity, DOER argues that low-use customers will incur higher bill impacts under the tiered customer charge proposal (e.g., a Rate R-2, low-use customer using 610 kWh per month will experience a 25 percent bill increase while a Rate R-2, high-use customer using 1,000-1,250 kWh per month will experience a 14 to 16 percent bill increase) (DOER Brief at 7-8, citing Exh. LI-JH-1, at 14). DOER expresses

concern with these bill impacts because it claims that low-income customers tend to be low-use customers (DOER Brief at 8). Therefore, DOER recommends that the Department reject the Company's tiered customer charge proposal because it disproportionately (and negatively) affects lower and moderate income customers, thereby violating the Department's rate design goal of fairness (DOER Brief at 8).

(B) Efficiency

DOER rejects any notion that a customer's maximum monthly energy use in a year is a proxy for their demand (DOER Brief at 8, citing Tr. 5, at 635). According to DOER, a rate structure based on maximum demand should consist of a customer charge and a per-kW charge based on maximum kW demand (DOER Brief at 8; DOER Reply Brief at 4). Because the Company's tiered customer charges are not based on kW demand or the customer's maximum demand in a month, DOER maintains that the Phase II rate design proposal does not represent a true demand charge (DOER Reply Brief at 4). Further, DOER argues that the Company's tiered customer charge proposal uses a kWh charge as a proxy for demand, and therefore fails to consider a customer's coincident peak demand (DOER Brief at 8; DOER Reply Brief at 4). Accordingly, DOER maintains that the Company's tiered customer charges are not an appropriate and efficient proxy for demand charges (DOER Brief at 8; DOER Reply Brief at 3).

Moreover, because the Company's proposal is based on total kWh usage in a month, DOER argues that a customer does not receive the proper price signal, which a demand charge would provide, to adjust his or her energy consumption within a month (DOER Brief at 8; DOER Reply Brief at 4). For example, DOER contends that under the Company's tiered customer charge proposal, a customer charging an electric vehicle, doing laundry, and using an

air conditioner at the same time would be billed the same amount as a customer staggering those activities throughout a month (DOER Brief at 8; DOER Reply Brief at 4). DOER maintains, however, that under a rate design with a true demand charge, the customer's bill would be lower under the staggered activity scenario (DOER Brief at 8; DOER Reply Brief at 4). Thus, for all of these reasons, DOER asserts that the Company's Phase II rate design is contrary to the Commonwealth's energy efficiency goals because it does not provide a price signal to reduce peak demand and lower system wide energy costs (DOER Reply Brief at 4).

c. Low Income Network

i. Phase I

The Low Income Network argue that the Department should reject the customer charge increases proposed by the Company in Phase I for low-income customers taking service on Rate R-2 (Low Income Network Brief at 13).[297] According to the Low Income Network, the Company's proposal to shift revenue collection from the volumetric rates to the customer charges burdens low-use customers that are disproportionately low-income (Low Income Network Brief at 13). The Low Income Network calculates the bill impacts for Rate R-2 customers that range from a 15.9-percent increase in Phase I to up to a 60-percent increase in Phase II (Low Income Network Brief at 14-15, citing Exhs. LI-JH-1, at 14; AG-SJR-1, at 28). Moreover, the Low Income Network argues that the Company's proposed increases to customer charges diverge from the Commonwealth's policies and programs designed to promote energy efficiency and investments in renewable energy and DG (Low Income Network Brief at 13-14).

---

297 While the Low Income Network's arguments are focused on low income customers and, therefore, on Rate R-2, many of the low-income customers take service on Rate R-1 (Low Income Network Brief at 13, n.39).

Therefore, the Low Income Network asserts that Rate R-2 customers will not be able to reduce the cost on their bills by reducing consumption under the Company's proposal (Low Income Network Brief at 14).

Further, the Low Income Network argues that a review of rate design proposals should take into account the differences between low income households and higher-income customers (Low Income Network Brief at 14). According to the Low Income Network, low income households generally have lower electric use than higher-income customers (Low Income Network Brief at 14). For example, the Low Income Network asserts that low-income customers on Rate R-2 have median monthly usage of approximately 460 kWh compared to the median usage for Rate R-1 customers of approximately 500 kWh per month (Low Income Network Brief at 14, citing Exhs. LI-JH-1, at 14; LI-2-10, Atts. 1 & 2).

ii. Tiered Customer Charges

The Low Income Network argues that the Department should also reject the Company's tiered customer charge proposal for Rate R-2 customers (Low Income Network Brief at 13). The Low Income Network maintains that the Company's proposed Phase II rate design will not achieve the rate design goals set forth by National Grid of ensuring that DG customers make a "modestly" greater contribution to Company distribution costs (Low Income Network Reply Brief at 3).

Further, the Low Income Network argues that the Phase II rate design proposal runs counter to the Commonwealth's energy efficiency and renewable energy goals (Low Income Network Brief at 15-16, citing Green Communities Act, Acts of 2008, c. 169; Global Warming Solutions Act, Acts of 2008, c. 298; An Act Relative to Solar Energy, Acts of 2016, c. 75; Low

Income Network Reply Brief at 3). The Low Income Network maintains that some of these energy efficiency policies date back to regulatory policies the Department established in the 1980s (Low Income Network Brief at 17, citing Order Opening Investigation, D.P.U. 11-120, at 1-2 (2011)). According to the Low Income Network, increasing customer charges and reducing volumetric charges reduces the incentive to implement energy efficiency measures because the value of each kWh saved is thereby reduced (Low Income Network Brief at 16, citing Exh. LI-JH-1, at 14-15; Low Income Network Reply Brief at 4). Further, the Low Income Network claims that the customer charge tiers create a further barrier to energy efficiency because customers cannot lower their bills for up to twelve months (Low Income Network Brief at 16, citing Tr. 5, at 633-634; Low Income Network Reply Brief at 4). In addition, the Low Income Network maintains that the Company did not perform analysis of the impact of its Phase II rate design proposal on the adoption of energy efficiency measures or renewable energy technology (Low Income Network Brief at 16, citing Tr. 5 at 633-634).

According to the Low Income Network, the Company's tiered customer charge proposal creates barriers for low-income customers that conserve electricity to maintain low electricity costs (Low Income Network Brief at 15). The Low Income Network argues that the Company's tiered customer charge proposal increases the burdens on low income customers who tend to be low-use customers, which the Low Income Network maintains is contrary to the Department's fairness and continuity rate design goals (Low Income Network Reply Brief at 3, 4). Additionally, the Low Income Network contends that by definition, a low-use customer is less likely to contribute to peak demand than a high-use customer (Low Income Network Reply Brief at 4). The Low Income Network maintains that customer charges are assessed equally to all

customers without considering monthly use, and therefore, customer charges affect customers with the lower use more than they affect customers with higher use (Low Income Network Reply Brief at 4). Under the Company's proposal, the Low Income Network claims that the median Rate R-2 customer would incur a bill increase of 25 percent and some customers would incur increases of more than 60 percent (Low Income Network Reply Brief at 4-5).

Further, the Low Income Network argues that the Company's tiered customer charge proposal may be confusing to customers (Low Income Network Brief at 16). According to the Low Income Network, customers will not understand their bills or how to control their use if volumetric charges are reduced, customer charges vary annually with use, and customers are unable to monitor their use in real time (Low Income Network Brief at 16, citing Exh. LI-JH-1, at 15; Tr. 8, at 1308; Low Income Network Reply Brief at 4).

Additionally, the Low Income Network maintains that National Grid's proposed Phase II rate design is an inadequate proxy for demand, and, therefore, will not achieve the rate design goals set forth by the Company (Low Income Network Brief at 15, citing Exh. AG-SJR-1, at 16-17; Low Income Network Reply Brief at 3). According to the Low Income Network, the Company fails to prove that distribution costs are driven by maximum monthly energy use as a reflection of demand (Low Income Network Reply Brief at 3). As a result, the Low Income Network asserts that customers can be bumped into a higher tier that does not accurately correlate with the peak demands that drive system costs (Low Income Network Brief at 15). Moreover, the Low Income Network argues that the correlation between historical energy consumption and demand is weak and does not consider whether a customer's maximum historical demand occurred at a time coincident with local or system peaks (Low Income

Network Reply Brief at 3). Instead, the Low Income Network contends that the costs of meeting demand are driven by local and system peaks (Low Income Network Reply Brief at 3, citing DOER Brief at 8; Attorney General Brief at 130, 134; NECEC Brief at 2, 11).

iii. Conclusion

In sum, the Low Income Network argues that Massachusetts law supports minimizing the risk that low-income utility consumers will lose their utility service (Low Income Network Brief at 17, citing G.L. c. 164, § 1F(4)). Further, the Low Income Network contends that the Commonwealth has policies promoting energy efficiency and renewable energy (Low Income Network Brief at 17). In addition, the Low Income Network claims that National Grid's need for rate design reform does not outweigh customers' needs for rate continuity, low-income customers' need for affordability, and policy requirements for energy efficiency and equity, especially in light of the revenue stability provided through revenue decoupling and other risks compensated through the Company's rate of return (Low Income Network Reply Brief at 5). Accordingly, the Low Income Network recommends that the Department reject the Company proposals of raising customer charges and lowering volumetric energy charges because these proposals will undermine the Commonwealth's ability to achieve its energy goals (Low Income Network Brief at 17).

d. Limited Intervenors[298]

i. Demand Ratchet

EFCA argues that the Company did not properly support its demand ratchet proposal for Rates G-2 and G-3 (EFCA Brief at 17, 18-19; EFCA Reply Brief at 15-16).[299] According to

[298] For purposes of this section, the "Limited Intervenors" shall refer to Acadia Center, EFCA, NECEC, and Vote Solar, collectively.

EFCA, the Company did not analyze the basis of the demand ratchet's structure or its impact on current customers to support its proposal (EFCA Brief at 17, 18; EFCA Reply Brief at 16, citing Tr. 7, at 1,108). Moreover, EFCA contends that the only evidence that the Company provided to support its proposal was that a utility in Rhode Island implemented a demand ratchet in 1987 (EFCA Brief at 18; EFCA Reply Brief at 15). However, EFCA claims that the Company did not analyze the similarities and differences between Massachusetts and Rhode Island or the changing conditions over the last 30 years (EFCA Reply Brief at 15-16). EFCA asserts that demand ratchets are an obsolete rate design tool, and National Grid's "back-of-the-envelope" bill impact estimation is inadequate evidence to support the Company's proposed demand ratchet rate design (EFCA Reply Brief at 16, citing Exh. DPU-AC-1-3, Att. 1).

Moreover, EFCA argues that a demand ratchet conflicts with the Department's rate design goals and the concept of efficient price signals for use of resources (EFCA Brief at 6, 11-12; EFCA Reply Brief at 10, citing Exh. EFCA-TM/MW-1, at 8; Boston Gas Co. v. Department of Public Utilities, 405 Mass. 115, 116, (1989)). EFCA contends that, because a demand ratchet reduces the volumetric price signal, it reduces the incentive for customers to manage their use and, as such, may result in higher total energy consumption (EFCA Brief at 5-6, 11-12). Further, EFCA claims that a demand ratchet operates as a fixed charge because it

---

299 On September 9, 2016, EFCA filed with the Department a copy of the 2016 NARUC Draft Manual on Distributed Energy Resources Compensation, along with a cover letter and comments regarding the draft manual. In the cover letter, EFCA 'encouraged' the Department to consider certain aspects of the draft manual as we evaluate National Grid's proposed rate increase and design. On September 16, 2016, the Company filed a response to EFCA's filing. EFCA's filing was made well after the record closed, with no opportunity for inquiry. Further, the filing is related to a draft manual that apparently has not yet been adopted by NARUC. The filing constitutes extra-record evidence, to which the Department gives no probative weight. Further, we decline to take official notice of the draft manual pursuant to 220 C.M.R. § 1.10(2).

provides little incentive for a customer to reduce demand each month after the annual peak is set (EFCA Brief at 6, 13, 19). According to EFCA, fixed charges violate the Department's "goal of achieving efficiency in customer consumption decisions" (EFCA Brief at 13, citing Exh. EFCA-TW/MW-1, at 38; EFCA Brief at 19). Therefore, EFCA claims that a "fixed" demand charge does not account for the timing of a customer's demand, and its coincidence with the system peek, and also fails to reflect cost causation (EFCA Brief at 21).

Further, EFCA argues that demand ratchets discourage the adoption of new technologies (e.g., storage and DG), and EFCA notes that a customer with these technologies could face a 21 percent bill increase (EFCA Brief at 5-6; EFCA Brief at 20, citing Exh. EFCA-TW/MW-1, at 50). Moreover, EFCA contends that a customer with solar DG will incur a demand charge based on higher winter demand because there are more daylight hours in the summer than there are in the winter (EFCA Brief at 20, citing Exh. EFCA-TW/MW-1, at 50). Thus, EFCA claims that the demand ratchet proposal does not recognize that these customers have low demand in the summer when the distribution system is most stressed (EFCA Brief at 20, citing Exh. EFCA-TW/MW-1, at 50). EFCA also asserts that the demand ratchet proposal disproportionately penalizes customers for brief equipment outages without recognizing that these customers could reduce system costs for all customers (EFCA Brief at 20-21, citing Exh. EFCA-TW/MW-1 at 52).

EFCA also rejects the notion that there will be a "de minimis" impact of the demand ratchet on the first year of an investment, and EFCA argues that the Company's purported analysis showing the same is limited and does not prove that technology investment will not be "deleteriously" impacted (EFCA Reply Brief at 13-15, citing Company Brief at 227-228;

Exh. DPU-15-16). Instead, EFCA claims that its own analysis show a range of bill impacts, such as bill increases of: 2.6 percent (i.e., similar to the Company's analysis), five percent, and 21 percent (EFCA Reply Brief at 15, citing Exh. EFCA-TW/MW-1, at 50).

According to EFCA, the Company has not carried its burden of proof to warrant approval of the demand ratchet (EFCA Reply Brief at 12). Accordingly, EFCA recommends that the Department reject the Company's demand ratchet proposal (EFCA Brief at 6, 13, 21).

ii. Tiered Customer Charges

(A) Introduction

The Limited Intervenors argue that the Department should reject the Company's tiered customer charge proposal (Acadia Center Brief at 1, 10, 12; EFCA Brief at 6; NECEC Brief at 9; NECEC Reply Brief at 1; Vote Solar Brief at 7). According to the Limited Intervenors, the Company's proposed Phase II rate design does not meet one or more of the Department's rate design goals (i.e., fairness, continuity, simplicity or understandability, efficiency or cost causation) (Acadia Center Brief at 2, 12; EFCA Brief at 3, 15; NECEC Brief at 1, 9; NECEC Reply Brief at 1; Vote Solar Brief at 7).

Further, the Limited Intervenors argue that the Company did not provide evidence of a cost shift from DG customers to non-DG customers or further analysis to support its Phase II rate design proposal (Acadia Center Brief at 2, 10; Acadia Center Reply Brief at 3; EFCA Brief at 9, citing Exh. NG-PP-1, at 28; EFCA Reply Brief at 4; Vote Solar Brief at 7, 8, citing Exhs. NG-PP-1, at 28; NG-PP-Rebuttal-1, at 53; Tr. 5, at 616-617; NECEC Brief at 45-46; NECEC Reply Brief at 1-2, 8-9). Specifically, the Limited Intervenors argue that the Company did not properly analyze the costs or benefits attributable to DG customers in its service territory

(Acadia Center Brief at 12; Acadia Center Reply Brief at 3; EFCA Brief at 9-10, citing Exhs. EFCA-TW/MW-1, at 19, 34, 36; EFCA-TW/MW-Rebuttal-1, at 5 n.9; EFCA-1-11; Tr. 7, at 1,067, 1,070-1,071; EFCA Reply Brief at 4-8; NECEC Brief at 46, citing Exh. LI-1-10; Tr. 5, at 602; Vote Solar Brief at 8, citing Exhs. NG-PP-Rebuttal-1, at 22; DPU-29-6, at 2; Tr. 5, at 620; Vote Solar Reply Brief at 4). According to the Limited Intervenors, without quantifying the costs and benefits attributable to DG customers, the Company cannot demonstrate that a cost-shift occurs (Acadia Center Brief at 10-12; EFCA Brief at 10; NECEC Brief at 45-46, citing Exh. EFCA-TM/MW-1, at 21-22; Vote Solar Reply Brief at 3-4). Thus, the Limited Intervenors claim that because the Company has not proven a cost shift with any analysis, its proposed Phase II rate design is not even necessary (Acadia Center Brief at 12; EFCA Brief at 10-11; EFCA Reply Brief at 4; NECEC Reply Brief at 8-10; Vote Solar Brief at 9; Vote Solar Reply Brief at 3-5). Further, EFCA and NECEC argue that National Grid did not analyze the effects of the tiered customer charges on the Company's alleged cost shift (EFCA Brief at 12, citing Exh. EFCA-1-2; NECEC Reply Brief at 8-9).

NECEC and Vote Solar also argue that the Company has not met its burden with analysis to show that its "ideal rate design," which includes actual residential demand charges, is just and reasonable, in the public interest, and desirable (NECEC Brief at 10-11; NECEC Reply Brief at 2; Vote Solar Reply Brief at 2-3, citing Fitchburg Gas Electric Light Company v. Department of Public Utilities, 375 Mass. 571, 582 (1978)). For example, Vote Solar contends that the Company did not provide evidence showing that actual demand charges will change residential and small C&I behavior or that these customers understand demand charges and have the tools to manage peak demand (Vote Solar Reply Brief at 3, citing Exh. VS-NP-1, at 39-40). Further,

NECEC claims that the Company's Phase II rate design does not meet its intent of moving toward demand charges, and Vote Solar argues that no other state-regulated utility in the country requires mandatory demand charges for residential customers (NECEC Brief at 9; Vote Solar Brief at 1). Finally, NECEC and Vote Solar assert that no other utility has implemented a rate design similar to the Company's proposal (NECEC Brief at 45, citing Exh. NECEC-RTB-1, at 14, 35; Tr. 5, at 654-657; Vote Solar Reply Brief at 1, citing Exh. DPU-12-2, Tr. 5, at 638-641).

(B) G.L. c. 164 § 141[300]

EFCA, NECEC, and Vote Solar claim that the Company's proposed Phase II rate design runs counter to state policy to promote energy efficiency and DG and may result in higher electricity prices for all electric customers in the Commonwealth (EFCA Brief at 2, 4; NECEC Reply Brief at 12-13; Vote Solar Brief at 1, 22). In particular, Vote Solar notes that the relevant portion of G.L. c. 164 § 141 ("§ 141) provides: "[i]n all decisions or actions regarding rate designs, the department shall consider the impacts of such actions, including the impact of new financial incentives on the successful development of energy efficiency and on-site generation" (Vote Solar Brief at 22, citing § 141).

---

300 G.L. c. 164, § 141 provides:

> In all decisions or actions regarding rate designs, the department shall consider the impacts of such actions, including the impact of new financial incentives on the successful development of energy efficiency and on-site generation. Where the scale of on-site generation would have an impact on affordability for low-income customers, a fully compensating adjustment shall be made to the low-income rate discount.

In Section XIII.E below, we address § 141 as it relates to the impact of on-site generation on affordability of electric service for low income customers, as provided by the second clause of § 141.

According to Vote Solar, the Company did not provide evidence regarding the impact of its tiered customer charges on energy efficiency, compliance with the three-year energy efficiency plan, and incentives to lower demand (Vote Solar Brief at 22-23, citing Exh. DOER-2-18; Tr. 5, at 634; Vote Solar Reply Brief at 11-12). Vote Solar argues that customers are incentivized to implement energy efficiency by the opportunity to save money through lowering their total kWh charges (Vote Solar Brief at 22, citing Exh. DOER-2-16; Tr. 5, at 632; Acadia Center Reply Brief at 7). However, Vote Solar maintains that the purpose of National Grid's tiered customer charges are "to ensure that customers who reduce kWh consumption either through implementation of DG or energy efficiency will pay their fair share of the Company's distribution system," shifting cost recovery away from the kWh charges and causing kWh rates to decline (Vote Solar Brief at 22, citing Exh. NG-PP-1, at 32, 64; Tr. 5, at 750). Vote Solar maintains that the Company does not dispute this evidence (Vote Solar Reply Brief at 11).

Acadia Center challenges the Company's analysis that purportedly shows that tiered customer charges have no effect on energy efficiency, and argues that such analysis is "cherry-picked" and misleading (Acadia Center Reply Brief at 7, citing Exh. LI-1-14, Att.). In particular, Acadia Center contends that the Company's analysis shows a Tier 3 customer using 650 kWh per month reducing consumption by 23 percent after installing energy efficiency technology, causing the customer to drop to Tier 2 with a new baseline of 500 kWh (Acadia Center Reply Brief at 7, citing Exh. LI-1-14, Att.). However, Acadia Center claims that under the same scenario, with a Tier 3 customer using 800 kWh per month, the customer would not

drop to Tier 2 after the 23-percent reduction in consumption (Acacia Center Reply Brief at 7, n.27, citing Exh. LI-1-14, Att.).

Further, Vote Solar argues that it is not advocating for "an absolute ban on any rate design that would affect existing incentives for customers to pursue DG and energy efficiency" (Vote Solar Reply Brief at 12, citing Company Brief at 222). Instead, Vote Solar maintains that the Company did not provide the evidence to satisfy its statutory obligation in the instant proceeding (Vote Solar Brief at 22-23, citing § 141; Vote Solar Reply Brief at 12-13).

Moreover, NECEC and Vote Solar argue that § 141 does not require the Department to consider the impacts of the Company's proposed rate design along with the incentives that are provided to energy efficiency and on-site generation (Vote Solar Reply Brief at 12-13, citing Company Brief at 222 (emphasis in original); NECEC Reply Brief at 12-13, citing Company Brief at 222). Rather, NECEC asserts that the Department must be mindful of the effects of rate design on the development of energy efficiency and on-site generation (NECEC Reply Brief at 13).

(C) Continuity and Fairness

Some of the Limited Intervenors argue that the Company's tiered customer charge proposal does not meet the Department's continuity goal and does not improve customer equity (Acadia Center Brief at 2, 12-13; Acadia Center Reply Brief at 5; EFCA Brief at 3; EFCA Reply Brief at 12; NECEC Brief at 27; NECEC Reply Brief at 11). In particular, NECEC contends that the Phase II rate design proposal is based on arbitrary factors that drive significant changes in customers' distribution bills (NECEC Brief at 9). Further, EFCA and NECEC calculate that under the Company's proposal the residential customer charge will increase by up to 400 percent

and the small commercial customer charge will increase by up to 200 percent (EFCA Brief at 16; NECEC Brief *at* 27, citing Exh. EFCA-TM/MW-1, at 7, 40). In addition, according to Acadia Center and NECEC, residential annual distribution bill impacts will range from approximate decreases of 10 percent to increases of over 100 percent (Acadia Center Brief at 13, citing Exh. AG-SJR-1, at 26-28; NECEC Brief at 28, citing Exhs. AG-SJR-1, at 24, 27-28; AG-SJR-10). More specifically, NECEC notes that ten percent of R-1 customers will incur bill increases of 45 percent or more, and 1,000 R-2 customers will incur bill increases of 60 percent or more (NECEC Brief at 28, citing Exhs. AG-SJR-1, at 27-28; AG-SJR-10; NECEC Reply Brief at 11-12). Further, NECEC claims that customers will be subjected to two significant changes in rate structure within a short period of time; first, the Company's Phase II proposal, then time-varying rates pursuant to the Department's decision in Time Varying Rates, D.P.U. 14-04-C (2014) (NECEC Brief at 28, citing Exh. NECEC-RTB-1, at 42). NECEC asserts that these two consecutive rate changes violate the Department's rate design goal of continuity (NECEC Brief at 28, citing Exh. NECEC-RTB-1, at 42).

Acadia Center argues that the proposed Phase II rate design is not fair because it shifts cost burden from high-use customers to low-use customers, and low-use customers are disproportionately low-income customers (Acadia Center Brief at 12-13, citing Exh. DPU-AC-1-2, Att.; Acadia Center Reply Brief at 5). For example, Acadia Center calculated only a $5 bill increase for a customer using 2,000 kWh per month, but a $10 monthly bill increase for a customer using 600 kWh per month (Acadia Center Brief at 13, citing Exhs. AC-1-8, Att.; NG-AC-1-1, Att. 1 at 1). Further, Acadia Center contends that approximately 25 percent of customers with usage above the highest tiered customer charge

cutoff would pay a per-kWh rate that is lower than their current tail block per-kWh rate (Acadia Center Brief at 13; Acadia Center Reply Brief at 5-6).

Further, Vote Solar maintains that the Company's Phase II rate design proposal is a punitive, one-sided ratchet, proposed without any supporting analysis to determine how likely customers are to move to different tiers (Vote Solar Brief at 18-19, citing Tr. 5, at 631). According to Vote Solar, using twelve months of historical use information to identify maximum monthly use is unreliable because the Company did not study whether the maximum monthly use for a customer is consistent year to year (Vote Solar Brief at 17, citing Exh. NG-PP-Rebuttal-1, at 29; Tr. 5, at 728-729; RR-NECEC-1, Att.; Vote Solar Reply Brief at 8-9). Moreover, NECEC contends that similar customers could have nearly identical patterns of use (e.g., customer one uses 600 kWh in a billing period while customer two uses 599 kWh), but a customer on Tier 3 for distribution services is billed 33 percent more than a customer on Tier 2 (NECEC Brief at 22, citing Exh. EFCA-TW/MW-1, at 33; NECEC Reply Brief at 12). Therefore, NECEC argues that this divergence of bills is unfair and does not reflect cost of service differences (NECEC Brief at 22-23).

(D) Simplicity

The Limited Intervenors argue that the Company's tiered customer charge proposal does not meet the Department's simplicity goal (Acadia Center Brief at 2, 14; EFCA Brief at 3; EFCA Reply Brief at 12; NECEC Brief at 23, citing D.T.E./D.P.U. 06-82-A, at 75; NECEC Reply Brief at 10; Vote Solar Brief at 15-16; Vote Solar Reply Brief at 8-9). Further, Acadia Center contends that the Company's Phase II rate design proposal is a departure from traditional rate

design and should have included bill management tools because potential bill impacts are large (Acadia Center Reply Brief at 6).

The Limited Intervenors also argue that customers cannot easily monitor, respond to, and manage bills under the Company's proposed Phase II rate design, and NECEC alleges that customers would find the adjustment to a tiered customer charge difficult (Acadia Center Brief at 14; Acadia Center Reply Brief at 6; EFCA Brief at 15, citing Exh. LI-2-12; NECEC Brief at 23-25, 27, citing Exhs. EFCA-TW/MW-1, at 41; NECEC-RTB-Rebuttal-1, at 16; Vote Solar Reply Brief at 8). Further, NECEC and Vote Solar contend that customers will not know when they are close to a tier boundary because they are unable to monitor use in real time (NECEC Brief at 25, citing Exh. LI-2-12; Tr. 5, at 626-627; Vote Solar Brief at 16; Vote Solar Reply Brief at 8). Additionally, Acadia Center and NECEC claim that customers will not understand what kinds of behavior will move them to a higher tier or whether energy efficiency and conservation measures will drop them into a lower tier (Acadia Center Brief at 14; NECEC Brief at 24-25). Accordingly, NECEC asserts that an arbitrary event could set a customer's new maximum annual kWh and move the customer into a higher tier (NECEC Brief at 25).

NECEC also argues that the Company's proposed Phase II rate design is complex and leaves other arbitrary consequences in place, such as the length of a billing period, number of weekend days within a billing period, and estimated meter reads, that could affect a customer's maximum monthly use and customer charge tier for an entire year (NECEC Brief at 22, citing Exhs. AG-SJR-1, at 24-26; NG-PP-Rebuttal-1, at 63; AG-SJR-Rebuttal-1, at 16; NECEC Reply Brief at 12). Further, Vote Solar contends that a customer may take action to lower his or her maximum monthly use, but it may not result in a bill reduction (Vote Solar Brief at 17-18,

citing Tr. 5, at 629; Vote Solar Reply Brief at 9). NECEC and Vote Solar maintain that it is unfair to subject customers to a higher tiered customer charge for twelve months based on one month's use, but to be moved to a lower tier, the customer must wait until he or she sustains a reduction in maximum use for twelve months (NECEC Brief at 22; Vote Solar Brief at 18-19, citing Tr. 5, at 630-631; Vote Solar Reply Brief at 8). EFCA describes the tiered customer charge proposal as having the same effect as the demand ratchet proposal for Rates G-2 and G-3 (EFCA Reply Brief at 9-10, citing Exh. EFCA-TW/MW-1, at 11).

Vote Solar also rejects the notion that customers are able to respond to demand charges, and, therefore, the Company's tiered customer charge proposal is acceptable, as Vote Solar argues that the Company's position is based on its experiences with larger commercial customers, not residential customers (Vote Solar Brief at 15-16, citing Tr. 5, at 675-676). Further, NECEC contends that residential and small commercial customers will not understand demand, much less the relationship between demand and their monthly use (NECEC Brief at 24, citing Exhs. VS-NP-Rebuttal-1, at 18; EFCA-TM/MW-1, at 41).

Moreover, NECEC and Vote Solar argue that there is no evidence in National Grid's Smart Energy Solutions Program, which studied customer behavior under time-of-use/critical peak pricing and peak-time rebate programs, that supports the Company's position that customers would understand the tiered customer charge proposal (Vote Solar Brief at 16, citing Tr. 5, at 624-626; NECEC Brief at 23-24, citing Exh. NECEC-RTB-Rebuttal-1, at 15; Tr. 5, at 625; NECEC Reply Brief at 10, citing Tr. 5, at 625-626). Further, although the Company plans to implement an outreach and education program for its tiered customer charges, NECEC and Vote Solar contend that the Company did not develop the materials and present this

evidence (NECEC Reply Brief at 11; Vote Solar Brief at 17, citing Exh. VS-2-6; Vote Solar Reply Brief at 9).

Finally, in response to the Company's argument that time-varying rates are complicated, Acadia Center and NECEC maintain that customers are able to respond to time-varying prices for other products, such as travel and cell phones (Acadia Center Reply Brief at 6; NECEC Reply Brief at 10). Acadia Center asserts that as technology advances, more complicated rate designs become more feasible (Acadia Center Reply Brief at 5-6).

(E) Efficiency

The Limited Intervenors argue that the Company's tiered customer charge proposal does not meet the Department's rate design goal of efficiency because it does not send transparent price signals, it is not based on cost-causation principles, it is not an improvement from current rate design, and it is unjustified (Acadia Center Brief at 2, 14, citing Exh. AG-SJR-1, at 14-24; EFCA Brief at 3; EFCA Reply Brief at 11; NECEC Brief at 14, 16-17, 23; Vote Solar Brief at 9-10, 12 n.8, 15). Therefore, the Limited Intervenors claim that the Company's tiered customer charge proposal fails to represent an efficient, cost-based rate design (Acadia Center Brief at 14-15; Acadia Center Reply Brief at 7-9; EFCA Reply Brief at 11; NECEC Reply Brief at 2-3; Vote Solar Brief at 15).

Further, EFCA contends that the Company has conflated historical and future costs in designing its tiered customer charges (EFCA Brief at 14). In this regard, EFCA notes that historical costs are fixed, sunk costs, but the purpose of rate design is to not only recover historical costs, but also to send clear price signals in order to encourage the efficient use of the distribution system and reduce avoidable future costs (EFCA Brief at 14). EFCA contends that

the volumetric rate sends a price signal to customers that reduced system use results in reduced costs (EFCA Brief at 14). Further, EFCA maintains that this price signal will reduce the need for supply-side resources, and, therefore, reduce long-run electricity costs for all customers (EFCA Brief at 15). Thus, EFCA and Vote Solar assert that the tiered customer charge proposal does not "provide strong signals to customers to decrease excess energy consumption in consideration of price and non-price social, resource, and environmental factors" because customers will be locked into a tier for a year (EFCA Brief at 4, 15; Vote Solar Reply Brief at 8-9). Accordingly, EFCA and Vote Solar maintain that such results are contrary to the Department's goal of achieving efficient price signals and efficiency in customer consumption decisions (EFCA Brief at 15; Vote Solar Reply Brief at 8-9).

Moreover, the Limited Intervenors disagree with the Company's portrayal of the relationship between a customer's maximum monthly kWh use and maximum hourly kW demand (Acadia Center Brief at 14-15; EFCA Brief at 15; NECEC Brief at 17; NECEC Reply Brief at 3-4; Vote Solar Brief at 9-10). According to NECEC and Vote Solar, the low R-squared[301] values produced from the Company's analysis demonstrate a weak relationship between maximum billed use and maximum hourly load for each customer charge tier, and therefore, maximum annual kWh serves as poor proxy for a customer's contribution to non-coincident peak demand (NECEC Brief at 16-18, citing Exh. VS-NP-1, at 26; Vote Solar Brief at 10-12, citing Exh. AG-SJR-5; DPU-9-8; Tr. 5 at 637-638, 688-689; Vote Solar Reply Brief at 6, citing Exh. DPU-9-8, Att.). Further, EFCA, NECEC, and Vote Solar argue that a

[301] The R-squared analysis measures the strength of a relationship (Exh. DPU-15-9; Tr. 8, at 1218). A R-squared value of one means that the model explains all the variability of the data, and a R-squared value of zero means that the model explains none of the variability of the data (Tr. 5, at 636).

customer's highest month of use is a worse indicator of the customer's maximum demand than a customer's average energy use (i.e., current rates) (EFCA Brief at 15; EFCA Reply Brief at 11, citing Exh. EFCA-TW/MW-1, at 25-28; NECEC Brief at 17-18, citing Exhs. NECEC-RTB-1, at 19-20; DPU-NECEC-1-4, Att.; EFCA-TW/MW-1, at 27-29; RR-DPU-27, Att.; NECEC Reply Brief at 5; Vote Solar Brief at 12, n.8, citing Exh. NECEC-RTB-1, at 19-20; RR-DPU-27, Att.; DPU-9-8, Att.).[302]

According to the Limited Intervenors, a tiered customer charge based on a customer's maximum monthly kWh use as a proxy for non-coincident peak demand is an inferior metric because it does not link rate design to the distribution system peak loads that drive distribution system costs (Acadia Center Brief at 15, citing Exh. AC-AA-Rebuttal-1, at 1-2; Acadia Center Reply Brief at 8-9; EFCA Brief at 16; NECEC Brief at 11; NECEC Reply Brief at 4; Vote Solar at 9-10, 12, 13, citing Fitchburg Gas and Electric Light Company 375 Mass. at 582). Vote Solar and NECEC contend that system costs are incurred based on customer's demand coinciding with collective peak demand of all customers, which Vote Solar claims that the Company acknowledges (NECEC Reply Brief at 4; Vote Solar Brief at 13-14, citing Exhs. NG-PP-1, at 31; VS-NP-1, at 27; EFCA-TW/MW-1 at 26-27; AC-AA-1, at 13; NECEC-RTB-1, at 18). Moreover, EFCA and Vote Solar claim that the Company did not perform an analysis showing that non-coincident peak demand charges actually reflect a customer's contribution to system costs, improve system utilization, cause customers to shift use in a way that reduces use during peak system hours, or reduce system costs (EFCA Brief at 16; NECEC Brief at 16; NECEC

---

302 EFCA contends that the Company acknowledges its analysis was inadequate, and Vote Solar maintains that the Company admitted its tiered customer charge proposal was a "second-best solution" (EFCA Reply Brief at 11, citing Tr. 5, at 688; Vote Solar Brief at 2, 10, n.6, citing Exh. NG-PP-1, at 31; Tr. 5, at 637).

Reply Brief at 3-4; Vote Solar at 14, citing Tr. 5, at 677-679). NECEC maintains that distribution system costs are highly dependent on the time of day and the time of year that services are used, and distribution system costs result from the infrastructure needed to provide service during times of the highest customer use (NECEC Brief at 11-12, citing Exhs. NECEC-RTB-1, at 18; VS-NP-Rebuttal-1, at 7; Tr. 5, at 666-667, 774; Vote Solar Brief at 13, citing Exhs. NG-PP-1, at 31; AC-AA-1, at 13; NECEC-RTB-1, at 18). Moreover, Vote Solar asserts that the Company admitted that reductions in customer use during peak hours benefit the system and reduces costs (Vote Solar Brief at 13, citing Tr. 5, at 681). NECEC maintains that rate design should be based on costs incurred during times when demand is the highest (NECEC Brief at 12, citing Exhs. NECEC-RTB-1, at 18; AC-AA-Rebuttal-1, at 1; EFCA-TW/MW-1, at 26-27; VS-NP-1, at 27; VS-NP-Rebuttal-1 at 7; Tr. 5, at 774). Given these considerations, the Limited Intervenors claim the tiered customer charges, based on an individual customer's non-coincident peak demand, is not an improvement over standard volumetric charges and does not improve cost-causation (Acadia Center Brief at 14-15; Acadia Center Reply Brief at 8, citing Exh. AG-SJR-1, at 14-24; EFCA Brief at 15, citing Exh. EFCA-TW/MW-1, at 25; NECEC Brief at 16-19; NECEC Reply Brief at 5; Vote Solar Brief at 12-15; Vote Solar Reply Brief at 6).

NECEC argues that the Company's proposed Phase I rates and current rates are more reflective of the cost to serve than the Company's proposed Phase II rates (NECEC Brief at 15-16, citing Exhs. AG-SJR-20-30; AG-SJR-6; AG-SJR-7; AG-SJR-8). For example, NECEC claims that under Phase I rates, a $1 increase in cost of service would correspond to a 57 cent increase in revenue recovery, but under Phase II rates, the same $1 increase would

correspond to only a 54 cent increase in revenue recovery (NECEC Brief at 16, citing Exhs. AG-SJR-1, at 22-23; AG-SJR-7; AG-SJR-8).

EFCA takes issue with Company's argument that a customer's maximum demand represents a customer's potential to contribute to the capacity requirements of the distribution system (EFCA Reply Brief at 10-11, citing Company Brief at 220-221; Exh. EFCA-TW/MW-1, at 25). According to EFCA, a customer's individual peak demand will not put the greatest strain on the system because individual peaks do not occur at the exact same time for all customers (EFCA Reply Brief at 11, citing Exhs. EFCA-TW/MW-1, at 26; DPU-9-13).

Further, the Limited Intervenors argue that the Company's counter argument that existing distribution demand charges already are based on non-coincident peak demand is flawed (Acadia Center Reply Brief at 8-9; EFCA Reply Brief at 10-11; NECEC Reply Brief at 4; Vote Solar Reply Brief at 7). In particular, Acadia Center contends that the Company does not explain why non-coincident peak demand is the basis of existing demand charges, and argues that metering limitations are a primary reason that existing demand charges are based on the non-coincident peak demand during a billing period (Acadia Center Reply Brief at 9). According to Vote Solar and NECEC, existing demand charges for large C&I customers do not justify application of such charges to small C&I and residential customers because these customers do not use the distribution system in the same way (Vote Solar Reply Brief at 7-8, citing Exh. VS-NP-Rebuttal-1, at 12; NECEC Brief at 12-13, citing Exhs. NECEC-RTB-1, at 27; VS-NP-1, at 27; NECEC Reply Brief at 4-5). Further, Vote Solar maintains that many small customers share one feeder, creating diversity of demand, whereas a medium or large C&I customer can comprise the majority of demand on an individual feeder (Vote Solar Reply Brief

at 7-8, citing Exh. VS-NP-Rebuttal-1, at 12; NECEC Brief at 12, n.5, citing NECEC-RTB-1, at 27, 29; VS-NP-1, at 27; VS-CP-Rebuttal-1, at 12-13; NECEC Reply Brief at 5). Moreover, NECEC contends that peak demand drives that the size and costs of the distribution system (NECEC Brief at 12, citing Exh. NG-PP-1, at 30, 33; NG-PP-Rebuttal-1, at 13; AG-SJR-Rebuttal-1, at 15; NG-PP-2; Tr. 10, at 1557-1558, 1574-1575). Thus, EFCA, Vote Solar, and NECEC argue that the Company's proposed Phase II rate design approach ignores diversity of demand, discussed in planning for distribution system investment (EFCA Reply Brief at 11, citing Exhs. EFCA-TW/MW-1, at 26; DPU-9-13; NECEC Brief at 11; NECEC Reply Brief at 4-5; Vote Solar Reply Brief at 7).

Finally, according to NECEC, tiered customer charges are an inaccurate measure of cost causation for customers who have installed solar DG (NECEC Brief at 20). NECEC maintains that solar DG customers typically reduce demand during summer months and are likely to have higher demand during off-peak months on the distribution system (NECEC Brief at 20, citing Exh. NECEC-RTB-1, at 21-24). Accordingly, NECEC asserts that tiered customer charges fail to provide accurate price signals indicating the value that solar DG provides in reduced costs on the distribution system (NECEC Brief at 21).

(F) Conclusion

In sum, the Limited Intervenors argue that the record does not support a finding that the Company's tiered customer charge proposal is just and reasonable (Acadia Center Brief at 2; EFCA Brief at 11; NECEC Reply Brief at 9-10; Vote Solar Brief at 7, citing Attorney General v. Department of Telecommunications and Energy, 438 Mass. 264, n.13 (2002)). Further, Vote Solar claims that no other utility uses a rate design similar to the Company's proposed tiered

customer charges (Vote Solar at 3, citing Exh. DPU-2-12; Tr. 5, at 640). Therefore, the Limited Intervenors conclude that National Grid has not met its burden to justify the tiered customer charge proposal, and the Department should reject it (Acadia Center Brief at 1, 10, 12; EFCA Brief at 6; NECEC Brief at 9; NECEC Reply Brief at 3; Vote Solar at 9, citing Fitchburg Gas and Electric Light Company v. Department of Public Utilities, 375 Mass. 582 (1978)).

iii. Seasonal Rate Design

Acadia Center and NECEC support the Attorney General's seasonal rate design proposal (Acadia Center Brief at 2, 17-18; Acadia Center Reply Brief at 11; NECEC Brief at 29-30). According to NECEC, the Department stated that it would consider seasonally differentiated rates where they were shown to more effectively indicate the underlying costs of the distribution system and encourage efficient consumption of electricity (NECEC Brief at 29, citing D.P.U. 10-70, at 330). Acadia Center and NECEC allege that the Attorney General's rate design proposal improves the relationship to cost of service compared to the Company's Phase I and Phase II rate design proposal (Acadia Center Brief at 17, 18; NECEC Brief at 29, citing Exhs. AG-SJR-1, at 22-24, 30; AG-SJR-7; AG-SJR-8; AG-SJR-12).

Acadia Center and NECEC also argue that the Attorney General's seasonal rate design meets the Department's rate making goals (Acadia Center Brief at 18; NECEC Brief at 29-30). They assert that the seasonal rate design is cost-based, results in reasonable bill impacts, is simple and understandable, and improves efficiency and cost causation (Acadia Center Brief at 18; NECEC Brief at 29-30, citing Exhs. AG-SJR-1, at 27-28, 30; NECEC-RTB-Rebuttal-1, at 3, 12; EFCA-TW/MW-Rebuttal-1, at 22-23).

Further, NECEC argues that a higher rate in the summer months would better align time of use with underlying costs (NECEC Brief at 29-30, citing Exhs. AG-SJR-1, at 16-20; AG-SJR-2; AG-SJR-4; AG-SJR-5). In this regard, NECEC contends that bill impacts range from 10 percent to 38 percent (compared to negative 14 percent to 181 percent under the Phase II rate design proposal) (NECEC Brief at 29, citing Exh. SG-SJR-1, at 27-28, 30). According to NECEC, the Rate G-1 seasonal rate design has similar bill impacts to the Company's proposed Phase I rate design (NECEC Brief at 30, n.15, citing RR-DPU-47; Tr. 10, at 1569-1570). Finally, NECEC asserts that seasonal rates are more efficient, do not require advanced meters, and can be implemented in conjunction with time-varying rates (NECEC Brief at 30, citing D.P.U. 14-04-C; Exhs. EFCA-TW/MW-Rebuttal-1, at 22-23; NECEC-RTB-Rebuttal-1, at 12-13).

NECEC also argues that the Company disputed the Attorney General's proposed seasonal rate design with two, unconvincing arguments (NECEC Reply Brief at 13). First, NECEC rejects the Company's argument that system-wide coincident peak demand reduction from a seasonal rate design is not beneficial because some feeders might not realize a reduction in their peak demand, as NECEC notes that the majority of the Company's feeders peak in the summer (NECEC Reply Brief at 14, citing Exhs. NECEC-RTB-Rebuttal-1 at 9-10; NG-PP-Rebuttal-1, at 14-15; NECEC-1-7; Company Brief at 224). Thus, NECEC asserts it cannot be disputed that for nearly all feeders, summer electricity use is the driver of demand-related system costs (NECEC Reply Brief at 14, citing Company Brief at 199, 217).

Second, NECEC rejects the Company's argument that seasonal rates will result in "arbitrarily" higher net metering credits (NECEC Reply Brief at 14, citing Company Brief

at 224). According to NECEC, the higher value of net metering credits in the summer months from the Attorney General's proposed seasonal rate design are not "arbitrary" because the value of net metering credits will rise with summer distribution rate (NECEC Reply Brief at 14). Further, NECEC contends that a higher summer rate is appropriate because cost responsibility for the majority of demand-related costs is based on the customer class contribution to summer peak demands in the Company's allocated COSS (NECEC Reply Brief at 14, citing Exhs. AG-SJR-1, at 17, 29-30; AG-SJR-Rebuttal-1, at 15-16). Therefore, NECEC asserts that there is nothing arbitrary about crediting excess generation from net metering facilities at a higher rate when that rate accurately reflects the increased value of the demand reduction associated with that generation during the summer months (NECEC Reply Brief at 14).

e. AIM and TEC

AIM and TEC argue that National Grid did not properly support its demand ratchet proposal for Rates G-2 and G-3 and did not analyze the impacts of the demand ratchet proposal on current customers (AIM and TEC Reply Brief at 8). According to AIM and TEC, the Company's own evidence contradicts its basis for proposing the demand ratchet (AIM and TEC Reply Brief at 8). For example, AIM and TEC contend that Rate G-3 customers' demand patterns show that the Rate G-3 class load is different than demand during the monthly system coincident peak (AIM and TEC Reply Brief at 5, citing Exh. NG-PP-3(b)). AIM and TEC claim that this data contradicts the Company's assertion that a customer's maximum demand during an annual period reflects the customer's contribution to coincident peak demand (AIM and TEC Reply Brief at 5). According to AIM and TEC, National Grid sizes its circuits to accommodate coincident peak demand, not the summation of non-coincident peak demands (AIM and TEC

Reply Brief at 5). Thus, AIM and TEC contend that cost causation occurs when a customer's peak demand coincides with the maximum monthly peak demand (AIM and TEC Reply Brief at 5). Therefore, AIM and TEC claim that because a demand ratchet does not account for the timing of a customer's demand, and its coincidence with system peak, and because it fails to reflect cost causation, the demand ratchet results in a fixed annual charge (AIM and TEC Reply Brief at 7). Accordingly, AIM and TEC assert that the Department should reject the Company's claim that all Rate G-2 and Rate G-3 customers pay for demand through a demand ratchet that is based on their annual peak load, regardless of when it occurs (AIM and TEC Reply Brief at 5).

Further, AIM and TEC argue that the demand ratchet proposal will reduce customer incentives for behavior that is beneficial to the system and demand reduction goals (AIM and TEC Reply Brief at 7). AIM and TEC agree with DOER that the Company's demand ratchet proposal will impede the Commonwealth's goal of achieving demand reduction and mitigating peak load growth because it operates as a fixed charge (AIM and TEC Reply Brief at 7-8).

Moreover, AIM and TEC argue that the demand ratchet is really a "de facto" stand-by charge for customer's with behind the meter DG because these customers will not be able to reduce their demand charge for an entire year (AIM and TEC Reply Brief at 4, 6, 8). In this regard, AIM and TEC contend that the demand ratchet proposal disproportionately penalizes customers for brief equipment outages (e.g., combined heat and power ("CHP")) without recognizing the benefit of demand reductions that could reduce system costs for all customers (AIM and TEC Reply Brief at 6). For example, AIM and TEC claim that a customer with a 30-minute CHP outage during a month that the grid has excess capacity (e.g., April) could result in additional demand charges of over $21,000 for that twelve-month period (AIM and TEC

Reply Brief at 6). Further, AIM and TEC maintain that some customers with DG must interrupt on-site generation when there are power quality issues completely beyond the customer's control (AIM and TEC Reply Brief at 6). Moreover, AIM and TEC note that current DG owners schedule maintenance during off-peak periods to avoid demand charges (AIM and TEC Brief at 7). According to AIM and TEC, a demand ratchet eliminates the incentive to schedule maintenance during off-peak periods because demand charge cost avoidance can no longer justify the added cost of overtime and weekend labor rates for the off-peak work (AIM and TEC Reply Brief at 7). Thus, AIM and TEC assert that the Company's demand ratchet proposal will unfairly penalize these customers and cause negative impacts for customers with distributed resources (AIM and TEC Reply Brief at 6-7).

AIM and TEC also take issue with National Grid's hypothetical customer example, and they argue that it represents a business only operating in the summer and thereby only paying a demand charge during the summer, but requiring a fixed distribution investment from the Company to accommodate this customer's peak load (AIM and TEC Reply Brief at 4-5, citing Exh. NG-PP-1, at 59). AIM and TEC contend that the scenario the Company modeled to support its proposal for a demand ratchet is rare and should not be used to justify a new charge applying to all customers (AIM and TEC Reply Brief at 5).

In light of these considerations, AIM and TEC argue that the Company has not carried its burden of proof to warrant approval of the proposed demand ratchet (AIM and TEC Reply Brief at 8, citing D.T.E. 99-118, at 7, n.5). Additionally, AIM and TEC argue that the Company's rationale for its demand ratchet proposal is confused, illogical, and flawed, and the Company's proposal violates the Department's rate design principles (AIM and TEC Reply Brief at 4, 7-8).

Thus, AIM and TEC recommend that the Department reject the Company's demand ratchet proposal (AIM and TEC Reply Brief at 10).

f. PowerOptions

i. Demand Ratchet

PowerOptions argues that the Company did not properly support its demand ratchet proposal for Rate G-2 and Rate G-3 because it did not provide evidence of the impacts of the demand ratchet proposal on current customers (PowerOptions Reply Brief at 5-7). Further, PowerOptions claims that the Company's demand ratchet proposal is a sweeping change in the manner of billing medium and large C&I customers (PowerOptions Reply Brief at 6).

PowerOptions argues that the Company's demand ratchet operates as a fixed charge (PowerOptions Reply Brief at 7). According to PowerOptions, fixed charges violate the Department's "goal of achieving efficiency in customer consumption decisions" because it provides little incentive to reduce demand each month after the peak has been set (PowerOptions Reply Brief at 7).[303] Therefore, PowerOptions contends that a fixed demand charge does not account for the timing of customer demand and its coincidence with the system peak, and also fails to reflect cost causation (PowerOptions Reply Brief at 7). Thus, PowerOptions claims that the demand ratchet proposal is unfair and causes negative impacts for customers with distributed resources (e.g., solar) (PowerOptions Reply Brief at 7).

Further, according to PowerOptions, the Company's billing demand definitions are confusing for customers (PowerOptions Reply Brief at 6). PowerOptions maintains that

---

303 PowerOptions agrees with DOER that the Company's demand ratchet proposal will impede the Commonwealth's goal of achieving demand reduction and mitigating peak load growth (PowerOptions Reply Brief at 7, citing DOER Brief at 5).

calculating a value based upon 75 percent of the greater of maximum metered kW or 90 percent of kVA during the prior eleven months is unclear (PowerOptions Reply Brief at 6). Therefore, PowerOptions argues that customers will be unable to manage their facilities appropriately (PowerOptions Reply Brief at 6). Accordingly, PowerOptions asserts that the Department should reject the Company's demand ratchet proposal (PowerOptions Reply Brief at 8).

ii. Tiered Customer Charges

PowerOptions argues that a tiered customer charge rate structure based on maximum demand is not appropriate for residential or small commercial customers (PowerOptions Reply Brief at 3). In this regard, PowerOptions contends that these customers cannot appropriately adapt or respond to a tiered customer charge structure without having advanced metering, demand meters, or appropriate technology to know when they are reaching their peak use (PowerOptions Reply Brief at 4). Further, PowerOptions maintains that National Grid did not sufficiently demonstrate that using non-coincident peak demand actually reflects a customer's contribution to distribution system costs, and, as such, it is the appropriate tool for charging distribution rates (PowerOptions Reply Brief at 4, citing NECEC Brief at 11, 13).

Moreover, PowerOptions argues that the Company's Phase II proposal removes the link between a customer's energy conservation and seeing reduced charges on the electric distribution bill because a customer must maintain a year of reduced monthly use to drop to a lower tier (PowerOptions Reply Brief at 3). PowerOptions contends that the tiered customer charge proposal risks undermining one of the Commonwealth's energy policy goals of maximum deployment of energy efficiency (PowerOptions Reply Brief at 4, citing DOER Brief at 7). Further, PowerOptions claims that the delay in monetary savings from the implementation of

energy efficiency measures inherent in National Grid's tiered customer charge proposal could discourage these investments and impact the Commonwealth's energy goals (PowerOptions Reply Brief at 4). Additionally, PowerOptions asserts that National Grid has not analyzed how the tiered customer charge proposal may affect the achievement of its three-year energy efficiency plan (PowerOptions Reply Brief at 4-5, citing DOER Brief at 7).

Finally, PowerOptions maintains that the Company's proposal is not consistent with the Department's "standard of review" (PowerOptions Reply Brief at 3). Based on all of these reasons, PowerOptions asserts that the Department should reject the Company's tiered customer charge proposal (PowerOptions Reply Brief at 3, 5).

iii. Seasonal Rate Design

PowerOptions supports the Attorney General's seasonal rate design proposal (PowerOptions Reply Brief at 5). PowerOptions maintains that it is easier for customers to understand than the Company's Phase II proposal and enables customers to respond to price signals (PowerOptions Reply Brief at 5). PowerOptions argues that there is a much stronger correlation between peak-season energy consumption and peak demand than the Company describes (PowerOptions Reply Brief at 5, citing Exhs. AG-SJR-1, at 17; AG-SJR-4). Thus, PowerOptions maintains that the Attorney General's seasonal rate design proposal links distribution prices to summer distribution peaks (PowerOptions Reply Brief at 5). According to PowerOptions, the seasonal rate design proposal is cost-based, results in reasonable bill impacts, is simple and understandable, improves efficiency and cost causation, and therefore, meets the Department's rate design goals (PowerOptions Reply Brief at 5, citing NECEC Brief at 30).

g. Company

i. Overview

National Grid argues that the appropriate regulatory forum to determine rate design is in a general rate case, based on the revenue requirement and cost studies used to establish "just and reasonable" rate design (Company Reply Brief at 83-84). According to the Company, its rate structure should consist of customer charges, demand charges, and consumption charges that are reflective of customer-related, demand-related and consumption-related costs, respectively (Company Reply Brief at 84). National Grid contends that its proposal is "the first step in a process towards an optimal rate design, which would include both customer and demand charges for each rate class" (Company Brief at 214).

Moreover, the Company maintains that its proposed rate design properly balances the Department's rate design goals: efficiency, simplicity, continuity, fairness, and earnings stability (Company Brief at 202, citing Exh. NG-PP-1, at 29; Company Brief at 211, 213-214). According to the Company, its rate design: (1) produces the desired revenue for each rate class determined in its allocation process; (2) generates revenue that is reasonably stable and predictable while reflecting cost-causation principles; (3) reflects the cost to serve and to ensure adequate revenue to the utility; (4) mitigates extreme bill impacts on customer groups; and (5) results in equalized rates of return amongst all rate classes pursuant to § 94I (Company Brief at 202, citing Exh. NG-PP-1, at 46-47). Therefore, the Company asserts that the Department should approve the Company's proposed rate design in this case (Company Reply Brief at 84).

The Company explains that its primary objective in its rate design proposal is customer equity and to design rates that reflect the actual relative cost to serve each customer (Company

Brief at 203, citing Exh. NG-PP-1, at 23; Company Reply Brief at 83). However, the Company argues that there are limitations in establishing the cost to serve customers and the ability to design rates that recover those costs (Company Brief at 212). In particular, National Grid contends that costs are determined for groups of homogeneous customers with similar cost-causation attributes, not for individual customers (Company Brief at 212, citing Exhs. NG-PP-1, at 39-41; AG-12-2). Further, the Company claims that the Department's rate design goals of simplicity, continuity, and earnings stability often lessen the cost-basis in rate design implementation (Company Brief at 212). Additionally, the Company maintains that it considers the cost and availability of meters in designing rates (Company Brief at 212).

The Company supports transparent and efficient rate designs that provide sufficient revenue to support the distribution system, motivate the appropriate behaviors, and assure fairness and equity among customers (Company Brief at 213). According to National Grid, both DG and non-DG customers impose demand on the distribution system and its associated services (Company Brief at 213). However, the Company asserts that distribution service provided to DG customers is being paid for, in whole or in part, by all customers through revenue decoupling and net metering credits[304] (Company Brief at 213). In this regard, National Grid notes that it recovers the bulk of distribution service costs through the volumetric portion of distribution rates (Company Brief at 213). Further, the Company contends that net metering allows DG customers to zero out bills and to build credits towards their cost for future electricity consumption (Company Brief at 214). The Company contends that this policy has enabled many customers to

---

304 The Company reports that net metering caps are over-subscribed, and it provided approximately $64 million of net metering credits to DG customers in 2015 (Company Brief at 215, citing Exhs. NG-PP-Rebuttal-1, at 19; DPU-5-3; Tr. 7, at 1043)

avoid payment for their use of the distribution system (Company Brief at 214). Therefore, the Company maintains that the current DG landscape and its rate design creates a growing cost-shift within the Company's service territory, while providing little benefits (Company Brief at 213-215, citing Exh. NG-PP-Rebuttal-1, at 37).

Finally, the Company argues that the price for distribution service should reflect the value and true cost of the service, and customers' bills should reflect each customer's demand for such service (Company Brief at 213). According to National Grid, current rate design does not properly attribute costs caused by customers with DG facilities to those customers, but its rate design proposal appropriately addresses cost responsibility for DG customers (Company Reply Brief at 83-84, 212). The Company contends that if rate design is not based on cost causation, customers that do not use DG facilities are cross-subsidizing those customers with DG facilities (Company Reply Brief at 83, 212).[305] Further, National Grid claims that the Limited Intervenors are employing delay tactics that ignore the impact on rates and cost recovery caused by the rapid development of DG facilities in Massachusetts (Company Reply Brief at 83).

ii. Demand Ratchets

National Grid argues that those opposing the Company's demand ratchet proposal do not dispute the ratemaking objective of demand ratchets, but rather, oppose the demand ratchets' effect on energy efficiency, solar DG, and storage (Company Brief at 226; Company Reply Brief

---

[305] According to the Company, it collects most of its costs through usage charges (Company Reply Brief at 84). The Company contends that the usage of a customer with a DG facility behind-the-meter may drop or vary from the baseline used to establish rate design (Company Reply Brief at 84). Therefore, the Company maintains that the relationship between cost incurrence and revenue collection is broken and the recovery of costs is shifted to other customers (Company Reply Brief at 84).

at 92). The Company asserts that such opposition lacks merit (Company Brief at 227; Company Reply Brief at 93).

In particular, National Grid rejects any arguments that a demand ratchet delays payback periods for energy efficiency and demand reduction investments, and the Company instead notes that its demand ratchet analysis shows little impact on customer savings from the implementation of energy efficiency because approximately 70 to 75 percent of energy efficiency savings result from reductions in kWh use (Company Brief at 227, citing Exh. NG-PP-Rebuttal-1, at 28; Company Reply Brief at 93). Further, National Grid maintains that the record demonstrates that a demand ratchet has little impact on a customer installing energy efficiency or demand reduction technologies (Company Brief at 227, 228; Company Reply Brief at 93, 94). According to the Company, it calculated a $200 to $400 reduction, from total savings ranging from $26,000 to $57,000, in the first year of an energy efficiency investment, due to the demand ratchet (Company Brief at 227, citing Exh. DPU-15-16, Att. at 3-4; Company Reply Brief at 93). Moreover, the Company argues that with or without the demand ratchet, the customer will accumulate all of the annual savings associated with energy efficiency investments after the first investment year (Company Brief at 227-228; Company Reply Brief at 93-94).

Regarding the installation of a demand reduction investment (i.e., DG or storage), the Company maintains that customer savings on an installation that reduces 50 percent of kW and kWh billing determinants reduced savings by 2.6 percent for the first year (from approximately $205,800 to $193,800) as a result of the demand ratchet (Company Brief at 228, citing Exh. DPU-15-16, Att. at 5; Company Reply Brief at 94). Therefore, National Grid

contends that demand ratchets will not cause a disincentive to invest in energy efficiency or demand reduction technologies (Company Brief at 228; Company Reply Brief at 94).

Further, the Company argues that a demand ratchet is reasonable and appropriate for Rate G-2 and Rate G-3 customers because it will assess demand charges based upon each customer's maximum demand during the year (Company Brief at 208; Company Reply Brief at 92). The Company notes that its system was designed and built to accommodate maximum aggregate demand of all customers at a single point in time (Company Brief at 226, citing Exh. NG-PP-1, at 56-57; Company Reply Brief at 92). Thus, the Company asserts that its proposal will better reflect a customer's contribution to coincident demand, and it will result in cost recovery more reflective of the costs that are incurred to serve that customer (Company Brief at 208, 226, citing Exh. NG-PP-1, at 56-57; Company Reply Brief at 92). Consequently, National Grid asserts that it has demonstrated that the demand ratchet for Rates G-2 and G-3 is reasonable, and that its proposal should be approved (Company Brief at 228; Company Reply Brief at 94).

iii. Tiered Customer Charges

National Grid argues that its Phase II rate design proposal is a reasonable change in rate structure to move rates for residential and small commercial customers toward the recovery of customer-related and demand-related costs to serve (Company Brief at 225; Company Reply Brief at 91). According to the Company, a higher customer charge for higher-use customers is a reasonable proxy to recover the higher demand-related costs imposed on the distribution system by these customers (Company Brief at 225; Company Reply Brief at 91). The Company asserts that its proposal is consistent with the Department's rate structure goals and objectives, and, therefore, it should be approved (Company Brief at 225; Company Reply Brief at 91).

According to the Company, a distribution system is sized and constructed to accommodate the maximum demand on the system at a single point in time, and, once constructed, distribution system costs are fixed in nature (Company Brief at 217, 218, citing Exhs. NG-PP-1, at 33, 38; Company Reply Brief at 85, 86). The Company maintains that a customer's monthly maximum kWh use during a 12-month period reflects the customer's contribution to total system demand and should be the basis for the customer's cost responsibility in rate design instead of a customer's monthly or annual kWh consumption (Company Brief at 217, 218, citing Exh. NG-PP-1, at 38-39; Company Reply Brief at 85, 86). Therefore, the Company contends that its Phase II rate design proposal better aligns the recovery of fixed distribution system costs than the current single customer charge for these rate classes and results in a more equitable contribution to costs by all customers on the basis of their size (Company Brief at 217, 218, citing Exh. NG-PP-1, at 32, 35; Company Reply Brief at 85, 86). Further, National Grid argues that a reduction in energy consumption does not necessarily result in a corresponding reduction in distribution costs (Company Brief at 218, citing Exh. NG-PP-1, at 32, 35; Company Reply Brief at 86). According to the Company, the Phase II rate design proposal is a reasonable proxy for a rate structure in which a fixed customer charge recovers the customer related cost to serve each customer and a demand charge based on customer size recovers capacity-related costs (Company Brief at 217, citing Exh. EFCA 1-1; Company Reply Brief at 85).

The Company disagrees with the argument that the adoption of the tiered customer charge would be inconsistent with § 141 (Company Brief at 222, citing Low Income Network Brief at 17-26; Vote Solar Brief at 22-23; Company Reply Brief at 88, citing Low Income

Network Reply Brief at 5-7; NECEC Reply Brief at 12-13; Vote Solar Reply Brief at 11-13). The Company argues that interpreting the statue to ban any rate design that would affect existing incentives for DG and energy efficiency is not consistent with the plain language of that statute (Company Brief at 222; Company Reply Brief at 88). Rather, according to the Company, a reasonable reading of the statutory language is that the Department is required to consider the impacts of the Company's proposed rate design along with the increased incentives that are provided to energy efficiency and on-site generation (Company Brief at 222 (emphasis in original); Company Reply Brief at 88-89). The Company maintains that the Department must balance the various interests (i.e., rate design and incentives for energy efficiency and DG), which the Company advocates for in its rate design proposals (Company Brief at 222; Company Reply Brief at 89).

Further, in response to the argument that the tiered customer charges do not reflect the demand-related costs that individual customers put on the system and that they do not consider the timing of the customer's non-coincident peak and peak demand, the Company asserts that existing demand charges are based on a customer's maximum demand (Company Brief at 220; Company Reply Brief at 87). For example, the Company argues that demand charges for C&I customers are assessed on the customer's maximum kW because it represents the customer's potential to contribute to the capacity requirements of the distribution system (Company Brief at 220-221, citing Exh. NG-PP-Rebuttal-1, at 14; Company Reply Brief at 87, citing Exh. NG-PP-Rebuttal-1, at 14). Therefore, the Company asserts that a demand charge designed to recover demand-related distribution costs billed to the customer on maximum

monthly demand is not new or unreasonable (Company Brief at 221; Company Reply Brief at 87).

Further, in response to the argument that the tiered customer charge proposal is not an improvement over the current rate design, the Company argues that its detailed analysis refutes the claim (Company Brief at 223, citing Exh. NG-PP-Rebuttal-2; Company Reply Brief at 89 citing Exh. NG-PP-Rebuttal-2). According to the Company, the analysis comparing bill charges resulting from: (1) the existing rate design; (2) the proposed residential Phase I rate design; (3) the proposed residential Phase II rate design reflecting tiered customer charges; and (4) a rate design that includes separate customer and demand charges, demonstrates that, for both high- and low-load factor customers, its Phase II proposal charge more closely approximates the rates based on separate customer and demand charges (Company Brief at 223, citing Exh. NG-PP-Rebuttal-1, at 12; Company Reply Brief at 89). In addition, National Grid argues that its Phase II rate design proposal does not produce monthly bills that are significantly different from those under either the current rate structure or its proposed Phase I rate design (Company Brief at 223; Company Reply Brief at 89). Therefore, the Company asserts that its Phase II proposal fulfills the Department's rate continuity goal (Company Brief at 223; Company Reply Brief at 89).

National Grid also rejects any arguments that its proposed tiered customer charge structure is confusing and provides insufficient price signals (Company Brief at 224, citing DOER Brief at 8; EFCA Brief at 14-15; NECEC Brief at 14-15; Vote Solar Brief at 15-19; Company Reply Brief at 90, citing DOER Reply Brief at 4; EFCA Reply Brief at 11-12; NECEC Reply Brief at 10-12; Vote Solar Reply Brief at 8-9). The Company contends that such

arguments are contradictory to the notion that customers demand more time varying rates (Company Brief at 224, citing DOER Brief at 8; EFCA Brief at 14-15; NECEC Brief at 14-15; Vote Solar Brief at 15-19; Company Reply Brief at 90, citing DOER Reply Brief at 4; EFCA Reply Brief at 11-12; NECEC Reply Brief at 10-12; Vote Solar Reply Brief at 8-9). In this regard, the Company argues that although its proposal is based on the concept that customer demand underlies the basis for the tiered customer charge, the actual structure of the rates (i.e., a customer charge and a per-kWh rate) does not change (Company Brief at 224-225, citing Exh. NG-PP-Rebuttal-1, at 30; Company Reply Brief at 90-91).

Moreover, while National Grid acknowledges that customers might not be familiar with the concept of demand, the Company argues that customers understand the implications on the distribution system resulting from changes in electricity consumption (Company Brief at 224, n.44, citing docket D.P.U. 10-82, evaluation report of the Company's Smart Energy Solutions Program; Company Reply Brief at 90 n.20). Further, the Company claims that its outreach and education program will resolve any customer confusion about its Phase II rate design proposal (Company Brief at 225; Company Reply Brief at 91). In particular, the Company maintains that it proposed a six month delay in its Phase II rate design effective date "to educate customers on the reason behind and determination of the tiered customer charges, including changes to their bills and ways to reduce usage to take advantage of tiers with lower customer charges" (Company Brief at 225, citing Exh. NG-PP-Rebuttal-1, at 31; Company Reply Brief at 91).

iv. Seasonal Rate Design

National Grid opposes the alternative seasonal rate design proposal recommended by the Attorney General and others, as the Company claims that there is no cost basis for the 15-percent

differential between summer and winter rates (Company Brief at 224; Company Reply Brief at 90; see Attorney General Brief at 137; Attorney General Reply Brief at 72, 76; Acadia Center Brief at 17-18; Acadia Center Reply Brief at 11; NECEC Brief at 29-30; NECEC Reply Brief at 3, 6, 10, 12, 13). According to the Company, "while there is little data identifying a peak load during the non-summer months of October through May, many feeders may experience non-summer peak demands that are very close to their summer peak demand" (Company Brief at 223-224, citing Exh. VS-2-12; Company Reply Brief at 89). Further, the Company contends that a summer-peaking feeder may become winter peaking during extremely cold weather, and that transition reduces the differences between summer and winter peak demands (Company Brief at 224; Company Reply Brief at 89-90). Further, National Grid claims that increasing solar generation affects summer demand far greater than winter demand, further increasing the probably of peak loads shifting from the summer months to the winter months in the future (Company Brief at 224; Company Reply Brief at 90). Therefore, the Company argues that "a system-wide reduction in coincident peak demand may not result in a commensurate reduction in actual or forecasted peak demand for each feeder" (Company Brief at 224; Company Reply Brief at 90). Finally, the Company asserts that setting a summer rate 15 percent higher than a winter rate will produce arbitrarily higher net metering credits (Company Brief at 224; Company Reply Brief at 90).

6. Analysis and Findings

In ruling on the Company's rate design proposals, the Department considers its rate design goals: to achieve efficiency and simplicity as well as to ensure continuity of rates, fairness between rate classes, and corporate earnings stability. D.P.U. 15-80/D.P.U. 15-81,

at 294; D.P.U. 13-75, at 330; D.P.U. 12-25, at 444; D.P.U. 10-114, at 341; D.P.U. 09-39, at 401. In practice, meeting the goal of efficiency should involve rate structures that provide strong signals to consumers to decrease energy consumption in consideration of price and non-price social, resource, and environmental factors. D.P.U. 15-80/D.P.U. 15-81, at 295; D.P.U. 12-25, at 445.

a. Demand Ratchets

DOER, EFCA, AIM and TEC, and PowerOptions, oppose the Company's demand ratchet proposal. The Company previously proposed to implement demand ratchets, and the Department denied the Company's request. Massachusetts Electric Company, D.P.U. 85-146, at 68-69 (1986). In denying the demand ratchet proposal, the Department found that demand ratchets can, in an uneconomic manner, provide no incentive to reduce demand beyond the class or system peak and little incentive to reduce kWh use. D.P.U. 85-146, at 69. Moreover, we determined that a demand ratchet distorts the price signal to the customers and discourages customers from investing in load control equipment that would otherwise be cost-effective. D.P.U. 85-146, at 68; see also D.P.U. 84-145-A at 125. Further, the Department has found that demand ratchets are inappropriate because they distort incentives to conserve electricity and could unfairly impose higher costs on certain customers. Western Massachusetts Electric Company, D.P.U. 94-101/95-36, at 50 (1995); D.P.U. 92-78, at 188; Western Massachusetts Electric Company, D.P.U. 86-280, at 196 (1987); D.P.U. 84-25, at 199.

Further, the Company did not present any particularly compelling argument that would persuade the Department to alter its precedent on this matter.[306] In particular, the Department finds that the Company failed to provide sufficient evidence to demonstrate that a customer would have any incentive to reduce their demand after it reaches its annual peak demand. Therefore, we find that the Company's proposed demand ratchet is inconsistent with the aforementioned Department precedent, as well as the Department's goals of efficiency and fairness. As such, the Company's demand ratchet proposal is denied. Accordingly, the Department directs the Company in its compliance filing to revise its proposed demand charges for Rates G-2 and G-3 to eliminate the demand ratchet component. Instead, the Company shall design the demand rates consistent with the definition of billing demand found in its currently effective Rates G-2 and G-3 tariffs, M.D.P.U. Nos. 1152 and 1153 (respectively for MECo) and M.D.P.U. Nos. 526 and 527 (respectively for Nantucket Electric).

b. Tiered Customer Charges

National Grid's tiered customer charge proposal is premised on the Company's position that under its current rates there is a shift in cost recovery from DG customers to non-DG customers (Exh. NG-PP-Rebuttal-1, at 53). The tiered customer charges are designed to mitigate that cost-shift by using a customer's highest monthly energy use as a proxy for that customer's peak demand, thereby employing a rate design that captures the cost that a customer imposes on

306 The Department recognizes that it accepted demand ratchets as a reasonable resolution of the issue of undue discrimination in allowing standby rates, but only in the context of a Settlement Agreement between NSTAR Electric, DOER, AIM, CLF, the Joint Supporters and SEBANE. NSTAR Electric Company, D.T.E. 03-121, at 42 (2004). In approving the Settlement Agreement, the Department's decision in that proceeding was not intended to represent a fully litigated review on the merits resulting in a wholesale change in rate making policy. D.T.E. 03-121, at 42 n.16.

the distribution system from the customer's individual peak demand (Exhs. NG-PP-1, at 32-35; NG-PP-Rebuttal-1, at 10; DPU-9-14). The Attorney General, DOER, the Low Income Network, the Limited Intervenors, and PowerOptions oppose the Company's tiered customer charge proposal.

The Company purports that "DG customers may contribute significantly less to support the distribution system as a result of their reduced kWh usage, thereby shifting the recovery of distribution system costs to all non-DG customers" (emphasis added) (Exh. NG-PP-1, at 28). The Company has not quantified the amount of costs attributable specifically to DG customers and has not quantified the distribution system benefits associated with DG customers in its service territory (Exhs. NG-PP-Rebuttal-1, at 22; DPU-29-6, at 2; LI-1-10, at 1; Tr. 5, at 620). Other than quantifying net metering credits and citing to current rate design, the Company did not substantiate its cost-shift assumption with reasonable analysis and quantitative record evidence (Exhs. NG-PP-Rebuttal-1, at 19; DPU-5-3, Att.). As such, the Department is not persuaded that a cost-shift from DG customers to non-DG customers, in fact, exists. Therefore, we find that the basis of the Company's tiered customer charge proposal is not sufficiently supported.

Further, § 141 states, in part: "[i]n all decisions or actions regarding rate designs, the [D]epartment shall consider the impacts of such actions, including the impact of new financial incentives on the successful development of energy efficiency and on-site generation." The Company's tiered customer charge proposal shifts cost recovery away from the volumetric, per-kWh charges, causing kWh rates to decrease (Exh. NG-PP-1, at 32). As volumetric, per-kWh rates decrease, customers' incentives to install energy efficiency and on-site generation

diminish as potential savings are lower and net metering credits are lower. Further, the Company failed to provide evidence regarding the impact of its tiered customer charges on energy efficiency, compliance with the three-year energy efficiency plan, and incentives to lower demand (Exh. DOER-2-18; Tr. 5, at 634). Moreover, although pricing distribution service on demand use may support the cost-to-serve principle, it is not the best rate structure to promote energy efficiency. D.P.U. 10-70, at 332.

The Company's tiered customer charge proposal and demand ratchet proposals are similar in operation. Similar to the demand ratchet proposal, the Department finds that the Company's tiered customer charge proposal provides no incentive to lower demand and electricity use below the highest level within a tier. Additionally, the tiered customer charges distort incentives to conserve electricity, may unfairly impose higher costs on certain customers, and discourage customers from investing in cost-effective energy efficiency. D.P.U. 94-101/95-36, at 50; D.P.U. 92-78, at 188; D.P.U. 86-280, at 196; D.P.U. 85-146, at 68-69; D.P.U. 84-145-A, at 125; D.P.U. 84-25, at 199.

Next, the Department addresses whether the Company's tiered customer charge proposal meets our rate design goal of simplicity. National Grid's tiered customer charge proposal is a transition toward mandatory demand charges for residential and small C&I customers (Exh. NG-PP-Rebuttal-1, at 10-11). However, the Company failed to establish that demand charges are understandable by residential and small C&I customers. Additionally, although the Company planned to implement an outreach and education plan, by the close of the record it had not developed a detailed customer outreach and education plan at this time (Exh. VS-2-6; see Exhs. NG-PP-1, at 45; DPU-9-16). Further, the Company's proposal, including residential

demand charges, is not a mandatory residential rate design used by any state-regulated utility in the country (Exh. DPU-12-2; Tr. 5, at 638-641, 654-657). The Department is concerned that the Company has not determined its customers' tolerance and acceptance of a significant change in rate design, and therefore, has not presented adequate strategies to ensure that its customers will understand the tiered customer charge proposal.

Further, under the Company's proposal, customers lack the ability to monitor their electricity consumption throughout the month in real time (Tr. 7, at 1186-1187). Under the Company's inclining block rate structure, customers were not able to monitor their use to ascertain when or if it would be high enough to be billed at the tail block rate (Tr. 7, at 1186-1187). Further, customers will experience a lag between actual consumption, and the availability of the data and resulting customer charge tier (Exh. VS-2-7). Thus, customers do not have the equipment to easily monitor electricity consumption in real time and would be unaware if they were about to reach a new maximum monthly kWh use that would increase their customer charge. Accordingly, the Department finds that the Company's tiered customer charge proposal fails to meet the Department's rate design goal of simplicity.

Next, the Department addresses whether the Company's tiered customer charge proposal meets our rate design goal of efficiency. In support of its tiered customer charge proposal, National Grid provided analysis of approximately 12,300 residential and 300 small C&I load research customers' relationship between maximum annual kWh use and maximum demand use and concluded from this analysis that a customer's maximum kWh use can be used to approximate their demand, as measured in kW (Exhs. NG-PP-1, at 41; NG-PP-10). The Company reached this conclusion based on the fact that the maximum billed use explained more

than 50 percent of the variation in maximum hourly load, as measured by the R-squared[307] value of 0.6093 for residential and 0.7512 for small C&I (Exhs. NG-PP-1, at 41; NG-PP-10; WP-NG-PP-3; Tr. 5, at 687-689). However, the Company was unsure if it would have proposed tiered customer charges if the R-squared value was less than 0.5 (Tr. 5, at 692). In similar analyses comparing customers' maximum annual kWh use and maximum demand within each of the four proposed customer charge tiers, only one R-squared value was greater than 0.5 (Exh. DPU-9-8; Tr. 5, at 637-638).[308] Therefore, the Department finds that the Company's tiered customer charge proposal is inadequate for serving as a proxy for a customer's contribution to maximum demand (see Exh. AG-SJR-1, at 19). Additionally, the Company's current rate design is more reflective of the cost to serve and a better indicator of customer's maximum demand than is the Company's tiered customer charge proposal (Exhs. AG-SJR-20-30; EFCA-TW/MW-1, at 27-29; NECEC-RTB-1, at 19-20; DPU-9-8, Att.; DPU-NECEC-1-4; DPU-NECEC-1-5, Att.; RR-DPU-27, Att.).

For all of these reasons, the Department finds that the Company's tiered customer charges do not meet our rate design goals of simplicity and efficiency, and do not provide strong signals to consumers to decrease energy consumption in consideration of price and non-price,

---

307 As noted, R-squared is a statistical measure of how close the data are to the fitted regression line and measures the strength of a relationship (Exh. DPU-15-9; Tr. 8, at 1218). In general, the higher the R-squared, the better the model fits the data (Exh. DPU-15-9). A R-squared value of one means that the model explains all the variability of the data, and a R-squared value of zero means that the model explains none of the variability of the data (Tr. 5, at 636).

308 For residential customers in Tiers 1, 2, 3, and 4, the analyses showed R-squared values of: 0.1911, 0.1352, 0.1134, and 0.4587, respectively (Exh. DPU-9-8, Att.). For Rate G-1 customers, the R-squared values for Tiers 1, 2, 3, and 4 were: 0.2306, 0.0576, 0.3617, and 0.5727, respectively (Exh. DPU-9-8, Att.).

social, resource, and environmental factors. Accordingly, we decline to accept the Company's Phase II, tiered customer charge rate design proposal.[309] The Department addresses rate design for Rates R-1, R-2, and G-1 in the Rate-by-Rate section, below.

c. Seasonal Rate Design

In the alternative to the Company's tiered customer charge proposal, the Attorney General proposed a seasonal rate design for Rates R-1 and R-2. This proposal is supported by Acadia Center, NECEC, and PowerOptions (Attorney General Brief at 134-135; Acadia Center Brief at 2, 17-18; NECEC Brief at 29-30; PowerOptions Reply Brief at 5).

The Department stated that it would consider seasonally differentiated rates, as well as other dynamic pricing alternatives to inclining block rates. D.P.U. 10-70, at 330. In considering "other dynamic pricing alternatives" in an investigation into time varying rates, the Department declined to implement time varying distribution rates. Time Varying Rates, D.P.U. 14-04-B at 13-14 (2014). We see no reason to deviate from that position here.

Moreover, the Attorney General's seasonal rate design proposal is only a slight improvement in cost-effectively collecting the cost to serve the distribution system compared to the Company's Phase I proposal (Exh. AG-SJR-1, at 30). For example, in an analysis of 12,056 residential customers comparing the cost of service and the Attorney General's proposed distribution bill, the seasonal rate design improves the relationship to cost increases by 0.004 R-square from 0.271 to 0.281, and the average variance between costs and revenues from 53 percent to 52 percent (Exhs. AG-SJR-1, at 30; AG-SJR-12). Annual bill impacts improve

309 Because the Department declines to adopt the Company's tiered customer charge proposal, we will not address continuity (i.e., bill impacts). In the Rate-by-Rate section, below, the Department considers continuity when determining each rate class's rate design.

slightly from a range of increases of 20 percent to 48 percent to 22 percent to 45 percent (Exh. AG-SJR-1, at 30). Further, residential customers already experience rate changes on March 1, May 1, and November 1 (Tr. 7, at 1182). Seasonal rates would establish additional mandatory rate changes on July 1 and October 1 (see Exh. AG-SJR-1, at 30). The Department finds that a "slight improvement" in rate design compared to the Company's Phase I proposal is outweighed by the potential for additional customer confusion and reduced simplicity in the Company's Phase I rate design. Based on the foregoing, the Department declines to adopt the Attorney General's seasonal rate design proposal for Rates R-1 and R-2. The Department addresses rate design for Rates R-1 and R-2 in the Rate-by-Rate section, below.

d. Inclining Block Rates

The Department finds that the Company's proposed flat rate structure for all rate classes is consistent with the rate design policy developed in recent base rate cases. D.P.U. 14-150, at 400; D.P.U. 13-90, at 250; D.P.U. 13-75, at 358-361; D.P.U. 12-25, at 468-469. As such, the Department approves the elimination of inclining block rates. Regarding the proper level to set the customer charge and volumetric rates for each residential and C&I rate class, the Department will make this determination on a rate class by rate class basis, balancing our rate design goals.

E. Low Income Discount

1. Introduction

a. Background

Pursuant to G.L. c. 164, § 1F, the Department requires distribution companies to provide discounted rates for low income customers comparable to the low income discount rate received off the total bill for rates in effect prior to March 1, 1998. See Expanding Low Income Customer

Protections and Assistance, D.P.U. 08-4, at 36 (2008). In the Company's last base rate proceeding, the Department made modifications to the application of the low income discount and established a low income discount of 25 percent applied to a Rate R-2 customer's total bill. D.P.U. 09-39, at 429-432.

The Company states that the current average low income monthly discount for a 500 kWh use customer is $30.04 or 28.8 percent (Exh. LI-1-5, at 2 (Supp.)). According to the Company, the monthly discount consists of the 25 percent total bill discount approved in D.P.U. 09-39 plus the discount from the Rate R-2 Energy Efficiency Reconciling Factor ("EERF") being less than that assessed to Rate R-1 customers (Exh. LI-1-5, at 2-3 (Supp.)).

b. Low Income Network's Recommendation

Pursuant to the second clause of § 141, [310] the Low Income Network initially recommended that the Department increase the average low income monthly discount from 28.8 percent to 35 percent (Exh. LI-JH-1, at 18). The Low Income Network's initial recommendation was based on the purported increase in costs associated with (1) renewable portfolio standard ("RPS") solar carve out; (2) RPS except solar carve out; (3) net metering recovery surcharge ("NMRS"); (4) long-term renewables contracts; (5) utility owned solar; and (6) Smart Grid pilots (Exhs. LI-JH-1, at 17-18; LI-1-5). According to the Low Income Network, these costs are related to the growth of on-site generation, and the increase in these costs has resulted in higher bills for low income customers (Exh. LI-JH-1, at 17-18, citing Exh. LI-1-5 (Supp.) & Att.). Therefore, the Low Income Network recommends an increase in the low

310 See n.300 above.

income discount to fully compensate low income customers for these increased costs (Exh. LI-JH-1, at 18).

Subsequently, on brief, the Low Income Network modified its recommendation for an increase of the low income discount from 25 percent to 33 percent (Low Income Brief at 23-24). The Low Income Network's revised calculation is based on the purported increase in costs associated only with (1) RPS solar carve out; and (2) NMRS (Low Income Brief at 23-24; Exhs. DPU-LI-1-5; WP-DPU-LI-4; WP-DPU-1-5). The Low Income Network acknowledges that only these two categories of costs are related to the growth of on-site generation (Low Income Brief at 23).

c. Company's Alternative Proposal

In response to the Low Income Network's proposal, the Company proposes to maintain the low income discount at its current level of 25 percent, but to exempt Rate R-2 customers from being charged for on-site generation costs that the Department concludes should be avoided by this customer group (Exh. NG-PP-Rebuttal-1, at 64). For instance, if the Department concludes that Rate R-2 customers should not pay for all or any part of the Company's cost of complying with the RPS that is a component of basic service rates, whether it be the solar carve-out and/or the non-solar carve out cost, the Company would exclude those costs from the RPS component of the low income basic service rates and allocate the estimate of those costs to all other Basic Service customers (Exh. NG-PP-Rebuttal-1, at 64).[311] Further, National Grid

[311] National Grid notes, however, that removing all or any part of the Company's cost of complying with the RPS from basic service rates for low income customers creates a lower basic service rate with which competitive suppliers would have to compete (Exh. NG-PP-Rebuttal-1, at 66). According to the Company, approximately 52 percent

states that with respect to net metering costs, the Company could alter the manner by which it recovers net metering credits paid for excess generation (Exh. NG-PP-Rebuttal-1, at 65). More specifically, in designing the NMRS factors, the Company proposes to exclude Rate R-2 in the allocation of the balance of the NMRS reconciliation and the amount would be recovered from all other customers (Exh. NG-PP-Rebuttal-1, at 65). Rate R-2 customers would therefore not be billed an NMRS (Exh. NG-PP-Rebuttal-1, at 65).

The Company's alternative proposal does not include the impact of displaced distribution revenue, which still would be recovered through the Company's RDM (Exh. NG-PP-Rebuttal-1, at 65). According to the Company, its alternative proposal is intended to simplify the application of the concept presented by the Low Income Network and has the added benefit of creating transparency in the amount of net metering costs recovered from non-low income customers (Exh. NG-PP-Rebuttal-1, at 65).

2. Positions of the Parties

a. The Low Income Network

The Low Income Network provided several reasons for its recommended increase to the low income discount. First, the Low Income Network argues that the scale of on-site generation[312] is now "substantial," with installed capacity from distributed generation on the Company's system exceeding 15 percent of the Company's peak load (Low Income Network

---

of Rate R-2 customers currently receive electricity supply from a competitive supplier (Exh. NG-PP-Rebuttal-1, at 66).

312 The Low Income Network asserts that the Department should determine the meaning of the term "on-site generation," in the context of § 141 (Low Income Network Brief at 19). In this regard, the Low Income Network argues that "on-site generation" is used in a "common-sense manner" that encompasses only solar and other renewable energy production on the site of an end-use customer (Low Income Network Brief at 19 n.65).

Brief at 19, 20-21, citing Tr. 7, at 1003; RR-LI-2). Second, the Low Income Network contends that the scale of on-site generation has resulted in a six-percent increase in total bills for low income customers, thereby impacting the affordability of electric service for low income customers (Low Income Network Brief at 19).[313] In this regard, the Low Income Network claims that low income households already do not have sufficient income to meet the high cost of living in Massachusetts, and that the burden of paying for electricity is higher on low income households than other customers (Low Income Network Brief at 21-22). Thus, according to the Low Income Network, a six-percent increase in bills as a result of the scale of on-site generation is particularly onerous for low income customers (Low Income Network Brief at 22).

Third, the Low Income Network argues that the record supports an increase of the low income discount to 33 percent, as this level of discount takes into account costs associated with the RPS solar carve out and the NMRS and will represent a "fully compensating adjustment" to the low income discount rate (Low Income Network at 19, 22-23, citing Exhs. LI-JH-1, at 17-18; NG-PP-Rebuttal-1, at 55; LI-1-5; DPU-LI-1-3; DPU-LI-1-5; Tr. 7, at 1034-1036). According to the Low Income Network, the Company does not dispute the Low Income Network's calculations that produce a 33-percent discount for the low income discount (Low Income Network Brief at 24; Low Income Network Reply Brief at 6).

Finally, the Low Income Network argues that the Company's alternative proposal would violate § 141 because the method of providing a "fully compensating adjustment" would require low income customers on competitive supply to find a competitive supplier that is willing to offer a similar discount to that being offered by the Company (Low Income Network Brief

313 The Low Income Network states that this increase is inclusive of distribution charges and basic service or competitive supply rates (Low Income Brief at 19).

at 24-25). According to the Low Income Network, nothing in the record suggests that there are any such competitive suppliers (Low Income Network Brief at 25, citing Tr. 7, at 1040). Moreover, the Low Income Network claims that the Company fails to explain how its approach would address current impacts on affordability due to increased on-site generation (Low Income Reply Brief at 6). For all of these reasons, the Low Income Network asserts that the Department should reject the Company's proposal (Low Income Network Brief at 25).

b. Company

The Company argues that its rate design proposals are meant to avoid the current and future scale of energy efficiency and on-site generation from having any impact on the affordability of electricity for all customers, not just low income customers (Company Brief at 222-223). As a result, National Grid claims that its rate design proposals would obviate the need for what the Company considers a reconciling mechanism to address the "fully compensating adjustment" to the low income discount (Company Brief at 223).

Further, the Company submits that the Department is not required to order an electric distribution company to automatically increase its low income discount to compensate for the cost of on-site generation billed through rates to low income customers, but rather the Department should consider the magnitude of those costs on the affordability of electric service to this group of customers in light of such costs paid by all customers (Exh. NG-PP-Rebuttal-1, at 54).[314] Nevertheless, the Company acknowledges that the cost of on-site generation has

[314] With respect to the scale of on-site generation, the Company submits that if the Department is contemplating any "impact on affordability for low income customers" from "the scale of on-site generation," it should limit its analysis to consider on-site generation of any technology with a nameplate capacity of 60 kW or less (Company Brief at 222-223 at n.43).

increased over the past several years for all customers and may result in an additional burden to low income customers in being able to pay their electric bills. (Exh. NG-PP-Rebuttal-1, at 54-55).

The Company does not directly address the Low Income Network's revised recommendation to increase the low income discount to 33 percent. However, the Company notes that in order to arrive at the Low Income Network's original recommended discount of 35 percent, without changing the rates charged to Rate R-2 customers and in consideration of the EERF, the current 25 percent low income discount would need to be 31.6 percent (Exh. NG-RRP-Rebuttal-1, at 55).

Finally, National Grid expresses concern with the Low Income Network's proposal because, according to the Company, changing the discount percentage would require "an annual re-setting of the percentage reflecting changes in the cost of distributed generation reflected in rates charged to Rate R-2 customers, or else the value of the discount would either be diluted or more generous, depending upon how those costs change over time" (Exh. NG-PP-Rebuttal-1, at 56). The Company submits that in D.P.U. 09-39 the Company's recommendation for a clear discount calculated at 25 percent of the entire bill was intended to avoid resetting a discount rate based on a set of rates in effect at a specific point in time. (Exh. NG-PP-Rebuttal-1, at 56)

3. Analysis and Findings

Pursuant to § 141, a fully compensating adjustment shall be made to the low income discount where the scale of on-site generation would have an impact on affordability for low income customers. Based on our review of the record, the Department finds that on-site generation has grown with an increase in costs from associated incentives (i.e., the RPS solar

carve out and the NMRS). The increased costs of these incentives are included in customers' bills, including bills of low income customers (see Exhs. LI-JH-1, at 16-18; NG-PP-Rebutal-1, at 54-55; LI-1-5 (Supp.) & Atts.; Tr. 7, at 1034; RR-DPU-41 & Att.). Thus, low income customers have experienced an increase in bills as a result of the growth of on-site generation. Therefore, pursuant to § 141, the Department finds it appropriate to adjust the Company's low income discount.

As an initial matter, we decline to adopt National Grid's alternative proposal. The Company's proposal appears overly complex and would require competitive suppliers to modify the products that they offer to low income customers. We note that competitive suppliers have not had an opportunity for comment on such a modification.

We find that a fully compensating adjustment to the low income discount would include only the costs associated with the RPS solar carve out and the NMRS, as these costs are directly related to the growth of on-site generation. The Department calculates the incremental increase between 2010 and 2015 for RPS solar carve out and NMRS costs for low income customers to be $50.46, or $4.20 per month.[315] In order to fully compensate low income customers for this increase, as required by § 141, the Department directs the Company in its compliance filing to this Order to increase the low income discount such that the low income discount produces an additional $4.20 in discount for the average low income customer each month, based on all rates that are in effect when the Company's new distribution rates take effect. In order to calculate the

[315] The Department's calculation is based on information in the response to record request DPU-41 and the attachment to the record request. The $50.46 is derived by first multiplying the incremental difference in the two charges for each month by 500 kWh. Second, those monthly totals are summed to arrive at an annual figure. Finally, the annual figure is multiplied by 0.75 to account for the 25 percent low income discount.

revised low income discount, the Company shall base its calculation on a bill for an R-2 customer using 500 kWh per month to an undiscounted bill for that same customer.[316]

The adjusted low income discount will remain in effect until the Company's next base rate case, at which time the Department will determine whether further adjustment is warranted. The Department expects that in their respective next base rate proceedings, all electric distribution companies will file revised rate design proposals for low-income customers that comply with the standard set forth in § 141.

F. Farm Discount

1. Introduction

The farm discount is offered to customers who meet the eligibility requirements for being engaged in the business of agriculture or farming as defined in G.L. c. 128, § 1a. 220 C.M.R. § 11.04(6)(a)[317] (see also Exh. NG-PP-23, at 5 (proposed M.D.P.U. No. 1264)). These customers are eligible for an additional ten percent discount from their distribution service rates. 220 C.M.R. § 11.04(6)(a) (see also Exh. NG-PP-23, at 5 (proposed M.D.P.U. No. 1264)). For

316 As an illustrative example, the calculation that was provided in response to Record Request DPU-41 would be modified such that the value in column (a), row (1) would be $99.05, which is the undiscounted value in row (2) ($74.29/0.75).

317 Pursuant to 220 C.M.R. § 11.04(6)(a):

> Each [d]istribution [c]ompany shall provide [c]ustomers who meet the eligibility requirements for being engaged in the business of agriculture or farming, as defined in [G.L. c. 128, § 1A], a [ten percent] reduction in the rates to which such [c]ustomers would otherwise be subject. Each [d]istribution [c]ompany shall allocate to other rate classes, as part of a general rate case, the revenue deficiency resulting from the farm discount using an allocation method approved by the Department for the [d]istribution [c]ompany.

rate classes R-1, R-2, R-4, G-1, G-2, and the street lighting rate classes, the Company proposes to recover through the base rate for each rate class, the revenue shortfall in the test year attributable to each rate class from the farm discount (Exhs. NG-PP-1, at 53-54; NG-PP-13, at 1-4, 6; DPU-18-15). The proposed farm discount is included as an increase to revenue to be collected through the Company's proposed rate design and totals $572,833 (Exh. NG-PP-13, at 1-4, 6).[318] No party commented on the Company's proposal.

2. Analysis and Findings

The Department stated in Farm Discounts, D.T.E. 98-47, Letter Order at 6 (November 16, 1998), that gas distribution companies may defer costs associated with the implementation of the farm discount for consideration in a subsequent general base distribution rate case. See also D.P.U. 13-75, at 246. The Department has allowed amortization of the deferred farm discounts over periods consistent with the normalization period used to normalize rate case expense. D.P.U. 15-80/D.P.U. 15-81, at 240; D.P.U. 10-70, at 144; D.P.U. 09-30, at 263; D.T.E. 02-24/25, at 204-205.

The Department finds that the Company's proposed method of recovering the farm discount shortfall for each rate class is inconsistent with the Department's policy regarding farm discounts. The farm discount is a social benefit and as such it should be recovered from all customers. Therefore, the Department rejects the Company's proposal. Rather, we conclude that the Company may defer and recover the farm discount credit balance as an amortization in

318 For R-1/R-2: $343,797; for R-4: $244; for G-1: $101,730; for G-2: $125,092; and for street lighting: $1,970 (Exh. NG-PP-13, at 1-4, 6). Therefore, $343,797 + $244 + $101,730 + $125,092 + $1,970 = $572,833.

its next base rate case. D.P.U. 15-80/D.P.U. 15-81, at 240; D.P.U. 10-70, at 143-145; D.P.U. 09-30, at 262-263; D.T.E. 98-47, Letter Order at 6.

G. Rate-by-Rate Analysis

1. Introduction

The Department must determine, on a rate class by rate class basis, the proper level at which to set the customer charge and delivery charges for each rate class, based on a balancing of our rate design goals. The Department's long-standing policy regarding the allocation of class revenue requirements is that a company's total distribution costs should be allocated on the basis of equalized rates of return. See, e.g., D.T.E. 02-24/25, at 256; D.T.E. 01-56, at 139; D.P.U. 92-250, at 193-194; D.P.U. 92-210, at 214. This allocation method satisfies the Department's rate structure goal of fairness. Nonetheless, the Department must balance its goals of fairness with its goal of continuity. For this balancing, we have reviewed the changes in total revenue requirements by rate class and bill impacts by consumption level within rate classes.

2. Rate R-1 and Rate E

a. Company Proposal

Rate R-1 is available to all residential customers in private dwellings, individual apartments, churches, and farms (Exhs. NG-PP-1, at 51; NG-PP-23, at 4-5 (proposed M.D.P.U. Nos. 1264 (MECo) and 576 (Nantucket Electric))). National Grid proposes to increase the monthly customer charge from $4.00 to $5.50 per month for Rate R-1 in Phase I (Exh. NG-PP-1, at 52). The per kWh charge is calculated as the total class revenue requirement less the revenue recovered through the proposed customer charge and the farm discount credit, divided by the rate year kWh deliveries (Exhs. NG-PP-1, at 53; NG-PP-13, at 1).

Rate E is a closed rate only applicable to Nantucket Electric and is applicable to customers who had separately metered space heating, with the remainder of their electricity use metered and billed on Rate R-1 (Exh. NG-PP-1, at 51). Rate E was retained after the merger of New England Electric System and Nantucket Electric to ensure that customers with consumption billed on Rate E were not adversely affected by new distribution rates after the merger (Exh. NG-PP-1, at 51).

The current distribution rates and structure for Rates R-1 and E are identical, except for the cable facilities surcharge billed to all Nantucket Electric customers (Exh. NG-PP-1, at 51; M.D.P.U. No. 551). The Company proposes to terminate Rate E and move these customers onto Rate R-1. The Company also proposes to eliminate the inclining block volumetric charges for the Rate R-1 and Rate E classes, which the Department allowed above (Exh. NG-PP-1, at 50).

b. Analysis and Findings

Initially, the Department evaluates the Company's proposal to combine customers on Rate E with Rate R-1. No party objected to the Company's proposal. The Department finds this proposal to be reasonable because the cost to serve Rate E is similar to the cost to serve Rate R-1. Therefore, the Department directs the Company to terminate Rate E and transfer those customers taking service on Rate E to Rate R-1.

Based on the Department's decision above not to accept the Company's tiered customer charge proposal, the Department directs the Company to design rates for the R-1 rate class with a single monthly customer charge. According to the Company's allocated COSS, the embedded customer charge for Rate R-1/E is $9.42 (Exhs. NG-PP-1, at 52; NG-PP-2(d) at 22; DPU-33-8, Att. at 22). Based on a review of the embedded costs and the bill impacts on customers, the

Department finds that a proposed monthly customer charge of $5.50 for Rate R-1 is reasonable. The Department directs the Company to set its volumetric charge for Rate R-1 so that the rate classes are charged based on a flat rate structure, truncated at five decimal places.

Such rate design satisfies our simplicity goal, as well as our continuity goal because it produces bill impacts that are moderate and reasonable, considering the size of the increase. Therefore, the Department directs the Company to set the volumetric charges for Rate R-1 to collect the remaining class revenue requirement approved in this Order.

3. Rate R-2

a. Introduction

Rate R-2 is a subsidized rate that is available at single locations to all residential customers in private dwellings and individual apartments (Exhs. NG-PP-1, at 51; NG-PP-23, at 6-8, 70-72 (proposed M.D.P.U. Nos. 1265 (MECo) and 577 (Nantucket Electric))). A customer will be eligible for this rate upon verification of the customer's receipt of any means-tested public benefit program or verification of eligibility for the low-income home energy assistance program ("LIHEAP") or its successor program, for which eligibility does not exceed 200 percent of the federal poverty level based on a household's gross income (Exh. NG-PP-23, at 6, 70 (proposed M.D.P.U. Nos. 1265 (MECo) and 577 (Nantucket Electric))). Rate design for Rate R-2 is the same as Rate R-1 for they are treated as one customer class group for rate design purposes, except customers on Rate R-2 currently receive a 25-percent discount off of their entire bill (Exh. NG-PP-1, at 52). The Company's RAAF, which operates outside of base rates on a reconciling basis, recovers the low-income discount and

arrears forgiven under the Company's Arrearage Management Program ("AMP") (Exh. NG-PP-1, at 47-48).

b. Position of the Parties

i. Low Income Network

The Low Income Network asserts that compared to the other electric utilities in the Commonwealth, the Company has a low rate of adding income-eligible customers onto its AMP (Low Income Network Brief at 2-6, citing Exhs. LI-ML-1, at 5-6; LI-2-2; Tr. 1, at 85 86; RR-LI-3; Low Income Network Reply Brief at 2). The Low Income Network argues that the Company should review its business practices to evaluate their affect AMP enrollment and file a report with the Department within six months of this Order outlining its future actions to improve AMP enrollment (Low Income Network Brief at 2-3, 6; Low Income Network Reply Brief at 2). Further, the Low Income Network maintains that the Company should continue to recover its AMP-related costs on a reconciling basis in the RAAF, consistent with recent Department orders regarding how AMP costs may be recovered (Low Income Network Brief at 3, 6-11, citing D.P.U. 15-80/D.P.U. 15-81, at 244-245; Investigation into Issues Affecting Low-Income Customers, D.P.U. 08-4, at 1-6, 40 (2008); Standards for Arrearage Management Programs for Low-income Consumers, D.T.E. 05-86, at 10-12 (2006); Low Income Network Reply Brief at 2-3). The Low Income Network contends that allowing AMP cost recovery on a reconciling basis is the best solution to meeting the Legislature's intent in requiring the Company to offer an AMP (Low Income Network Brief at 3, 6-11, citing Acts of 2005, c. 140, § 17(a); Low Income Network Reply Brief at 2-3). According to the Low Income Network, the

Company agrees with both of its recommendations (Low Income Network Brief at 3; Low Income Network Reply Brief at 2-3). The Company did not comment on these issues on brief.

c. Analysis and Findings

Based on the Department's decision above not to accept the Company's tiered customer charge proposal, the Department directs the Company to design rates for the R-2 rate class with a single monthly customer charge. According to the Company's allocated COSS, the embedded customer charge for Rate R-2 is $9.42 (Exhs. NG-PP-1, at 52; NG-PP-2(d) at 22; DPU-33-8, Att. at 22). Based on a review of the embedded costs and the bill impacts on customers, the Department finds that National Grid's proposed monthly customer charge of $5.50 for Rate R-2 is reasonable. The Department directs the Company to set its volumetric charge for Rate R-2 so that the rate class is charged based on a flat rate structure, truncated at five decimal places.

Such rate design satisfies our simplicity goal, as well as our continuity goal because it produces bill impacts that are moderate and reasonable, considering the size of the increase. Therefore, the Department directs the Company to set the volumetric charges for Rate R-2 to collect the remaining class revenue requirement approved in this Order.

Moreover, the Department accepts the Low Income Network's recommendations regarding the AMP program (Exh. NG-PP-1, at 48-49; Tr. 1, at 85-86; Tr. 7, at 972-973). Therefore, the Department directs the Company to review its business practices that affect AMP enrollment and within six months of the date of this Order, file a report with the Department outlining its future actions to improve AMP enrollment. The Department allows the Company to continue AMP cost recovery through the Company's RAAF.

4. Rate R-4

a. Company Proposal

Rate R-4 is available to all residential customers in private dwellings, individual apartments, churches, and farms whose use exceeds 2,500 kWh per month for a twelve-month period and who opt for time-of use rates (Exhs. NG-PP-1, at 53; NG-PP-23, at 9-11, 73-75 (proposed M.D.P.U. Nos. 1266 (MECo) and 578 (Nantucket Electric))). The Company does not propose any changes to the Rate R-4 rate structure (Exh. NG-PP-1, at 53).

The Company proposes to decrease the monthly customer charge from $20.87 to $20.00 (Exhs. NG-PP-1, at 53; NG-PP-2(d), at 22). The also Company proposes that the peak and off-peak kWh charges recover the remaining revenue requirement and to set them to produce the same peak to off-peak ratio that is present in the current charges (Exh. NG-PP-1, at 53).

b. Analysis and Findings

Based on the Rate R-4 embedded costs and bill impacts, the Department finds that the Company's proposed customer charge and method for establishing the volumetric charges for Rate R-4, subject to our findings on the farm discount, satisfy continuity goals and produce bill impacts that are moderate and reasonable. Therefore, the Company is directed to set the monthly customer charge at $20.00 and to set its volumetric charges to collect the remaining class revenue requirement approved in this Order using the peak to off-peak ratio that is present in the current charges, truncated at five decimal places.

5. Rate G-1

a. Company Proposal

Rate G-1 is available to C&I customers who have average use that does not exceed 10,000 kWh per month or 200 kW of demand (Exhs. NG-PP-1, at 54; NG-PP-23, at 12-14,

78-80(proposed M.D.P.U. Nos. 1267 (MECo) and 580 (Nantucket Electric))). The Company proposes to maintain the customer charge at $10.00 per month (Exhs. NG-PP-1, at 54). In addition, the Company proposes to maintain the customer charge for unmetered Rate G-1 service at $7.50 per month (Exh. NG-PP-13, at 3). The per kWh charge is calculated as the total class revenue requirement less the revenue recovered through the proposed customer charge, minimum bill provision and the farm discount credit, divided by the rate year kWh deliveries (Exhs. NG-PP-1, at 54; NG-PP-13, at 3). The Company also proposes to increase the minimum charge for G-1 service for all kVA over 25 kVA from $2.08 per kVA to $2.11 per kVA (Exh. NG-PP-13, at 3).

b. Analysis and Findings

Based on the Department's decision above not to accept the Company's tiered customer charge proposal, the Department directs the Company to design rates for the G-1 Rate class with a single monthly customer charge. According to the Company's allocated COSS, the embedded customer charge for Rate G-1 is $9.95 (Exhs. NG-PP-1, at 54; NG-PP-2(d) at 22). The Company also proposes to maintain the customer charge for unmetered Rate G-1 customers and a modest increase for the minimum charge for Rate G-1 service (Exhs. NG-PP-1, at 54; NG-PP-13, at 3). Based on a review of the embedded costs and the bill impacts on customers, the Department finds that the G-1 Rate, including the proposed changes to the customer charges for metered and unmetered service and the increase to the minimum charge, satisfies continuity goals and produces bill impacts that are moderate and reasonable. The Department directs the Company to set its volumetric charge for Rate G-1 so that the rate class is charged based on a flat rate structure, truncated at five decimal places.

Such rate design satisfies our simplicity goal, as well as our continuity goal because it produces bill impacts that are moderate and reasonable, considering the size of the increase. Therefore, the Department directs the Company to set the energy charge for Rate G-1 to collect the remaining class revenue requirement approved in this Order.

6. Rate G-2

a. Company Proposal

Rate G-2 is available to C&I and institutional customers who have average consumption greater than 10,000 kWh, but do not exceed 200 kW of demand (Exhs. NG-PP-1, at 55; NG-PP-23, at 15, 81 (proposed M.D.P.U. Nos. 1268 (MECo) and 581 (Nantucket Electric))). National Grid proposes to increase the customer charge for Rate G-2 customers from $16.56 to $25.00 per month (Exhs. NG-PP-1, at 57). Additionally, the Company proposes to increase the per-kW demand charge such that approximately 90 percent of the total revenue requirement is recovered through a combination of the customer charge and the demand charge (Exh. NG-PP-1, at 57). Further, National Grid proposes to increase the demand charge for Rate G-2 customers from $6.00 per kW to $8.50 per kW, and to collect the remainder of the rate class's revenue requirement through a uniform per-kWh charge (Exhs. NG-PP-1, at 57; NG-PP-18, at 7-12). Additionally, the Company proposes a high voltage delivery discount of $0.50 per kW for customers supplied at not less than 2,400 volts and not needing a line transformer (Exhs. NG-PP-1, at 57; NG-PP-14, at 1; NG-PP-13, at 4; NG-PP-23, at 16, 82 (proposed M.D.P.U. Nos. 1268 (MECo) and 581 (Nantucket Electric))).

b. Analysis and Findings

According to the Company's allocated COSS, the embedded customer charge for the G-2 Rate class is $31.83 per month (Exh. NG-PP-1, at 57). Based on a review of the bill impacts on customers, the Department finds that the G-2 Rate, designed with an increase in the monthly customer charge from $16.56 to $25.00, satisfies continuity goals and produces bill impacts that are moderate and reasonable. The Department finds that the Company's proposed method for establishing the volumetric charge and demand charge[319] for Rate G-2, subject to our findings on the farm discount, satisfies continuity goals and produces bill impacts that are moderate and reasonable. Therefore, the Company is directed to set the demand charge at $8.50 per kW, and the volumetric charge to collect the remaining class revenue requirement approved in this Order, truncated at five decimal places.

7. Rate G-3

a. Company Proposal

Rate G-3 is available to C&I and institutional customers who have average use that exceeds 200 kW of demand (Exhs. NG-PP-1, at 57-58; NG-PP-23, at 18-20, 84-86 (proposed M.D.P.U. Nos.1269 (MECo) and 582 (Nantucket Electric))). The Company proposes to increase the customer charge for Rate G-3 customers from $200.00 to $223.00 per month (Exhs. NG-PP-1, at 57-58). The Company also proposes to eliminate the off-peak per kWh charge and collect the remaining class revenue requirement through only a demand charge (Exh. NG-PP-1, at 58). Further, National Grid proposes to increase the demand charge for Rate G-3 customers from $3.92 per kW to $7.00 per kW (Exhs. NG-PP-13, at 5; NG-PP-18, at 13).

---

[319] The Department disallowed the Company's demand ratchet proposal for Rate G-2 in Section XIII.D.6.a above.

Additionally, the Company proposes a high voltage delivery discount of $0.50 per kW for customers supplied at not less than 2,400 volts and not needing a line transformer and a $6.91 per kW high voltage 115kV delivery discount (Exhs. NG-PP-1, at 57; NG-PP-13, at 5; NG-PP-14, at 1; NG-PP-23, at 19, 85 (proposed M.D.P.U. Nos. 1269 (MECo) and 582 (Nantucket Electric))).

b. Positions of the Parties

EFCA maintains that the Company did not provide evidence showing that a reduced volumetric rate is more efficient to promote energy conservation than the current rate (EFCA Brief at 17, citing Tr. 7, at 1,092). On the contrary, EFCA asserts that a zero per kWh rate sends a strong price signal that electricity conservation is not valuable by reducing incentives for energy efficiency, storage, and other technologies (EFCA Brief at 17, citing Exh. EFCA-MW/TW-1, at 53-54). Accordingly, EFCA recommends that the Department deny the Company's proposed volumetric rate design for Rate G-3 (EFCA Brief at 18).

Further, EFCA opposes the Company's proposed increase to the demand charge from $3.92 per kW to $7.00 per kW (EFCA Brief at 17). EFCA asserts that this $3.08 per kW increase violates the Department's rate design goal of continuity (EFCA Brief at 17). The Company did not specifically comment on the Rate G-3 on-peak volumetric rate or demand rate on brief.

c. Analysis and Findings

According to the Company's allocated COSS, the embedded customer charge for the G-3 Rate class is $218.54 per month (Exhs. NG-PP-1, at 57; NG-PP-2(d), at 22). Based on a review of the bill impacts on customers, the Department finds that the G-3 Rate, designed with an

increase in the monthly customer charge from $200.00 to $223.00, satisfies continuity goals and produces bill impacts that are moderate and reasonable.

In the Department's decoupling Order, D.P.U. 07-50-A, we stated that decoupling revenues should be reconciled through the volumetric component of the distribution charge, because that rate design would provide customers with a greater incentive to reduce their energy consumption and would further the goal of promoting demand resources. D.P.U. 07-50-A at 59; see also, D.P.U. 10-70, at 332. Allowing the Company to reduce the volumetric distribution charge to zero in this proceeding is contrary to the Department's findings in D.P.U. 07-50-A and D.P.U. 10-70. A primary rate principle for the Department is to provide customers with the appropriate incentive to consume electricity as efficiently as possible. D.P.U. 10-70, at 332.

Although pricing distribution service on demand use may support the cost-to-serve principle, it is not the best rate structure to promote energy efficiency. D.P.U. 10-70, at 332. Therefore, it would be inappropriate to adopt the Company's proposal to recover all distribution costs through either customer charges, which are fixed, or demand charges, which are more difficult to avoid through energy efficiency. D.P.U. 10-70, at 332.

Another factor in the Department's decision is the current Rate G-3 volumetric distribution time-of-use rate. The Company's current Rate G-3 volumetric rate includes an on-peak volumetric distribution charge, thus providing a price signal to consume energy during off-peak periods (Exh. NG-PP-1, at 55).

Based on these considerations, the Department rejects the Company's proposal to reduce the on-peak volumetric distribution charge for Rate G-3 to zero. The Company is hereby directed to maintain the volumetric distribution charges at their current levels when designing

distribution rates in compliance with this Order. Given that the volumetric distribution charges will remain unchanged and the Department allowed the customer charge to increase to $223.00, the remaining increase in distribution rates for Rate G-3 should be applied to the demand charge component of distribution rates, truncated at two decimal places.[320] Therefore, all customers will continue to be charged a volumetric charge for distribution service.

The Department finds that this method for establishing the volumetric charges and demand charges for the G-3 Rate satisfies continuity goals and produces bill impacts that are moderate and reasonable. Therefore, the Company is directed to set the on-peak volumetric charge at $0.00753 per kWh, the off-peak volumetric charge at zero, and the demand charge to collect the remaining class revenue requirement approved in this Order (Exh. NG-PP-3(i) at 4).

8. Street Lighting

a. Introduction

National Grid currently has seven street lighting rates: (1) Rate S-1, for luminaires and supports owned and maintained by the Company; (2) Rate S-2, for customer-owned luminaires mounted on Company-owned distribution poles with maintenance provided by the Company; (3) Rate S-3 (Option A), for underground wiring installations with customer-owned foundations and Company-owned and -maintained luminaires and supports; (4) Rate S-3 (Option B), for underground wiring installations with customer-owned luminaires and supports, with limited maintenance by the Company; (5) Rate S-5, for equipment owned and maintained by customers; (6) Rate S-6, for Company-owned decorative street and area lighting, available to municipal and other governmental customers for municipally owned or accepted roadways; and (7) Rate S-20,

320 The Department disallowed the Company's demand ratchet proposal for Rate G-3 in Section XIII.D.6.a above.

for luminaires and supports owned and maintained by the Company, which is available to any customer on the S-1 rate that agreed to convert all existing incandescent and mercury vapor source lights to sodium-vapor source lights (Exhs. NG-PP-1, at 58-59; NG-JEW-1, at 3-5; DPU-1-1). Rates S-2 and S-3 are closed to new customers (Exh. NG-PP-1, at 58-59).

b. Company Proposals

In its initial filing, the Company proposed to increase the rates for each luminaire and support in Rates S-1, S-2, S-3, and S-6 by 4.41 percent (Exhs. NG-PP-1, at 59; NG-PP-13, at 7-9). The 4.41 percent increase represents the overall street lighting increase necessary to achieve the level of revenue assigned in the revenue allocation process, after calculating the revenue achieved from Rate S-5 (Exh. NG-PP-1, at 59). For the Rate S-5 per kWh rate, the Company divided the cost associated with the support of the distribution system by the total street lighting kWh deliveries (Exhs. NG-PP-1, at 60; NG-PP-15; WP NG-PP-6).

As noted above, National Grid proposes revisions to Rate S-1 for the purpose of offering a Company-owned LED lighting service option to Rate S-1 customers (Exh. NG-JEW-1, at 5). National Grid's proposal allows for customer selection of LED luminaires that are owned and maintained by the Company (Exh. NG-JEW-1, at 5). The Company explained that the LED luminaires would replace existing incandescent, mercury-vapor, and high pressure sodium lighting equipment installed at existing locations, at the customer's request, or could be installed in new locations (Exh. NG-JEW-1, at 5-6).

Under the proposal, when a customer requests the installation of LED lighting equipment, National Grid will require the customer to pay the unamortized balance of the original installation costs, plus cost of removal less salvage value, for the existing streetlights, in excess

of one percent of the total streetlights on the customer's account (Exh. NG-JEW-1, at 10-11). The Company proposes to offer four different types of roadway LED fixtures and one post-top LED fixture (Exh. NG-JEW-1, at 6). The proposed LED fixtures range from 30 watts to 275 watts and provide comparable illumination to existing lighting fixtures installed throughout the Company's service area (Exh. NG-JEW-1, at 6). Additionally, National Grid proposes a cap on the number of LED fixtures that it will replace of ten percent per year of the total quantity of active and inactive street and area lighting fixtures per customer account, if that customer is considered a municipal, governmental authority, or public entity (Exh. NG-JEW-1, at 9). Typically, a customer's request to exchange a lighting fixture is incorporated into the Company's work schedules (Exh. NG-JEW-1, at 9). However, National Grid expresses concern with managing operational priorities and ensuring safe and reliable electric service while meeting customer demand for LED fixture installations (Exh. NG-JEW-1, at 9).

Finally, the Company proposed to cancel Rate S-20 and transfer all customers to Rate S-1, effective with the implementation of new rates resulting from this rate case (Exh. NG-PP-1, at 61). Rate S-20 provided customers with an incentive to convert older, less energy efficient technology of incandescent and mercury vapor lamps to more efficient sodium vapor lamps by offering a lower rate to the customer while the Company performed the conversion (Exh. NG-PP-1, at 61). After the Company completes the conversion work, the customer was transferred back to Rate S-1 (Exh. NG-PP-1, at 61). National Grid has converted all of the customers that took advantage of the conversion incentive, though some remain to be transferred to Rate S-1 (Exhs. NG-PP-1, at 61; NG-PP-3(i) at 6; DPU-15-23).

c. Positions of the Parties

DOER argues that the Department should approve the Company's proposed S-1 tariff for the LED lighting option with certain additional revisions (DOER Brief at 2-3). Specifically, DOER contends that the Company should offer its municipal street-lighting customers a 20-watt LED fixture as an economically beneficial replacement for a 50-watt high-pressure sodium ("HPS") fixture (DOER Brief at 3). Further, DOER recommends that the Company offer a 30-watt LED fixture to replace a 70-watt HPS fixture (DOER Brief at 3). DOER claims that these modifications are necessary to encourage municipal customers to convert to the more efficient LED lighting technology (DOER Brief at 3). According to DOER, the Company has agreed to these S-1 tariff revisions (DOER Brief at 3, citing Tr. 6, 808-809; RR-DOER-3).

Additionally, DOER recommends that the Department remove the ten-percent annual cap on LED lighting conversions (DOER Brief at 3). According to DOER, National Grid did not provide any evidentiary support for the ten-percent annual cap or any alternative amount (DOER Brief at 3-4). Therefore, DOER asserts that the ten-percent cap is arbitrary and unsubstantiated (DOER Brief at 4). Instead, DOER recommends that the Company prioritize LED lighting conversions in the context of other customer service priorities, capital investment plans, and storage costs (DOER Brief at 4). Neither National Grid nor any other party commented on the Rate S-1 and S-20 tariff proposals on brief.

d. Analysis and Findings

National Grid has proposed a variety of changes to its street lighting service. The Department has examined the proposed rate design for the street lighting rate classes S-1, S-2, S-3, S-5, and S-6 (Exh. NG-PP-23, at 21-65, and 87-132 (proposed M.D.P.U. Nos. 1270 through

1274 (MECo); and 583 through 587 (Nantucket Electric))). The Department finds that the proposed rate design for the street lighting rate classes satisfies continuity goals and produces bill impacts that are moderate and reasonable. Therefore, the Department directs National Grid in the compliance filing to compute the street light charges using the method proposed by the Company, subject to our findings on the farm discount, and the increase from the allocation process and revenue requirement for the street light class approved in this Order.

Regarding DOER's recommendations that the Company offer certain LED fixtures to replace existing HPS luminaries, the Company has agreed to accept DOER's recommendation to offer a 20-watt LED fixture that is an economically beneficial replacement for a 50-watt HPS fixture (RR-DOER-3, Att. 2). Further, we note that in its initial filing, the Company already offers a 30-watt LED fixture as a comparable luminaire to the 70-watt HPS (see Exhs. NG-PP-16, at 3; NG-PP-23, at 24 and 90 (proposed M.D.P.U. Nos. 1270, Sheet 4 (MECo); 583, Sheet 4 (Nantucket Electric))).

National Grid corrected its calculations used to determine its proposed LED lighting rates from its initial filing (RR-DPU-21; RR-DOER-3 & Atts). The Department has reviewed National Grid's method of calculating the S-1 rate for the LED lighting option, and finds that it is cost-based and, therefore, reasonable (see RR-DOER-3, Atts.). Therefore, the Department directs the Company in its compliance filing to compute the rate for the LED lighting option for Rate S-1 using the revised method proposed by National Grid, a revised carrying charge calculation pursuant to our findings in Sections VII, VIII.G, and XII, and the allocation process and revenue requirement for the Rate S-5 approved in this Order.

Next, with respect to the Company's proposed cap on fixture replacements, the Company proposed the following provision in its S-1 tariff:

> The Company shall use its best efforts to replace existing lights with LED within a reasonable length of time after receipt of the written notice requesting such replacement. Depending upon the number of street and area lighting facilities to be replaced with LED lights and the availability of the Company's crews, the Company may limit the quantity of LED replacements to 10 [percent] per account per calendar year to allow for efficient operations. The Company reserves the right to be flexible in responding to the Customer's request. However, the Company shall complete all requests according to a mutually accepted schedule between the Customer and the Company upon receipt of written notice.

(Exh. NG-PP-23, at 24, 90 (proposed M.D.P.U. Nos. 1270, Sheet 4 (MECo); and 583, Sheet 4 (Nantucket Electric))).

As noted above, DOER recommends that the Department remove the ten-percent annual cap on LED lighting conversions from the proposed tariff (DOER Brief at 3). The Department agrees with this recommendation. The Company's need to limit replacements at ten percent is speculative and premature (see, e.g., Exhs. DOER-1-3, at 2; DOER-1-7). The Company is unable to provide an estimate regarding the quantity of street lighting fixtures that were replaced for past municipal inquiries into efficient lighting (Exh. DPU-1-2). Additionally, National Grid has previously implemented similar street lighting activities in a way that allowed the Company to work these activities into its existing workload and resource plans (Exh. DOER-1-7). Therefore, the Department directs National Grid to strike the following sentence from its proposed tariff: "Depending upon the number of street and area lighting facilities to be replaced with LED lights and the availability of the Company's crews, the Company may limit the

quantity of LED replacements to 10 [percent] per account per calendar year to allow for efficient operations."[321]

Finally, we note that National Grid has converted all customers that took advantage of the Rate S-20 incentive (Exh. NG-PP-1, at 61). Therefore, the Department finds that the Company's proposal to discontinue Rate S-20 is reasonable. Accordingly, the Department approves the cancellation of Rate S-20 and the transfer of all customers who are currently billed on Rate S-20 to Rate S-1.

XIV. PROPOSED FEES AND TARIFF CHANGES

A. Access Fee for Stand-Alone Distributed Generation Facilities

1. Introduction

a. Background

Stand-alone DG facilities are those that are directly connected to the distribution system and have no associated on-site load (Exh. NG-PP-1, at 70). The Company states that because stand-alone DG facilities generally have no on-site load, the facilities are eligible for and typically are assigned to Rate G-1, which is available for any C&I customer who uses less than 10,000 kWh per month (Exh. NG-PP-1, at 73). Customers who take service under the Rate G-1 class, including stand-alone DG facilities, pay a monthly customer charge of $10.00, plus associated taxes (Exh. NG-PP-1, at 73; Tr. 7, at 1124). In addition to the customer charge, all stand-alone DG facilities that apply for interconnection to the Company's distribution system

---

321 Should the actual level of replacement of streetlights to LED lights be such that the Company's crews are unable to complete in a timely fashion, then the Company may petition the Department and request an appropriate limit on the pace of replacement. The Department expects that the petition would be supported by sufficient evidence showing that such a limit is warranted.

may incur the costs that are necessary to expand or upgrade the distribution system (i.e., "system modifications") in order for the facility to safely interconnect without adversely affecting the reliability or the distribution system (Exh. NECEC-1-12).[322]

Apart from the customer charge, associated taxes, and any system modification costs, stand-alone DG facilities do not pay any other costs for use of the Company's distribution system (Exhs. NG-PP-1, at 73; NECEC-1-12). In particular, the Company states that interconnection costs for stand-alone DG facilities do not include the costs associated with: (1) the recovery of ongoing O&M and the replacement of interconnection equipment;[323] (2) energy and transmission and distribution ("T&D") service, as well as, non-T&D service for continued use of the electric power system;[324] (3) short term and long term investments to support enhanced quantities of DG on the electric power system;[325] and (4) the interval metering required for the stand-alone DG facilities (Exhs. NG-PP-1, at 74-75; DPU-12-3, at 1; DPU-21-3;

---

322 See also, Standards for Interconnection of Distributed Generation Tariff, M.D.P.U. No. 1248.

323 The Company identifies the following O&M expenses it incurs to provide service to a stand-alone DG facility: (1) ISO-NE communications and settlement; (2) allocating net metering credits; (3) resolving billing issues; (4) municipal property taxes; (5) repair and replacement of damaged equipment; and (6) vegetation management (Exhs. DPU-21-3, at 2; LI-1-10).

324 The electric power system includes both the distribution system and the transmission system.

325 National Grid states that it has made relatively low-cost investments to date as a result of low levels of DG penetration, but over the long term the Company expects to make higher cost investments to handle two-way power flow between customer DG implementations and the electric distribution system (Exh. EFCA-1-9; Tr. 7, at 1142-1144).

AG-27-8; LI-1-22; EFCA-1-9, at 2; EFCA-1-10, at 2; EFCA-1-11; NECEC-1-13; NECEC-1-19).[326]

b. Company Proposal

National Grid proposes to assess new stand-alone DG facilities that take service under its Rate G-1 a monthly access service fee ("Access Fee") (Exh. NG-PP-1, at 70, 73). The proposed Access Fee is intended to recover from the stand-alone DG facilities the costs beyond those recovered from the customer charge, associated taxes, and payments for system modification that are attributable to interconnection with the distribution system (Exhs. NG-PP-1 at 74; AG-27-8). The Company proposes an Access Fee charge of $7.00 per kW-month for customers connected at the primary voltage level and $8.50 per kW-month for customers connected at the secondary voltage level (Exh. DPU-12-4).[327] The Company's proposed Access Fee charges are identical to the proposed demand charges for Rate G-3 (primary voltage fee) and Rate G-2 (secondary voltage fee) (Exh. DPU-12-4).

The Company proposes to calculate the monthly Access Fee by multiplying the applicable Access Fee charge by the nameplate capacity of the stand-alone DG facility, adjusted for its expected availability at peak loading conditions, which the Company refers to as the

---

326 To comply with ISO-NE load reporting requirements, National Grid must install for these stand-alone DG facilities a complex and expensive interval meter that typically is installed on larger C&I customers. The cost of this type of meter is not included in the Rate G-1 revenue requirement (Exh. NG-PP-1 at 74). The Company provides a cost estimate of $1,690 to install an interval meter for a stand-alone DG facility (Exh. NECEC-1-19 & Att.).

327 Under the Company's proposed Access Fee charge, voltage greater than or equal to 1,000 volts would qualify as a primary voltage; voltage less than 1,000 volts would qualify as secondary voltage (Exhs. NG-PP-1, at 71; DPU-12-4).

"capacity availability factor" (Exhs. NG-PP-1, at 70-72; DPU-12-4).[328,329] National Grid proposes that the Access Fee will apply to stand-alone DG facilities applying for interconnection service after the effective date of its proposed Phase I rates, however, the Company will not begin billing the proposed Access Fee until its proposed Phase II rates go in effect, which is expected to be no earlier than April 2017 (Exhs. NG-PP-1, at 72-73; NG-PP-Rebuttal-1, at 48; DPU-12-5) (see Section XIII.D.3 above). Finally, the Company proposes that all revenues it bills for the Access Fee will be credited to customers through the RDM (Exh. DPU-32-30).

c. Chapter 164, § 139(j)

On April 11, 2016, Governor Baker signed into law Chapter 75 of the Acts of 2016, An Act Relative to Solar Energy ("Solar Act"). Among other things, the Solar Act amended General Laws Chapter 164 by adding Section 139(j) ("§ 139(j)"), which provides:

> (j) Distribution companies may submit to the department proposals for a monthly minimum reliability contribution to be included on electric bills for distribution utility accounts that receive Class I, Class II, Class III, or market net metering credits pursuant to this section, subject to the review and approval of the department. Any such minimum contributions shall ensure that all distribution company customers contribute to the fixed costs of ensuring the reliability, proper maintenance and safety of the electric distribution system. Proposals shall be filed with the department in: (i) the distribution company's base distribution rate proceeding; or (ii) a revenue neutral rate design filing that is supported by appropriate cost of service data across all rate classes. The department may

328 The Company defines the capacity availability factor as the peak load in kilowatts that a turbine or solar array needs from the distribution system to monetize its output (Tr. 7, at 1170).

329 The Company proposes the following capacity availability factors for stand-alone DG facilities: solar- 40 percent; wind – 30 percent; anaerobic digestion – 50 percent; and hydroelectric – 10 percent (Exhs. NG-PP-1 at 72, DPU-12-4). Thus, for example, a monthly access fee for a 1-MW stand-alone DG facility connected at the primary voltage level would incur a $2800 monthly access fee. The calculation would be $7.00 Access Fee charge x 1000-kW nameplate capacity x 40 percent solar capacity availability factor (Exh. DPU-12-4).

> approve a monthly minimum reliability contribution that: (i) equitably allocates the fixed costs of the electric distribution system not caused by volumetric consumption; (ii) does not excessively burden ratepayers; (iii) does not unreasonably inhibit the development of Class I, Class II, Class III facilities; and (iv) is dedicated to offsetting reasonably and prudently incurred costs necessary to maintain the reliability, proper maintenance and safety of the electric distribution system.
>
> The department may only approve a proposal for a monthly minimum reliability contribution after the aggregate nameplate capacity of installed solar generating facilities in the commonwealth is equal to or greater than 1,600 megawatts. The department shall conduct a full adjudicatory proceeding when reviewing proposals for a monthly minimum reliability contribution, which shall include at least [one] public hearing and an opportunity for public comment.

See also 220 C.M.R. § 18.10.

National Grid submits that the proposed Access Fee meets the purpose of § 139(j), as it is intended as a monthly contribution from stand-alone DG customers to ensure that these customers contribute toward the fixed costs of ensuring the reliability, proper maintenance, and safety of the electric distribution system (Exh. NG-PP-Rebuttal-1, at 47). Further, the Company submits that while § 139(j) provides for a monthly minimum reliability contribution ("MMRC"), it does not expressly curtail or prohibit the Department, acting pursuant to its plenary ratemaking authority, from approving the proposed Access Fee in another manner (such as on an earlier timeframe) (Exh. NG-PP-Rebuttal-1, at 47). Moreover, National Grid contends that assuming the requirements of the statute are applicable to its proposed Access Fee, these requirements have been satisfied because its proposed Access Fee: (1) equitably allocates fixed costs not caused by volumetric consumption; (2) does not excessively burden its customers; (3) will not unreasonably inhibit the development of DG facilities; and (4) is dedicated to offsetting the Company's reasonable and prudently incurred costs necessary to maintain the reliability, proper maintenance, and safety of the distribution system (Exh. NG-PP-Rebuttal-1, at 47). Finally, the

Company notes that the implementation of its proposed Access Fee is expected to coincide with the expected date that the aggregate nameplate capacity of installed solar generating facilities in the Commonwealth is equal to or greater than 1,600 megawatts, as described in § 139(j) (Exh. NG-PP-Rebuttal-1, at 47).

2. Positions of the Parties

a. Intervenors, Limited Intervenors, and Limited Participants

i. Introduction

Eversource supports the Company's proposed Access Fee. According to Eversource, the proposed Access Fee is appropriate because: (1) the record in this case demonstrates that stand-alone DG facilities impose costs on the distribution system similar to the costs imposed by medium- and high-use commercial customers yet these stand-alone DG facilities pay the same customer charge as low-use commercial customers; (2) the Company does not recover the full costs to serve stand-alone DG facilities; and (3) the Company's other customers cross-subsidize the stand-alone DG customers (Eversource Brief at 2-3). Further, Eversource asserts that the Department has the ratemaking authority to approve the proposed Access Fee, which Eversource contends complies with the MMRC provision of the Solar Act (Eversource Brief at 2-3).

On the other hand, the Acadia Center, EFCA, NECEC, and Vote Solar (collectively as "Limited Intervenors"), along with the Attorney General, DOER, and PowerOptions, all oppose the Company's proposed Access Fee. Their arguments essentially are three-fold: (1) there is insufficient evidentiary support for the proposed Access Fee; (2) the proposed Access Fee is not a valid substitute for the MMRC; and (3) the proposed Access Fee is inconsistent with the Department's rate design goals. These arguments are discussed in further detail below.

ii. Evidentiary Support for the Proposed Access Fee

Several commenters argue that the Company bears the burden of proving the propriety of any of its proposed rate increases, including documenting and quantifying with record evidence the distribution costs it claims that stand-alone DG customers are shifting to other customers (Acadia Center Reply Brief at 3; DOER Reply Brief at 5; EFCA Reply Brief at 3). In this regard, the Limited Intervenors and the Attorney General contend that the Company did not provide record evidence to show that the Access Fee is required to recover costs that the stand-alone DG facilities impose on the distribution system, or that the Access Fee is set at an appropriate level, or that, absent an Access Fee, there would be a cost shift from stand-alone DG customers to non-DG customers (Attorney General Brief at 145-146; Acadia Center Brief at 15-16; EFCA Brief at 9-10; NECEC Brief at 37; Vote Solar Brief at 20; Vote Solar Reply Brief at 10).

In particular, the Attorney General contends that National Grid does not provide sufficient information for the Department to properly design or evaluate the proposed Access Fee, as the Company fails to include any analysis of (1) current costs for stand-alone DG facilities' use of the distribution system, or (2) incremental distribution system costs for upgrades to accommodate additional stand-alone DG facilities (Attorney General Brief at 145-146). Further, Acadia Center argues that the Company has not shown that the current rate design is unfair where stand-alone DG customers pay their marginal cost and non-DG pay reliability costs, safety costs, and other embedded costs (Acadia Center Brief at 15-16). EFCA also asserts that the Company provided no evidence that DG customers are shifting costs to non-DG customers (EFCA Brief at 9-10). Further, NECEC argues that National Grid provided no analysis to show

the actual cost to serve stand-alone DG facilities, but rather the Company merely asserts that such costs exist because of the expanded adoption of DG resources (NECEC Brief at 37). Finally, Vote Solar maintains that as the Company does not quantify the costs that stand-alone DG customers impose on the distribution system, consequently the Company does not know if these customers contribute more or less revenue than is the cost to serve (Vote Solar Brief at 20; Vote Solar Reply Brief at 10).

Next, DOER and several of the Limited Intervenors argue that the Company provided no evidence to prove that stand-alone DG facilities impose the same costs on the distribution system as are imposed by a Rate G-3 or Rate G-2 customer (DOER Brief at 9-10; EFCA Brief at 22-25; EFCA Reply Brief at 17-18, 21; NECEC Brief at 33-36; NECEC Reply Brief at 2; Vote Solar Brief at 21; Vote Solar Reply Brief at 10). DOER and the Limited Intervenors also contend that the Company's rationale, that the Access Fee is appropriate because the distribution system must be sized to accommodate maximum demand whether inflow or outflow of electricity, is flawed because: (1) diversity of demand ensures that any individual customer's use of the distribution system is not a significant driver for sizing upstream portions of the system; (2) stand-alone DG resources pay for necessary system upgrades in their vicinity through the interconnection process; (3) backflow,[330] from the two-way power flows, is not a significant problem for the

[330] The Company notes that backflow (or "backfeed") occurs on the distribution system when power on a radial distribution system that is designed to flow from substations out to customers flows back into the substation from DG located on the feeder (Tr. 7, at 1007).

Company's distribution system;[331] and (4) electricity produced by stand-alone DG facilities during peak demand time reduces demand on the upstream portion of the distribution system (DOER Brief at 9-10; Acadia Center Brief at 15-16; EFCA Brief at 11, 22-25; EFCA Reply Brief at 17-18, 21; NECEC Brief at 33-36; NECEC Reply Brief at 2; Vote Solar Brief at 21; Vote Solar Reply Brief at 10).

In addition, the Attorney General and EFCA argue that the Company failed to justify certain cost categories that it uses to substantiate the need for its proposed Access Fee (Attorney General Brief at 146; EFCA Reply Brief at 5). In particular, the Attorney General asserts that the Company failed to justify such costs as on-going customer service aspects and the need for further investments to its distribution system (Attorney General Brief at 146). EFCA posits that the Company only quantifies costs for two additional full-time employees and future O&M expenses as costs that it presently does not recover in stand-alone DG customers' interconnection fees (Exh. LI 1-21; EFCA Brief at 9, n.27; EFCA Reply Brief at 5; Tr. 7, at 1067, 1070-71).

The Attorney General, DOER and NECEC also raise issues regarding the sufficiency of the evidence regarding the capacity availability factors. According to the Attorney General and NECEC, the Company's capacity availability factors are flawed, violate the principles of cost causation, and lacks transparency (Attorney General Brief at 142-145; NECEC Reply Brief at 7-8). In this regard, the Attorney General and NECEC maintain that the Access Fee calculation does not recognize the load reducing benefits of DG, which reduce the Company's distribution system costs when the stand-alone DG facilities generate power during peak hours;

---

331 The Attorney General maintains that a number of the Company's feeders are experiencing back flow conditions (Attorney General Brief at 145 n.51, citing Exhs. AG- 27-14, Att.; NECEC-1-16, Att. (Supp.); RR-AG-24).

rather, they contend that the Company designed the Access Fee calculation to increase if the load reducing benefits increase from a higher capacity availability factor (Attorney General Brief at 142-143; NECEC Reply Brief at 8).[332] According to the Attorney General, an Access Fee proposal aligned with cost-causation should increase where the cost-reducing benefits of a stand-alone DG facility decreases (Attorney General Brief at 142-143). In addition, the Attorney General contends that using a system-wide availability factor to calculate the Access Fee does not accurately track cost causation for all DG technology types, because peak times vary by the customer mix on a given feeder (Attorney General Brief at 144). Further, the Attorney General claims that the Company did not provide adequate support for using a 40-percent solar capacity availability for the Access Fee calculation (Attorney General Brief at 144-145). Finally, DOER argues that the Company improperly used a limited sample size of wind, anaerobic digestion, and hydroelectric facilities to determine the proposed capacity availability factors (DOER Brief at 10).

The Attorney General and several Limited Intervenors also argue that in, addition to the lack of evidence to support the costs and design of the proposed Access Fee, National Grid failed to provide complete data on the benefits and costs associated with DG in general, and, without this information, the Company cannot fully understand the impact of increasing DG penetration on its distribution system and determine whether DG customers will be charged the appropriate

---

332 The Attorney General contends that the Access Fee as proposed would increase if a stand-alone DG facility provides more generation into the Company's distribution system (Access Fee = voltage charge x nameplate capacity x capacity availability factor) (Attorney General Brief at 142-143, citing Tr. 7, at 1148-1153). The Attorney General explains that this result is counterintuitive. If generation from these stand-alone DG facilities increases during periods when the Company experiences peak load condition, the stand-alone DG facilities will decrease the system peak and, therefore, decrease the Company's overall system costs (Attorney General Brief at 142-143).

cost of service (i.e., Access Fee) (Attorney General Brief at 145-146; Acadia Center Brief at 10-12; EFCA Brief at 11; EFCA Reply Brief at 4-5, 6-7, 20; NECEC Brief at 46). According to the Attorney General and these Limited Intervenors, further study of costs and benefits is necessary to fairly assess and assign incremental costs that DG customers impose on the distribution system (Attorney General Brief at 145-147; Acadia Center Brief at 10-12; EFCA Brief at 10-11; EFCA Reply Brief at 6-7, 20; NECEC Brief at 46). Further, Acadia Center and EFCA note that National Grid is participating in regulatory proceedings in New York,[333] and Rhode Island,[334] that seek to identify and quantify the benefits and costs of DG, so it is reasonable to expect that the Company would do the same in the instant proceeding as part of its Access Fee proposal (Acadia Reply Brief at 3-4; EFCA Reply Brief at 6-7). Moreover, Acadia Center contends that the value of DG resources should be a part of the next evolutionary phase in economic analysis of ratemaking as it is a key element in analysis of cost shifts (Acadia Center Brief at 10-11). Further, the Attorney General argues that a properly designed access fee, including costs and benefits, would take into account any incremental distribution system costs

---

333 Case 15-E-0751, In the Matter of the Value of Distributed Energy Resources at the New York Public Service Commission (Acadia Center Reply Brief at 3, n.9). EFCA and Acadia Center remark that National Grid is a signatory to the New York Progress Partnership, a New York REV (Revolutionizing the Energy Vision) regulatory proceeding that seeks to value DG and distributed energy resources in which utilities conduct a benefit-cost analysis to quantify the value and explore how to incent DG facilities to cite facilities in locations that will maximize their benefit to the grid (Acadia Center Reply Brief at 3-4; EFCA Reply Brief at 7, citing Exh. EFCA-CG-Rebuttal-1, at 12).

334 Docket 4600, Investigation into the Changing Distribution System and the Modernization of Rates in Light of the Changing Distribution System, at the Rhode Island Public Utilities Commission (Acadia Center Reply Brief at 3 n.9).

driven by upgrades needed to accommodate DG, which depends on whether the location of the DG is reducing or adding feeder load (Attorney General Brief at 145).

Several of the Limited Intervenors reject the Company's claim that there is little evidence of locational capacity benefits from DG on its system; they argue that the record includes evidence that demonstrates locational benefits (Acadia Center Reply Brief at 10; EFCA Reply Brief at 6-7; NECEC Brief at 39-41). For instance, NECEC argues that stand-alone DG facilities on the Company's distribution system reduced maximum circuit loads by ten percent on those circuits serving such stand-alone DG facilities, which then provided additional capacity to serve other customers; and in Massachusetts, an average distributed generation resource provides 36 percent of its nameplate capacity during times of peak feeder loading (NECEC Brief at 40-41). EFCA maintains that the Company recognized the load relief provided by DG projects by incorporating solar capacity on its system into its load forecasting, and that the Company conceded that the output from a stand-alone DG customer reduces the upstream load on the distribution system (EFCA Reply Brief at 20; EFCA Brief at 11; Tr. 5, at 737). Further, EFCA rejects the Company's claim that it is double-counting to quantify distribution system benefits both from solar in solar renewable energy credits ("SRECs")[335] and from net metering incentives (EFCA Reply Brief at 8). EFCA asserts that the Company's argument that SRECs are a proxy for the total value that distributed resources provide to the grid is erroneous as distributed

---

335 According to EFCA, SRECs value is based primarily on the targets that "state policy-makers" assign to supply and demand as a means of incenting carbon reductions, which is independent of the total value of distributed generation on the Company's distribution system (EFCA Reply Brief at 8). Further, EFCA contends that SRECs are environmental commodities that represent the environmental attributes from renewable energy resources and should be taken into account (EFCA Reply Brief at 8).

resources provide more than environmental benefits, and that the Company does not present any evidence of the value of SRECs (EFCA Reply Brief at 8).

iii. MMRC and the Solar Act

The Attorney General and NECEC argue that, as a threshold procedural matter, the Department cannot approve the Company's proposed Access Fee as a MMRC because Massachusetts has not yet reached the 1,600-megawatt aggregate nameplate capacity of installed solar generating facilities, and will likely not reach this threshold until 2017 (Attorney General Brief at 140-141; NECEC Brief at 49, citing § 139(j)).

NECEC and Vote Solar contend that National Grid's proposed Access Fee does not meet the requirements of § 139(j) because the Company has failed to demonstrate that the proposed Access Fee: (1) equitably allocates the fixed costs of the electric distribution system, as the Company has not conducted any analysis to equate the demand-related costs to serve Rate G-2 and Rate G-3 customers to that of stand-alone DG facilities; (2) will not excessively burden ratepayers as it does not quantify costs attributed to stand-alone DG facilities; (3) will not unreasonably inhibit the development of Class I, Class II and Class III net metering facilities;[336] and (4) will offset reasonably and prudently incurred costs necessary to maintain the reliability, proper maintenance, and safety of the distribution system (NECEC Brief at 48-51; Vote Solar Brief at 23-25; Vote Solar Reply Brief at 13-18).

Acadia Center also argues that the proposed Access Fee contradicts the stated policy goals of the Solar Act, which Acadia Center claims are to support community-shared and low income solar facilities, and that the proposal may encourage more expensive on-site solar

336 The three classes of net metering facilities are defined in 220 C.M.R. § 18.02.

projects rather than more cost-effective stand-alone DG facilities (Acadia Center Brief at 16, citing, Exh. AC-AA-Rebuttal-1, at 7; Acadia Center Reply Brief at 10). Further, Acadia Center, EFCA, and Vote Solar contend that the Department should reject the Company's proposed Access Fee as unnecessary because the Solar Act provides for a 40-percent reduction in the market net metering credits to alleviate any purported cost shifts from DG customers to non-DG customers (Acadia Center Brief at 17; EFCA Reply Brief at 5-6; Vote Solar Brief at 25). Further, EFCA questions whether the Access Fee is legal under the Public Utility Regulatory Policies Act of 1978 ("PURPA"),[337] as EFCA alleges that the Company's proposal constitutes a fee on qualifying facilities that could make the cost to operate a qualifying facility economically prohibitive (EFCA Brief at 26).

The Attorney General and PowerOptions recommend that the Department open a generic proceeding to consider creating a standardized MMRC or Access Fee applicable to stand-alone DG facilities, so that all potential stakeholder can participate in the process (Attorney General Brief at 147-148; PowerOptions Reply Brief at 8-9). According to the Attorney General and PowerOptions, a general proceeding would allow the Department to decide many of the issues relevant to the design of an Access Fee before the 1600-MW threshold is met and to promote administrative efficiency for future base rate proceedings (Attorney General Brief at 147-148; PowerOptions Reply Brief at 8-9).

---

337 PURPA, Pub. L. 95–617, 92 Stat. 3117 was passed as part of the National Energy Act of 1978. EFCA notes that PURPA is meant to promote energy conservation (reduce demand) and promote greater use of domestic energy and renewable energy (increase supply) (EFCA Brief at 26 n.87).

iv. Rate Design Issues

NECEC notes that it supports re-evaluating rate design so that rates send accurate price signals that allow customers to optimize energy consumption and encourage the deployment of advanced technologies (NECEC Reply Brief at 2-3). Acadia Center also supports reforms to rate design that correct for significant cost shifts, such as the MMRC (Acadia Center Reply Brief at 4-5). However, NECEC and Acadia Center, along with DOER, argue that the Company's proposed Access Fee would not meet the Department's rate design goals of fairness and efficiency (DOER Brief at 10; Acadia Center Brief at 10; NECEC Brief at 39). In particular, DOER contends that the Access Fee is inconsistent with the Department's rate design goal of fairness as the Company's proposal targets only those DG facilities that export all power to the grid and not those that consume some power on-site (DOER Brief at 10).

Further, NECEC maintains that National Grid's Access Fee is contrary to the Department's rate design goal of sending efficient price signals because the Company failed to appropriately allocate any costs associated with stand-alone DG facilities in a fair and equitable manner as required under G.L. c. 164, § 142, and it did not consider various benefits of DG[338] (NECEC Brief at 39). Additionally, NECEC joins Vote Solar in arguing that the Department must reject the Company's proposed Access Fee because the Company failed to consider the impacts of its rate design proposal on the successful development of energy efficiency and DG, as required under G.L. c. 164, §§ 141, 142 (NECEC Brief at 39, 42; NECEC Reply Brief at 13; Vote Solar Brief at 22-23; Vote Solar Reply Brief at 12-13).

---

338 As an example of a benefit that DG provides to the grid, NECEC cites avoided line losses from using generation located near load rather than transporting generation from a more distant source (NECEC Brief at 39-40).

b. National Grid

i. Evidentiary Support for the Proposed Access Fee

The Company argues that it is experiencing a growing cost shift from net metering customers to non-net metering customers from increased net metering incentives,[339] and that the bulk of distribution service costs are recovered through the variable portion of distribution rates,[340] instead of through fixed rates (Company Brief at 213-215). Further, the Company contends that the price for distribution service should be based on transparent and efficient rate designs that reflect the costs to provide service to both DG and non-DG customers (Company Brief at 212-213). As such, the Company proposes the Access Fee to reflect the costs imposed on the distribution system by the stand-alone DG facilities (Company Brief at 212-214, 228).

The Company argues that it proposed to set the Access fee at the same values as the demand charges proposed for Rates G-2 and G-3 customers because stand-alone DG customers use the distribution system for exporting electricity in the same way that customers on Rates G-2 and G-3 use the distribution system to import electricity (Company Brief at 229 citing Exhs. DPU-12-4, AG-27-10; Company Reply Brief at 95-96). More specifically, the Company contends that whether a particular customer imports or exports electricity, that customer relies on the electric distribution system and the services provided by the Company, and imposes a demand on the distribution system for which the system must be designed to

339 The Company calculates that the net costs to customers from net metering amounts to $27.99 million in 2014 and $53.14 million in 2015 (Exh. EFCA 1-3, Att. 1-3-2).

340 In addition to net metering credits, the Company contends that the cost shift consists of (1) O&M costs; (2) energy, transmission and distribution costs and (3) short- and long-term investments to support DG (Exhs. EFCA 1-3; EFCA 1-9; EFCA 1-11; EFCA 2-7; LI 1-10; AG-27-8).

accommodate (Company Brief at 229, citing, Exhs. NG-PP-Rebuttal-1, at 33; AG-27-10; Company Reply Brief at 95). Thus, the Company asserts that the proposed Access Fee has been appropriately set at the same values as the demand charges proposed for customers in Rate G-2 and Rate G-3, respectively (Company Brief at 229, citing Exh. DPU-12-4; Company Reply Brief at 95-96).

The Company argues that while Department precedent requires companies to design rates based on cost causation as well as balancing a number of oft-competing policy goals, there are practical limitations in establishing the level of the cost to serve and recovering those costs from customers (Company Brief at 211-212).[341] The Company contends that many of the criticisms of its rate proposals would require the Company to undertake an unprecedented level of precision in determining cost-causation; such an undertaking is not practical or required for ratemaking purposes (Company Brief at 212).

Further, National Grid rejects any notion that is has not met its burden of proof relative to the proposed Access Fee because it has not conducted special cost studies to demonstrate that the costs incurred to flow electricity in one direction are the same as the costs to flow the electricity in the other direction (Company Brief at 230, citing, DOER Brief at 9-10; EFCA Brief at 23; NECEC Brief at 37-38; Company Reply Brief at 96). The Company claims that such an analysis may not be possible, and even if it were, it would be meaningless because the distribution system still has to be constructed to meet demand, regardless of which way electricity flows (Company

---

341 For example, the Company notes that costs are generally not calculated for individual customers, but rather for groups of homogenous customers with similar cost-causation attributes; and Department goals of simplicity, continuity, and earnings stability may temper the implementation of cost-based rates (Company Brief at 212, Exh. NG-PP-1, at 39-41).

Brief at 230, citing Exh. AG-27-10; Company Reply Brief at 96-97). Further, the Company asserts that the Intervenors and Limited Intervenors have provided no basis for the claim that the costs incurred to transport power away from a stand-alone DG facility is different from the costs incurred to transport power to a similarly sized retail customer (Company Brief at 231, citing Tr. 12, at 1330-1336; Company Reply Brief at 97).

The Company also dismisses any claims that the proposed Access Fee fails to account for any benefits of stand-alone DG facilities associated with their contribution toward distribution capacity (Company Brief at 231, citing, Attorney General Brief at 142-143; DOER Brief at 9-10; EFCA Brief at 23-25; NECEC Brief at 39-41; Company Reply Brief at 97). The Company contends that the record shows that stand-alone DG projects have been constructed in areas remote from load and that the generation from these facilities does not typically match feeder, substation, or system peak loads (Company Brief at 231, citing Exh. NG-PP-Rebuttal-1, at 37; Company Reply Brief at 97). Therefore, according to the Company, the claimed distribution capacity benefits of stand-alone DG facilities are "illusory" (Company Brief at 231; Company Reply Brief at 97). Further, National Grid argues that the record shows that the Company does consider solar capacity in its load forecasting methodology, as well as using actual measured peak loads on feeders and at substations (Company Brief at 231; Company Reply Brief at 97). Thus, the Company asserts that any load relief benefits created by solar will be realized over time in a similar fashion as the load relief provided by over 30 years of energy efficiency programs and services (Company Brief at 231; Company Reply Brief at 97).

With respect to system benefits from DG, the Company maintains that: (1) while correctly located DG may provide benefits, it has little hard evidence of such benefits within its

service territory;[342] and (2) system benefits of solar DG already have been assumed by the Commonwealth through implementation of net metering and the solar carve-out incentives (Company Brief at 215-216; Exh. NG-PP-Rebuttal-1, at 37). The Company alleges that, in light of these solar DG incentives, counting distribution system benefits from solar DG as an offset to distribution system costs would constitute double-counting, creating bill impacts to all customers (Company Brief at 216). The Company asserts that performing a cost-benefit or value-of-solar study to establish rates, as suggested by the Limited Intervenors, would be a departure from the Department's traditional ratemaking framework that raises more questions than it answers (Company Brief at 216).

ii. MMRC and Solar Act

On brief, the Company repeats its positions set forth in rebuttal testimony regarding the propriety of the proposed Access Fee in the context of § 139(j) and the MMRC (Company Brief at 231-233; Company Reply Brief at 97-99; see Section XIV.A.1.c above). In particular, the Company argues that: (1) the Department has the authority to approve the Access Fee irrespective of § 139(j); (2) assuming that the requirements of the statute apply to the proposed Access Fee, the requirements have been satisfied; and (3) by the time the proposed Access Fee is imposed, the 1600-megawatt threshold will likely be achieved (Company Brief at 231-233; Company Reply Brief at 97-99).

342 The Company contends that any distribution benefits from stand-alone DG facilities are illusory as record evidence shows that stand-alone DG projects have been constructed in remote areas away from load and do not match feeder, substation or system peak loads; any load relief benefits created by solar will only be realized over time similar to energy efficiency programs (Exh. NG-PP-Rebuttal-1, at 37; Company Brief at 231; Company Reply Brief at 97).

iii. Rate Design Issues

The Company does not specifically address the arguments of the Intervenors and Limited Intervenors regarding whether the proposed Access Fee meets the Department's rate design goals. However, the Company argues that its rate design proposals, which include the proposed Access Fee, meet the Department's rate design goals, represent a substantial improvement over its current rate design, and are the first step in a process towards an optimal rate design, which would include both customer and demand charges for each rate class (Company Brief at 213-214).

3. Analysis and Findings

National Grid argues that its proposed Access Fee is necessary to recover costs imposed on the distribution system by stand-alone DG facilities that take service under Rate G-1, but use the distribution system in the same manner as a typical Rate G-2 or Rate G-3 customer does (Exhs. NG-PP-1, at 74; AG-27-8; Tr. 5, at 653). According to National Grid, stand-alone DG facilities do not pay for O&M and some capital costs that they impose on the Company's distribution system (Exhs. NG-PP-1, at 74-75; DPU-12-3, at 1; DPU-21-3; AG-27-8; LI 1-22; EFCA-1-9, at 2; EFCA-1-10, at 2; EFCA-1-11; NeCEC-1-13; NECEC-1-19). National Grid claims that stand-alone DG facilities' lack of contribution creates a growing cost shift, as the Company is required to socialize these costs by recovering them from all distribution customers (Company Brief at 212-214, 228-229).

As noted above, the Company claims that interconnection costs for stand-alone DG facilities do not include the costs associated with: (1) the recovery of ongoing O&M and the replacement of interconnection equipment; (2) T&D and non-T&D service for continued use of

the electric power system; (3) short term and long term investments to support enhanced quantities of DG on the electric power system; and (4) the interval metering required for the stand-alone DG facilities (Exhs. NG-PP-1, at 74-75; DPU-12-3, at 1; DPU-21-3; AG-27-8; LI-1-22; EFCA-1-9, at 2; EFCA-1-10, at 2; EFCA-1-11; NECEC-1-13; NECEC-1-19). The record shows, however, that with the exception of interval meters, the Company has not quantified the costs that it contends stand-alone DG facilities impose on its distribution system (Exhs. EFCA 1-9, at 2; EFCA-1-10, at 2; NECEC 1-13, NECEC 1-19; Tr. 5, at 647-654). For instance, the Company identifies several categories of O&M associated with system modifications to stand-alone DG facilities to estimate O&M costs, but it does not quantify the actual O&M costs incurred by operating stand-alone DG facilities (Exhs. DPU-29-8; LI-1-10, EFCA-1-9, at 2, EFCA-1-11, EFCA-2-7, NECEC-1-13, DPU-21-3, Tr. 5, at 646, 652-654). Further, National Grid has not specifically quantified T&D and non-T&D costs related to use of the Company's system by stand-alone DG facilities (Tr. 5, at 649-651). In addition, the Company identifies, but does not quantify, other short- and long-term capital investments it states will need to be made to accommodate higher penetration of stand-alone DG facilities on its distribution system (Exhs. LI 1-10, LI 1-22, EFCA 1-9, EFCA 1-11). Rather, apart from the interval meters, the Company seems to rely on the allocated COSS applicable to the Rate G-2 and Rate G-3 classes as the cost basis for the proposed Access Fee (Tr. 5, at 644-645, 646, 648, 650-651).

Based on these considerations, we find that the amount of costs that the Company seeks to recover through the proposed Access Fee is not based on sufficient quantification of all of the costs that stand-alone DG facilities impose, but rather rests primarily on demand-related costs of

Rate G-2 and Rate G-3 customers, as determined by the allocated COSS (Exhs. DPU-12-4; DPU-29-9; AG-27-10; Tr. 5, at 652-653; Tr. 7, at 1122-1123). Further, the Company has not conducted an appropriate analysis to determine whether the reliance on the distribution system by a typical stand-alone DG facility is greater than, equal to, or less than customers on Rate G-2 and Rate G-3 (Exh. AG-27-10; Tr. 5, at 654). Therefore, we are not persuaded that the Company's reliance on costs attributable to Rate G-2 and Rate G-3 customers provides a sufficiently reliable cost basis to derive an Access Fee attributable to stand-alone DG customers who take service on Rate G-1. Accordingly, we decline to accept the Company's proposal.

The Department notes that our decision today should not be construed as a rejection of the concept of an Access Fee for stand-alone DG facilities.[343] The Department recognizes that there are distribution system-related costs that may be associated with these facilities for which the stand-alone DG customer should be responsible.[344] However, without a sufficiently reliable quantification of those costs, we are unable to approve the proposed Access Fee. Having rejected the Company's proposed Access Fee, we need not address the other arguments raised by the Intervenors, Limited Intervenors, and Limited Participants.

Further, we decline in this case to consider the Company's proposed Access Fee in the context of a MMRC under the Solar Act. The provision of the Solar Act permitting a MMRC

---

343 The Company also considered as an alternative proposal to assign stand-alone DG facilities to retail delivery service tariffs commensurate with the size of the DG unit, such as Rate G-2 or Rate G3 (Exh. NG-PP-1, at 75). The Department is not necessarily opposed to such a concept, but notes that such a proposal would need to be supported by sufficient evidence showing that the costs attributable to the stand-alone DG facility are commensurate with costs caused by Rate G-2 or Rate G-3 customers.

344 The Department also recognizes that there are distribution system related revenues that are associated with net metering (RR-DPU-26).

proposal was enacted after the filing of this base rate case, and it contains specific procedural requirements that have not been satisfied here.[345] The Department currently is evaluating the timeline and implementation of potential MMRC proposals. Net Metering Rulemaking, D.P.U. 16-64-D at 16-17 (2016). Therefore, at the appropriate time, the Company may submit a proposal for a MMRC pursuant to § 139(j).[346]

Finally, we find that National Grid has provided sufficient quantification of the $1,690 cost of the interval meters required for stand-alone DG facilities (Exhs. NG-PP-1, at 74-75; NECEC-1-19 & Att.). Therefore, we allow the Company to recover this cost from new stand-alone DG facilities who take service under Rate G-1. The Company shall revise its Standards of Interconnection of Distributed Generation tariff accordingly.

B. Application Fee for Simplified Distributed Generation Applications

1. Introduction

The Company's Standards for Interconnection of Distributed Generation tariff ("Interconnection Tariff") (M.D.P.U. No. 1248) includes a fee structure applicable to interconnecting DG customers that varies depending on the size and type of interconnection. The fee structure was originally approved by the Department in 2004 and more recently reviewed and approved in 2013 following a DG working group process, which included the electric distribution companies and many stakeholders. See Distributed Generation

345 In particular, we note that the Company first addressed the MMRC provision in its rebuttal testimony, after discovery closed, and approximately two weeks before evidentiary hearings began. There was no public hearing relative to a MMRC, or opportunity to comment from interested parties.

346 This statute requires a revenue neutral rate design filing that is supported by appropriate cost of service data across all rate classes.

Interconnection, D.P.U. 11-75-E at 36, 40 (2013); Investigation Into Distributed Generation, D.T.E. 02-38-B at 41 (2004).

The Company's current Interconnection Tariff exempts interconnection fees for a generating facility using the "Simplified Process" of interconnecting to the Company's electric distribution system (Exhs. NG-RRP-1, at 18; EFCA-1-6, at 2; M.D.P.U. No. 1248, § 3.10 (Table 6)).[347] However, the current tariff includes a $4.50 per kW interconnection fee for customers that choose either the Expedited Process,[348] or the Standard Process,[349] of interconnecting (M.D.P.U. No. 1248, § 3.10 (Table 6)).

2. Company Proposal

The Company proposes to assess a $28.00 one-time application fee for interconnecting DG customers that use the Simplified Process (Exhs. NG-MLR-1, at 21; NG-RRP-1, at 18;

---

347 The Simplified Process is applicable to interconnecting customers (i) using certain single-phase inverter-based facilities with power ratings of 15 kilowatt or less at locations receiving single-phase, secondary service from a single-phase transformer, or (ii) using certain three-phase inverter-based facilities with power ratings of 25 kilowatt or less at locations receiving three-phase, secondary service from a three-phase transformer configuration, and requesting an interconnection on a radial electric system where the aggregate generating facility capacity is less than 15 percent of feeder/circuit annual peak load and, if available, line segment (M.D.P.U. No. 1248, § 3.1). This process is the fastest and least costly interconnection path (M.D.P.U. No. 1248, § 3.1).

348 The Expedited Process is open to certain larger interconnecting customers that do not qualify for the Simplified Process or the Standard Process (M.D.P.U. No. 1248, §§ 3.3, 3.10 (Table 6)).

349 The Standard Process is open to any size interconnecting customer, but it has the longest maximum application time period and highest potential costs (M.D.P.U. No. 1248, §§ 3.4, 3.10 (Table 6)).

NG-PP-24, at 286 (proposed M.D.P.U. No. 1285 (Table 6)); Tr. 7, at 1160).[350] The Company states the application fee is intended to cover costs associated with the intake and processing of the Simplified Process applications, such as: (1) reviewing applications for accuracy and completeness; (2) performing a technical screening based on the proposed equipment and characteristics of the local electric power system; (3) answering questions about the interconnection process; (4) providing the customer with status updates by email and/or phone; (5) reviewing completion documentation; (6) authorizing interconnection; and (7) validating processing timelines with customers in anticipation of annual reports to the Department (Exh. DPU-29-12; Tr. 7, at 1161-1162).

National Grid states that the primary reason for the proposed application fee is the significant growth in the number of Simplified Process applications on radial circuits received by the Company in recent years, and the associated cost of processing those applications (Exhs. NG-RRP-1, at 18-19; EFCA-1-6, at 2; Tr. 7, at 1163). In particular, National Grid notes that during the test year, the Company processed 13,027 Simplified Process applications, which was an increase of 8,821 applications (or 210 percent) from the previous year (Exh. NG-RRP-1, at 18-19).[351]

The Company derived the $28.00 application fee by considering the current application fee of $4.50 per kW applicable to interconnecting customers applying for interconnection through the Expedited or Standard Process. More specifically, the Company first determined

---

350 The Company does not propose any changes to the Expedited or Standard Process fees (see Exh. NG-PP-24, at 286 (proposed M.D.P.U. No. 1285 (Table 6)).

351 The Company states that from approximately 2004 to 2006, the Company received only 64 Simplified Process applications (Exh. EFCA-1-6, at 2).

that the total capacity in kW of the interconnecting customers that applied through the Simplified Process during the test year was 81,636 kW (Exhs. WP-NG-PP-3g; AG-2-2, Att. 13). The Company then multiplied this total by the $4.50 per-kW application fee applicable to Expedited and Standard Process applications to arrive at $367,362 (Exhs. WP-NG-PP-3g; AG-2-2, Att. 13). Next, the Company divided this total by the number of Simplified Process applications received during the test year of 13,027 and rounded to the nearest dollar to arrive at $28.00 (Exhs. WP-NG-PP-3g; AG-2-2, Att. 13; Tr. 7, at 1161). Finally, the Company notes that as part of its proposal, a revenue credit has been applied to its cost of service in the amount of $364,756 ($28.00 x 13,027) (Exhs. NG-RRP-1, at 19; NG-RRP-2, at 3 (Rev. 3); EFCA-1-6, at 2).

The Company states that the proposed application fee is an appropriate way to recover from DG customers the costs associated with the Simplified Process applications (Exh. EFCA-1-6, at 2). According to the Company, without the application fee, ratepayers would be at risk for these costs (Exh. EFCA-1-6, at 2).

3. Positions of the Parties

No party addressed the Company's proposal on brief. In its prefiled testimony, EFCA provided conditional support for the Company's proposal (Exh. EFCA-CG-1, at 29). However, EFCA submits that the application fee should be implemented in a manner that does not create an administrative burden or application delay due to the processing of payment (Exh. EFCA-CG-1, at 29). EFCA further maintains that the Company should make every effort to optimize the Simplified Process for applying for interconnection (Exh. EFCA-CG-1, at 29).

4. Analysis and Findings

The Department approved the current fee structure applicable to interconnecting DG customers in D.P.U. 11-75-E at 36. In that Order, the Department recognized that if electric distribution companies do not collect enough funds to cover the costs associated with the interconnection of DG, ratepayers risk paying for the unrecovered costs. D.P.U. 11-75-E at 36. The Department noted that such an outcome is inconsistent with the interconnection framework, whereby the interconnecting customers pay for costs associated with the applicable interconnection. D.P.U. 11-75-E at 36, citing D.T.E. 02-38-B at 13-14.

In the instant case, the Company has demonstrated that there has been a significant increase in Simplified Process applications in recent years (Exhs. NG-RRP-1, at 18-19; EFCA-1-6, at 2; Tr. 7, at 1163). The Company also has provided evidence of the nature of the tasks associated with processing the Simplified Process applications (Exh. DPU-29-12; Tr. 7, at 1161-1162). Given these considerations, we find that the Company is incurring costs associated with processing Simplified Process applications for which interconnecting DG customers should be responsible. Therefore, we find that an application fee is a reasonable and appropriate way to recover application-related costs from interconnecting customers and to prevent ratepayers from paying for any such unrecovered costs. See D.P.U. 11-75-E at 36; D.T.E. 02-38-B at 13-14. Further, while the Company's proposed $28.00 application fee may not be derived through a precise calculation of the specific costs associated with processing the Simplified Process applications, we conclude that the one-time fee is not so disproportionate to the scope of work necessary to process the applications as to render the fee unreasonable.

Finally, we acknowledge EFCA's concerns with respect to implementing the application fee and optimizing the Simplified Process for interconnection. However, there is nothing in the record that leads us to conclude that any further direction to the Company with respect to these concerns is warranted.

Based on these findings, we approve the Company's proposal to assess a one-time application fee of $28.00 for interconnecting DG customers that use the Simplified Process. In addition, the Department also approves the Company's proposed credit to revenues in the amount of $364,756. The Company is directed in its compliance filing to revise its Interconnection Tariff accordingly.

C. Summary of Charges Tariff

In the Company's last rate case, the Department directed National Grid to include a separate tariff that shows the approved charges for each rate class, which is referred to as the summary tariff. D.P.U. 09-39, at 442. The summary tariff is the sole tariff that states the current charges for each delivery service factor.[352] The Department found that the use of a summary tariff is administratively efficient, consumer-friendly, and consistent with Department precedent. See, e.g., D.P.U. 09-39, at 442; D.P.U. 07-71, at 197-198; D.T.E. 05-85, M.D.P.U. No. 190 (2005).

---

352 The currently effective summary tariff shows for each rate class: (1) the M.D.P.U. number; (2) the applicable blocks of kWh hours use; (3) customer and other distribution charges; (4) other delivery service charges including pension and PBOP adjustment factor, RAAF, basic service adjustment, SFRF, revenue decoupling adjustment factor, solar cost adjustment factor, attorney general consultant expense factor, smart grid distribution adjustment factor, transition, transmission, renewable, and energy efficiency charges; and (5) the date of the last change of each rate (see M.D.P.U. Nos. 1-16-B, 1-16-C).

During the course of this proceeding, National Grid agreed to amend its standard summary tariff by including basic service pricing (Exh. DPU-18-11 & Atts.; Tr. 7, at 1183). Accordingly, the Department directs the Company in its compliance filing to include in its summary tariff, the basic service rates for each rate class, consistent with the summary tariffs for NSTAR Electric, Unitil, and WMECo, and to include the changes to the delivery service rates consistent with the directives in this Order (see M.D.P.U. Nos. 190-16-C, 290-16-C, 390-16-C (NSTAR Electric); 297 (Unitil); 1052-16-D (WMECo)).

D. Other Tariff Changes

The Company proposes changes to the following tariffs that are not addressed above or elsewhere in this Order: (1) Terms and Conditions for Distribution Service (proposed M.D.P.U. No. 1275); (2) Solar Cost Adjustment Provision (proposed M.D.P.U. No. 1281); (3) Optional Enhanced Metering Service (proposed M.D.P.U. No. 1283); and (4) Optional Interval Data Service (proposed M.D.P.U. No. 1284) (Exhs. NG-PP-1, at 79-80, 87; NG-PP-24, at 204-243, 275-278, 281-284). No party addressed the Company's proposed changes. The Department has reviewed the changes and we find that they are acceptable. National Grid, as part of its compliance filing, is directed to revise these tariffs accordingly.

National Grid also proposes changes to its Net Metering Provision (proposed M.D.P.U. No. 1279)[353] and its Standards for Interconnection of Distributed Generation (proposed

[353] The Company also proposes revisions to its Net Metering Provision and its Qualifying Facility Power Purchase Rate P (proposed M.D.P.U. No. 1286) to reflect the inclusion of the proposed Access Fee applicable to stand-alone DG facilities (Exhs. NG-PP-1, at 80; NG-PP-24, at 289-294). As discussed in Section XIV.A.3 above, the Department has rejected the proposed Access Fee and directed the Company to revise these tariffs accordingly.

M.D.P.U. No. 1285)[354] to implement the Company's proposal to bid capacity of customer-owned solar facilities in the forward capacity market (Exhs. NG-PP-1, at 80; NG-PP-24, at 257-272, 285-288). The proposed changes related to the forward capacity market are inconsistent with our findings in Massachusetts Electric Company and Nantucket Electric Company, D.P.U. 15-155, Interlocutory Order (February 9, 2016). Therefore, the Department disallows the proposed changes. The Company, as part of its compliance filing, is directed to revise these tariffs accordingly.

354 The Company also proposes revisions to its Standards for Interconnection of Distributed Generation to reflect the inclusion of a $28 application fee for some interconnecting DG customers (Exhs. NG-PP-1, at 80; NG-PP-24, at 285-288). As discussed in Section XIV.B.4 above, the Department has allowed the application fee and directed the Company to revise this tariff accordingly.

XV. SCHEDULES

A. Schedule 1 – Revenue Requirements and Calculations of Revenue Increase

	PER COMPANY	COMPANY ADJUSTMENT	DPU ADJUSTMENT	PER ORDER

XVI. ORDER

Accordingly, after due notice, hearing and consideration, it is

ORDERED: That tariffs M.D.P.U. Nos. 1264 through 1286, as applicable to Massachusetts Electric Company, and tariffs M.D.P.U. Nos. 576 through 587 and M.D.P.U. Nos. 1275 through 1286, as applicable to Nantucket Electric Company, filed on November 6, 2015, to become effective, after suspension by the Department, on October 1, 2016, are DISALLOWED; and it is

FURTHER ORDERED: That Massachusetts Electric Company and Nantucket Electric Company shall file new schedules of rates and charges designed to increase annual electric revenues by $169,670,239; and it is

FURTHER ORDERED: That Massachusetts Electric Company and Nantucket Electric Company shall file all rates and charges required by this Order and shall design all rates in compliance with this Order; and it is

FURTHER ORDERED: That Massachusetts Electric Company and Nantucket Electric Company shall comply with all other orders and directives contained in this Order; and it is

FURTHER ORDERED: That the new rates shall apply to electricity consumed on or after the date of this Order, but unless otherwise ordered by the Department, shall not become effective earlier than seven days after the rates are filed with supporting data demonstrating that such rates comply with this Order.

By Order of the Department,

/s/

Angela M. O'Connor, Chairman

/s/

Robert E. Hayden, Commissioner

XVII. PARTIAL DISSENT OF COMMISSIONER WESTBROOK

While I join with the majority's conclusions for much of this decision, I dissent specifically from the conclusions found in Sections V.D.4 and XII.E above, with respect to the inclusion of property taxes in the Company's CIRM and the ROE. For the reasons below, I am of the opinion that the Department should not expand National Grid's CIRM to include recovery of property taxes. The Department recently excluded property taxes from the capital cost recovery mechanism approved for Fitchburg Gas and Electric Light Company (Electric Division) ("Fitchburg"), and I see no reason to treat National Grid's proposal differently.[355]

In D.P.U. 09-39, the Department approved a reconciling mechanism, then referred to as the capital expenditures ("CapEx") mechanism, which allowed the Company to recover an annual revenue requirement on incremental capital investments. D.P.U. 09-39, at 80. We did so, recognizing that revenue decoupling would remove the Company's opportunity to earn additional revenue to fund projected capital expenditures from growth in sales between rate proceedings. D.P.U. 09-39, at 79-80. National Grid's CapEx does not provide for inclusion of property taxes in the recovery mechanism. In D.P.U. 15-80/D.P.U. 15-81, at 52, we approved a capital investment recovery mechanism for Fitchburg that was designed to operate similar to National Grid's CapEx mechanism. One way in which the Department revised Fitchburg's CCAM to make it consistent with National Grid's CapEx was the exclusion of property taxes from the calculation of Fitchburg's CCAM. D.P.U. 15-80/D.P.U. 15-81, at 55-56.

In this Order, the Department finds that National Grid has adequately demonstrated a continued need to recover incremental costs associated with capital expenditure programs

---

355 Fitchburg's capital investment recovery mechanism approved by the Department is the capital cost adjustment mechanism ("CCAM"). D.P.U. 15-80/D.P.U. 15-81, at 1.

between base distribution rate proceedings (see Section V.D above). In approving National Grid's CIRM, this Order, however, modifies the existing CapEx in three ways. First, the Department has increased the investment cap from $170 million to $249 million, allowing the Company to recover more of its capital investment between rate cases. Second, the Department has removed the CIRM from the RDM tariff, thereby separating the rate caps and allowing the Company further latitude to recover costs associated with capital investments between rate cases. Third, the majority has found it appropriate to include the recovery of property taxes associated with capital investments as part of the CIRM allowing the Company to recover property tax expense outside of the $249 million investment cap. While I find the first two modifications to be appropriate, I am of the opinion that including property taxes in the CIRM has expanded this mechanism beyond its original purpose and that such expansion is not in the best interests of ratepayers.

Previously, the Department has only allowed capital investment recovery mechanisms upon a finding that the mechanism strikes the appropriate balance between: (1) providing a company with sufficient funds to ensure safe and reliable electric service; and (2) protecting ratepayers from overinvestment in capital infrastructure. D.P.U. 09-39, at 81-82; D.P.U. 15-80/D.P.U. 15-81, at 51. As noted above, the Department rejected a similar proposal by Fitchburg to include property taxes in the calculation of its capital cost recovery mechanism. D.P.U. 15-80/D.P.U. 15-81, at 54. In that case, the Department stated that the revised CCAM, including the exclusion of property taxes in the calculation of the capital cost recovery mechanism, strikes an appropriate balance of providing Fitchburg with a source of funds to invest in capital expansion projects between rate cases, while protecting ratepayers from the

Company's incentive to over-invest. D.P.U. 15-80/D.P.U. 15-81, at 54. See also D.P.U. 07-50-A at 48. Further, the Department explained that the purpose of a capital cost recovery mechanism is not to provide a company with dollar-for-dollar recovery of capital investments between rate cases, but to provide rate relief in between base distribution rate cases to fund capital investments that were available to be funded through sales growth prior to decoupling. D.P.U. 15-80/D.P.U. 15-81, at 54. Thus, in my opinion, the inclusion of property taxes in the National Grid's CIRM is contrary to the intended goal of capital investment recovery mechanisms. I continue to support that concept of the CIRM and conclude that excluding property taxes strikes the appropriate balance.

In this case, I do not believe that excluding property taxes in the calculation of the CIRM will adversely affect the Company's financial well-being. The Company would recover its property taxes expense under traditional ratemaking as an O&M expense in the Company's cost of service. Moreover, while the need for a capital cost recovery mechanism is specific to each company, I see no evidence in the record that warrants different treatment between Fitchburg and National Grid with respect to the underlying policy goals of a capital investment recovery mechanism.

I disagree with the majority that "exclusion of [property taxes] does not provide the appropriate rate relief between base rate proceedings" (see page 57 above). By increasing the investment cap and separating the CIRM and RDM rate caps, the Department has provided sufficient support for the Company to fund its capital expenditures. Additionally, including recovery of property taxes through the CIRM, in my opinion, provides the Company with more

than adequate funding to compensate for the effect of decoupling.[356] While the majority notes that the inclusion of a portion of property taxes in National Grid's CIRM does not constitute dollar-for-dollar recovery (see page 58 above), it is my opinion that the inclusion of property taxes expands the CIRM beyond the intended purpose aligning it more with a dollar-for-dollar recovery mechanism.

Further, unlike the gas companies' targeted capital investment recovery factors that include property tax recovery (e.g., TIRF, GSEP),[357] the Company's CIRM is broad. The TIRF and the GSEP programs are more narrow, focus on a specific public safety issue identified by the Legislature, and the GSEPs require the Department's approval of a capital investment plan. See, e.g., Boston Gas Company/Colonial Gas Company, D.P.U. 14-132, at 3-5 (2015). Under the CIRM, however, the Company can recover any and all capital investments under the investment cap that are not recovered through another factor. Expanding the already broad CIRM to include property taxes is not necessary for the intended purpose of capital investment recovery mechanisms and will result in annual cost increases for ratepayers.

Lastly, the majority finds that an ROE of 9.90 percent is appropriate (see Section XII.E above). While I agree that 9.90 percent is within the range of reasonableness, I believe that a downward adjustment to the ROE that would still remain within the range of reasonableness is appropriate to more fully reflect the reduced risk to the Company as a result the CIRM, including property taxes, and our treatment of protected hardship account balances in Section VIII.J.3.

---

356 A utility can file a base rate case with the Department under G.L. c. 164, § 94 if the utility determines that it is not earning sufficient revenues to fund its operations.

357 Targeted Infrastructure Recovery Mechanism ("TIRF"); Gas System Enhancement Plan ("GSEP").

Apart from these points and their consequences for other features of the final Order in this docket, I join in the remainder of the decision.

/s/

Jolette A. Westbrook, Commissioner

An appeal as to matters of law from any final decision, order or ruling of the Commission may be taken to the Supreme Judicial Court by an aggrieved party in interest by the filing of a written petition praying that the Order of the Commission be modified or set aside in whole or in part. Such petition for appeal shall be filed with the Secretary of the Commission within twenty days after the date of service of the decision, order or ruling of the Commission, or within such further time as the Commission may allow upon request filed prior to the expiration of the twenty days after the date of service of said decision, order or ruling. Within ten days after such petition has been filed, the appealing party shall enter the appeal in the Supreme Judicial Court sitting in Suffolk County by filing a copy thereof with the Clerk of said Court. G.L. c. 25, § 5.

Public Utilities Reports, Inc.

Chapter 10
Flotation Cost Adjustment

This chapter demonstrates that an adjustment to the market-based cost of capital is necessary for flotation costs associated with the procurement of equity capital, and discusses the mechanics and controversies involved in applying this adjustment.

A typical utility is continuously issuing stock through its dividend reinvestment plan and employee stock option plan, and/or is selling new shares to the public on a regular basis in order to maintain its construction program and meet its mandated service requirements. The costs of issuing these securities are just as real as operating and maintenance expenses or costs incurred to build utility plants, and fair regulatory treatment must permit the recovery of these costs.

10.1 Flotation Cost Allowance

The simple fact of the matter is that common equity capital is not free. Flotation costs associated with common stock issues are very similar to the flotation costs associated with bonds and preferred stocks. Flotation costs are incurred, and if they are not expensed at the time of issue, they must be recovered through a rate of return adjustment. This is routinely done for bond and preferred stock issues by most regulatory commissions. To illustrate the conventional regulatory practice, consider this example. A utility company issues $100 million of 10-year bonds at an interest rate of 5%. Flotation costs are 2% of the amount of the proceeds, $2 million. The interest paid each year is $100 million x 5% = $5 million. The flotation cost of $2 million is amortized over the 10-year life of the bond, so that the amortization each year equals $2M/10 = $0.2 million. The cost of debt K_d is then:

$$K_d = \frac{\text{Interest} + \text{Amortization of flotation costs}}{\text{Principal} - \text{Unamortized flotation costs}}$$

$$= \frac{\$5{,}000{,}000 + \$200{,}000}{\$100{,}000{,}000 - \$2{,}000{,}000} = 5.31\%$$

The cost of debt needs to be increased by 31 basis points in order to allow for the recovery of flotation costs. The recovery process is very similar for common stock issues.

In the case of issues of new common equity, flotation costs represent the discounts that must be provided to place the new securities. Flotation costs have three major components:

approximately 2% and 4%–5%, respectively, of the amount of the proceeds from the issue. Moreover, the cost associated with the decline in stock price at announcement date represents approximately 1%–3% as a result of a large utility stock offering.

10.3 Application of the Flotation Cost Adjustment

This section formally demonstrates: (1) how and why it is necessary to apply a flotation cost allowance to the dividend yield component of the DCF model in order to obtain the fair return on equity capital; (2) why the flotation adjustment is permanently required to avoid confiscation even if no further stock issues are contemplated; and (3) why flotation costs are only recovered if the rate of return is applied to total equity, including retained earnings, in all future years.

An analogy with bond issues, as discussed in Brigham, Aberwald, and Gapenski (1985), is useful here in order to understand the treatment of issue costs in the case of common stock issues. In the case of bonds as seem earlier in the chapter, flotation costs are recovered over the life of the bond in two steps: (1) flotation costs are amortized over the life of the bond and the annual amortization charge is incorporated into revenue requirements, in much the same way that funds invested in utility plant are recovered through depreciation charges; (2) the unamortized portion of flotation costs is included in rate base, and a return is earned on the unamortized costs, in the same way that a return is earned on the undepreciated portion of a utility's plant. The recovery continues year after year until the recovery process is terminated, regardless of whether the utility raises new debt capital. This is analogous to the process of depreciation, which allows the recovery of funds invested in utility plant. The recovery continues whether the utility constructs new facilities or not.

Unlike the case of bonds, common stock has no finite life so that flotation costs cannot be amortized and therefore must be recovered by way of an upward adjustment to the allowed return on equity.

In theory, flotation costs could be expensed and recovered through rates as they are incurred. This procedure, although simple in implementation, is not considered appropriate, however, because the equity capital raised in a given stock issue remains on the utility's common equity account and continues to provide benefits to ratepayers indefinitely. It would be unfair to burden the current generation of ratepayers with the full costs of raising capital when the benefits of that capital extend indefinitely. The common practice of capitalizing rather than expensing eliminates the intergenerational transfers that would prevail if today's ratepayers were asked to bear the full burden of flotation

marketability from the estimated publicly traded equivalent value. Two sets of studies to provide quantitative guidance for this are:

a. Restricted stock studies
b. Pre–IPO studies

2. *Adjust the discount rate.* Add percentage points to the discount rate used to discount the expected cash flows to present value.

A commonly used estimate of the minimum increase in the cost of equity for the lack of marketability of the subject closely held investment is to adjust the cost of equity for hypothetical flotation costs. This adjustment is recognition that the cost of capital for an illiquid investment is greater than the cost of equity capital for publicly traded companies. Flotation costs occur when a company issues new stock. The business usually incurs several kinds of flotation or transaction costs, which reduce the actual proceeds received by the business. Some of these are direct out-of-pocket outlays, such as fees paid to underwriters, legal expenses, and prospectus preparation costs. Because of this reduction in proceeds, the business's required returns must be greater to compensate for the additional costs. Flotation costs can be accounted for either by amortizing the cost, thus reducing the net cash flow to discount, or by incorporating the cost into the cost of equity capital. Since flotation costs typically are not applied to operating cash flow, they must be incorporated into the cost of equity capital. The cost of flotation is a function of size and risk. The greater the size of the hypothetical stock offering, the lower the flotation cost relative to the size of the offering. Obviously the flotation cost estimate understates the appropriate increase in the cost of equity capital due to lack of marketability in cases where the subject closely held business could never become public. In addition, the owner of a minority interest could never cause the business to become public.

We also discussed results of Ashok Abbott's study of the cost of illiquidity for public companies.

Business Valuation

One required element of the income approach to company valuation is the discount rate. Under the income approach, cash flows are projected into the future and discounted back to present value using a discount rate reflective of the risk inherent in those cash flows. The income approach is expressed in the following formula:

$$PV_s = \frac{CF_1}{(1+k_s)^1} + \frac{CF_2}{(1+k_s)^2} + \ldots + \frac{CF_i}{(1+k_s)^i}$$

where:

PV_s = the present value of the expected cash flows for company **s**;
CF_i = the dividend or cash flow expected to be received at the end of period **i**; and
k_s = the cost of capital for company **s**.

The discount rate is synonymous with the cost of capital.

While determining the appropriate future cash flow stream is an essential element of the income approach, determining the appropriate discount rate is equally important. Under the income approach, small changes in the discount rate can have a large impact on the ultimate value that is derived.

Table 2-2 is a simple valuation example that illustrates the impact of small changes in the discount rate. In the example, the entity being valued produces cash flows of $1,000 each year in years one through four, and $10,000 in year five. The lower portion of the table shows the values derived from this cash flow stream using different discount rates.

Table 2-2: Valuing Future Cash Flows with Different Discount Rates

Projected Cash Flows ($)

Year 1	Year 2	Year 3	Year 4	Year 5
1,000	1,000	1,000	1,000	10,000

Present Value of Cash Flows ($)

Discount Rate (%)	Year 1	Year 2	Year 3	Year 4	Year 5	Total
10	909	826	751	683	6,209	**9,379**
11	901	812	731	659	5,935	9,037
12	893	797	712	636	5,674	8,712
13	885	783	693	613	5,428	8,402
14	877	769	675	592	5,194	8,107
15	870	756	658	572	4,972	**7,827**

Whether this entity is worth $9,379 using a discount rate of 10 percent or $7,827 using a discount rate of 15 percent may seem trivial. If these values were in thousands or millions of dollars, however, the differences would be significant.

The preceding example focused on values produced from discount rates that are 500 basis points apart. While this may seem extreme, basic assumptions in the determination of the cost of capital can lead to discount rates that are widely divergent. Understanding the assumptions that underlie the discount rate is as important as understanding the assumptions that underlie the cash flows.

Regulatory Proceedings

Even in this era of deregulation, most utilities are regulated to some extent by local government bodies. An appointed commission ensures that the utility, because of its alleged monopolistic power, does not take advantage of its customers and that its investors receive a fair rate of return on their invested capital. One of the most important functions of the commission is to determine an appropriate (often called the "allowed") rate of return. The procedures for setting rates of return for regulated utilities often specify or suggest that the required rate is that which would allow the firm to attract and retain debt and equity capital over the long term.

Although the cost of capital estimation techniques set forth later in this book are applicable to rate setting, certain adjustments may be necessary. One such adjustment is for flotation costs (amounts that must be paid to underwriters by the issuer to attract and retain capital). In addition, certain regulatory environments may require that shareholders not earn more than the allowed rate of return. If a shareholder does earn more, future rates for the utilities services may be reduced by the regulating body. If the allowed rate of return falls below the cost of capital, regulators may allow a rate increase in order to compensate the investor so that they will on average over time earn the market-required rate of return. Yet other regulatory conditions may require that the allowed rate of return be different from the cost of capital.

I. Introduction

1. This case arises in part out of a complaint, filed on November 2, 2004, by several cooperatives (the Cooperative Customer Group, CCG, or complainants).[1] These cooperatives purchase requirements service from Southwestern Public Service Company (SPS).[2] SPS, a subsidiary of Xcel Energy Inc., is an operating utility engaged primarily in the generation, transmission, distribution and sale of electricity. SPS serves approximately 386,000 electric customers in portions of Texas and New Mexico, and also operates in Oklahoma and Kansas.

2. The complaint, filed under section 206 of the Federal Power Act (FPA),[3] alleges that SPS has historically violated, and continues to violate, the fuel cost adjustment clause (FCAC) provisions of its wholesale customers' rate schedules and the Commission's FCAC regulations. Complainants assert that SPS may be flowing through

[1] When the complaint was filed, CCG included Golden Spread Electric Cooperative, Inc. (Golden Spread), Lyntegar Electric Cooperative, Inc. (Lyntegar), Farmers' Electric Cooperative, Inc. (Farmers'), Lea County Electric Cooperative, Inc. (Lea County), Central Valley Electric Cooperative, Inc. (Central Valley), and Roosevelt County Electric Cooperative, Inc. (Roosevelt County). However, since that time, Golden Spread and Lyntegar have resolved with SPS all issues except one in a settlement filed on December 3, 2007 (Settlement Agreement). Therefore, in this order, CCG will only include Farmers', Lea County, Central Valley, and Roosevelt County.

[2] All of the cooperatives involved in this proceeding are full requirements customers, except Golden Spread, which is a partial requirements customer.

[3] 16 U.S.C. § 824e (2000).

20080421-3031 FERC PDF (Unofficial) 04/21/2008

its FCAC virtually all energy-related purchased power costs, and that some of the costs are not permissible under the filed rate or the Commission's regulations. Complainants also expressed concern that SPS was not appropriately crediting the FCAC (and as a result, its requirements customers) with the cost associated with incremental fuel when it makes intersystem sales. That is, complainants argue that intersystem sales are opportunity sales and that the intersystem customers should have higher cost incremental fuel attributed to their transactions for purposes of computing the FCAC. They also argue that lower cost energy purchases incurred to meet SPS' requirements customers' needs have been allocated to intersystem sales, resulting in requirements customers subsidizing SPS' marketing function. Complainants asked the Commission to investigate FCAC charges dating back to the last Commission audit of SPS under section 205(f) of the FPA,[4] or at least from 1994. We address the issue of how to treat fuel costs under market-based contracts when determining the FCAC for wholesale requirements customers in section II of this order.

3. The complainants also allege that SPS' cost-based rates for full and partial requirements service are excessive, unjust and unreasonable, and unduly discriminatory or preferential for a number of reasons as explained below.[5] SPS' cost-based rates are addressed in section III of this order.

4. On the same date that CCG filed its complaint against SPS,[6] SPS filed a proposal under section 205 of the FPA[7] to change its FCAC and to make corresponding revisions to SPS' power supply contracts.[8] SPS stated that it filed the revised FCAC to conform to the Commission's current fuel cost and purchased economic power adjustment clause regulations,[9] and also to account for expenses and revenues associated with SPS' participation in the Southwest Power Pool, Inc. (SPP) Open Access Transmission Tariff (OATT). Under the revised FCAC, SPS would collect the net difference between the amounts SPS pays to SPP for transmission losses and the amounts that SPP distributes to

20080421-3031 FERC PDF (Unofficial) 04/21/2008

SPS to compensate it for supplying energy to cover transmission losses. Issues pertaining to SPS' former FCAC are addressed in section IV of this order. Issues pertaining to SPS' proposed FCAC are addressed in section V.

5. On December 21, 2004, the Commission established hearing and settlement judge procedures in response to the CCG complaint, and set a refund effective date of January 1, 2005, for damages arising from the complaint.[10] On December 29, 2004, the Commission accepted and suspended, for a nominal period, subject to refund (also effective January 1, 2005, sixty days following the filing of the FPA section 205 proposal), SPS' proposed changes to the FCAC.[11] The Commission also consolidated SPS' proposed FCAC changes with the proceeding already underway in the complaint case before an administrative law judge (ALJ).

6. On May 24, 2006, the ALJ issued an Initial Decision.[12] Briefs on Exceptions were filed by SPS, CCG,[13] Central Valley, Trial Staff, Occidental Permian Ltd. and Occidental Power Marketing, L.P. (collectively, Occidental), Public Service Company of New Mexico (PNM), and Cap Rock Energy Corporation (Cap Rock) on June 23, 2006. Briefs Opposing Exceptions were filed by SPS, CCG, Trial Staff, Occidental, PNM, and Golden Spread on July 13, 2006.[14]

---

[10] *Golden Spread Elec. Coop., Inc.*, 109 FERC ¶ 61,321 (2004) (order on complaint establishing hearing and settlement judge procedures). In accordance with FPA section 206(b) as it existed at the time of the complaint, the refund effective date in complaint proceedings shall not be earlier than the date sixty days after the filing of a complaint, nor later than five months after the expiration of such sixty-day period. Here the refund effective date is sixty days after the filing of the complaint.

[11] *Golden Spread Elec. Coop., Inc.*, 109 FERC ¶ 61,373 (2004) (order accepting and suspending proposed fuel adjustment clause changes, establishing hearing and settlement judge procedures, and consolidating proceedings).

[12] *Golden Spread Elec. Coop., Inc.*, 115 FERC ¶ 63,043 (2006) (Initial Decision).

[13] As noted above, at the time Briefs on Exceptions and Briefs Opposing Exceptions were filed, CCG included Golden Spread and Lyntegar.

[14] Due to the Settlement Agreement, we will not discuss the briefs of Golden Spread and Occidental in this order.

20080421-3031 FERC PDF (Unofficial) 04/21/2008

7. Between July and November 2007, the parties filed three motions asking the Commission to defer action on the Initial Decision to permit additional time for settlement discussions.[15] The Commission granted all of these motions.

8. On December 3, 2007, SPS submitted a Settlement Agreement on behalf of itself, Golden Spread, Lyntegar, and Occidental (collectively, the Settling Parties). The Settlement Agreement resolves all issues between the Settling Parties except one, which is the issue of the appropriate demand cost allocator for use on the SPS system. On January 18, 2008, the Settlement Judge certified the Settlement Agreement to the Commission as uncontested.[16]

9. On March 14, SPS, Golden Spread, and Lyntegar filed a motion requesting that the Commission promptly approve the Settlement Agreement. PNM, Occidental, Central Valley, Farmers', and Roosevelt County filed answers to the Settling Parties' motion stating that they do not oppose the motion, but request that the Commission also promptly issue an order on the Initial Decision.

10. This order resolves all issues between the non-settling parties. In addition, because the Settlement Agreement does not resolve the demand cost allocator issue, this order also resolves that issue as it applies to both the Settling Parties and the non-settling parties.

11. This order affirms in part, and reverses in part, the Initial Decision. Broadly speaking, the dispute addressed by this order involves intersystem sales and how they relate to the FCAC, a range of cost of service issues associated with SPS' cost-based rates for full and partial requirements service, and SPS' former FCAC and proposed FCAC.

---

[15] On July 17, 2007, SPS and Golden Spread filed a joint motion asking the Commission to defer action on the Initial Decision to permit additional time for settlement discussions. On September 17, 2007, SPS, Golden Spread, Lyntegar, Farmers', Lea County, Central Valley, Roosevelt County, and Cap Rock, filed another joint motion asking the Commission to defer action on the Initial Decision for the same reason. On November 14, 2007, Golden Spread, Lyntegar, and Occidental filed a third joint motion requesting more time to engage in settlement discussions.

[16] *Southwestern Public Service Co.*, 122 FERC ¶ 63,003 (2008). In an order issued contemporaneously with this order, the Commission approved the Settlement Agreement, subject to modification. *Golden Spread Elec. Coop., Inc.*, 123 FERC ¶ 61,054 (2008) (Order Approving Uncontested Partial Settlement Subject to Modifications).

20080421-3031 FERC PDF (Unofficial) 04/21/2008

II. Intersystem Sales and the FCAC

12. The most significant aspect of this case involves how the FCAC operates under section 35.14 of the Commission's regulations with respect to market-based rate transactions. CCG argues that SPS' allocation of average fuel cost for market-based sales impermissibly subsidizes intersystem sales at the expense of native load customers. It is not disputed that SPS' market-based sales contracts provide that SPS recovers the average cost of fuel, not the incremental cost as complainants would prefer.

A. The Commission's Fuel and Purchased Power Cost Adjustment Regulations, 18 C.F.R. § 35.14(a)(2)(v) (2006)[17]

13. Rates for electric service generally have two components; a "demand charge" to recover the utility's fixed (capacity related) costs and an "energy charge" to recover the utility's variable costs, primarily cost of fuel.

14. The energy charge is further composed of two elements. The first element is the "basic energy rate." This recovers the "base cost" of fuel. The basic energy rate must be approved in advance by the Commission. The second element is the "fuel adjustment" charge. This charge is based on a formula designed to recover the difference between the base cost of fuel and the actual cost of fuel incurred over time. A utility's fuel adjustment formula must be approved by the Commission, for it is part of the utility's filed rate. The monthly charge that results from application of the formula, which is an approved rate, thus need not be filed for Commission approval. The fuel adjustment clauses enable utilities to keep their rates in line with the current cost of their fuel without continually having to file for rate increases and decreases.

15. Section 35.14(a)(2) of the Commission's regulations provides in pertinent part as follows:

> 35.14 – Fuel cost and purchased economic power adjustment clauses
> (a)(2) – Fuel and purchased economic power costs shall be the cost of:
> (i)-(iv) – [various costs and charges]
> (v) – *And less* the cost of fossil and nuclear fuel recovered through all intersystem sales. (Emphasis in original).

[17] Unless otherwise stated, all references to section 35.14 are to the 2006 version (in earlier years, subsection (a)(2)(v) was (a)(2)(iv)).

20080421-3031 FERC PDF (Unofficial) 04/21/2008

SPS' FCAC largely tracks the Commission's *pro forma* FCAC. SPS submitted into evidence a sample of its wholesale fuel cost and economic purchased power adjustment clause, which provides in relevant part as follows:

> 2. Fuel costs (*F*), measured in $, shall be the cost of:
>
> (i) fossil and nuclear fuel consumed in Company's own plants . . . .
>
> * * *
>
> (viii) less, the cost of fossil and nuclear fuel and the costs of energy purchases recovered through all inter-system sales.[18]

16. As the Commission has explained before, "[t]he fuel adjustment clause is intended to keep utilities whole with respect to changes in the cost of their fuel. It allows utilities to pass through to their ratepayers increases or decreases in the cost of their fuel, without having to make separate rate filings to reflect each change in fuel cost, and without having to obtain Commission review of each change in fuel cost."[19]

17. The FCAC issues in this proceeding fall into two categories: those raised in the complaint against SPS in Docket No. EL05-19 concerning the SPS FCAC that was in effect prior to the effective date of the proposed FCAC (January 1, 2005) and those in Docket No. ER05-168 concerning the FCAC that SPS proposed in the FPA section 205 filing that is also part of this proceeding.[20] In the following section we address the

general question of how fuel costs recovered from intersystem sales should be allocated per the FCAC under section 35.14(a)(2)(v) when the intersystem sales are market-based rate transactions.

1. Initial Decision

18. The ALJ concluded that SPS' FCAC practices are not permissible. The ALJ first noted that SPS had a long-standing practice of allocating system average fuel and purchased energy costs to firm system capacity sales.[21] The ALJ further observed that in recent years, as the industry has evolved from cost-based to market-based rates, SPS did not reexamine its practice of allocating system average fuel and purchased energy costs to its capacity sales, regardless of whether such sales were opportunity-type sales made under a market-based tariff or traditional requirements sales made under a cost-based tariff.

19. In finding that the sales in question were intersystem opportunity sales, the ALJ characterized them as having a "lesser status" than native load sales, and the ALJ distinguished the intersystem sales from native load sales in that intersystem opportunity sales do not require the same amount of capacity planning, construction, or maintenance.[22]

20. The ALJ stated that the Commission's policy has been "that opportunity sales are generally priced to reflect incremental fuel cost, so that the risk of recovery would fall upon the utility, not other customers."[23] Recognizing the converse, i.e., that wholesale requirements customers pay the average fuel cost, the ALJ also stated that "the record supports the view that this policy was well understood in the industry, as [Golden Spread's witness] suggested, when he stated that other utilities believed that system average fuel belonged to 'the regulated customers, being native load customers, retail, long-term wholesale, those that are considered native or captive customers within their jurisdiction.'"[24]

21. In response to Trial Staff's argument that wholesale requirements customers do not have a superior claim to service than a non-requirements customer, the ALJ stated that "to charge market-based rate customers system average fuel costs should not bind

non-signatory wholesale customers and the Company's retail customers to subsidize such sales through the FCAC by failing to recover from the opportunity sale customers the real incremental fuel costs associated with the market-based sales."[25] The ALJ referenced *Heartland Energy Services, Inc.*,[26] *Entergy Services, Inc.*,[27] and *Consumers Energy Co.*[28] for the proposition that cost-based requirements customers should not subsidize a utility's market-based activities, and the ALJ also noted that other utilities avoided situations such as the one that SPS entered into.[29]

22. The ALJ concluded that:

> The plain facts are that SPS improved its competitive position in making market-based sales by charging market-based customers lower system average fuel costs, and collected the difference from the Company's cost-based customers, who were forced to cover their own fuel costs and the difference between average costs and the incremental fuel costs associated with the market-based sales.[30]

23. The ALJ directed SPS to make a compliance filing "designed to restore its wholesale customers to the position in which they would have been had they been paying a just and reasonable rate, i.e., one calculated to assign incremental fuel costs to market-based customers from 1999 to 2004."[31]

2. Briefs on Exception

24. On this issue, SPS disagrees with the ALJ on two general principles. First, SPS argues the ALJ erred in concluding that SPS' contested market-based rate sales were intersystem opportunity sales. Second, SPS argues the ALJ erred in concluding that the incremental fuel and purchased power costs attributable to those market-based sales should be credited against the costs of fuel and purchased power recovered from the CCG members and Cap Rock.[32]

25. SPS contends that the market-based sales at issue were neither opportunity nor intersystem sales. Rather, SPS describes the sales as "firm system capacity sales."[33] SPS argues that among the salient characteristics of these contracts, most were for periods of one year or more, and many of these contracts contained the "standard SPS FCAC." Furthermore, SPS states that many of these contracts were filed with the Commission. Although these contracts were made under SPS' market-based rate authority, SPS asserts that the rates were designed to recover SPS' average imbedded costs. The rates included a negotiated demand charge that was no lower than the demand charge assessed on SPS' cost-based partial requirements customers operating within the SPS control area. The rates also incorporated SPS' standard FCAC mechanism to recover average fuel and purchased power costs, which SPS alleges is the same mechanism used to recover such costs from the CCG members.[34]

26. SPS argues that, based on the Commission's statements in cases such as *Wisconsin Public Power, Inc. v. Wisconsin Power & Light Co.*,[35] the disputed sales should not be classified as opportunity or intersystem sales.[36] Citing *Kentucky Utilities Company*,[37] SPS characterizes opportunity sales as non-firm and for limited terms. SPS describes firm service as being available on an as-needed basis, being continuously available, and being priced on a fully-allocated cost basis. SPS cites *Commonwealth Edison Company* as support for this proposition.[38] SPS argues that the disputed sales are not opportunity

sales because SPS' sales "were continuously available to the customer from the Company's generation resources, which include capacity purchases made to meet planning reserves," were multi-year sales, and were considered in performing annual system planning.[39] SPS states that "[t]he Presiding Judge's conclusion that the firm system capacity sales made by SPS to neighboring utilities are 'fundamentally different from sales to SPS' cost of service customers' is not well founded."[40]

27. SPS argues that neither its FCAC nor the Commission's fuel clause regulations contemplate the attribution of incremental fuel costs to intersystem sales.[41] SPS states that its FCAC, which is on file with the Commission, provides that SPS shall reduce the fuel and purchased costs that it recovers in monthly FCAC billings by "the cost of fossil and nuclear fuel *recovered through inter-system sales . . . .*"[42] SPS further argues that "there is no basis . . . to impute, attribute or otherwise ascribe to such sales an incremental cost for purposes of making monthly FCAC calculations."[43]

28. SPS next argues that the Initial Decision violates the filed rate doctrine by retroactively amending SPS' filed FCAC provisions.[44] Specifically, SPS invokes the filed rate doctrine in response to the ALJ's order that SPS "restore its wholesale customers to the position in which they would have been had they been paying a just and reasonable rate, i.e., one calculated to assign incremental fuel costs to market-based rate customers from 1999 to 2004."[45] SPS states that FPA section 206(b)[46] limits the Commission to ordering prospective relief, which may take effect no earlier than the

---

[39] SPS Brief on Exceptions at 24. SPS also cites Ex. CCG-8, CRE-32, and Tr. at 1042:5-9 in support of its argument that it plans for these intersystem sales.

[45] *Id.* at 30 (quoting Initial Decision at P 252). As stated above, the Commission's order on setting the complaint for hearing, *Golden Spread Elec. Coop., Inc.*, 109 FERC ¶ 61,321 (2004), established January 1, 2005, as the refund effective date pursuant to FPA section 206.

[46] 16 U.S.C. § 824e(b) (2000).

20080421-3031 FERC PDF (Unofficial) 04/21/2008

refund effective date established when the complaint proceeding begins.[47] SPS also argues that rates established in power sales contracts filed with and accepted by the Commission are binding on the parties even when it is alleged that the selling utility committed fraud on the purchaser.[48]

29. SPS states that the average cost energy rates were the appropriate basis for pricing the disputed sales.[49] SPS argues that the Commission has approved the sale of firm energy priced on the basis of average system energy costs when the transaction was labeled an opportunity sale, but the sale was firm in nature.[50]

30. SPS also argues that nothing in the power sales agreements, under which SPS serves its wholesale requirements customers, gives them preference rights to SPS' most efficient energy production.[51]

31. Trial Staff argues that SPS was correct in attributing average costs to long-term market-based sales.[52] Specifically, Trial Staff focuses on whether sales for more than one year should be called opportunity sales and treated the same as short-term opportunity sales of one year or less.[53] Trial Staff also argues that "[t]he real problem is that SPS' FCAC practices become less objectionable, the longer the term of the long-term contract, to the extent that SPS would be planning, acquiring, constructing and operating capacity and energy to meet its system-wide load requirements, including these long-term sales."[54] Thus, Trial Staff concludes that the ALJ should have approved of SPS' charging of average fuel cost to long-term market-based rate transactions.

3. Briefs Opposing Exceptions

32. CCG argues that the Initial Decision correctly finds that incremental fuel costs should be attributed to SPS' market-based sales.[55] CCG further states that SPS should be required to recalculate the FCAC billings to account differently for SPS' intersystem market-based sales, and that the Commission is permitted to do this under the filed rate doctrine.[56] According to CCG, the Commission has stated that whenever a public utility acts inconsistently with Commission-filed tariffs or with specific requirements in its rate authorizations, the Commission may order refunds to rectify such action.[57] CCG further argues that such refunds are not retroactive ratemaking, but rather serve to ensure that only the filed rate is charged. With formula rates such as the FCAC, argues CCG, the formula itself is the filed rate, and consequently any misapplication of it is a violation of the CCG members' filed rates which the Commission can and should remedy.[58] CCG accordingly asks the Commission to affirm the ALJ and award refunds.[59]

33. CCG states that SPS' sales at issue involve "improper, coerced subsidization by SPS' native load" and that the ALJ properly decided that the policy of protecting wholesale customers from subsidization is an important principle that should be applied here.[60] CCG argues that the filed rate doctrine does not protect SPS because SPS never obtained authorization to engage in a new pricing scheme affecting market-based rate sales that, in turn, could modify the formula applied to cost-of-service based customers.[61]

34. CCG illustrates a distinction between long-standing cost-of-service customers and market-based customers by arguing that CCG and SPS have a regulatory compact to serve and receive service at cost-based rates, as well as the corollary obligation to pay for

[61] *Id.* at 24-25.

embedded capacity resources over the life of those resources.[62] CCG notes that this compact substantially predates the advent of SPS' market-based rate authority in 1995.[63]

35. PNM argues that "[t]he basic problem with the paradigm advanced by SPS and Staff is that under their theory, the terms of SPS' market-based contracts would control the manner in which the Commission applies its regulations governing automatic recovery of fuel costs. If this is so . . . the amount of fuel costs billed under the market-based contract would control, no matter how little such amounts contributed to recovery of actual fuel costs."[64] PNM also argues that SPS' cost-of-service customers were not on notice of SPS' FCAC practice.[65]

4. Commission Determination

36. Given that SPS' FCAC largely tracks section 35.14 of the Commission's regulations, a review of that section is instructive in understanding how SPS' FCAC should be interpreted. When section 35.14 of the Commission's regulations was changed to roughly its present form in 1974 (as otherwise modified since), the Federal Power Commission (FPC) explained that "the purpose of this fuel cost adjustment clause is to keep the utilities whole with regard to changes in the fuel costs per [kWh] sold" by "pass[ing] on to customers the increases or decreases in the fuel costs actually incurred."[66]

37. In order to calculate the fuel cost for native load customers under section 35.14, a utility first computes the fuel cost for all kWh sold, whether to native load customers or intersystem customers.[67] The utility then deducts from the total fuel cost the cost of fuel recovered through intersystem sales.[68] Native load customers pay the remainder. This

"ensures that wholesale customers will not pay for fuel costs already paid for by the intersystem customers."[69]

38. In the past, most utilities were vertically integrated entities that generated, transmitted, and distributed energy to customers in a defined region, known as the utility's native load. Those customers paid for the construction and maintenance of the utility's infrastructure and, in return, the utility served that native load.

39. At times, however, a utility may have available excess generation not already committed to native load customers, providing the utility with an opportunity to sell this capacity to buyers outside its home area. These sales are called opportunity sales or intersystem sales. Duration is not necessarily the determining factor in distinguishing opportunity sales from wholesale requirements sales. Opportunity sales "are simply transactions that are entered into from time to time for . . . an immediate economic benefit reason."[70]

40. In *Minnesota Power & Light Co.*, the Commission stated that in considering how to apply the fuel cost of intersystem sales to the requirements customers' FCACs, requirements customers "are credited with the cost of fuel recovered from the off-system customer."[71] In that case, the Commission also explained that the "[u]tilities generally price the fuel component of intersystem sales on the basis of the cost of the incremental fuel used in meeting intersystem load. Pricing an intersystem sale by reference to the incremental fuel cost assures that the requirements customers pay no more than they would have paid had the off-system sale never occurred."[72]

41. The Commission has clearly sought to prevent the subsidization of shareholders at the expense of captive customers.[73] It would be unreasonable for SPS' intersystem

---

[69] *Id.* at 61,079. The total amount a utility can collect under the FCAC is limited to the amount spent; the Commission explained that "[w]hile we believe that a utility should be made 'whole for increased fuel costs,' we do not believe that a utility should be made whole and plus some." *Id.*

[70] Tr. at 284:19-21 (Daniel).

[71] 47 FERC ¶ 61,064, at 61,184 (1989) (denying petition for declaratory order that it is just and reasonable to assign to intersystem sales lower cost fuel than to requirements customers, but also stating that such an assignment is not *per se* unjust and unreasonable).

20080421-3031 FERC PDF (Unofficial) 04/21/2008

customers to be subsidized by wholesale requirements customers through an FCAC mechanism based on average fuel cost. Preventing such subsidization was the original reason for requiring that utilities price opportunity sales at a price that, at a minimum, made wholesale requirements customers economically indifferent to the sales.

42. In this case, the Commission must consider the workings of a market-based intersystem sale on a FCAC. Market-based rate transactions may take many forms: prices can be fixed by the contract, based on an index, or derived by some other formula. By definition, such prices may have no basis in actual cost.[74] Consequently, fuel cost must be imputed for these transactions for purposes of the utility's fuel cost clause.

43. The Commission finds that because the market-based intersystem transactions do not necessarily have a basis in actual cost, and to avoid the possibility of subsidization of these transactions by the wholesale requirements customers, the Commission must impute an appropriate fuel rate to the fuel cost calculation in order to avoid native load customers overpaying as a result of intersystem transactions under market-based rate contracts. In reaching this conclusion, the Commission recognizes that the FCAC in SPS' cost-based contracts with respect to fuel costs for market-based intersystem sales may not have been entirely clear.

44. Imputing the incremental cost of fuel to intersystem transactions assures that native load customers pay no more for fuel than they would have paid had the intersystem sale not occurred. To impute something different from incremental costs as a surrogate for the actual fuel cost could allow market-based rate sellers to include an artificially low fuel cost into their market-based rate contracts. Imputing an artificially low fuel cost would result in unjust and unreasonable subsidization of intersystem sales by requirements customers, which is contrary to the intent of the fuel cost clause.[75]

45. Attributing incremental fuel cost is consistent with the only market-based rate case that addressed this subsidizing effect. In *Entergy Services, Inc.*,[76] the Commission acknowledged that there is "no requirement [that the utility, when making off-system

---

[74] In the instant proceeding, there is no dispute that SPS' market-based contracts provide for average fuel costs. But the specification of costs in a market-based contract is not determinative for purposes of the current issue, as explained below.

[75] Because the Commission does not review fuel costs in market-based rate contracts, parties could set the fuel cost at any price, or even at zero, which would result in requirements customers compensating the utility for *all* of the utility's fuel costs incurred for sales to others.

[76] 58 FERC ¶ 61,234 (*Entergy*).

sales] sell power and energy . . . at rates that would recover at least its system incremental costs."[77] But to protect wholesale customers who had FCACs in that case, the Commission ordered Entergy to incorporate a floor into the relevant rate schedule equal to the incremental costs incurred to provide the service.[78] The same principles of protecting wholesale requirements customers from an unjust subsidization as applied in *Entergy* apply here.

46. In *Consumers Energy Company*,[79] the Commission addressed the potential for captive wholesale customers to subsidize an affiliate sale because the fuel cost clause excluded sales that Consumers made to an affiliate. The Commission found that the amounts collected by Consumers from its affiliates would have been insufficient to cover the incremental cost of the sales. Recognizing the potential for improper subsidization by captive customers, the Commission directed Consumers to amend its contracts to credit the cost of fuel recovered at the incremental cost or otherwise accomplish the same objective.

47. In the instant proceeding, for market-based rate transactions, SPS' prices are limited by competition in lieu of cost-based regulation. If SPS or any other seller wishes to include a fuel price in its market-based contract, that price may be defined as average (as SPS so defined), indexed, incremental, or in any other manner. The fact that at least some of these contracts were filed with the Commission and accepted for filing is not germane because, as we stress here, the Commission is not seeking to change the contract language regarding fuel costs in market-based contracts, if fuel costs are even addressed at all. The Commission is simply directing here that, in order to avoid subsidization, the incremental cost of fuel for these market-based intersystem sales must be flowed through the FCAC.[80]

---

[77] *Id.* at 61,772.

[78] *Id.*

[79] 94 FERC ¶ 61,180 (*Consumers*).

[80] The Commission notes that it may be appropriate to allow a cost of fuel other than the incremental cost to be attributed to market-based intersystem sales where the utility provides clear evidence that it planned and constructed its system or made purchases specifically to serve particular market-based intersystem transactions. However, SPS has failed to provide any such evidence here. Instead, it has provided little more than a general statement that it engaged in such plans (Tr. 1042:5-9 (Diller)), and several load forecast charts that do not make clear what planning, if any, was done to support intersystem sales (Ex. CCG-8 and CRE-32). We are not convinced that such

(continued…)

48. Consistent with this finding, SPS itself appears to have questioned the appropriate cost treatment for market-based intersystem sales transactions. As discussed by the ALJ in the Initial Decision,[81] a former SPS employee who testified for Golden Spread[82] stated that, when he worked at SPS, he had discussions with utilities such as Oklahoma Gas & Electric and other companies in the Southwest Power Pool about utilities not offering system capacity with system fuel costs due to "regulatory risk."[83] According to this witness, whose duties varied at SPS but who described himself as "basically . . . a bulk power sales manager or representative that conducted sales negotiations [with] various wholesale . . . power purchasing entities,"[84] the regulatory risk was:

> the concern . . . that the system average fuel really belongs to the regulated customers, being native load customers, retail, long-term wholesale, those that are considered native or captive customers within their jurisdictions. So they were

---

evidence demonstrates that SPS engaged in planning specifically to support its intersystem transactions.

[81] Initial Decision at P 148.

[82] Though Golden Spread settled with SPS and is not a party to the issue discussed in this section of the order, the testimony of Golden Spread's witness remains a part of the record, and as such, the Commission relied upon this testimony in making its determination.

[83] Initial Decision at P 148 (discussing the record supporting the view that opportunity sales are generally priced to reflect incremental fuel cost and citing testimony sponsored by Golden Spread that this was well-understood in the industry). *See generally* Tr. 959-66 (Wise) (redirect examination of Golden Spread witness Wise, attesting that SPS was aware of regulatory risk in offering wholesale system sales at system average fuel cost).

[84] Tr. 957:17-19 (Wise). This witness described his career at SPS more fully in testimony contained in Exhibit GSL-26 at 2-3. His positions at SPS included: Statistician; Supervisor, Market Research; Competitive Analyst; Strategic Analyst; and Regional Power Sales Manager. Ex. GSL-26 at 2-3. In his capacity as Regional Power Sales Manager, this witness states that he was "responsible for analyzing markets and developing and negotiating significant power contracts . . . including: energy, capacity, transmission and ancillary services." *Id.* He further states that he worked with electric cooperatives, municipal utilities and investor owned utilities within SPP, Electric Reliability Council of Texas, and the Northwest Power Pool. *Id.* at 3.

> very concerned, and they said they were frankly surprised that SPS was willing to offer wholesale system sales at system average fuel.[85]

The former SPS manager further testified that "the discussion about system average fuel was well known within the company . . . and it was well known throughout the company . . . there was a potential to have a regulatory treatment that was unfavorable due to it."[86] In this regard, this witness testified that SPS' wholesale power business

> included the regulatory folks . . . and the legal folks in Denver. They were a part of the line of individuals we had to get approvals for to sign any of these contracts. So they were fully aware of all of the conditions . . . .[87]

49. For the reasons discussed in the following section of this order (Time Period Concerning Historical FCAC Charges), the Commission concludes that refunds will be ordered beginning on January 1, 2005, the refund-effective date established in the December 21, 2004, order setting the complaint for hearing,[88] and SPS will be required to implement the FCAC as instructed herein.[89]

B. Time Period Concerning Historical FCAC Charges[90]

1. Initial Decision

50. The ALJ determined that the relevant period for considering the FCAC is from 1999 forward.[91] The ALJ found that FCAC implementation practices became questionable beginning in 1999, after the Commission implemented open access and market-based rate sales increased. The ALJ observed that while market participants had no basis to complain about the FCAC prior to 1999, beginning in 1999, SPS was under a

---

[89] Because the Commission is ordering refunds effective January 1, 2005, we need not address SPS' argument that contracts are binding on parties even when fraud is alleged.

[90] Initial Decision at P 120-25 (Issue II.A.1).

[91] *Id.* P 125.

20080421-3031 FERC PDF (Unofficial) 04/21/2008

duty to examine its FCAC implementation practices due to changed market conditions. Therefore, the ALJ determined that SPS would owe refunds for a period beginning in 1999 and ending in 2004.

2. Briefs on Exception

51. SPS argues the ALJ erred because law and equity demand that a decision granting refunds should only be given prospective effect. SPS contends neither SPS nor the Commission has the authority to modify SPS' contracts with SPS' market-based wholesale customers retroactively to provide for the recovery of incremental costs.[92]

3. Commission Determination

52. Sections 205 and 206 of the FPA are the statutory foundation for the filed rate doctrine and the rule against retroactive ratemaking. According to section 205(c), all rates must be on file with the Commission: "Under such rules and regulations as the Commission may prescribe, every public utility shall file with the Commission, within such time and in such form as the Commission may designate . . . schedules showing all rates and charges . . . subject to the jurisdiction of the Commission . . . ."[93] The Commission has determined that utilities engaging in market-based sales must file a tariff with the Commission so stating, but components of the price need not be broken out in the tariff. Instead, information relating to transactions must be filed in Electric Quarterly Reports,[94] and the contracts remain jurisdictional without having to be filed with us.[95]

53. In the instant proceeding, both as to SPS' prior FCAC that is the subject of a complaint and as to the FCAC that SPS proposes in its FPA section 205 filing, SPS

flowed through (and proposes to continue to flow through) its FCAC the amount of money recovered for fuel for its market-based sales based on the average cost. The Commission may take retroactive refund action to address circumstances where a seller did not charge the filed rate or violated statutory or regulatory requirements or rules in applicable rate tariffs, but SPS' FCAC is ambiguous on the issue in dispute.[96] Following consideration of all of the evidence presented, the Commission has concluded above that in order to avoid wholesale requirements customers subsidizing intersystem sales, SPS' FCAC should be construed as requiring SPS to attribute incremental costs for purposes of the FCAC.[97] However, because the interpretation of the FCACs contained within SPS' contracts with respect to such attribution may not have been clear prior to the institution of these proceedings, the Commission will apply the clarification of FCACs to take effect as of the refund effective date established in these proceedings. We note that "the breadth of agency discretion is, if anything, at zenith when the action assailed relates primarily . . . to the fashioning of policies, remedies and sanctions . . . ."[98] Accordingly, SPS is directed to make refunds starting with the refund effective date, January 1, 2005,[99] and to apply the FCAC as directed herein on a prospective basis.

III. Cost of Service

54. In its original complaint, CCG argues that SPS' full requirements and partial requirements rates for the period January 1, 2005 to July 1, 2006[100] are unjust and unreasonable and are unduly discriminatory and/or preferential.[101] CCG cites its

allocated cost-of-service analysis in arguing that SPS' current demand and energy charges and the associated revenues in the aggregate and as applicable to each of the cooperatives' members exceed prudently incurred and properly allocated costs of providing requirements power supply service. CCG concludes that SPS' "overcharges . . . will result in higher rates for the retail consumers."[102] CCG also asserts that SPS data submissions to the Commission contain inconsistencies, and that these submissions lack detail; the result, CCG claims, is that they cannot confirm the proper values to be used in a cost of service analysis. CCG also alleges that SPS' parent company, Xcel Energy Inc., allocates excessive costs to SPS. Based on the allegations raised in the complaint, the Commission set the matter for hearing and settlement judge procedures.

A. Rate of Return[103]

1. Initial Decision

55. As explained by the ALJ, the determination of a just and reasonable return on equity (ROE) is governed by two standards: (1) the rate must be sufficient to allow the regulated entity to maintain its financial integrity and to allow the utility to maintain its credit and attract investment capital; and (2) the rate must be commensurate with returns on investments in enterprises that have a corresponding risk.[104]

56. The ALJ also stated that the discounted cash flow (DCF) methodology has been favored by the Commission, and that the Commission has expressed a preference for using current market data to develop an electric utility's ROE.[105] When, as in this case, the rate under consideration is "locked-in" (the rate being litigated has been superseded or is otherwise no longer in effect), the Commission updates the equity allowance for the

[105] *Id.* P 80.

locked-in period based on the change in average yields on ten-year constant maturity U.S. Treasury bonds.[106]

57. The ALJ accepted Trial Staff's proxy group.[107] Using that proxy group, the ALJ determined that 9.64 percent is the just and reasonable ROE for SPS. In making this determination the ALJ used 9.20 percent, the median ROE of Trial Staff's proxy group, as a base and added seven basis points as a flotation adjustment for an ROE of 9.27 percent.[108] The ALJ then added 37 basis points to account for interest rate risk, for a total ROE of 9.64.[109]

2. Briefs on Exception

58. SPS argues[110] that the ALJ's reliance on Trial Staff's analysis using the median value for the zone of reasonableness was incorrect because the Commission's recent orders relating to ROE employ the midpoint, not the median, in setting the ROE for electric utilities.[111] SPS also argues that the ALJ compounded this error by adopting the ROE at the median for the zone of reasonableness established by the high and low returns of Trial Staff's four proxy companies. SPS claims that the ROE should be placed in the upper half of the zone of reasonableness because three of the four companies in Trial Staff's analysis have higher credit and bond ratings than SPS and therefore SPS presents

[109] *Id.* P 104.

[110] SPS Brief on Exceptions at 71-75.

[111] SPS Brief on Exceptions at 72. SPS cites *Consumers Energy Company*, 98 FERC ¶ 61,333, at 62,416 (2002), and *Southern California Edison Company*, Opinion No. 445, 92 FERC ¶ 61,070 (2000) (*Southern California Edison*), as support for using the midpoint. The Commission notes here that the midpoint of all the estimates of ROE of a proxy group is the average of the highest and lowest estimated ROE of all members of the group. The median is that point within the zone of reasonableness where half the returns have a higher value and half the returns have a lower value. The mean, or average, is the sum of the estimates of each member of the proxy group, divided by the number of estimates.

a greater financial risk.[112] SPS states that it is seen by the financial community as a company that presents relatively more risk than Trial Staff's proxy companies do, and that when faced with similar facts in *Southern California Edison Co.*,[113] the Commission found that the ROE should be above the midpoint of returns indicated for the comparison group.[114] SPS argues that the appropriate ROE in the instant case should be 10.65 percent.[115] SPS also claims that this should be adjusted upward for the increase in the 10-year constant maturity Treasury bonds for the period ending June 30, 2006, the end of the period for the rates at issue in this case.[116]

59. CCG argues the ALJ should not have rejected its proxy group based on a determination that one of the proxy group companies did not accurately reflect the risks of SPS, nor should the ALJ have concluded that a three company proxy group was insufficient to judge return in a DCF analysis. CCG also claims the ALJ should have used the Commission's long-standing methodology for locked-in rates rather than a method used for open-ended periods.[117] CCG states that it does not object to adjusting the ROE *per se*; however, it highlights the fact that the rates at issue here are for a locked-in period.[118] CCG cites several cases in support of its position that "in updating an ROE applicable to a locked-in period, the appropriate inquiry is to compare the average yield on ten-year constant maturity Treasury bonds in the period used to establish the ROE to the average yield on such bonds for the entire locked-in period."[119] Then, CCG states, the Commission should adjust the locked-in period ROE for any difference found, if the resulting ROE is still within the zone of reasonableness established in the

record.[120] CCG contends following the locked-in method results in an adjustment of 6 basis points rather than 37, with the resulting ROE being 9.33 percent (9.27 + .06).[121]

3. Briefs Opposing Exceptions

60. CCG and Trial Staff object to SPS' claim that Commission policy is to use the midpoint to set the ROE for a single utility. CCG and Trial Staff cite the Commission's discussion in *Midwest Independent Transmission System Operator, Inc*.[122] as the correct policy: i.e., that the median is the appropriate measure of central tendency of a single utility. Further, CCG and Trial Staff argue that the ALJ was correct in rejecting SPS' request to place the ROE in the upper end of the range of the zone of reasonableness. CCG argues that SPS' claims of higher risk based on three of four companies having higher risk credit and bond ratings does not justify a higher ROE. This is because, in total, SPS is no greater risk than the proxy group based on an analysis of multiple credit risk factors. CCG highlights Staff's testimony that addressed three indicators of risk and concluded that SPS and the proxy group were equal in risk.[123] In its brief opposing exceptions, Trial Staff asserts that while three of the four companies in its proxy group had higher S&P Corporate Credit Ratings, SPS ignored other important risk factors. These factors are: (1) the *Value Line* Safety Rank, a comprehensive measurement of risk derived from the volatility of the stock as measured by its index of price stability relative to 1,700 other stocks over the past five years; (2) *Value Line's* Financial Strength rating of the company; and (3) S&P's Business Profile comparisons. S&P's Business Profile is a rating system that measures a company's business risk relative to an overall utility industry business risk profile.[124] Trial Staff's analysis indicated that its proxy group members and SPS' parent, Xcel Energy Inc., all had a Safety Rank of 2. In addition, SPS' S&P Business Profile number was 5 (on a scale of 1 to 10, where 1 is least risky and 10 is most risky) as opposed to Trial Staff's proxy group average of 5.5.[125] Therefore, Trial Staff argues, SPS poses no greater risk than the proxy group and SPS should be placed in the median of the zone of reasonableness.

[123] CCG Brief Opposing Exceptions at 63-66.

[124] Trial Staff Brief Opposing Exceptions at 23-25.

[125] *Id.*

61. SPS argues that the ALJ's decision rejecting CCG's proxy group was reasonable, because Energy East did not face the same business risks as SPS and therefore was not a reliable basis for an ROE determination.

4. Commission Determination

62. Based on the record in this case, we find the just and reasonable ROE to be 9.33 percent for the period beginning January 1, 2005 and ending July 1, 2006. The Commission affirms the ALJ's determination to use Trial Staff's proxy group.[126] We also affirm the ALJ's use of the median value for the zone of reasonableness to determine the just and reasonable ROE. However, as discussed below, we reverse the ALJ's finding that a 37 basis point interest rate adjustment is appropriate.

63. When deriving the ROE for an individual utility facing average risk, the Commission has held that the median best represents the central tendency in a proxy group with a skewed distribution of returns.[127] In *Midwest ISO*[128] the Commission contrasted the formula for deriving the ROE for an individual utility versus the formula for deriving the ROE for a diverse group of utilities included in the Midwest ISO.

---

[126] Both Trial Staff's proxy group and CCG's proxy group result in a 9.27 percent ROE. Initial Decision at P 89 and P 96. The Commission also agrees with the ALJ's decision to reject CCG's proxy group based upon its inclusion of Energy East, because the company may not accurately reflect SPS' risks. *Id.* P 107. While a larger group is generally desirable, the group cannot include companies that are not reflective of the subject companies. Using Trial Staff's proxy group is thus preferable to CCG's proxy group because when two groups' risk profiles are interchangeable, the larger group is statistically preferable. Trial Staff's proxy group is also more representative than SPS', which the ALJ found, *inter alia*, included companies with business and related risks that are significantly different from SPS' regulated utility business and wholesale electric service. *Id*. P 106. Finally, the Commission agrees with the ALJ's rejection of SPS' proxy group because of the inclusion of Constellation, which was in the midst of merger activity at the relevant time. *Id.* P 106.

[127] *Northwest Pipeline Corp.*, 99 FERC ¶ 61,305, at 62,276 (2002). However, as discussed further below, to the extent that the Commission determines that an applicant is not of average risk vis-à-vis the proxy group, then the Commission's *Southern California Edison* precedent would apply to the determination of the appropriate ROE within the range of reasonableness.

[128] 106 FERC ¶ 61,302 at P 10.

20080421-3031 FERC PDF (Unofficial) 04/21/2008

> Because the ROE in this case will apply to a diverse group of companies, the entire range of results yielded by the subset is relevant here. Thus, we find that using the midpoint is the most appropriate measure for determining a single ROE for all Midwest ISO [transmission operators], since it fully considers that range. Selecting the most refined measure of central tendency, as might be achieved with use of the median, is not the Commission's goal in this case, given that we are not selecting a ROE for a single utility of average risk.[129]

64. Here, we are determining the just and reasonable ROE for a single utility of average risk and find the median to be appropriate for setting the ROE. In *Transcontinental Gas Pipe Line Corp.*,[130] the Commission determined that setting the ROE at the median of the zone of reasonableness lessens the impact of any single proxy company whose ROE is atypically high or low. While there are no concerns of extremes here, using the median also has the advantage of taking into account more of the companies in a proxy group rather than only those at the top and bottom. We decline to place SPS in the upper half of the zone of reasonableness because we conclude, based on the S&P Safety Rank and Business Profile factors, SPS does not have any higher risk than the proxy group, despite SPS' arguments to the contrary.[131] SPS cites *Southern California Edison*, a case in which the Commission placed the utility in the upper half of the zone of reasonableness because it found the company to be more risky than the proxy group.[132] Unlike in *Southern California Edison*, here we find that SPS is not more risky than the proxy group. Accordingly, we affirm the use of the median in establishing the ROE for SPS.

65. We reverse the ALJ's finding that there should be a 37 basis point interest rate adjustment. Instead, the adjustment should be 6 basis points, because the rates at issue here are for a locked-in period. Therefore, the ROE should be 9.33 percent (9.27 plus 6 basis points). As CCG correctly noted, where the rate under consideration is "locked-in" (that is, the rate being litigated has been superseded or is otherwise no longer in effect),[133]

---

[129] *Midwest ISO*, 106 FERC ¶ 61,302 at P 10.

[130] 84 FERC ¶ 61,084, *aff'd* Opinion No. 414-B, 85 FERC ¶ 61,323 (1998).

[131] Trial Staff Brief Opposing Exceptions at 23-25.

[132] *Southern California Edison*, 92 FERC ¶ 61,070, at 61,266 (2000) ("[W]e find that SoCal Edison is more risky than the comparison group. Therefore, the appropriate ROE for SoCal Edison should be above the midpoint of returns indicated for the comparison group").

[133] As noted, the rates at issue here are for the locked-in period from January 1, 2005 to July 1, 2006.

20080421-3031 FERC PDF (Unofficial) 04/21/2008

the Commission updates the equity allowance for the locked-in period based on the change in average yields on ten-year constant maturity U.S. Treasury bonds.[134] Instead of following the Commission's methodology for adjustments applicable to locked-in period rates, the ALJ used the Commission's method for updating based on open-ended rates. This was inconsistent with Commission policy, as the rates at issue here were for a locked-in period. Accordingly, we adopt the adjustment required by Commission precedent for locked-in rates, 6 basis points instead of 37 basis points.

B. Coincident Peak Basis (3 CP v. 12 CP)[135]

66. Demand allocation refers to the method of apportioning fixed capacity costs among customer classes. The Commission typically uses a coincident peak method to allocate demand costs, in which demand costs are allocated based on the customer class' demand at the time of (coincident with) the system peak demand.[136] The coincident peak may be based, for example, on a single peak month (1 CP), the average of three peak months (3 CP), or the average of peaks in twelve months (12 CP). A company that has a relatively flat demand curve throughout the year would typically allocate demand on a 12 CP basis, which assumes that a utility's demand is relatively constant throughout all twelve months of the year. A summer (or winter) peaking company would more typically allocate demand on a 3 CP basis, which assumes demand will peak during the three peak usage months.

1. Initial Decision

67. The ALJ concluded that SPS remains a 3 CP system,[137] not a 12 CP system as Cap Rock, SPS, and CCG propose. The ALJ cited *Louisiana Power & Light Co.*,[138] in

---

[134] *E.g.*, *Jersey Cent. Power & Light Co.*, Opinion No. 408, 77 FERC ¶ 61,001, at 61,009-10 (1996).

[135] Initial Decision at P 10-24 (Issue I.A). We note that the issue of the Coincident Peak Basis is the sole issue that the Settling Parties did not resolve in the Settlement Agreement. Therefore, this portion of the order applies to both the Settling Parties and non-settling parties.

[136] *See generally Delmarva Power & Light Co.*, 17 FERC ¶ 63,044, at 65,199-203 (1981), *aff'd in relevant part*, Opinion No. 185, 24 FERC ¶ 61,199 (1983) (*Delmarva Initial Decision*) (discussing method of demand cost allocation).

[137] *Cf. Southwestern Pub. Serv. Co.*, Opinion No. 162, 22 FERC ¶ 61,341, at 61,589-591, *reh'g denied*, 23 FERC ¶ 61,406 (1983) (Opinion No. 162) (affirming that SPS is a 3 CP system); *Southwestern Pub. Serv. Co.*, Opinion No. 337, 49 FERC

(continued…)

rejecting calls for changing SPS' demand allocation method. *Louisiana P&L*, the ALJ explained, states that the demand allocation method should not be changed except when there are changed circumstances or a change in policy.[139] The ALJ concluded that the data suggest modest changes but not "major shifts" in the load curve.[140] The ALJ further observed that one of the factors that may have caused the movement in the direction of a flatter demand curve – the increase in intersystem sales caused by the availability of excess power due to the shift of Golden Spread to a partial requirements customer – has run its course.[141] Moreover, the ALJ found that one cannot assume the continuation of whatever flattening of the demand curve occurred.[142]

2. Briefs on Exceptions

68. CCG,[143] Cap Rock,[144] and SPS[145] argue that SPS is now a 12 CP system, and they disagree with the ALJ's conclusion that SPS remains a 3 CP system. They claim that SPS' peak load ratios and other operating realities have changed substantially since the Commission last examined the SPS system in 1989. They claim that analyses by Cap Rock, SPS, and others in the proceeding take into account factors besides the availability of excess power due to the shift of Golden Spread to a partial requirements customer, such as large retail customers seeking to firm up service previously taken on an interruptible service basis and SPS' rapidly increasing growth in high load factor oil field load. They state that the evidence clearly establishes that SPS is now a 12 CP system.

69. For example, CCG states that during the hearing they introduced updated analyses of various aspects of SPS' system demand curve and other system characteristics, based on data from recent years, to show the appropriate wholesale demand cost allocator in

---

¶ 61,296, at 62,132 (1989), *reh'g denied*, Opinion No. 337-A, 51 FERC ¶ 61,130 (1990) (Opinion No. 337) (same).

[138] Opinion No. 110, 14 FERC ¶ 61,075, at 61,128, *reh'g denied*, 15 FERC ¶ 61,297 (1981) (Opinion No. 110 or *Louisiana P&L*).

20080421-3031 FERC PDF (Unofficial) 04/21/2008

light of current conditions, and that, in total five witnesses concluded that SPS has now become a 12 CP system.[146] CCG argues that the Initial Decision does not discuss or dispute this evidence, undermining its ruling that a 3 CP allocator should continue to be used.[147]

70. CCG, Cap Rock, and SPS also claim that the burden of proof for a change in methodology is satisfied by a just and reasonable standard, and that the ALJ broke with precedent set in *Louisiana P&L* by ruling that "there should be a strong reason for changing allocation methodologies," and parties seeking to do so must show "major shifts in the load curve."[148] They claim that Opinion No. 110[149] states that the demand allocator should not be changed "except where there are changed circumstances or a change in policy."

3. Brief Opposing Exceptions

71. Golden Spread argues that the Initial Decision was correct in concluding that SPS' operating realities remain consistent with a 3 CP system.[150] Golden Spread submits that its demand allocation testimony demonstrates that SPS remains a 3 CP system, and that its evidence complies with the requirements set forth in *Illinois Power Co.*[151] Golden Spread asserts that Cap Rock, CCG, and SPS failed to meet the burden of proof, and shifting to a 12 CP would impose a significant cost shift on the sole entity that has done anything of significance on the system to curtail summer demand. Golden Spread claims that the ALJ recognized its comprehensive analysis and correctly concluded that "there should be a strong reason for changing allocation methodologies, given the impact on customers' expectations and the shifting price signal effects associated with a change in methodology."[152]

72. Golden Spread claims that what little change has occurred in the SPS system in metrics can be attributed to the response by Golden Spread to the 3 CP price signal.

---

[146] CCG Brief on Exceptions at 4.

[151] *Id.* at 17 (citing *Illinois Power Co.*, 11 FERC ¶ 63,040, at 65,247-48 (1980), *aff'd in relevant part*, 15 FERC ¶ 61,050, at 61,093 (1981) (*Illinois Power*)).

[152] Initial Decision at P 24.

20080421-3031 FERC PDF (Unofficial) 04/21/2008

Golden Spread states that it built a highly efficient generating facility that tempered the growth of the SPS summer peak, limiting cost increases to the SPS ratepayers, and providing significant energy cost savings. Golden Spread states that affirming the ALJ would ensure that customers will not be penalized for merely responding to price signals and reducing the burden they impose on a summer peaking system.

73. Golden Spread points out that the Trial Staff witness who advocated the switch to 12 CP in prefiled testimony was not as certain during the hearing, and admitted that a 12 CP would probably produce a price signal that would not discourage customers to reduce their summer load, but rather have the opposite effect.[153]

4. Commission Determination

74. We reverse the Initial Decision's finding that the 3 CP methodology remains the correct demand cost allocator for the SPS system. Although the Commission previously determined that SPS was a 3 CP system, we find that the ALJ misapplied the *Louisiana P&L* standard and overlooked numerical data in concluding that demand changes on the SPS system do not provide a "strong reason" for shifting the demand allocator to a 12 CP methodology.[154]

75. While the Commission has not established hard and fast rules for determining whether the 3 CP or 12 CP allocation method is appropriate, we have explained that the following factors should be considered when determining which allocation to use: "[t]he full range of a company's operating realities including, in addition to system demand, scheduled maintenance, unscheduled outages, diversity, reserve requirements, and off-system sales commitments."[155]

76. Historically, the Commission has considered three tests in determining whether a system is better characterized as 3 CP or 12 CP. First, the Commission compares the average of the system peaks during the purported peak period, as a percentage of the annual peak, to the average of the system peaks during the off-peak months, as a percentage of the annual peak – the On and Off Peak test. Generally, the Commission

[154] Initial Decision at P 9.

[155] *Carolina Power & Light Co.*, Opinion No. 19, 4 FERC ¶ 61,107, at 61,230 (1978); *Illinois Power*, 11 FERC ¶ 63,040 at 65,247-48; *see also Delmarva Initial Decision*, 17 FERC ¶ 63,044 at 65,199-203 ("The Commission has not adopted any one method . . . its determination of the appropriate allocation method has rested on the facts of each case.").

20080421-3031 FERC PDF (Unofficial) 04/21/2008

has held that a nineteen percentage point or less difference between these two figures supports using the 12 CP method.[156] The second test, the Low-to-Annual Peak test, involves the lowest monthly peak as a percentage of the annual peak. The Commission considers a range of sixty-six percent or higher as indicative of a 12 CP system.[157] The third test is the Average to Annual Peak test, and it computes the average of the twelve monthly peaks as a percentage of annual peak. Generally, the range for a utility to be considered 12 CP is eighty-one percent or higher.[158]

77. The Commission is persuaded by testimony and evidence submitted by SPS, Cap Rock, the full requirements customers,[159] and Golden Spread that substantive changes have occurred on the SPS system since the Commission last addressed the issue in 1989. The chart below is a comparison of previously accepted ratios from the peak tests indicative of a 12 CP system to the ratios submitted as evidence by various parties at trial regarding SPS' system. Differences in ratio values can be attributed to the inclusion or exclusion of interruptible loads, off-system sales, and the number of years used to calculate the average ratios shown below. The chart illustrates that applying the same analytical criterion that was primarily used in Opinion Nos. 162 and 337 to determine that SPS was a 3 CP system now clearly demonstrates it is a 12 CP utility. Even Golden Spread's witness Linxwiler's ratios, who testified in support of SPS remaining a 3 CP utility, meet the acceptable range.

---

[156] *See, e.g., Illinois Power*, 11 FERC ¶ 63,040 at 65,248-49 (comparing average summer peak of ninety-four percent of annual peak to eight-month average peak of seventy-five percent of annual peak, a difference of nineteen percentage points).

[157] *Id.* (approving 12 CP where lowest monthly peak as percentage of annual peak was sixty-six percent); *Delmarva Initial Decision*, 17 FERC ¶ 63,044 at 65,201 (stating that Commission favors 12 CP method and citing 12 CP cases with low monthly peaks).

[158] *See, e.g.*, *Illinois Power*, 11 FERC ¶ 63,040 at 65,249 (approving 12 CP where average monthly peak for five-year period was eighty-one percent); *Lockhart Power Co.*, Opinion No. 29, 4 FERC ¶ 61,337, at 61,807 (1978) (approving 12 CP where average monthly demand was eight-four percent of annual system peak); *El Paso Elec. Co.*, Opinion No. 109, 14 FERC ¶ 61,082, at 61,147 (1981) (approving 12 CP where twelve-month average was eighty-four percent of maximum peak).

[159] Central Valley Electric Cooperative, Inc., Farmers' Electric Cooperative, Inc., Lea County Electric Cooperative, Inc., and Roosevelt County Electric Cooperative, Inc.

	Lowest-To-Peak	On-Peak-Off-Peak	Average-To-Peak
Historical Commission Range for 12 CP	66% or higher	19% or less	81% or higher
Heintz, SPS-37 at 16	68%	19%	82%
Saffer FRC-2 Pro Forma	70%	18%	84%
Linxwiler, GSL – 1 at 9-10	67.55%	19%	82.05%
Diller, CRE-1 at 18	70%	18%	84%

78. In addition, in the years since Opinion Nos. 162 and 337, Golden Spread switched from a full-requirements, high summer-peaking customer on SPS' system to a partial requirements customer with a year-around, fixed contract. SPS testified that this and other factors have increasingly flattened its load profile to a point inconsistent with a 3 CP utility, as illustrated by the peak ratio percentages submitted by SPS and others.[160] We agree and will reverse the ALJ's finding that SPS is a 3 CP utility and conclude that use of the 12 CP demand allocation methodology appropriately reflects SPS' system.

C. Demand Cost Allocation Factors[161] and Post Test Year Adjustments[162]

1. Initial Decision

79. The ALJ determined that the interruptible load deductions[163] issue was resolved in the Joint Trial Stipulation, and that Cap Rock is free to further pursue the matter in

[160] *See* SPS Brief on Exceptions at 64 (citing Tr. 1560:3-9).

[161] Initial Decision at P 108-113 (Issue I.J).

[162] *Id.* P 114-119 (Issue I.K).

[163] When deriving demand cost allocation factors, interruptible loads, which are wholesale and/or retail loads whose service may be interrupted in peak periods, should be removed from the demand calculation. *See Louisiana Pub. Serv. Comm'n v. Entergy Corp*., 106 FERC ¶ 61,228 (2004) *aff'd*, 111 FERC ¶ 61,080 (2005).

20080421-3031 FERC PDF (Unofficial) 04/21/2008

Docket No. ER06-274.[164] On the question of post test year adjustments, the ALJ determined that none should be made in the instant proceeding.[165]

2. Brief on Exception

80. In its Brief on Exceptions, Cap Rock stated that it does not except to the Initial Decision's determination on interruptible loads to the extent it is limited to the cost of service for the test year. Rather, Cap Rock asks that the Commission clarify that the stipulation does not control the treatment of interruptible loads in the analysis of the system load characteristics used in determining demand cost allocation.[166] Cap Rock asserts that the parties did not stipulate how to treat interruptible loads for purposes of analyzing the SPS system characteristics.[167] Similarly, Cap Rock does not except to the ruling that no post-test year adjustments may be made but claims it sweeps too broadly by prohibiting the use of post-test year adjustments made solely for the purpose of analyzing SPS' system load characteristics.[168] Cap Rock also requests that the Commission rule that it is appropriate to include intersystem sales in analyzing system load characteristics.[169]

3. Commission Determination

81. The Commission clarifies that the stipulation does not control the treatment of interruptible loads in the analysis of the system load characteristics in determining demand cost allocation. Cap Rock argues that retail loads that are not interruptible in the non-summer months of October through May should be included for purposes of analyzing system load characteristics.[170] Doing so has the effect of further flattening the SPS load profile, which changes its load ratio measures to be more in line with a utility with a 12 CP profile. While we make this clarification, Cap Rock's request is moot because we find that SPS is a 12 CP utility even without this adjustment. Regarding Cap

[170] Cap Rock Brief on Exceptions at 63-69 (citing Opinion Nos. 468 and 468-A; *Delmarva Power & Light Co.*, 22 FERC ¶ 63,053, at 65,204-05, *aff'd*, Opinion No. 189, 25 FERC ¶ 61,022 (1983)).

20080421-3031 FERC PDF (Unofficial) 04/21/2008

Rock's other two requests, we find that it would be inappropriate to include opportunity sales or inapplicable test year adjustments in the allocation of demand costs. To do so would, in effect, provide double credit to Cap Rock. If opportunity sales are included in the demand cost allocators and given revenue credit treatment, Cap Rock benefits twice through reduced demand rates and revenue credits from the proceeds of the off-system sales. Including post-test year results would have a similar effect. Accordingly, we deny Cap Rock's requests.

D. Revenue Crediting vs. Cost Allocation[171]

82. In a cost-based regime, revenues from intersystem sales are typically reflected in wholesale rates through either a revenue credit or an allocation in the cost of service. Under the revenue credit method, all the costs are allocated to requirements customers, and each requirements customer group is then subsequently credited with its share of intersystem demand revenues and energy revenues via demand and energy allocators, respectively. The revenue crediting method is most often used when sales are opportunity sales.[172] The Commission has expressed a preference for the use of revenue crediting for opportunity sales.[173] Under the cost allocation method, intersystem sales customers are treated as if they are a separate customer group in a cost of service study by including their monthly demands in the energy and demand cost allocator denominators. Thus, intersystem customers are allocated a share of the total system fixed and variable costs as if they were requirements customers. The Commission has found the allocation method appropriate for firm intersystem sales with a term of one year or more.[174]

[171] Initial Decision at P 25-33 (Issue I.B).

[172] *See Public Serv. Co. of New Mexico*, Opinion No. 146, 20 FERC ¶ 61,290, at 61,547 (1982) (Opinion No. 146) (crediting revenue from intersystem opportunity sales to native load customers).

[173] *See, e.g., Public Serv. Co. of Oklahoma*, Opinion No. 788, 57 FPC 1041, 1050 (1977) (FPC Opinion No. 788) (crediting revenue from intersystem sales to on-system customers); Opinion No. 146, 20 FERC ¶ 61,290 at 61,546-48 ("The Commission has typically used revenue crediting for opportunity sales.").

[174] *See, e.g.*, *Boston Edison Co.*, Opinion No. 53, 8 FERC ¶ 61,077, at 61,283 (1979) (finding allocation of costs to firm services preferable to revenue credit approach).

1. Initial Decision

83. In the Initial Decision, the ALJ found that the nine SPS intersystem market-based sales at issue,[175] excluding the expired sales to Manitoba Hydro and Midwest Energy, are more in line with what the Commission found to be "opportunity sales" in *Florida Power & Light Co.*[176] and *Kentucky Utilities Company*,[177] rather than the type of requirements sales for which SPS is required to plan, construct, and maintain capacity.[178] The ALJ also found that the sales at issue are fundamentally different from long-term sales to SPS' cost of service customers and have a lesser status than the native load. Therefore, the ALJ determined that the revenues from these sales should be credited against the cost of serving the requirements customers whose rates are at issue in this proceeding.

2. Briefs on Exceptions

84. Trial Staff and SPS except to the ALJ's determination to use the revenue crediting methodology. SPS states that, consistent with *Florida P&L*, revenue credit treatment has been limited to short-term sales of less than a year, usually referred to as opportunity sales, where no system planning is involved to ensure that a firm capacity sale commitment can be met over the term of the underlying contract. Trial Staff and SPS argue that the sales in question are all long-term firm sales that are part of the "system" for which it must plan, construct, maintain, and operate its system of transmission, generation, and power resources,[179] and claim that the allocation methodology is more appropriate.

85. Trial Staff and SPS cite Order No. 2001 for the proposition that the market-based sales at issue are long-term sales.[180] They conclude that these sales should thus be treated like requirements sales for cost-of-service purposes.[181]

---

[175] Ex. CCG-1 at 36.

[176] 33 FERC ¶ 61,116, at 61,247 (1985) (*Florida P&L*).

[177] 15 FERC ¶ 61,002 (1981).

[178] In these cases the Commission determined that in developing rates, fixed costs should not be allocated to services that do not cause the utility to plan, construct, or maintain capacity.

[179] Trial Staff Brief on Exceptions at 9-12; SPS Brief on Exceptions at 58-61.

[180] *Revised Public Utility Filing Requirements*, Order No. 2001, FERC Stats. & Regs. ¶ 31,127, at 30,171 (2002) (defining long-term market-based rate sale as equal to or greater than one year).

86. Trial Staff and SPS also contend that the sales in question are "firm loads" according to the Commission's analysis in Opinion No. 468,[182] and thus are not "fundamentally different" from the services rendered to SPS' cost-of-service customers.[183] Trial Staff and SPS state that SPS' generation resource planning is not done for individual customer load, but rather uses the total company firm energy and peak demand to determine the best overall generation mix to serve all customers. Furthermore, SPS states that it has no ability to refuse or curtail service to either group of firm service customers except in the case of *force majeure* or a system emergency.

87. CCG generally agrees with the ALJ's revenue crediting determination, and excepts only to the ALJ's ruling that the sales contracts to Manitoba Hydro and Midwest Energy should not be treated as revenue credits merely because the contracts expired during the 2004 test year period.[184] CCG claims that the expiration of the contracts in 2004 simply means that they should be treated as short-term and non-firm sales, which are revenue-credited.

3. Briefs Opposing Exceptions

88. CCG states that only its witness performed a substantive review of the specific terms and conditions of the contracts in question, and that Trial Staff relied upon SPS' incomplete and inaccurate analysis of the contracts to determine that the sales in question are not different from true requirements contracts. CCG states that its witness' analysis clearly reveals that the sales in question are substantially different from requirements contracts in that they are voluntary, market-based sales of limited duration, and only available for as long as SPS could claim that it had surplus capacity, which qualifies them as opportunity sales.[185] Furthermore, CCG claims that the contracts make clear that interruption will occur before SPS' own ultimate customers and, in contrast to true firm

---

20080421-3031 FERC PDF (Unofficial) 04/21/2008

loads, relieve SPS of the requirement to deliver and the customer of the obligation to pay in the event of adverse conditions.[186]

89. CCG and PNM argue that SPS' reliance on *Wisconsin* is unfounded, and the sales must be considered opportunity sales because SPS does not "plan, construct, or maintain" the capacity in the long-run. CCG claims SPS admits that because its wholesale and retail native load requirements are growing, its marketing of opportunity sales from its generation will shrink, a core characteristic of opportunity sales as determined in *Florida P&L* and *Kentucky Utilities Co.*[187] Furthermore, CCG states the fact that SPS has had to buy short-term capacity from third parties when its own resources were insufficient demonstrates that it has not incurred long-term fixed costs to build capacity specifically to serve the 2004 market-based opportunity sales.

90. CCG states that opportunity sales are made to market temporary surplus of capacity and/or energy, and the length of a contract does not exclude it from being considered an opportunity sale. CCG states that even though the sale was for 13 years in *Public Service Co. of New Mexico*,[188] the Commission determined that it was clearly an opportunity transaction because it was undertaken to utilize idle capacity. CCG also argues that in *Tampa Elec. Co.*, the Commission found revenue crediting the cost-of-service for the underlying requirements customers to be appropriate for a 4-year and an 18-year contract to an intersystem customer.[189]

91. CCG states that the Commission has long held that opportunity sales should be revenue credited. CCG also states that Opinion No. 337 found "all of the revenues from off-system sales should be credited to the on-system customers."[190]

92. SPS supports the ALJ's conclusion to exclude the Manitoba Hydro and Midwest Energy sales from the test year for the cost of service study on the basis that neither sale was extended or replaced in 2005.[191]

[190] Opinion No. 337, 49 FERC ¶ 61,296 at 62,133.

[191] SPS Brief Opposing Exceptions at 34-35.

4. Commission Determination

93. We will affirm the ALJ's determination that revenue crediting is the proper cost of service treatment for the sales at issue. This conclusion is consistent with our finding made earlier, that SPS' market-based intersystem sales are opportunity sales. The sales were entered into when SPS experienced a temporary level of excess capacity when Golden Spread changed from a full to partial requirements customer in 2000. While these sales were for firm power and some were for more than one year, SPS neither planned, constructed, or maintained its system to accommodate these sales, a general predicate to classify the sales as other than opportunity sales. And, as demonstrated by CCG, SPS' opportunity sales, while not interruptible, do get interrupted prior to the wholesale requirements customers.[192] The fact that some of the sales could be considered long-term under the Commission's market-based rate policy is not a determining factor because, as noted above, the Commission has considered sales of up to thirteen years as opportunity sales. The Commission has expressed a preference for the use of revenue crediting for opportunity sales.[193] Accordingly, we direct that SPS revenue credit these sales.

94. However, the Commission disagrees with the ALJ's exclusion of the expired sales contracts to Manitoba Hydro and Midwest Energy from revenue credit treatment. The ALJ excluded these contracts because "they have expired and whether similar sales will recur is speculative."[194]

95. The test year in this proceeding is calendar year 2004. SPS states that two "long-term firm power sales agreements that expired in 2004 . . . will not be in effect on or after January 1, 2005, when any rate changes made in this case would be made effective."[195]

Specifically, a 100 MW sale to Manitoba Hydro Energy Board (Manitoba Hydro) terminated December 31, 2004, and a 25 MW sale to MidWest Energy, Inc. (Midwest Energy) terminated May 31, 2004.[196]

---

[192] CCG Brief Opposing Exceptions at 52-53.

[193] *See, e.g.*, Opinion No. 788, 57 FPC at 1050 (crediting revenue from intersystem sales to on-system customers); Opinion No. 146, 20 FERC ¶ 61,290 at 61,546-48 ("The Commission has typically used revenue crediting for opportunity sales.").

[194] Initial Decision at P 33.

[195] Ex. SPS-37 at 11:11-16.

[196] *Id.*

96. Although the contracts expired during the test year, these revenues should not be excluded simply because they expired during the test period. As the name "test period" implies, the test period costs and revenues form the basis for testing the justness and reasonableness of a rate.[197] The development of that rate involves (1) total utility expenses *for the test period*, (2) allocation of a portion of those expenses to wholesale service based upon wholesale cost responsibility *during the test period*, and (3) development of a unit charge or rate that is based upon wholesale billing determinants projected *for the test period.*[198] By synchronizing these three parameters - expenses, allocation factors, and billing determinants - the resulting unit rate should allow the utility to fully recover its cost of providing wholesale electric service. While historic test period data may be adjusted to reflect known and measurable changes that affect revenues and costs,[199] such adjustments must also be synchronized so that the resulting unit charge would not result in over- or under-recovery of the utility's cost of providing wholesale electric service.

97. Here, the fact that the two contracts expired and were not replaced with new contracts is not enough to justify elimination of the revenue credits associated with these contracts. Instead, other related factors would need to be considered, such as whether SPS reduced its production resources after the termination of its obligation to supply Manitoba Hydro and Midwest Energy, or whether, instead, the capacity previously used to supply those contracts was subsequently used to meet load growth of SPS' retail and wholesale requirements customers. Elimination of the revenue credits associated with these contracts without reflecting other related changes in expenses, allocation factors, and billing determinants, would violate the principle that these parameters must be synchronized so that the resulting rate would not result in over- or under-recovery of the utility's cost of providing wholesale electric service.

E. Cash Working Capital Allowance[200]

98. A cash working capital allowance (CWCA) is an amount included in rate base to allow a company to pay "out-of-pocket" expenses that are incurred in daily operations before the expenses are recovered through customer revenues. The Commission has used two methods to calculate CWCA, the 45-day rule, and a fully developed and reliable

---

[200] Initial Decision at P 44-52 (Issue I.D).

20080421-3031 FERC PDF (Unofficial) 04/21/2008

lead-lag study. The Commission has stated that the 45-day rule has "produced reasonable results over the years without the expense of prolonged litigation . . . [and] it affords substantial advantages from the standpoints of administrative convenience."[201] The Commission has also found that the 45-day rule avoids imposing the costs of a detailed lead-lag study on utilities, and ultimately, on their consumers.[202] The Commission also allows parties to submit fully developed and reliable lead-lag studies to develop a working capital allowance in lieu of the 45-day rule.

99. A fully developed and reliable lead-lag study's revenue lag calculation must be based on, or confirmed by, a study of the wholesale customers' actual bill paying practices. Absent this, the lead-lag study cannot be found to reflect the actual cash needs of the company.[203] However, where a study is conducted based on assumptions that payments were received on time, rather than on actual bill paying practices, and those assumptions are verified by checking the data against actual payment practices, the Commission affords the lead-lag study the same credibility as if it had been based on data derived from payments.[204]

1. Initial Decision

100. In the Initial Decision, the ALJ determined that the 45-day rule should be applied to determine SPS' CWCA.[205] The ALJ found that CCG's lead-lag study is not fully developed and reliable, stating that CCG could not provide an explanation of the sampling methodology for the lead-lag study, and that the study is based on too many assumptions that were not necessary and created the possibility of repetition error.[206]

2. Brief on Exception

101. CCG argues that the ALJ erred in ruling that a 45-day CWCA is appropriate.[207] CCG argues that the ALJ incorrectly rejected the lead-lag study merely because it was

[207] CCG Brief on Exceptions at 16-24.

20080421-3031 FERC PDF (Unofficial) 04/21/2008

not based on 100 percent actual data. CCG claims that the study relied on limited assumptions, and the assumptions used were advantageous to SPS and disadvantageous to CCG, the proponent of the assumptions. CCG further states that the Commission has determined that such a study may establish a utility's working capital requirements, even if the study is not based on 100 percent of actual service and payment data, if the opponent of the study fails to present persuasive evidence that the study was not reasonably illustrative of the utility's cash requirement.[208]

102. CCG claims that the ALJ applied an overly-stringent test for the "fully developed and reliable" standard. It asserts that the Commission requires lead-lag studies to be prepared only so that "the Commission can be *reasonably confident* that the study reflects the actual, rather than just an approximation of, the cash needs of the utility."[209] CCG further argues that the Commission is particularly flexible in determining what is fully developed and reliable when the study is reliable to show a negative allowance.[210] CCG claims its study produces a three to four day negative lag, and therefore it is reasonable to adopt a zero cash working capital allowance.

3. Briefs Opposing Exceptions

103. Trial Staff and SPS claim that none of CCG's three attempted lead-lag studies was fully developed because CCG used the contract terms to determine cash flow and made no attempt to determine the actual billing and payments of revenues and expenses.[211] SPS asserts that the information needed to determine the actual service periods was readily available, and CCG's witness did not follow through on plans to obtain it.[212] Trial Staff further states that CCG's data were indeed questioned, and CCG's claim that no party presented evidence showing substantive error is irrelevant because the study itself was insufficient.[213]

[210] *Minnesota Power and Light Co.*, 16 FERC ¶ 63,012, at 65,060 (1981).

[211] Trial Staff Brief Opposing Exceptions at 34; SPS Brief Opposing Exceptions at 19.

[212] SPS Brief Opposing Exception at 21.

[213] Trail Staff Brief Opposing Exception at 34.

4. Commission Determination

104. We affirm the ALJ's ruling and agree with Trial Staff and SPS that CCG's lead-lag study was not fully developed and reliable. For example, the record shows that the actual invoices were never inspected.[214] Thus, the assumptions made with regard to the service periods and payment dates were never validated against actual payment practices.[215] Therefore, we cannot be reasonably confident that the study reflects the actual rather than a mere approximation of the cash needs of the utility. Accordingly, we affirm the ALJ's ruling that the 45-day rule is appropriate and consistent with Commission policy to determine SPS' CWCA.

F. Renewable Energy Credits[216]

105. Renewable Energy Credits/Certificates (RECs) are required pursuant to some state programs intended to promote renewable energy. In furtherance of that goal, these credits may be used to offset the cost of purchasing renewable energy. The issue in this case is whether SPS should reduce, by the amount of the credit, the cost that it flows through the FCAC.

1. Initial Decision

106. In the Initial Decision, the ALJ determined that even though the Commission's regulations do not contemplate the inclusion of renewable energy credits proceeds in the FCAC, the sales of renewable energy credits should not be separated from the costs of wind energy purchases. The ALJ explained that not requiring the wind energy purchase price to be offset by the renewable energy credits overstates the cost of these purchases and could provide a windfall to SPS.[217]

2. Briefs on Exceptions

107. Trial Staff argues that the ALJ's determination that the renewable energy credits should be flowed through the FCAC should be reversed because the Commission's regulations do not allow FCAC treatment of renewable energy credits.[218]

---

[214] Initial Decision at P 54 (citing Tr. 817-19 (Humphrey).

[215] *Id.* P 56.

[216] *Id.* P 73-79 (Issue I.H).

[217] *Id.* P 79.

[218] Trial Staff Brief on Exceptions at 13-14.

108. SPS excepts on the same grounds as Trial Staff and adds that the requirement to flow its renewable energy credits through its FCAC would violate the Administrative Procedure Act.[219] SPS also argues that the Commission's findings in *Cincinnati Gas & Electric Co.*,[220] where the Commission permitted the inclusion of emission allowances in the FCAC even though the Commission's regulation did not explicitly reference inclusion of such costs, does not apply here. SPS points out that the recovery of the cost of emission allowances related to power purchases was consistent with the Commission's FCAC policy, whereas the recovery of renewable energy credits is not.[221]

3. Briefs Opposing Exceptions

109. CCG argues that SPS' current revenue crediting approach for renewable energy credits would result in a significant mismatch of costs. By design, if SPS chose to avoid or defer selling renewable energy credits in a ratemaking test year, it would then reap all of the profits for sales of renewable energy credits in subsequent years. CCG adds that this problem will become magnified in future years as SPS increases its purchases from wind generation. By allowing FCAC treatment, the actual cost-recovering nature of the FCAC will be maintained, according to CCG.

110. PNM argues that the ALJ's decision is entirely consistent with the Commission's ruling in *Cincinnati Gas & Electric*. PNM concludes that the ALJ correctly ruled that offsetting the proceeds of REC sales is necessary to determine the true "total cost" of SPS' wind energy purchases for purposes of FCAC recovery.

4. Commission Determination

111. We affirm the ALJ's conclusion that not addressing the issue of renewable energy credits in the FCAC would result in overstating the total cost of wind purchases. While the Commission's regulations do not directly address FCAC treatment of renewable energy credits, the Commission's regulations do provide that the total cost of purchased economic energy must be flowed through the FCAC.[222] Therefore, when SPS sells

---

[219] SPS Brief on Exceptions at 78.

[220] 71 FERC ¶ 61,083, at 61,294 (1995) (*Cincinnati Gas & Elec.*).

[221] *Id.* at n.80.

[222] Under the Commission's FCAC regulations, the "[*t*]*otal cost of the purchase* is all charges incurred in buying economic power and having such power delivered to the buyer's system. The total cost includes, but is not limited to, capacity or reservation charges, energy charges, adders, and any transmission or wheeling charges associated with the purchase." 18 C.F.R. § 35.14(a)(11)(i) (2007); *see* 18 C.F.R. § 35.14(a)(2)(iii)

(continued…)

20080421-3031 FERC PDF (Unofficial) 04/21/2008

renewable energy credits, it must subtract the proceeds of these sales from the cost of the wind energy purchases it flows through the FCAC. Otherwise, SPS would not be including in the FCAC the true total cost of the purchase of wind power.

112. In addition, we find that our determinations in *Cincinnati Gas & Electric* are applicable to the instant proceeding. The Commission's logic in requiring FCAC treatment of emission allowances, which increase the purchase cost and "constitute[] a component of the purchased power costs that are eligible for fuel adjustment clause recovery, just as other non-fuel components of purchased power costs," applies equally to renewable energy credits that decrease the purchase cost.

G. Pollution Control Construction Work in Progress[223]

113. Pollution control construction work in progress (pollution control CWIP or CWIP) refers to any expenditure of a utility in the process of constructing a pollution control facility.[224] A pollution control facility is an identifiable structure or portions of a structure that is designed to reduce the amount of pollution produced by the utility.[225] In determining if a facility qualifies as a pollution facility, the Commission considers, among other things, "evidence showing that such facilities are for pollution control."[226] Commission regulations permit a public utility to include costs of pollution control CWIP from qualifying pollution control facilities in its rate base.[227]

1. Initial Decision

114. The ALJ determined that a pollution control CWIP of $3,835,043 is properly included in SPS' rate base. The ALJ stated that the Commission's regulations permit the recovery of pollution control CWIP. Furthermore, the ALJ states that SPS submitted a

---

(2007) (providing that fuel and purchased economic power costs shall be the cost of "[t]he total cost of the purchase of economic power, as defined in paragraph (a)(11) . . . .").

[223] Initial Decision at P 57-61 (Issue I.E).

[224] 18 C.F.R. § 35.25 (2007).

[225] *Id.* § 35.25 (b)(4).

[227] *Id.* § 35.25 (c)(1).

list of pollution control facilities[228] it includes in its rate base as well as testimony indicating they are pollution control facilities associated with existing facilities SPS owns.[229]

2. Brief on Exception

115. CCG asserts that SPS has not met the requirements in 18 C.F.R. § 35.25 to include pollution control CWIP, and therefore the ALJ's determination is an exception to the rate-making principle that customers cannot be required to pay for facilities that are not used and useful during the applicable test year.[230] CCG argues that SPS made no showing that its claimed pollution control facilities are "[an] identifiable structure or portions of a structure that is designed to reduce the amount of pollution produced by the power plant"[231] as required by the Commission's regulations. CCG states that the Commission has historically rejected CWIP when a utility does not describe the facility allegedly serving a pollution control function in sufficient detail for the Commission to make a determination.[232]

116. CCG also claims SPS did not comply with the requirement to use forward-looking allocation ratios to allocate its requested total system CWIP to its customers,[233] which it states is a precondition for the inclusion of pollution control CWIP in the rate base.[234] CCG states that SPS employed a single demand allocation ratio derived from 2004 test year data for all production-related costs, including CWIP projects.[235] CCG cites Order No. 474 in asserting that this will result in an unjust "double whammy"[236] effect on a

utility's wholesale customer by requiring that customer to pay for the costs of the utility's future facilities even though the customer may have purchased or incurred the costs to construct alternate capacity.

117. CCG claims that SPS failed to comply with section 35.25(f) of the Commission's regulations, which requires a utility to propose accounting procedures that ensure that wholesale customers will not be charged for (1) both capitalized allowance for funds used during construction (AFUDC) and corresponding amounts of CWIP proposed to be included in the rate base, and (2) any corresponding AFUDC capitalized as a result of different accounting or ratemaking treatments accorded CWIP by state or local regulatory authorities.

3. Briefs Opposing Exception

118. Trial Staff and SPS argue that the CWIP regulations that CCG claims the ALJ did not address apply only when a utility is seeking to initiate or change its CWIP in a section 205 rate case, and not in a section 206 complaint case.[237] Furthermore, SPS claims it has met the requirements to include pollution control CWIP in its rate even though the requirements are not applicable in this case. Trial Staff and SPS claim that SPS has provided adequate evidence that the facilities it has included are in fact pollution control facilities. SPS also states it provided assurances that SPS would not charge customers for both AFUDC and pollution control CWIP in rate base, explaining how SPS would track CWIP recovery in wholesale rates to assure that in future years there would be no AFUDC accruals recovered in a plant on this same CWIP. SPS provided an example of how the accounting would track the CWIP to ensure that customers would not be charged for the same projects both in CWIP and AFUDC.[238]

4. Commission Determination

119. The Commission affirms the ALJ's finding that pollution control CWIP is properly included in SPS' rate base, as it is allowable by the Commission's regulations.[239] Section 35.25(c)(1)(i) of the Commission's regulations states that "[a]ny CWIP for pollution control facilities allocable to electric power sales for resale may be

---

30,702 n.5 (1987) (defining "double whammy"). CCG also cites *South Carolina*, 63 FERC ¶ 61,218, at 62,599.

[238] Exhibits SPS-158 and SPS-159.

[239] 18 C.F.R. § 35.25(c) (2007).

included in the rate base of the public utility." SPS provided evidence and testimony indicating the facilities are properly designated as pollution control facilities. For example, Exhibit SPS-52 provides work order numbers, descriptions, and the costs for facilities and equipment that SPS included in its rate base as pollution control CWIP. SPS also submitted in Exhibits SPS-158 and 159 a description of the accounting procedures it will undertake to ensure that wholesale customers will not be charged for both AFUDC and CWIP in future years. We are persuaded by SPS' evidence that SPS will not charge customers for both pollution control CWIP and AFUDC in rate base. CCG has not provided any evidence to convince us otherwise. Accordingly, we find that SPS' pollution control CWIP is properly allowable in its rate base.

H. Undistributed Subsidiary Earnings[240]

120. Income earned by a utility's subsidiary appears in the utility's Account 216.1, Undistributed Subsidiary Earnings. These funds are only represented on paper, and not actually available for the utility to use. Once the subsidiary pays a dividend or the utility sells the subsidiary, the amount becomes available for the utility to use at its discretion. The funds from the dividend or sale are then characterized as distributed subsidiary earnings, and the amount is moved to Account 216.0, Retained Earnings. In 1997, SPS sold two subsidiaries, Utility Engineering Corp. and Quixx Corp. and recorded the proceeds as undistributed subsidiary earnings.[241]

1. Initial Decision

121. The ALJ states that although the operations of the subsidiaries at issue did not involve the provision of utility service, the $22,855,828 from the sale of the subsidiaries was properly moved to account 216.0 (Retained Earnings) in 2004.[242] Thus, the ALJ ruled that the funds are no longer undistributed subsidiary earnings, but rather retained earnings available for use by SPS to invest in its electric operations. Therefore the ALJ held that the funds are includable in SPS' equity balance under *United Gas Pipe Line*.[243]

---

[240] Initial Decision at P 62-69 (Issue I.F).

[241] *Id.* P 64.

[242] Tr. 2197 (Heintz).

[243] 13 FERC ¶ 61,044, at 61,096 (1980) (stating that distributed subsidiary earnings (retained earnings) are available to the utility for rate base investment (or retirement of debts previously used for rate base investment) and are therefore properly includable in capitalization) (*United Gas Pipe Line*).

2. Brief on Exceptions

122. CCG argues that it was erroneous for the ALJ now to allow SPS to treat the earnings as retained earnings (Account 216.0) after SPS inexplicably treated the earnings as undistributed subsidiary earnings (Account 216.1) for seven years after the sale of the subsidiaries.[244] Furthermore, CCG argues that, even assuming the shift from Account 216.1 to Account 216.0 was proper for accounting purposes, SPS has not shown that including the earnings in SPS' common equity is proper for ratemaking purposes.[245] CCG claims that the undistributed subsidiary earnings should be removed from SPS' common equity calculation because the subsidiaries are not affiliated with the electric operation of SPS, and wholesale ratepayers should not be required to pay a return on earnings derived from non-existent, non-utility operations.[246]

3. Brief Opposing Exceptions

123. SPS argues that CCG has inaccurately characterized the funds as undistributed subsidiary earnings, because the funds had been distributed to SPS' retained earnings account by the end of 2004 and were, thereafter, available for investment in utility rate base and no longer represented undistributed subsidiary earnings.[247] SPS claims that all retained earnings represent a return from an investment and the fact that some of SPS' retained earnings may have had their source in SPS' investment in a subsidiary is beside the point. SPS argues that by using straightforward accounting logic, it is clear the funds are available for investment in SPS' regulated utility business, and are therefore properly recognized in the test year capital structure used for rate regulation.[248]

---

[244] CCG Brief on Exceptions at 31.

[245] *Id.* at 31-32 (citing letter dated March 22, 2006, from Ms. J. G. Nicholas, Chief Accountant and Director, Division of Audits and Accounting, in *Delta Energy Center, LLC*, Docket No. AC06-10-000 ("Our determination that Delta's lease is a capital lease is for accounting purposes only and does not constitute approval of the appropriate level or timing of cost recovery for ratemaking purposes. Your accounting for the lease costs should be adjusted, if appropriate, to reflect the ratemaking treatment approved by the Commission.")).

[246] CCG Brief on Exceptions at 30-31.

[247] SPS Brief Opposing Exceptions at 13.

[248] *Id.* at 13-14.

4. Commission Determination

124. We affirm the ALJ's ruling that the funds are retained earnings, not undistributed subsidiary earnings as CCG claims, and therefore includable for ratemaking purposes. In *United Gas Pipe Line*, the Commission determined that because undistributed subsidiary earnings are not available for purposes of rate base investment, they must be excluded from capitalization. Here, the funds are no longer in the control of SPS' former subsidiaries and are available for investment in SPS' regulated utility business. The fact that the amount from the sale of the subsidiaries was treated as undistributed subsidiary earnings for seven years after the sale of the subsidiaries is not relevant. SPS explained that there was a note payable over a five year term to SPS, and the note was held on the books until the note was paid.[249] While the amounts could have been transferred to Account 216.0, Retained Earnings, SPS stated that they were transferred in 2004, and therefore are now properly retained earnings includable in SPS' rate structure.

125. We also agree with SPS that the source of the retained earnings is not relevant. CCG claims that although the funds may now properly be retained earnings for accounting purposes, they may not be properly included for ratemaking purposes because the funds represent a return from an investment in a subsidiary. The Commission disagrees. Retained earnings represent a return from investment, or net profit after dividends are paid, and are a component of a firm's capitalization.[250] As stated above, the funds are properly included in the Retained Earnings Account and, therefore, are includable for ratemaking purposes.

I. Allocation of Demand Side Management Programs[251]

126. Demand response means a reduction in the consumption of electric energy by customers from their expected consumption in response to an increase in the price of electric energy or to incentive payments designed to induce lower consumption of electric energy. The issue here is whether SPS should be permitted to include the cost of demand side management programs in its cost of service for wholesale customers.

1. Initial Decision

127. In the Initial Decision, the ALJ determined that the costs of demand side management programs are properly allocated to wholesale customers. The ALJ

---

[249] Initial Decision at P 68 (citing Tr. 2198 (Blair)).

[250] SPS Brief Opposing Exceptions at 14.

[251] *See* Initial Decision at P 70-72 (Issue I.G).

determined that SPS had provided sufficient evidence that its demand side management programs had reduced its peak generation and thereby benefited customers by reducing the cost of providing service.[252]

2. Brief on Exception

128. Trial Staff asserts that SPS did not provide enough hard data to support a finding that its wholesale customers benefited from the demand side management programs. Trial Staff argues that SPS must perform a study that demonstrates conclusively that the demand side management programs have allowed SPS to reduce load on its system to the point where SPS has been able to delay the installation of new generation capacity.[253]

3. Brief Opposing Exception

129. SPS contends that Trial Staff's assertion that SPS did not prove the benefits of its demand side management programs is incorrect. SPS states that in the past four years demand side management programs have reduced energy needs by approximately 323,000 MWh and shaved SPS' system peak generation needs by approximately 38 MW.[254] SPS argues that while it cannot claim that the demand side management programs have yet enabled it to avoid expenditures on building new generation capacity, Trial Staff has not justified a requirement that demand side management programs must delay generation capacity additions in order for their costs to be included in rate base.[255]

4. Commission Determination

130. We find sufficient justification for allocating the costs of demand side management programs to wholesale customers, because SPS has demonstrated that its demand side management programs have benefited wholesale customers by reducing energy needs by approximately 323,000 MWh and shaving SPS' system peak generation needs by approximately 38 MW.[256] We disagree with Trial Staff that there must be a conclusive demonstration that the programs have specifically delayed the installation of new generation capacity. Such a requirement is an unduly stringent standard for cost

recovery (i.e., deferral of new generation capacity additions) and may discourage companies from considering all cost-effective options in meeting customer needs, including generation, transmission and demand resources. While we agree that there must be evidence of a program's benefits, we are satisfied that, in the instant case, SPS' evidence is sufficient.[257]

IV. Issues Relating to SPS' Prior FCAC

131. The FCAC issues in this case fall into two categories, those concerning the SPS FCAC that was in effect prior to the effective date of the proposed FCAC (January 1, 2005) and those concerning the FCAC that SPS proposed in the FPA section 205 filing that is involved in the instant case.[258] Due to a settlement between SPS and its customers, disputes arising from the former FCAC are governed by Order No. 517, which was issued in 1974 by this agency's predecessor, the FPC.[259] In contrast, issues arising from the proposed FCAC are governed by this Commission's Order No. 352, issued in 1983.[260]

A. Long-Term Energy-Related Qualifying Facility (QF) Costs[261]

132. FPC Order No. 517 permitted utilities to flow through the FCAC "the net energy cost of energy purchases, exclusive of capacity or demand charges . . . when such energy is purchased on an economic dispatch basis. Included therein may be such costs as the charges for economy energy purchases and the charges as a result of scheduled outage, all such kinds of energy being purchased by the buyer to substitute for its own higher cost energy . . . ."[262] In 1990, SPS amended its contracts to include a fuel clause that permitted purchases from QFs at or below SPS' avoided variable energy cost to be

---

[257] In the Energy Policy Act of 2005, Pub. L. No. 109-58, §§ 1261 *et seq.*, 119 Stat. 594 (2005), Congress stated that "[i]t is the policy of the United States that time-based pricing and other forms of demand response . . . shall be encouraged."

[258] *See Golden Spread Elec. Coop., Inc.*, 109 FERC ¶ 61,373 (2004) (accepting and suspending proposed FCAC).

[260] *Treatment of Purchased Power in the Fuel Cost Adjustment Clause for Electric Utilities*, FERC Stats. & Regs. ¶ 30,525 (1983), *reh'g denied*, Order No. 352-A, 26 FERC ¶ 61,266 (1984) (Order No. 352).

[261] Initial Decision at P 126-131 (Issue II.A.2).

[262] FPC Order No. 517 (amending section 35.14(a)(2)(c) of the Commission's regulations).

included in the customer's FCAC. As drafted, this FCAC varied slightly from the Commission's regulations because it permitted SPS to flow through costs other than "net energy costs."

1. Initial Decision

133. The ALJ concluded that the record supports a finding that SPS was permitted, as a result of the settlement in Docket No. ER89-50-000 and subsequent agreements with its wholesale customers, to collect energy-related costs of its QF purchases at or below its avoided variable energy costs, as determined by state regulatory authorities.[263] The ALJ found that the "plain language" of the settlement permits the collection of the energy-related costs of SPS' QF purchases at or below avoided variable energy costs. The ALJ also found that the customers did nothing to complain about the inclusion of these costs in the FCAC calculations that they routinely received and reviewed.

2. Briefs on Exceptions

134. Trial Staff argues that the ALJ erred in concluding that SPS was permitted to collect through its former FCAC all energy-related costs of its QF purchases at or below its avoided variable energy costs, and that the ALJ should have found that only the net energy costs of a QF purchase made on an economic dispatch basis may be passed through.[264]

135. Trial Staff also argues that the ALJ's conclusion is correct only if the language of the settlement is considered outside of the context in which the settlement was agreed upon. However, Trial Staff points out that in 1990, when the settlement added the QF provision to the SPS FCAC, the only QF purchases SPS was making were puts.[265] Trial Staff also states that SPS did not have any QF contracts for capacity. [266]

---

[263] *Id.* P 130-31.

[264] Trial Staff Brief on Exceptions at 14-18.

[265] In a put, a QF would have the right to require SPS to make a purchase under the relevant regulations.

[266] Trial Staff argues that the record shows capacity QF purchases are of more recent origin. Trial Staff Brief On Exceptions at 15. Trial Staff states that the QF contract SPS has with Borger Energy Associates, L.P. was dated May 23, 1997, and its QF contract with Sid Richardson Carbon, Ltd. was dated August 1, 2001. *Id.* at 16-17; *see also* Exhibit CCG-46 at 37-38 (Testimony of Daniel). The QF contract SPS had with Engineered Carbons, Inc. went into effect in 1989, but was modified on August 15, 1999,

(continued…)

20080421-3031 FERC PDF (Unofficial) 04/21/2008

136. Trial Staff further argues that the Commission should reject SPS' recovery through its former FCAC of energy-related costs incurred under long term QF contracts. Trial Staff argues that SPS should be required to refund monies that were improperly included in the fuel clause and that "the Commission's policy of strictly construing its FCAC regulations should be followed."[267]

137. CCG argues that the "plain language" of the settlement in Docket No. EL89-50[268] cannot be reasonably read to contemplate reliability purchases from QFs, because these transactions did not exist at the time the settlement was executed.[269] Thus, CCG states, the Commission should interpret the settlement in the context of the relevant evidence of the situation and relations of the parties. CCG adds that it is unlikely that the Commission would have sanctioned such a radical departure from the regulations established in FPC Order No. 517[270] if the Commission believed that one or both of the parties intended "purchases" to be so broad as to include the non-fuel energy components of long-term reliability purchases.

---

to provide for capacity payments and increased energy purchases if the plant was expanded to produce more than twelve MW net output. *Id*.

[267] Trial Staff Brief on Exceptions at 18.

[268] The relevant section of SPS' former FCAC reads:

> 2. Fuel costs (F) shall be the cost of:
>
> (i) Fossil and nuclear fuel consumed in Company's own plants, and Company's share of fossil and nuclear fuel consumed in jointly owned or leased plants.
>
> (ii) Plus, the actual identifiable fossil and nuclear fuel costs associated with energy purchased for reasons other than identified in (iii) below. *Included therein shall be the portion of the cost of purchases from Qualifying Facilities at or below Company's avoided variable energy cost.*

(Emphasis added by CCG).

[269] CCG Brief on Exceptions at 39-43.

[270] 52 FPC at 1308.

3. Brief Opposing Exceptions

138. SPS argues that nothing in the language of the prior agreements or the SPS FCAC limits recovery to "QF puts" or fuel costs associated with long-term transactions.[271] According to SPS, the agreements are unambiguous and attribute no significance to whether the purchases are associated with the purchase of firm capacity or whether they are simply energy purchases that are made at an avoided cost rate. SPS adds that although at the time the settlement agreements were negotiated SPS had no avoided capacity costs, the Commission's QF regulations then in effect clearly contemplated the obligation of electric utilities to enter into long-term agreements for the purchase of QF capacity and associated energy, which is what SPS did several years later.

139. SPS also argues that the intervenors were dilatory in contesting the recovery of QF costs given the fact that they had routinely received detailed information concerning the company's FCAC calculations. In that vein, SPS argues that where an agreement involves repeated occasions for performance by either party and the other party has knowledge of the nature of the performance and opportunity for objection, any course of performance accepted or acquiesced without objection is given great weight in the interpretation of the agreement.[272]

4. Commission Determination

140. The Commission agrees with the ALJ that SPS was permitted, as a result of the settlement in Docket No. EL89-50-000 and subsequent agreements with its wholesale customers, to collect energy-related costs of its QF purchases at or below its avoided variable energy costs, as determined by state regulatory authorities. The settlement makes clear that the costs should be included. While the contracts were modified after the settlement and therefore the context of the purchases was changed, the repeated performance of the contract without any objection by the customers establishes a course of performance that leads us to interpret the settlement as including such costs.[273]

---

[272] SPS Brief Opposing Exceptions at 38 (citing *Restatement (Second) of Contracts* § 202(4) (1981)).

[273] U.C.C. § 2-208. Section 2-208 states:

> Where the contract for sale involves repeated occasions for performance by either party with knowledge of the nature of the performance and opportunity for objection to it by the other, any course of performance accepted or acquiesced in without objection shall be relevant to determine

(continued…)

B. Testing of Energy Purchased Against Hourly Avoided Costs[274]

141. FPC Order No. 517 required that the net energy cost of energy purchases could be flowed through the FCAC when such energy is purchased on an "economic dispatch basis." The issue here is whether the Commission's FCAC regulations in effect at the time required an after-the-fact hourly analysis to determine if the purchased energy costs were less than the utility's actual avoided cost for that hour.

1. Initial Decision

142. The ALJ agreed with SPS that nothing in FPC Order No. 517 requires after-the-fact testing of purchases to ensure that they were on an economic basis. The ALJ found that SPS was under no obligation to evaluate purchases on any basis other than a projected estimate of avoided cost in any given hour. The ALJ points out that the Commission changed this regime in Order No. 352 to one where recovery of energy purchases would be permitted as long as the purchased energy costs are not more than total avoided variable cost, and that this method necessarily involves an after-the-fact analysis. Therefore, the ALJ concluded that SPS properly tested its energy purchases under the prior rule, and there is no need to plan a second phase of the proceeding.

2. Briefs on Exceptions

143. Trial Staff argues that the "economic dispatch basis" language in the Commission's prior rule could be interpreted to require after-the-fact testing.[275] Trial

20080421-3031 FERC PDF (Unofficial) 04/21/2008

Staff argues that *Pennsylvania Power & Light Co.*[276] supports its position that any portion of an economy purchase that passes through the FCAC must be tested after-the-fact each hour to determine if it is less than the utility's actual avoided cost for that hour. While Trial Staff's witness Sammon testified that the plain meaning of the Commission's prior rule suggests before-the-fact determination, Trial Staff nevertheless argues that the Commission has required after-the-fact confirmation.[277]

144. CCG argues that the ALJ erred in accepting SPS' use of a projected estimate of avoided cost in any given hour in evaluating purchases.[278] CCG cites *Philadelphia Electric Company*,[279] in which the Commission held that under Philadelphia's FCAC "the energy charge in each hour *must be less* than Philadelphia's alternate cost *in that hour*."[280] CCG adds that if SPS were not required to make hourly comparisons of its actual costs and avoided costs, the FCAC could have generated a windfall for SPS by the use of a faulty forecast or estimate. Accordingly, CCG concludes that the Initial Decision should be reversed and the Commission should direct that an appropriate redetermination or purchase eligibility be performed based on actual hour-by-hour costs.[281]

3. Brief Opposing Exceptions

145. SPS argues that the reference to "purchased on an economic dispatch basis" in its former FCAC was a reference to dispatching decisions to select those resources that would provide the lowest cost of energy in the next hour.[282] Such decisions are necessarily based on a comparison of the cost quoted for an energy purchase against the *anticipated* cost of the resources that otherwise would be used to provide the same energy if the purchase were not made. Therefore, SPS asserts that Trial Staff's interpretation of the "purchased on an economic dispatch basis" language is incorrect. SPS concedes that it did not perform after-the-fact testing under its former FCAC but holds that such testing was not required. SPS adds that since CCG did not make a valid showing that SPS'

[282] SPS Brief on Exceptions at 26-29.

energy purchases were uneconomic, there is no reason why SPS should be put to the significant burden of further analyzing its past purchases under its former FCAC.[283]

4. Commission Determination

146. We affirm the ALJ's conclusion that the plain meaning of the Commission's prior rule suggests before-the-fact determination, and we reject the contention that the Commission's prior rule required after-the-fact confirmation. Specifically, the prior rule states that "[f]uel [c]osts (F) shall be the cost of . . . the net energy cost of energy purchases, exclusive of capacity or demand charges, when such energy is purchased on an economic dispatch basis." We agree with SPS that "purchased on an economic dispatch basis" implies that a dispatch decision is to be made at the time of the dispatch. Such a decision can only be made prior to dispatch and as such can only be made based on the expected costs. If after-the-fact information were required, then "economic dispatch" would not be possible. SPS followed the plain meaning of the Commission's regulations in this regard, and we are not persuaded to require a reexamination in this case.

147. Trial Staff and CCG incorrectly argue that the Initial Decision erred in finding that SPS' prior fuel clause was consistent with the Commission's prior fuel clause regulations. CCG cites two cases, *Pennsylvania Power* and *Philadelphia Electric* as undercutting the Initial Decision's determination that the prior fuel cost regulation does not require an after-the-fact determination of energy purchases against hourly avoided cost. CCG states that *Pennsylvania Power* stands for the proposition that "the purpose of [the Commission's former] fuel clause is to pass on to customers the increases or decreases in fuel costs *actually* incurred by the utility."[284] Moreover, CCG asserts that *Philadelphia Electric* can be read to require an hour-by-hour comparison of the actual cost of the purchased energy and the cost that would have been incurred in that hour if the purchase had not been made. CCG implies that this determination could only be made after-the-fact. Trial Staff similarly argues that *Pennsylvania Power* supports an after-the-fact confirmation of whether costs related to a claimed economic dispatch are recoverable under the old fuel clause. We disagree. As stated above, in interpreting the old fuel cost regulation, *Pennsylvania Power* explains that the purpose of the old

---

[283] SPS notes that, in Order No. 352, the Commission specifically found that system lambda data, which CCG witness Daniel purported to use to test whether SPS' energy purchases were economic, are not an accurate measure of avoided costs. SPS Brief Opposing Exceptions at 29 (citing Order No. 352 at 30,803).

[284] CCG Brief on Exceptions at 44 (quoting *Pennsylvania Power*, 6 FERC ¶ 61,036 at 61,078 (emphasis in original)).

20080421-3031 FERC PDF (Unofficial) 04/21/2008

regulation is to ensure that utilities recover their actual fuel costs, i.e. to make them whole for increased fuel costs. It does not endorse an after-the-fact determination. Nor does *Philadelphia Electric* speak directly to the question of whether an economic dispatch decision is to be evaluated after-the-fact. In any event, the after-the-fact test to which CCG alludes and Trial Staff advocates was not adopted by the Commission until Order No. 352, which does not govern SPS' prior fuel clause.[285]

C. TUCO, Inc. Coal Contract[286]

148. CCG alleged that SPS engaged in a complex arrangement for the purchase of coal for its Harrington station that resulted in wholesale customers paying a higher amount for coal than if SPS had dealt directly with its affiliate Northern States Power Co. (NSP). Instead of procuring coal for its Harrington and Tolk stations through NSP, according to the record, SPS secured coal pursuant to long term supply contracts with TUCO, Inc. (TUCO), an unaffiliated corporation, which in turn was instructed to solicit bids on SPS' behalf. CCG contends that, although Peabody Coal Sales won the TUCO contract to supply SPS, the coal ended up coming from NSP through a swap, and that this could have been done at lower cost had SPS gone to NSP directly.

1. Initial Decision

149. The ALJ concluded that SPS adequately and convincingly explained that ratepayers paid no more than the market price for the coal that TUCO supplied.[287] The ALJ bases his conclusion on the fact that SPS had an exclusive requirements contract with TUCO for Harrington's and Tolk's coal needs, which precluded SPS from dealing directly with NSP.[288] The ALJ points out that SPS ended up benefiting from this

---

[285] In contrast to FPC Order No. 517, the Commission's Order No. 352 regulations allow the recovery of the energy-related costs of a purchase, even if not economic in every hour in which the energy is purchased, so long as over the duration of the transaction the sum of the energy purchase costs are not more than the total costs of alternative energy avoided by the purchase. See 18 C.F.R. § 35.14(a)(2)(iv). "After-the-fact" comparisons of energy purchase costs to avoided costs must necessarily be made to ascertain whether the aggregate costs of energy purchased over the duration of the transaction are less than the costs that the transaction allowed the utility to avoid. This is not the case, however, under SPS' prior fuel clause.

[286] Initial Decision at P 174-178 (Issue II.A.6).

[287] *Id.* P 178.

[288] *Id.* (citing Ex. SPS-71 at 5-6).

20080421-3031 FERC PDF (Unofficial) 04/21/2008

transaction due to a reduction in the market price of the coal during the course of the transaction.[289]

2. Brief on Exceptions

150. On exception, CCG states that, although TUCO had the requirements contract to supply the stations in question, SPS had the ability to exercise significant control over TUCO in this regard.[290] The CCG explains that a single person was responsible for purchasing coal for both SPS and NSP, and that, because this person knew that SPS needed coal and NSP had contract rights to purchase coal, TUCO should have been directed to deal directly with NSP.

151. CCG argues that Peabody won the contract by bidding coal that was of a lower quality than that offered by other bidders even after SPS personnel expressed concern about the coal's quality. According to the CCG, Peabody ended up providing the very coal to which NSP had option rights, and that this set of transactions resulted in SPS paying a higher price than it would have paid had TUCO been directed to purchase the proper quality coal from NSP in the first place.[291] The CCG argues that the ALJ was incorrect in concluding that SPS did not overpay for coal because the price SPS paid included a multi-million dollar premium TUCO added to the price that NSP paid under its option.[292]

3. Brief Opposing Exceptions

152. SPS responds that CCG does not adequately explain its claim that SPS overpaid for the coal, and that the Initial Decision should be sustained.[293] SPS reiterates that TUCO is a non-affiliated coal supplier which has the exclusive right to provide coal for the stations in question. SPS explains that under these contracts, TUCO arranges for purchasing, receiving, transporting, unloading, handling, crushing, weighing, and delivery of coal to the station bunkers to meet SPS' requirements. TUCO also is responsible for negotiating and administering contracts with coal suppliers, transporters, and handlers.

[289] *Id.*

[290] CCG Brief on Exceptions at 46-49.

[291] *Id.* at 48.

[292] *Id.* at 49.

[293] SPS Brief Opposing Exceptions at 29-33.

153. SPS explains that the transaction in dispute arose out of a coal price spike in 2000-2001. SPS states that its demand and risk analysis prompted it to encourage its coal supplier to secure coal for the coming years. SPS explains that TUCO accepted a bid from Peabody for 8475 Btu/lb coal from the Caballo mine (SPS states that Caballo coal had been used successfully at the SPS plant). Although plant personnel expressed concern about the Btu content of the coal, SPS states that the purchase was subject to a test burn and that there would be provisions in the contract should the coal cause problems. SPS states that it eventually asked TUCO to procure coal having a higher heating value at the urging of SPS plant personnel, which almost entirely replaced the original lower Btu coal.

154. SPS states that the transactions neither disadvantaged SPS' ratepayers nor effected a windfall to NSP or its parent Xcel Energy Inc. In fact, according to SPS, SPS' ratepayers benefited because by the time the swap for higher Btu coal was negotiated, prices had fallen from the time the original award was made for the lower Btu coal. This resulted in ratepayers paying the same price for higher quality coal that had originally been agreed to be paid for lower Btu coal.[294]

155. SPS further states that any margin that NSP earned on its option coal was passed on to its retail ratepayers. SPS summarizes its position by stating that it was required to purchase coal through TUCO, that TUCO prudently followed a request for proposal process. Thus, SPS concludes, the ALJ's findings were supported by substantial evidence and should be affirmed.[295]

4. Commission Determination

156. The Commission affirms the Initial Decision in this regard. In its brief on exceptions, CCG does not provide evidence demonstrating that SPS paid more through the Peabody swap than NSP could have paid at the outset. But even if the CCG did show that, in hindsight, higher quality coal could have been purchased for less, SPS' exclusive contract with TUCO obligated TUCO to solicit bids and a decision was made to purchase the lower cost Peabody coal and blend it with higher quality coal, in the hopes of a lower cost of coal. The coal decision was a judgment call that SPS and its parent corporation made, and the Commission is not persuaded to reverse the ALJ's finding that SPS' activity was just and reasonable.

V. SPS' Proposed FCAC in Docket No. ER05-168-000

157. On November 2, 2004, the same date CCG filed its complaint against SPS, SPS filed a proposal under section 205 of the FPA to change its FCAC and to make corresponding revisions to SPS' power supply contracts. SPS stated that it filed the revised FCAC to conform to the Commission's current fuel cost and purchased economic power adjustment clause regulations,[296] and also to account for expenses and revenues associated with SPS' participation in the SPP OATT. The proposed FCAC is subject to the Commission's current FCAC policy as set forth in Order No. 352, *Treatment of Purchased Power in the Fuel Cost Adjustment Clause for Electric Utilities*.[297] According to Order No. 352, the Commission's *pro forma* FCAC allows electric utilities to recover all expenses associated with purchased power through fuel clause adjustments if two conditions are met. First, the total cost of the purchase must be less than the buyer's total avoided variable cost and the purchase must be of less than twelve months duration. And second, the purpose of the purchase must be solely to displace higher cost generation.[298]

158. On December 29, 2004, the Commission accepted and suspended, for a nominal period, subject to refund, SPS' proposed changes in the FCAC.[299] The Commission also consolidated SPS' proposed FCAC changes with the proceeding already underway in the complaint case before an ALJ in Docket No. EL05-19-000.

159. The following issues are in dispute regarding SPS' proposed FCAC: recovery of energy related costs (specifically long-term QF purchases, wind energy purchases); transmission costs; FCAC protocols; wind energy costs; avoided variable costs; and a separate QF provision.

A. Energy Related Costs

160. The issue here is whether the FCAC SPS proposes complies with the Commission's regulations governing the recovery of costs associated with long-term QF purchases and wind energy purchases. The ALJ determined that the proposed FCAC is consistent with the Commission's FCAC regulations.

20080421-3031 FERC PDF (Unofficial) 04/21/2008

1. Long-Term QF Purchases[300]

a. Initial Decision

161. Noting that SPS agreed to amend its FCAC to include only energy charges associated with QF energy purchases on a going-forward basis, the ALJ concluded that this satisfactorily resolves the issue.[301] The ALJ concluded that a reading of the plain language of 18 C.F.R. § 35.14(a)(2)(iv) contemplates inclusion of energy charges if the total of such charges is less than the buyer's total avoided variable costs, with no distinction made between short and long-term contracts. In the ALJ's words, "[t]hat's what the regulation requires and that's what ought to be in the Company's FCAC."[302]

b. Briefs on Exceptions

162. CCG argues that the ALJ erred in failing to consider that Order No. 352 does not allow FCAC treatment for non-fuel energy costs or recovery of fuel costs for purchases greater than one year in duration that are maintained for reliability reasons.[303] CCG asserts that SPS' version of the FCAC improperly eliminates the limitations contemplated by Order No. 352, and that therefore the Commission should reverse the ALJ on this issue.

c. Briefs Opposing Exceptions

163. SPS cites Order No. 352, in which the Commission stated, in part, "[w]e have added the phrase "for any purchase" [to the FCAC], which allowed *energy charges only* to be recovered through fuel clause adjustments."[304] SPS argues that the Commission used the phrase "energy charges only" to distinguish the costs that were allowed to be recovered under section 35.14(a)(2)(iv) from the "total costs of the purchase of economic power" that are authorized for FCAC recovery under section 35.14(a)(2)(iii).[305] SPS argues that recoveries under the latter section are subject to two tests. First, the economic test compares the total cost of the purchase (including capacity and transmission

[305] *Id.* at 40.

20080421-3031 FERC PDF (Unofficial) 04/21/2008

charges)[306] to the total avoided cost over the purchase. Second, the regulation requires that the "economic power" purchase be for a period of twelve months or less.[307]

164. In contrast, SPS argues that recovery of *energy charges only* is not limited to energy purchases made under contracts with terms of twelve months or less; energy charges for *any purchase* may be recovered so long as they are less than avoided costs over the duration of the transaction, however long it may be. Therefore, SPS argues that the ALJ correctly found that "energy only costs" are eligible for recovery under section 35.14(a)(2)(iv) and are not subject to the reliability criterion.[308]

165. Trial Staff argues that the Initial Decision correctly reads Commission FCAC regulation 35.14(a)(2)(iv) and should be affirmed on this issue. The Initial Decision held that the plain language of regulation 35.14(a)(2)(iv) permits recovery of energy charges, including non-fuel energy charges, associated with purchase power contracts of one year or greater duration.[309] Indeed, section 35.14(a)(2)(iv) provides for FCAC pass through of

> Energy charges for *any purchase* if the total amount of energy charges incurred for the purchase is less than the buyer's total avoided variable cost . . . . (emphasis added by trial staff).

166. Trial Staff states that according to the Initial Decision, "any purchase" in section 35.14(a)(2)(iv) means "any purchase." That includes purchases pursuant to purchased power contracts of one year or greater duration. The regulation clearly does not say "any purchase of less than one year duration," according to Trial Staff.

d. Commission Determination

167. The Commission agrees with the ALJ that energy charges can be included in the FCAC as long as the total of such charges is less than the buyer's total avoided variable costs, regardless of the length of the contract. CCG's argument that Order No. 352 imposes two limitations appears to be a misunderstanding of the terms "total costs of the purchase of economic power" and "energy charges only." The Commission's regulations clearly provide that the total costs of purchases of economic power can be flowed through the FCAC only if the purchases are both economic and less than twelve months in

[308] *Id.* at 41.

[309] Trial Staff Brief Opposing Exceptions at 36-40.

duration. However, the purchase duration under section 35.14(a)(2)(iii) does not apply to purchases under section 35.14(a)(2)(iv). Thus, the energy charge portion (including non-fuel energy charges) of power purchases can be flowed through the FCAC regardless of the length of the contract as long as the purchased power price is less than total avoided variable costs.

2. Wind Energy Purchases[310]

168. The issue here is whether SPS' proposed FCAC permits SPS to recover the energy-related costs of all of its wind energy purchases.

a. Initial Decision

169. In its proposed FCAC, SPS originally sought to include the total cost of energy purchases, as long as they were less than the total avoided costs during the purchase period. SPS agreed to revise the language of section 2(iv) of its FCAC to refer only to energy charges incurred for wind energy purchases. The ALJ determined that this resolved the issue.

b. Briefs on Exceptions

170. CCG states that the record demonstrates that SPS' wind purchases are long-term purchases that are factored into SPS' planning forecasts as capacity resources. CCG points out that in SPS' proposed FCAC, SPS seeks FCAC recovery of energy costs associated with all wind energy purchases "without limitation" of total energy costs and "over the term of the purchase."[311] CCG asserts that Order No. 352 states that "purchases

---

[310] Initial Decision at P 186-190 (Issue II.B.2). This section also addresses Issue II.B.5 of the Initial Decision, at P 200 (Should SPS be permitted to recover the energy-related cost associated with long-term (one year or more) purchases if such purchase costs are less than the avoided cost over the term of the contract?).

[311] Ex. SPS-2, section 2(iv) (emphasis added) provides:

> [E]nergy charges for any *purchase including, without limitation, the total energy costs associated with purchases from any wind energy projects* to the extent that the energy related charges incurred for the purchase *over the term of the purchase* are less than the Company's total avoided variable costs. For energy purchases greater than one year, the Company will measure the monthly purchase price relative to the Company's total monthly avoided variable cost. The Company will only include in the FCA the lesser of the

(continued…)

longer than a year are bound to have some reliability benefits . . . . We want only purchase expenses made solely for economy purposes to be passed through the fuel clause . . . [E]xpenses for purchases longer than one year can be estimated in rate cases."[312]

171. CCG argues that because SPS' wind purchases are long-term, SPS should not be permitted to recover energy costs associated with these purchases through the FCAC. CCG adds that wind purchases by definition have no fossil fuel costs, so wind costs should be recovered through base rate.[313]

172. PNM argues that section 2(iv) of SPS' proposed FCAC should be modified to delete references to wind energy purchases in order to ensure that such purchases are treated consistently with other purchases for purposes of FCAC recovery.[314]

c. Brief Opposing Exceptions

173. SPS states that in referencing wind purchases it is only pointing out that wind purchases are part of the subset of energy purchases addressed by section 2(iv) of its proposed FCAC. SPS argues that, consistent with Order No. 352, it may recover such associated energy costs, provided that these are less than avoided variable costs over the term of the purchase. SPS believes that the ALJ's findings should be affirmed.[315]

d. Commission Determination

174. In considering above the issue of SPS' recovery of the energy related costs of purchases from QFs under long-term contracts under SPS' proposed FCAC, we agreed with the ALJ that energy charges can be included in the FCAC only where the total of such charges is less than the buyer's total avoided variable costs, regardless of the length of the contract. Similarly, the Commission agrees with the ALJ that SPS' recovery of the energy-related costs of all wind energy purchases is permissible when the total of such charges is less than the buyer's total avoided variable cost.

---

cumulative purchase price or the total avoided variable cost incurred through the term of the purchase to date.

[312] CCG Brief on Exceptions at 51 (citing Order No. 352 at 30,802).

[313] *Id.* at 55-57.

[314] PNM Brief on Exceptions at 5-7.

[315] SPS Brief on Exceptions at 41-42.

175. In addition, with regard to whether SPS should be permitted to recover the energy-related costs associated with long-term (one year or more) purchases if such purchase costs are less than the avoided cost over the term of the contract, we also find that SPS is permitted to recover the energy-related costs as long as they are less than the avoided variable costs as governed by section 35.14(a)(2)(iv). We reach this conclusion because the regulation states that energy charges for any purchase may be included as long as those charges are less than the total avoided variable costs.

3. Aggregation of Wind Energy Purchases[316]

176. CCG asserts that SPS attempts to enhance its treatment of wind energy purchases by not testing each single wind purchase, or any "forward purchase," on a purchase-by-purchase basis, but bundling them together for economic evaluation in its after-the-fact analysis.[317] CCG claims that this is a violation of the Commission's FCAC regulations which, CCG asserts, requires that the purchases be measured individually.

177. Section 35.14(a)(2)(iv) reads as follows:

> 2. Fuel costs (*F*), measured in $, shall be the cost of:
>
> * * *
>
> (iv) Energy charges for any purchase if the total amount of energy charges incurred for the purchase is less than the buyer's total avoided variable cost[318]

a. Initial Decision

178. The ALJ found that, due to the time-consuming nature of doing individual contractual analysis, SPS' practice of aggregating the wind purchases for economic test purposes is justified.[319] The ALJ adds that while a literal reading of the Commission's FCAC regulations does not contemplate aggregation of wind purchases, the use of "short-cuts" to avoid the unnecessary expense and burden of implementing certain provisions is acceptable, especially when there is no specific prohibition of such practices.[320]

---

[316] Initial Decision at P 191-194 (Issue II.B.3).

[317] Initial Joint Brief of CCG at 64.

[318] 18 C.F.R. § 35.14(a)(2)(iv) (2007).

[319] Initial Decision at P 194.

[320] *Id.*

b. Briefs on Exceptions

179. Trial Staff argues that the regulation clearly intends that wind energy purchases must be evaluated on a purchase-by-purchase basis to qualify for FCAC treatment. According to Trial Staff, the plain language of Commission regulation 35.14(a)(2)(iv) states that added to energy charges passed through the FCAC will be "energy charges for *any purchase* if the total amount of energy charges incurred for *the purchase* is less than the buyer's total avoided variable cost."[321] Trial Staff argues that the use of the singular number demonstrates that the regulation intends that each individual purchase be evaluated against SPS' total avoided variable cost. Therefore, Trial Staff concludes that aggregating purchases for evaluation purposes violates the regulation.[322]

180. CCG states that the Commission's regulations contemplate that utilities will make economic decisions about each of their purchases, consistent with the requirements of FPA section 205(f).[323] CCG states that neither SPS nor the Initial Decision cited precedent or regulation that supports aggregation of purchases.[324]

181. PNM also argues that the language in section 35.14(a)(2)(iv) of the Commission's regulations indicates that, in order to evaluate whether a given purchase may be flowed through the FCAC, it is necessary to examine whether that purchase—in and of itself, and not in conjunction with other purchases—is economic. Therefore, PNM asserts that the Initial Decision permitting aggregation should be reversed.[325]

c. Brief Opposing Exceptions

182. SPS argues that the practical implementation of its FCAC provisions by aggregating wind energy purchases was sensible and not in violation of the Commission's regulations. SPS adds that in any month typically wind energy costs will be substantially less than avoided costs. Therefore, SPS asserts, the ALJ was correct in

---

[321] 18 C.F.R. § 35.14(a)(2)(iv) (2007) (emphasis added).

[322] Staff Brief on Exceptions at 60.

[324] CCG Brief on Exceptions at 59.

[325] PNM Brief on Exceptions at 7-9.

determining that SPS' practice of aggregating wind energy purchases would reduce expense and burden in administering its FCAC, and this determination should be affirmed.[326]

d. Commission Determination

183. The Commission will reverse ALJ on this issue. The language of our regulation refers in the singular to "any purchase" and "the purchase."[327] This regulation thus requires a purchase-by-purchase analysis, as opposed to aggregate analysis. Administrative convenience notwithstanding, counting purchases individually serves a purpose that aggregation would not. This is illustrated by the following scenario:

> Assume that SPS purchases 100 MWh of wind energy at $30/MWh in a month when avoided costs are $40/MWh. Under the Initial Decision approach, SPS in effect would bank $1,000 ($10/MWh times 100 MWh hours) that it could net against future purchases that would otherwise be uneconomic and therefore ineligible for fuel clause recovery. Were this to happen for the first six months of a contract, SPS would have banked $6,000. In subsequent months, SPS would be able to purchase well above avoided costs but nevertheless recover all of its costs through the FCAC by aggregating over the contract life. For example, in the next six months SPS could purchase 100 MWh at $50/MWh, assuming avoided costs remain at $40, and still flow costs through the FCAC.[328]

The Commission's interpretation prevents abuse of the system which could occur if a utility was permitted to aggregate purchases. Further, we do not believe that performing a purchase-by-purchase analysis as required by the FCAC would place an undue administrative burden on SPS.

184. When the Commission interprets its own regulations, "a court must necessarily look to the administrative construction of the regulation if the meaning of the words used

is in doubt. . . . The ultimate criterion is the administrative interpretation, which becomes of controlling weight unless it is plainly erroneous or inconsistent with the regulation."[329]

B. Transmission Costs[330]

185. SPS proposes to recover, through its proposed FCAC, the cost of transmission losses purchased from SPP, less the payments for transmission losses that it receives from SPP. It claims the right to do this by virtue of 18 C.F.R. § 35.14(a)(4), which provides that "[t]he adjustment factor developed according to this procedure shall be modified to properly allow for losses (estimated if necessary) associated only with wholesale sales for resale."

1. Initial Decision

186. In the Initial Decision, the ALJ determined that it would be unfair to allow SPS to recover the cost of transmission losses purchased from SPP, less the payments for transmission losses that it receives from SPP, through its proposed FCAC because SPS cannot ensure that they are related to the wholesale sales.[331] No briefs on exceptions were filed on this issue.

2. Commission Determination

187. We affirm the ALJ's ruling to prohibit SPS from recovering net transmission losses through the FCAC for the reasons given by the ALJ as described above. Section 35.14(a)(4) of the Commission's regulations provides that the FCAC adjustment factor "shall be modified to properly allow for losses (estimated if necessary) associated only with wholesale sales for resale." Because SPS admittedly cannot identify each transaction for which SPS is charged a loss, we agree with CCG that SPS has failed to demonstrate that the losses paid actually relate to services provided to the customers at issue or any wholesale sales.

[331] Tr. 1966 (Hudson).

20080421-3031 FERC PDF (Unofficial) 04/21/2008

C. FCAC Protocols[332]

1. Initial Decision

188. The ALJ found that there should be a set of protocols as part of the filed rate that explain in detail how SPS will implement its proposed FCAC on a monthly basis.[333] To accomplish this, the ALJ recommended that the parties form a study group to identify the new information and protocols that will provide the additional support for the FCAC calculations and billings necessary to obtain a greater understanding of the costs included in the charges.

2. Brief on Exceptions

189. SPS argues that the protocols requirement modifies and amends the Commission's FCAC regulations and that this would necessitate a notice and comment rulemaking to implement the FCAC protocol requirement.[334] SPS cites *American Federation of Government Employees, Local 3090 v. Federal Labor Relations Authority*[335] and *Consumer Energy Council of America v. FERC*[336] in support of its position.[337] SPS also argues that the evidence does not support the need for the addition of elaborate protocols to the FCAC provisions of SPS' wholesale rate schedules. SPS states that the evidence cited by the ALJ in support of the protocols does not actually support the ALJ's decision.[338] In fact, SPS argues, the discovery of the error in the preparation of one month's FCAC by a Golden Spread employee actually demonstrates SPS' customers' thorough understanding of SPS' FCAC charges as they would not have caught the error otherwise.

---

[332] Initial Decision at P 201-204 (Issue II.B.5).

[333] *Id.* P 204 (adopting CCG's position as described in P 201).

[334] SPS Brief on Exceptions at 75-76.

[335] 777 F.2d 751, 759-60 (D.C. Cir. 1985).

[336] 673 F.2d. 425, 446 (D.C. Cir. 1982).

[337] SPS Brief on Exceptions at 75-76.

[338] The evidence cited includes: (1) an error in the preparation of one month's fuel clause calculations related to the inadvertent exclusion of clearly eligible costs; and (2) the restatement of fuel charges for another month in order to take into account new information not available at the time of the original calculation.

20080421-3031 FERC PDF (Unofficial) 04/21/2008

190. Lastly, SPS argues that it already provides extensive information to its wholesale customers detailing the FCAC calculations. SPS states that its practice is to provide information in a timely manner whenever customers contact SPS with questions or concerns about its FCAC calculations.

3. Briefs Opposing Exceptions

191. Trial Staff argues that the Initial Decision correctly ruled that SPS and its customers should form a study group to develop and recommend to the Commission detailed protocols to clarify and complete the proposed FCAC rate schedule at issue in this case. Trial Staff points out that section 205(c) of the FPA imposes an obligation upon SPS to ensure that its rate schedules are in a form that facilitates inspection and monitoring by the public and investigation by the Commission's auditors.[339] Unclear and incomplete rate schedules frustrate those rights. In particular, Trial Staff states that when SPS uses a complex computer model to determine whether the energy charges of a purchase that it has "incurred" are valid under the proposed FCAC – a determination that the current FCAC regulation requires – it is reasonable to conclude that the operation of the model should be explained in the rate schedule. The explanation should be in protocols, according to Trial Staff. The Initial Decision, therefore, should be affirmed.

4. Commission Determination

192. The Commission will not adopt the ALJ's recommendation that SPS be required to file detailed protocols as part of its proposed FCAC. Because the rates established in the instant proceeding are for a locked-in period (January 1, 2005 to July 1, 2006), the issue of SPS establishing protocols to explain how it will implement its proposed FCAC on a monthly basis is moot. SPS recently filed a rate case in Docket No. ER08-749-000 and it included protocols in that filing. The Commission will have the opportunity to address the adequacy of SPS's protocols in that proceeding.

193. However, as a safeguard, we will direct that SPS make an informational filing two years from implementation of its new FCAC. SPS should include sufficient detail through narrative and comparative numbers to enable the Commission to evaluate SPS' treatment of fuel for its market-based rate sales for compliance with the Commission's directives herein and to assure the Commission that it is not aggregating its wind energy purchases (as discussed above) for the purpose of fuel clause calculations to its wholesale customers. While we will not mandate fuel clause protocols, we encourage SPS to be responsive to any customers' concerns with respect to implementation of the FCAC.

---

[339] 16 U.S.C. § 824d(c) (2000).

20080421-3031 FERC PDF (Unofficial) 04/21/2008

D. Wind Energy Costs[340]

1. Initial Decision

194. The ALJ determined that SPS' mention of wind energy costs in its FCAC is consistent with the Commission's FCAC regulation, which allows energy charges associated with any purchase to be recovered through the FCAC if such charges are less than the buyer's total avoided cost over the purchase period. No briefs on exception were filed.

2. Commission Determination

195. For the reasons stated above, we affirm the ALJ's ruling that section 2(iv) of the proposed FCAC is, as amended, consistent with our regulations.

E. Avoided Variable Costs[341]

1. Initial Decision

196. The ALJ found that in order for section 2(v) of SPS' proposed FCAC to be consistent with the Commission's current FCAC regulations, SPS must conduct an after-the-fact comparison of actual avoided costs against the purchase costs.[342] No briefs on exceptions were filed.

2. Commission Determination

197. The Commission affirms the ALJ's conclusion because our FCAC regulations permit the flow through of "avoided variable costs," and an after-the-fact test is necessary to make this determination.

---

[340] Initial Decision at P 208-212 (Issue II.B.10).

[341] *Id.* P 213-217 (Issue II.B.11).

[342] *Id.* P 217.

F. Separate QF Provision[343]

1. Initial Decision

198. The ALJ determined that there was nothing wrong with SPS' inclusion of a separate provision regarding QF purchases in its proposed FCAC because the energy-related costs of any purchase are eligible for FCAC recovery, so long as they are less than the buyer's total avoided variable cost. The ALJ found fault with the language used by SPS in the proposed FCAC regarding the appropriate test to ensure that the energy-related costs of the QF purchases are less than the buyer's total avoided variable costs. The ALJ determined that SPS must change its language to specify an after-the-fact analysis to support recovery of such costs via the FCAC. No briefs on exception were filed.

2. Commission Determination

199. In considering above the issue of SPS' recovery of the energy related costs of purchases from QFs under long-term contracts under SPS' proposed FCAC, the Commission agreed with the ALJ that energy charges can be included in the FCAC if the total of such charges is less than the buyer's total avoided variable costs, regardless of the length of the contract. Therefore, the Commission agrees with the ALJ that SPS' inclusion in its proposed FCAC of a separate provision regarding QF purchases is consistent with the Commission's regulations.

200. With regard to the language in the FCAC referring to the buyer's total avoided variable cost, the Commission agrees with the ALJ that SPS must change its language to specify an after-the-fact analysis to support recovery of such costs via the FCAC, instead of using state authority estimates.

VI. Refunds to Cap Rock

201. Because Cap Rock is not a formal complainant but an intervenor in this docket, the question arises as to its rights to refunds as a full requirements customer of SPS.[344]

---

[343] *Id.* P 218-221 (Issue II.B.12).

[344] On December 2, 2004, Cap Rock filed a pleading captioned "Motion to Intervene" in the complaint docket, but in the body of the motion it wrote that it was submitting the motion also as a complaint under section 206 of the FPA. The Commission granted Cap Rock intervenor status in its order establishing hearing and settlement procedures. Cap Rock subsequently requested clarification of its intervenor status. In an order issued May 2, 2006, the Commission clarified that Cap Rock is an

(continued…)

Even though Cap Rock is not a complainant, this neither prevents Cap Rock from receiving refunds, nor does it prevent its rates from being subject to the full requirements rates after the refund effective date. When the same customer class and the same rates are at issue, a separate complaint is not required for refunds to apply to all customers served under that rate.[345] Cap Rock pays the same charges that the full requirements customers pay and SPS admits that it groups them with the other full requirements customers when setting rates.[346] Accordingly, Cap Rock is entitled to refunds consistent with the outcome of the compliance phase in this case.

VII. Post-Hearing Motions

A. Background

202. On June 23, 2006, the day that briefs on exceptions to the Initial Decision were due, West Texas Municipal Power Agency (West Texas) filed a Motion to Intervene Out-of-Time. Citing section 214(d) of the Commission's Rules of Practice and Procedure,[347] West Texas states that it meets the Commission's standards for late intervention, namely: (1) West Texas has good cause for not seeking to intervene earlier; (2) West Texas' intervention will cause no disruption in this proceeding; (3) it has become apparent that West Texas' interests are not being adequately represented by any other party to this proceeding; and (4) West Texas' intervention will not prejudice, or impose additional burdens on, any party.[348] West Texas states that it is a long-term firm power supply purchaser from SPS, with fuel costs calculated on an average system basis for many years and, in this respect, is similarly situated to the complaining cooperatives in this proceeding.[349]

203. On July 10, 2007, PNM filed an answer in opposition to West Texas' motion to intervene. PNM asks the Commission to deny West Texas' motion citing the late stage

---

intervenor, not a party complainant. That order did not address whether any relief that might eventually be granted would apply to Cap Rock. *See Golden Spread Elec. Coop., Inc*., 115 FERC ¶ 61,136 (2006).

[345] *See, e.g.*, *North Carolina Elec. Membership Corp.*, 57 FERC ¶ 61,332, at 62,067 (1991).

[348] West Texas Motion to Intervene at 1.

[349] *Id.* at 4.

of the proceeding, the prejudice to parties who intervened and participated in a timely manner, and West Texas' failure to articulate a reason why it should be permitted to intervene at this stage or why it failed to do so earlier.

204. On July 17, 2006, SPS filed an answer to the answers opposing West Texas' motion to intervene. SPS restates West Texas' arguments.[350]

205. On the same day that West Texas filed its motion, El Paso Electric Company (El Paso), filed a four-page letter to the Commission commenting on the Initial Decision. On June 30, 2006, CCG filed a motion to reject El Paso's comments, arguing that El Paso lacks standing to make a filing because it is not a participant, as defined by rule 711 of the Commission's Rules of Practice and Procedure,[351] and thus is not permitted to file what is essentially a brief on exceptions. On July 10, 2006, PNM filed a motion to strike El Paso's submission. PNM argues that El Paso is a non-party to this proceeding and that El Paso's letter is "in blatant disregard for the Commission's rules governing the submission of evidence" and "will violate the due process rights of parties" to this proceeding.[352]

206. On July 17, 2006, SPS filed an answer in support of El Paso's comments. SPS reiterates El Paso's comments, and argues that the letter should be considered a proper submission "by a member of the public."[353] SPS further argues that there is no prohibition on the Commission "merely receiving extra-record communications, as long as they are made available to the public and served on the parties."[354] SPS moves that the Commission reopen the record to accept El Paso's comments as a response to hearsay and to permit a response by PNM.[355]

207. On August 1, 2006, PNM filed a motion for leave to respond and a response to SPS' answer. PNM argues that El Paso's comments are not proper comments submitted by a member of the public, that the letter is not a proper response to alleged hearsay testimony, and that the record should not be reopened under rule 716.

[353] SPS Answer at 6.

[354] *Id.* at 6-7.

[355] *Id.* at 7-8.

B. Commission Determination

208. The Commission will reject West Texas' motion to intervene out-of-time.[356] West Texas filed its motion after issuance of the Initial Decision, but fails to present an adequate reason why, for a year and a half since this proceeding began, it remained silent and relied on others to defend its interests. West Texas is not free to now change its mind and conclude that the participants in the case did not live up to its expectations. West Texas cannot remain inactive throughout and then enter the proceeding following the conclusion of a full evidentiary hearing and all that it entails.[357] As we have long held, the failure of one's interests to be adequately represented can be blamed on no one but oneself.[358] West Texas made a conscious decision not to intervene earlier. It cannot be permitted to intervene at this late date and raise an issue which will cause delay in the culmination of this proceeding.[359]

209. The Commission will reject El Paso's submittal because El Paso is not a participant in this proceeding and therefore, under Rule 711, El Paso lacks the standing to make such a filing.

The Commission orders:

(A) The Initial Decision is affirmed in part and reversed in part, as described in the body of this order.

(B) SPS is directed to file, within 30 days of the date of this order, a compliance filing quantifying refunds relating to cost of service rates and FCAC billings. This filing shall include a cost of service analysis and rate design consistent with the Joint Stipulation and the Commission's findings herein.

(C) Cap Rock is entitled to refunds as described in the body of this order, with such refunds to be effective January 1, 2005.

v.

Southwestern Public Service Company

Southwestern Public Service Company Docket No. ER05-168-001

(Issued April 21, 2008)

WELLINGHOFF and KELLY, Commissioners, *dissenting in part*:

In the initial decision in this proceeding, the Administrative Law Judge (ALJ) found that

> [t]he plain facts are that SPS improved its competitive position in making market-based sales by charging market-based customers lower system average fuel costs, and collected the difference from the Company's cost-based customers, who were forced to cover their own fuel costs and the difference between average costs and the incremental fuel costs associated with the market-based sales.[360]

The ALJ stated that the "complainants should not be foreclosed from pursuing an investigation back in time, so long as it is reasonably bounded."[361] The ALJ then determined that the relevant period for considering Southwestern Public Service Company's (SPS) fuel cost adjustment clause (FCAC) is from 1999 forward.[362]

---

[360] *Golden Spread Elec. Coop., Inc.*, 115 FERC ¶ 63,043, at P 150 (2006) (Initial Decision).

[361] Initial Decision, 115 FERC ¶ 63,043 at P 125.

[362] *Id.*

Despite the ALJ's determination, today's order directs SPS to make refunds starting with the refund effective date of January 1, 2005, based on a finding that SPS' FCAC is ambiguous on the issue in dispute. We do not agree with the order's assertion that SPS' FCAC language was ambiguous as to the fact that SPS should credit incremental fuel and purchased power costs attributable to intersystem sales, rather than system average fuel costs, against the cost of fuel and purchased power recovered through the FCAC. As today's order correctly states, the Commission may "take retroactive refund action to address circumstances where a seller did not charge the filed rate or violated statutory or regulatory requirements or rules in applicable rate tariffs . . . ."[363] Therefore, we agree with the ALJ's determination, based upon his careful review of the extensive record in this proceeding, that we should direct SPS to pay refunds from 1999 to 2004. Further, consistent with the ALJ's determination, we believe that today's order should have directed SPS to make a compliance filing in order to allow the Commission to quantify what, if any, refunds are due for the period beginning January 1, 2005.[364]

Accordingly, we dissent in part from this order.

ARKANSAS PUBLIC SERVICE COMMISSION

IN THE MATTER OF THE APPLICATION OF ARKANSAS WESTERN GAS COMPANY FOR APPROVAL OF A GENERAL CHANGE IN RATES AND TARIFFS	))))	**DOCKET NO. 04-176-U** **ORDER NO. 6**

ORDER

PROCEDURAL HISTORY

On December 29, 2004, Arkansas Western Gas Company ("AWG" or the "Company") filed an application for approval of a general change or modification in its rates and tariffs. AWG requested that its rates be increased by $9,739,459 annually. Order No. 2, entered January 10, 2005, suspended AWG's proposed rates, charges, and tariffs pending further investigation by the Commission. Order No. 2 also established a procedural schedule for the purposes of investigating AWG's application.

The parties to this proceeding are AWG, the General Staff of the Arkansas Public Service Commission ("Staff"), the Attorney General of Arkansas ("AG"), Northwest Arkansas Gas Consumers ("NWAGC"), and the Commercial Energy Users Group ("CEUG").

On December 29, 2004, AWG filed the Direct Testimony and Exhibits of Alan N. Stewart, Executive Vice-President of AWG, Donna R. Campbell, Manager, Rates and Regulation Department of AWG, Ricky A. Gunter, Vice President of Rates and Regulation for AWG, Glenn M. Morgan, Controller and Treasurer for AWG, and Dr. Roger A. Morin,[1] Principal, Utility Research International, in support of its application.

[1]Professor of Finance, Georgia State University and Professor of Finance for Regulated Industry at the Center for the Study of Regulated Industry at Georgia State University, Atlanta, Georgia.

On July 12, 2005, Staff filed the Direct Testimony and Exhibits of Gayle Freier, Senior Capital Recovery Analyst, Robert H. Swaim, Rate Analyst, Steven McGarity, Public Utility Auditor, Robert D. Booth, Manager of the Gas and Water Utility Section, Randy Kersten, Auditor, Larry Walker, Public Utility Audit Supervisor, Sandra B. Green, Rate Analyst, and Johnny Brown, Senior Financial Analyst. In addition, Direct Testimony and Exhibits were filed on that date by William B. Marcus on behalf of the AG, Christopher A. John and Raymond Reno Cassidy on behalf of the NWAGC, and William E. Tinsley on behalf of the CEUG.

On August 9, 2005, AWG filed the Rebuttal Testimony and Exhibits of witnesses Gunter, Campbell, Dr. Morin, Morgan, Stewart, Charles V. Stevens, Senior Vice President, AWG, and Dr. Kimbugwe A. Kateregga, Vice President, Foster Associates, Inc.

On September 2, 2005, Staff filed the Surrebuttal Testimony and Exhibits of witnesses Freier, Swaim, McGarity,[2] Booth, Walker, Green, Brown, Alisa Williams, Staff Auditor,[3] and Alice D. Wright, Manager Cost Allocation and Rate Design Section. Additionally, filing Surrebuttal Testimony on that date were AG witness Marcus, NWAGC witnesses Cassidy and John, and CEUG witness Tinsley. On September 15, 2005, the Supplemental Surrebuttal Testimony of AG witness Marcus was filed.

On September 19, 2005, AWG, Staff, the AG, NWAGC, and CEUG, (the "Parties") filed an *Issues List*, outlining those issues which were still contested and providing the Commission an outline of those issues on which the Parties had reached consensus ("Issues List").

---

[2] Jeff Hilton, Manager of the General Staff's Audits Section, subsequently adopted Mr. McGarity's pre-filed testimonies. (Tr. at 1376-1378)

[3] Ms. Williams adopted the testimony of Staff witness Kersten.

Public evidentiary hearings were held in Little Rock, Arkansas, from September 20 through September 22, 2005, for the purpose of receiving public comments, opening statements, and litigating the issues contested by the parties in this proceeding. Additional public comment hearings within AWG's service territory were held on September 26, 2005, in Fayetteville, Arkansas, and on September 27, 2005, in Blytheville, Arkansas.

GENERAL OVERVIEW

AWG is an Arkansas corporation and a natural gas public utility under APSC jurisdiction which provides service to 144,000 customers in this state. (Application at pp.1-2) AWG and its operations in natural gas exploration and production "were transferred to separate wholly-owned subsidiaries of a newly formed, publicly owned, holding company named Southwestern Energy Company ("SWN")." (Tr. at 208) SWN provides services to its subsidiaries, the costs of which are shared by AWG and its affiliates. (Tr. at 209) AWG initially filed a non-gas revenue requirement of $60,344,518 and rate schedule revenue requirement of $58,449,249. (Tr. at 1353) The Company sought an increase in its current base rates of $9.739 million which equates to a 20% increase in those base rates or a 5.2% increase in its overall rates, inclusive of gas cost. (Application at p. 2, Tr. at 210) AWG subsequently amended its request in Surrebuttal Testimony and now seeks a non-gas revenue requirement of $58,920,973, reporting a deficiency of $7,626,351. (Tr. at 918)

In conjunction with its application, AWG filed a depreciation study (as required by the Stipulation and Agreement approved in Docket No. 02-227-U) and has used the resulting rates in support of this filing. (Application at pp. 2-3) AWG proposes no changes to customer charges, with the entire increase to be collected through the delivery charge. (Tr. at 210) AWG recommends

adoption of its cost of service, as modified to address certain allocation changes as proposed by the other parties. (Tr. at 804, Ex. at 459) As part of its application, AWG requests that the Commission "make two changes in the manner in which rates are ordinarily determined . . ." and approve "a return on equity using a blend of several methods rather than relying solely on the discounted cash flow ('DCF') method" and "a Revenue Evaluation Plan ("REP") under which AWG's rates will be evaluated annually and adjusted up or down if AWG's actual earned return on equity is 50 basis points below or above an established reasonable return." (Tr. at 210-211)

Staff has proposed in its Surrebuttal Testimony a non-gas revenue requirement of $55,591,342, resulting in a deficiency of $4,325,174 which was $3,229,631 less than AWG's current request. (Tr. at 1607-1608) Staff recommends that the proposed revenue requirement be allocated using its proposed cost of service and rates be designed using its recommendations. (Tr. at 1538-1539) AWG has adopted Staff's Cost of Service and its design of rates. Staff also recommends that equity return be determined primarily upon the results of the DCF methodology (Tr. at 652-658), subject to checks for reasonableness, including comparison to results under the risk premium method. (Tr. at 658-659) Staff also recommends that the Commission deny AWG's request for approval of its REP Rider. (Tr. at 1600)

The AG recommends that, based on a series of its proposed adjustments, AWG's initially-filed revenue requirement should be, at a minimum, reduced by $3.5 million.[4] (Tr. at 52) The AG also recommends that AWG's cost of service and proposed rate design be rejected and that the

[4]The AG does not endorse a specific revenue requirement or rate of return in its initially filed Testimony, recognizing that other adjustments recognized by it or Staff may also be applicable. (Tr. at 108, footnote 36)

Commission adopt those proposed by the AG. (Tr. at 53) The AG's proposed cost allocation differences with AWG are related to production (Tr. at 87-90, 92) and transmission. (Tr. at 90-93) For these, Mr. Marcus proposes increasing allocation based on usage rather than demand. Mr. Marcus also differs on main allocation, testifying that his preferred recommendation is that the Commission approve a zero mains allocation to the customer component. (Tr. at 96-103). With regard to equity return, the AG recommends that the Commission place little reliance on AWG's risk premium method. (Tr. at 58) The AG also rebuts AWG's conclusions regarding the return on equity based upon the Capital Asset Pricing Model ("CAPM"), recommending that the Commission reject AWG's proposed equity return as too high. (Tr. at 65-67)

NWAGC recommends that the Commission reject AWG's proposed cost of service and its proposed rate design and adopt its proposed methods for allocation. NWAGC recommends greater demand based allocation for production (Tr. at 1098-1101) and transmission (TR. at 1102-1103) functions, greater assignment of cost to the customer component for distribution mains (Tr. at 1118), allocation of storage costs based upon 'heat sensitive' usage (Tr. at 1096), and zero assignment of certain distribution expenses to larger customers. (Tr. at 1097) In addition, NWAGC recommends approval of an equity return derived from application of the DCF as adjusted for flotation cost (Tr. at 1046) and rejection of AWG's application of the CAPM model. (Tr. at 1059) NWAGC also recommends disapproval of AWG's proposed REP. (Tr. at 1097)

The CEUG filed revenue requirement recommendations which relate only to capital structure and equity return and a few specific expense items (Tr. at 1135-1136, 1157-1162, 1182-1184) The CEUG addresses both the cost of service and rate design (Tr. at 1184-1186, 1215) and

proposes (1) more reliance on coincident peak demand after curtailment for cost allocation, (2) implementation of a line item on bills for Lost and Unaccounted For Gas ("LUFG"), with increased allocation on demand and transportation customers allowed to use 'in-kind' payment, (3) cost of gas clause recovery of production/gathering costs and storage costs, and (4) a mechanism for allocation of mains using actual pipe size under the minimum size method. (Tr. at 1186-1208) The CEUG also makes certain proposals regarding tariff provisions for transportation, master metering and billing, weather normalization, and recommends that the Commission approve the REP subject to certain requirements. (Tr. at 1223-1224, 1232-1333)

CONTESTED ISSUES

The Parties have provided an Issues List which contains items still contested by two or more parties. More importantly, the Issues List also provides a list of issues and agreements regarding the disposal of certain previously contested items which we accept and incorporate by reference in this Order. The issues which remain to be decided fall into the following broad areas related to AWG's request in this docket: revenue requirement determination; allocation of revenue requirement to rate class or cost of service; design of resulting rates; tariff provisions; new services; and, certain miscellaneous items. Additionally, AWG's alternative rate change process under its proposed REP remains contested. The Commission addresses below those contested issues identified by the Parties in the Issues List within these general categories.

Revenue Requirement

Issues remaining in dispute which impact the calculation of revenue requirement fall under the general categories of rate base, rate of return, operating expenses, and other revenues. Those

components of revenue requirement determination that continue to be at issue in the rate base category are: *working capital assets* - Cash Balances. Issues still contested related to rate of return used to calculate revenue requirement are: *capital structure; cost of debt – short- term; cost of debt - long-term*; *level of Current, Accrued, and Other Liabilities ("CAOL")*; and *cost of equity.* Those operating expenses used to calculate revenue requirement and which are still in dispute are: *advertising, dues and fees; payroll and payroll taxes - incentive bonuses;* related *fringe benefits; uncollectible accounts expense; officers and directors insurance;* and, the *revenue conversion factor.* Other issues still in dispute which may impact operating expenses are *inter-jurisdictional allocations of cost.*

Rate Base

The appropriate level of cash to be allowed in cash working capital is the only rate base item which remains in dispute. Staff witness Larry Walker, consistent with the last AWG rate filing, Docket No. 02-227-U, has reduced cash working capital by $587,697 to reflect the minimum bank balances required. (Tr. at 1335-1356) AWG witness Morgan seeks approval of an amount equal to a full day's deposit of customer payments, on the basis that these deposits cannot be transferred under bank requirements before one full business day has passed. (Tr. at 327-328) According to AWG witness Morgan, it is only on the second day after deposit that AWG can transfer those funds to SWN to reduce its indebtedness and reduce its interest expense. (Tr. at 327-328) It is therefore appropriate, according to Mr. Morgan, that the full amount of deposits which cannot be transferred from the bank be included for purposes of Cash Working Capital. Should the Commission determine that these balances are not appropriately included as cash, then alternatively, Mr. Morgan

contends that the funds be considered as accounts receivable, reflecting the one day lag between deposit and investment. (Tr. at 328) Staff witness Walker testifies that, while the Commission has determined that the level of cash included in Working Capital Assets should be the minimum amount needed to meet daily operational needs, the Commission also found "'that a portion of the minimum balance could be placed in an interest bearing account . . .,'" which is not included in rate base to earn a return. (Tr. at 1369-1370) In this regard, Mr. Walker also testifies that Mr. Morgan's assertion that $595,297 is the minimum required by the bank is unsubstantiated. (Tr. at 1370) Mr. Walker states that it is not evident that this full $595,000, which is simply the 13-month end average of the account, represents one day's receipts. Furthermore, although Mr. Walker requested an analysis by AWG which would show an average of one day's receipts, no such analysis was provided. (Tr. at 1370) Mr. Walker also testifies that prudent cash management would dictate transferring all funds in excess of minimum bank balances and investing that excess so that it may earn interest, which eliminates the excess from earning a return in rate base. (Tr. at 1371) Mr. Walker testifies that Mr. Morgan's proposed alternative accounts receivable treatment for this excess cash is also not appropriate, as the funds are no longer accounts receivable once they have been received. (Tr. at 1371)

The Commission finds Staff's adjustment appropriate. AWG fails to provide any analysis which indicates its actual minimum operational cash needs nor has AWG provided material evidence to indicate that the 13-month end average represents the average daily receipt of payments. And, as Mr. Walker notes, funds in excess of minimum balances should prudently be moved to available, interest bearing investments. To the extent AWG asks that the Commission allow

alternative treatment as accounts receivable, AWG has failed to establish that recognition as an accounts receivable on a stand alone basis is appropriate under the MBSA or that the actual daily balance of accounts receivable would be materially changed. The Commission, therefore, rejects AWG's cash balance treatment as well as its alternative accounts receivable treatment and approves the adjustment as proposed by Staff.

Rate of Return

Issues remaining in dispute with regard to the calculation of the rate of return for revenue requirement determination are: *capital structure*, *cost of short-term debt*, *cost of long-term debt*, *level of current, accrued, and other liabilities ("CAOL")* and the *cost of equity*. Capital Structure proposals differ only as to the position of CEUG which opposes the position taken by AWG, Staff, and the AG. Additionally, while the majority of the parties have agreed on the overall capital structure with regard to the appropriate level of debt to equity components of 54% debt and 46% equity (Tr. at 55, 647, 941), issues related to the level of and the accounts which should be appropriately included will have an impact on the capital structure and related overall return. Debt cost, both short-term and long-term, are addressed by AWG, Staff, and CEUG witnesses. CAOL levels are addressed by AWG, Staff, and CEUG. Recommendations regarding the appropriate common equity rate are addressed by witnesses for all parties including AWG, Staff, the AG, the CEUG, and the NWAGC.

A. Capital Structure/Debt to Equity Ratio

Staff witness Brown testifies that, because AWG is not a publicly traded company, it is necessary to impute the debt to equity ratio to be included in the capital structure. (Tr. at 646) Mr.

Brown recommends a debt to equity ratio of 54% debt and 46% equity, imputing this ratio using analysis of the debt to equity ratios of a risk-comparable sample of companies having similar characteristics of AWG. Mr. Brown also notes that he has checked his imputed debt ratio of 54% against the current Standard and Poors ("S&P") published financial benchmarks, given AWG's expected credit rating and business risk profile, and determined that his recommended debt percentage fell within the S&P benchmarks. (Tr. at 638-642, 646-647) CEUG witness Tinsley recommends that the Commission maintain the capital structure approved in AWG's last rate case in Docket 02-227-U, with 52% debt and 48% equity, a recommendation which AWG witness Gunter states the Company will not oppose. (Tr. at 941-942, 1158-1160, 1270) Mr. Tinsley agrees with Staff that an imputed capital structure may be appropriate but disagrees with Staff's proposal, testifying that review of Mr. Brown's sample indicates he has included two companies with "highly irregular" levels of debt. Mr. Tinsley notes that, if these companies are removed from the sample, the resulting debt ratio would be approximately 52%. Mr. Tinsley also recommends that the Commission consider providing general guidance to parties in setting capital structures that will result in the lowest cost, without financially jeopardizing the company. Mr. Tinsley asserts that the current process is too cumbersome and that reliance on comparisons to other regulated utilities may not provide the correct result, relegating it to the decisions of other regulators. (Tr. at 1268-1270)

AWG is not a publicly traded company and the Commission finds that using the sample average of publicly traded companies is a reasonable method to develop a proxy. Staff conducted a full analysis of companies to produce a risk-comparable sample of other gas utilities. The Commission also finds that, alternatively, Mr. Tinsley has done no independent sample analysis.

Mr. Tinsley recommends exclusion of two companies from the Staff sample based solely on debt levels he deems "highly irregular." The Commission, however, finds that exclusion of these companies as "outliers" ignores the basis of using a sample average which will appropriately catch the vagaries of companies with similar business risks and similar operations. The Commission also finds Mr. Brown has appropriately tested his results based on external benchmarks and that those benchmarks support his results and recommendation. The Commission rejects Mr. Tinsley's proposal and adopts for revenue requirement calculation, the capital structure proposed by Staff.

B. Cost of Debt - Short Term

AWG witness Gunter testifies that neither AWG nor SWN recognizes short-term debt as a capital source in each company's respective capital structure. He also states that he accepts Staff's recommendation to impute 8.12% of external capital as short-term debt. Mr. Gunter, however, also testifies that the Commission should adopt a cost rate for that imputed debt of 4.49% which is applicable to SWN's multi-year revolver account, an account with properties similar to short-term debt, and that the Commission rejects Staff's proposed rate of 2.14%, which is the average short-term debt rate of Staff's proxy group. (Tr. at 938-939) Staff witness Brown recommends that the Commission adopt the end of period 2004 average rate paid by the risk-comparable sample of utilities, which would provide for a cost for short-term debt of 2.14%. Mr. Brown testifies that adopting the sample's rate provides an accurate and up to date cost of short-term debt consistent with his overall methodology in assessing the reasonableness of the capital structure components and each component's cost. (Tr. at 651) Mr. Brown rejects Mr. Gunter's proposed use of AWG's parent debt to set a cost of debt, testifying that AWG has already accepted Mr. Brown's sample

average debt proportion and it is more appropriate to reflect the average debt cost of those sample companies than it is to reflect debt cost of AWG's more risky parent. (Tr. at 678-679) Mr. Brown also testifies that he has, however, updated that cost to reflect more current interest rates, and recommends a cost of short-term debt of 3.94%. (Tr. at 679)

The Commission finds that Mr. Brown's methodology represents a consistently applied one, which, in effecting a hypothetical capital structure and its component costs, coordinates the relationship among capital structure components with the rate applicable to each component. Mr. Gunter adopts Staff's proposed external capital structure which, as Mr. Brown testifies, is based upon that of comparable utilities. However, Mr. Gunter fails to price those components consistent with those same utilities, rather adopting internal costs on a piecemeal basis. The Commission finds AWG's proposed method less consistent and reasonable than that applied by Staff and, therefore, adopts the level of and cost for short-term debt which Mr. Brown proposes.

C. Cost of Debt - Long Term

AWG witness Gunter proposes that the cost of long-term debt should be the weighted average cost of long-term debt for SWN, as adjusted to recognize the losses on reacquired debt. (Tr. at 892) AWG proposes a rate of 8.401% as updated in Mr. Gunter's Rebuttal Testimony. That, he testifies, is the current June 30, 2005, long term-debt rate of 7.972%, adjusted for reacquired debt losses and excluding SWN's revolver capital source ("Revolver"). It is Mr. Gunter's position that Staff has inappropriately included the Revolver as part of long-term debt, when it actually reflects a short-term source with a lower cost. Mr. Gunter testifies that by including a short-term debt source,

the Revolver account, as long-term debt, Mr. Brown essentially exceeds his proposed hypothetical level of short-term debt. (Tr. at 939-940. Ex. at 1553)

Staff witness Brown testifies that he also uses SWN's most current cost of debt of 6.571% as a proxy for that of AWG and, as adjusted for unamortized discounts and expenses, is 7.047%. (Tr. at 651) Mr. Brown testifies that he accepted this cost of debt specifically because it fell within the range of the weighted average cost of long-term debt for his sample companies. That range, he testifies, is between 4.92% and 7.73%, with an average of all companies of 6.54%. He notes that Mr. Gunter's proposed rate of 8.401% not only is greater than the average but falls outside of the entire range. Mr. Brown continues to recommend his original cost of long-term debt, 7.047%, be used on calculation of revenue requirement. (Tr. at 680)

CEUG witness Tinsley testifies that combining an imputed capital structure, which reflects less equity than the actual, with an imputed cost of debt, which reflects a lower cost than the actual, is unduly punitive to AWG. Mr. Tinsley testifies that he analyzed the sample companies used by Mr. Brown and noted that for these companies, as the level of equity increases, the cost of debt decreases. Mr. Tinsley concludes that Mr. Brown's use of the actual cost of debt, which is a result of AWG's higher equity level, coupled with an imputed and lower equity level, rewards ratepayers with a lower debt cost than would be achieved under the lower equity level. Mr. Tinsley recommends that the cost of debt be adjusted by adding 7.08 basis points to the actual cost proposed by Mr. Brown to reflect the debt cost which would be effected for a company with reduced equity. (Tr. at 1270-1272) We agree with Mr. Tinsley's 7.08 basis points adjustment.

The Commission finds that Mr. Brown's proposed cost for long-term debt falls within the

range of long-term debt cost of the sample companies he uses to test the reasonableness of AWG's requested capital costs. The Commission notes that Mr. Brown's rate is in the upper range of those sample companies and, in fact, exceeds the average of the sample. The Commission also finds that Mr. Gunter's proposed rate also exceeds the average of the sample but his proposed rate also exceeds the uppermost debt cost of that sample by a significant level and, as such, does not reflect a reasonable cost rate. Therefore, with the exception of Mr. Tinsley's 7.08 basis points adjustment, we find that Mr. Brown's methodology and proposed long-term debt cost is reasonable and supported by substantial evidence. The Commission, therefore, adopts a long-term cost of debt of 7.1178%, adding 7.08 basis points to Staff's proposed rate of 7.047%.

D. Level of Current, Accrued, and Other Liabilities or CAOL

AWG has included in its application a calculation of its working capital needs using the Modified Balance Sheet Approach ("MBSA"), pursuant to Commission Order No. 7 in Docket No. 84-199-U. (Tr. at 1354-1335) AWG witness Gunter testifies to and sponsors Schedule D-6 of AWG's Application containing the summary of Current, Accrued, and Other Liabilities ("CAOL"), with adjustments, which AWG has included in its capital structure at zero cost. (Tr. at 893) Staff witness Walker supports and testifies to Staff's calculation in this regard and the differences between the AWG proposed CAOL level and that proposed by Staff. Mr. Walker testifies that Staff has included $22,228,055 in CAOL (Tr. at 1373) whereas Mr. Gunter includes $16,821,321 in CAOL. (Tr. at 934)

Both Mr. Gunter and Mr. Walker have adjusted the CAOL to 13-month end balances, which should be more representative of their average balance, and removed interest bearing accounts,

which are included elsewhere in the capital structure. (Tr. at 894, 1357-1358) However, Mr. Gunter objects to the inclusion in CAOL of (1) certain other deferred credits in the amount of $65,733 and (2) deferred gas purchase costs related to unbilled revenues in the amount of $5,341,001. (Tr. at 928) Mr. Gunter testifies that the deferred credits account to which he objects relates to the estimate of certain FERC revenues and are "trued-up" each year. This account can be either a debit or credit from one year to the next and that, because it is such a "quick turn around," item it is not appropriate for long-term ratemaking. (Tr. at 933-934)

Mr. Gunter also testifies that, while both AWG and Staff do not include the over/under account for gas cost on the asset side, Staff has included in CAOL the deferred gas purchase cost account which is created when booking unbilled revenues. Mr. Gunter testifies that, when including this account on the liability side of the MBSA, there is no appropriate matching asset booked to rate base. Mr. Gunter asserts that the lack of an offsetting asset entry and the volatile nature of the liability render this account inappropriate for inclusion as a zero cost item for long-term ratemaking. (Tr. at 932-933)

Mr. Gunter also testifies that, although the MBSA approach to measuring working capital is supposed to mimic the results of conducting a lead-lag study, he questions whether the two methods will produce the same results with regard to gas cost items. (Tr. at 935-936) He observes that the gas cost portion of accounts receivable (the gas cost included in the revenue which produced the account receivable) may be either more or less than the gas cost which is payable. Under the MBSA, he notes, this will result in either a positive or negative working capital requirement, while

most utilities will pay for gas consumed before recovering it from ratepayers. Under the lead-lag method, working capital requirement will almost always be positive. (Tr. at 936)

Staff witness Walker, as supported by CEUG witness Tinsley, makes no changes to his originally filed CAOL levels. (Tr. at 1274-1275, 1373) Mr. Walker rebuts both Mr. Gunter's proposed exclusions from the CAOL and his observations regarding lead-lag results in comparison to the MBSA results in measuring working capital. With regard to the latter, Mr. Walker testifies (1) Mr. Gunter does not provide a lead lag study to which he can compare MBSA results, basing his observations on only one liability account and a part of one asset account (Tr. at 1364-1365); (2) the only way to compare the two is to compare their net revenue requirement impacts - piecemeal comparisons of only portions of the components included in the MBSA or lead-lag are not valid (Tr. at 1365); and (3) the Commission's application of the less complicated and less expensive MBSA as an alternative for lead lag studies has, for the last 20 years, been upheld on appeal. (Tr. at 1366-1367) Further, Mr. Walker testifies there is no flaw in the MBSA because of the different working capital treatment of the over/under gas cost account and the deferred over/under account, testifying that one account accrues interest (to be received or to be paid depending on whether it is positive or negative) and is excluded from working capital treatment, while the deferred account does not accrue interest and is included. (Tr. at 1367)

Mr. Walker also explains that including the deferred gas account in liabilities without a corresponding asset in rate base is appropriate and that assets and liabilities need not be equal. (Tr. at 1368) He also testifies that the volatility of both liability accounts at issue is no reason to exclude

them from working capital treatment, noting that many accounts are seasonal and volatile, which is why a 13-month average is used to measure them. (Tr. at 1369)

With one exception, the Commission finds that Mr. Walker has appropriately included all non-interest bearing liabilities, using 13-month end averages, in CAOL as contemplated by the MBSA. However, we agree with AWG witness Gunter that the deferred gas purchase costs of $5,341,001 related to unbilled revenues should not be included in CAOL.

E. Cost of Equity

AWG, Staff, the AG, NWAGC, and CEUG each offer cost of equity testimony and each propose a different rate. AWG witness Morin's final recommendation is that AWG be allowed a cost of equity of 11% (Tr. at 540), Staff witness Brown recommends an equity return of 9.7% based upon a range of reasonableness of 9.2% to 10.1% (Tr. at 673, 677), AG witness Marcus recommends an equity return of 9.5% (Tr. at 124), NWAGC witness Cassidy recommends an equity return of 9.24% (Tr. at 1044), and CEUG witness Tinsley originally recommended that the Commission approve an equity return based on AWG's last approved rate case or a maximum return of 9.9%.[5] (Tr. at 1162)

1. <u>AWG Recommended Return on Equity</u>:

AWG witness Morin bases his recommended equity return of 11.0% on analysis he performs using the Capital Asset Pricing Model ("CAPM") and the Risk Premium ("RP") method, which are both risk premium approaches, and the Discounted Cash Flow ("DCF")

[5] In Surrebuttal Testimony, Mr. Tinsley does not specifically recommend the same return, but rather recommends that the Commission set a return on equity "that is appropriate for the current LDC business environment with due consideration of flotation costs and all available methods of analysis including DCF, CAPM, and RPM." (Tr. at 1278)

method. Dr. Morin testifies that he ran (1) one normal CAPM and an empirical approximation of the CAPM ("ECAPM"), (2) three RP models, including an analysis based on natural gas distribution companies' historical data, one based on electric utilities' historical data as a proxy for AWG's energy business, and one using risk premiums allowed by regulators in setting rates for natural gas distribution companies. (Tr. at 391)

According to Dr. Morin, the basis for using risk premium methods is to set equity based upon a risk-free rate and add to it the premium required by investors for bearing incremental risk. (Tr. at 407) Dr. Morin testifies that it is necessary to evaluate the results of varied methods, applied to varied companies to avoid errors, omissions, and to accommodate vagaries in the market data. Further, he notes that reliance solely on DCF, as some commissions do, ignores capital market evidence. (Tr. at 399-401, 403, 404, 406) Dr. Morin testifies that, using CAPM and ECAPM analysis, his equity returns with flotation costs[6] range from 11.8% to 12.7%, with a 12.3% average. (Tr. at 418) He testifies the results of his RP analysis for gas distribution companies, for electric distribution companies, and for the one using the regulator-allowed risk premiums, including flotation costs, range from 11.0% to 11.8% and average 11.4%. (Tr. at 418-425) Dr. Morin also testifies that, using the DCF model and the proxy samples of both gas distribution companies and combination gas and electric distribution companies, his range of equity returns, with

[6] Flotation costs are direct and indirect, or market pressure, costs which are incurred upon issuance of stock and Dr. Morin testifies he has incorporated the impact of these costs as a percent of the dividend yield in calculating his expected equity return. (Tr. at 431 - 435)

flotation costs, is 9.3% to 10.4%. (Tr. at 424-431) Dr. Morin asserts that AWG faces demand and financial risks greater than other gas distribution companies and, therefore, experiences greater investment risk than other gas distribution companies. For these reasons, Dr. Morin concludes that AWG requires an additional equity return of 30 basis points to recognize that increased risk. (Tr. at 436-441) Dr. Morin recommends, based upon current market conditions and his judgment, an equity return of 11.0% for AWG, which is lower than his initial recommendation of 11.5%. (Tr. at 540)

2. Staff Recommended Return on Equity:

Mr. Brown testifies that he has applied the DCF method to his sample using the appropriate price term, dividend term, and growth rates which results in a range of reasonable returns for AWG of 9.2% to 10.1% within which his recommend equity return of 9.7% falls. (Tr. at 655-658) In addition, he testifies that, as a check, he has run a comparable analysis which confirmed the reasonableness of his DCF results. (Tr. at 658-660) Mr. Brown also testifies that, as a check to Morin's 30 basis point flotation cost adjustment, he has calculated an estimate of actual flotation costs as a percent of stock and concludes that it would be less than 5 basis point. He concludes that, therefore, no such adjustment is appropriate. (Tr. at 669-672) Mr. Brown recommends that the Commission adopt his DCF analysis and return on equity.

3. AG Recommended Return on Equity:

AG witness Marcus recommends an equity return of 9.5%. (Tr. at 124) In support of his proposed return, Mr. Marcus also recommends that (1) the Commission focus its

attention upon the opinion of utilities and market analysts, when they are not testifying in support of rate increases (Tr. at 60-62), and (2) the Commission also focus on current market-to-book ratios for gas utilities. (Tr. at 64-65) In this regard, Mr. Marcus testifies that, based on SWN's own annual report disclosures regarding its employee pension investments and based on his sample of gas utilities' pension fund investments, expected returns for these funds approximate an average of 9% and between 8% to 9%, respectively. (Tr. at 61-64) He also testifies that current comparison gas utilities' market-to-book ratios are approaching 185%, which indicates that investors see gas utility returns as providing significantly healthy earnings relative to original cost. (Tr. at 64-65) Mr. Marcus asserts that, with the overall market expecting returns of 10-11%, equity returns for the less risky utility should be much less. He testifies that he has run his own CAPM analysis reflecting the expectations of pension fund managers. He notes that the analysis indicates expected returns of 8.5% to 9.9%, a range he also recommends can be used to measure the reasonableness of DCF results. (Tr. at 65-67)

4. **NWAGC Recommended Return on Equity**:

NWAGC witness Cassidy recommends, based solely upon his DCF analysis, a return on equity for AWG of 9.24%. (Tr. at 1044, 1046-1047) Mr. Cassidy testifies that he adopted, with one exception, Dr. Morin's proxy group (Tr. at 1046-1047), and he ran the DCF under three different growth rate assumptions.[7] (Tr. at 1048-1052) He notes that,

[7]The growth rate assumptions used by Mr. Cassidy are: DCF with short term, using the mean of the 5-year growth rates taken from Zacks Investment Research, April 5, 2005 (Tr. at 1053, Ex. at 1577), DCF with a two stage growth rate, using the short term above and the sustainable growth rate (Tr. at 1054-1055, Ex. at 1583), and DCF with a three stage

applying a quarterly dividend payment schedule which reflects SWN's actual dividend payment schedule (Tr. at 1053), his analysis results, under the three assumptions were (1) from 7.93% and 10.12%, averaging 9.06% (Ex. at 1578), (2) from 7.39% to 11.01%, averaging 8.53% (Ex. at 1585), and (3) from 7.93% to 10.25% averaging 8.79% (Ex. at 1589). Averaging the results of his three different models, Mr. Cassidy recommends that the appropriate equity return for AWG should be 9.0%. (Tr. at 1056-1057) Mr. Cassidy testifies that he also has calculated flotation costs for AWG in the amount of .24% which he has added to his return and recommends an overall equity return of 9.24%. (Tr. at 1057-1058)

5. CEUG Recommended Return On Equity:

CEUG witness Tinsley originally recommended that the Commission adopt the maximum equity return approved in AWG's last rate case in the amount of 9.9%, asserting that AWG has not sufficiently justified its requested return on equity. (Tr. at 1162) However, in Rebuttal, Mr. Tinsley recommends only that the Commission set equity return, fully considering all forms of analysis, the current gas utility business environment, and any flotation costs applicable. He also recommends that the Commission adjust that return appropriately if the Commission approves the WNA or REP. Mr. Tinsley also recommends that "(t)he Commission should consider providing guidance to the parties on the subject of the ROE in an effort to streamline the ratemaking process." (Tr. at 1278-1279)

---

growth rate, using the short term above, the sustainable as discussed, and the long term growth rate for GDP. (Tr. at 1055-1056, Ex. 1589)

6. Return on Equity - Response to AWG Filed/Rebuttal/Surrebuttal

Staff witness Brown testifies that Dr. Morin's proposed equity return is unrealistic and contrary to movement in the capital markets where interest rates are falling. (Tr. at 663) Mr. Brown testifies that he also used a proxy sample of companies which will be used to effect an appropriate cost of capital for AWG, a non-publicly traded company, but notes that Dr. Morin's sample appears to be riskier than AWG, thus, resulting in higher equity estimates. (Tr. at 639-642) He rebuts the weight Morin has assigned to methods other than DCF in estimating a fair equity return, noting that the risk premium methods are not industry or company specific and that the CAPM approach incorporates assumptions, as do all financial models, for which financial analysts must accommodate in estimating expected equity returns. Mr. Brown also notes that the Commission has consistently and repeatedly expressed its preference for application of the DCF model. (Tr. at 664-666) Mr. Brown observes that use of risk premia exposes RP analysis to fluctuating and unstable results, noting that Morin's RP risk premia values for his natural gas sample ranged from -27.89 % to 61.21%, an over 8900 basis point spread, with risk premia from his electric sample ranging from -37.34% to 71.96%, a basis point spread of over 10,900, and that significant reliance on this method will reflect that instability of results. (Tr. at 666-667) In addition, Mr. Brown criticizes Dr. Morin's application of the CAPM which he states is a form of RP and, as such, is subject to all the same infirmities. Mr. Brown testifies that, in Dr. Morin's application of CAPM, Dr. Morin assumes earnings growth of 16.4%, a level which is not commensurate with investors' and analysts' market expectations. (Tr. at 667-668)

AG witness Marcus testifies that (1) some of the companies in Dr. Morin's sample include regulated gas distribution companies engaging in other activities and that those companies should be eliminated (Tr. at 55-56), (2) the RP method is circular, one in which commissions are basing equity returns on the possibly generous equity returns already provided by other commissions[8] (Tr. at 56-59), (3) Dr. Morin's CAPM model uses stock and income growth rates of 13.5% and 16.7%, respectively, which Dr. Morin fails to support and which are not credible (Tr. at 58-60), and (4) Dr. Morin's analysis is not particularly well supported given that his application of the CAPM depends, in large part, on estimates previously made by analysts for 1983-1998. (Tr. at 60, footnote omitted)

In addition, Mr. Marcus recommends that the Commission consider the reduced risk and increased earned returns of gas utilities as a whole and, when doing so, weigh the reasonableness of Dr. Morin's resulting equity return of 10% to 11%. Mr. Marcus additionally notes that using the CAPM model will actually produce returns ranging from 8.5% to 9.9%, if more reasonable assumptions[9] are adopted. (Tr. at 65-66)

NWAGC witness Cassidy testifies that Dr. Morin has erred in his analysis, resulting in an overstatement of required equity return. (Tr. at 1059) Mr. Cassidy testifies that those errors include (1) Dr. Morin's choice of methods, including the CAPM and RP, as well as

---

[8]Mr. Marcus notes that risk premiums for gas utilities have actually been declining, with Dr. Morin reaching back to pre-1960 to effect his estimate of the risk premium. Using only the last 19 years, the risk premium has been only 3.46%. Further, he notes that gas utilities, a lower risk investment, are actually earning returns reflective of the market for more risky and non-regulated entities, indicating the circularity of the RP model and the expected willingness of investors to continue to invest in gas utilities, even with lower equity returns approved by regulatory bodies. (Tr. at 57-58)

[9]Mr. Marcus suggest that those more reasonable assumptions would be those made currently by corporate actuaries.(Tr. 65-66)

the data he used under those methods and under the DCF, (2) his adjustments for Flotation Costs, and (3) his adjustment to reflect the increased risk he asserts AWG faces.

With regard to Dr. Morin's choice of methods, Mr. Cassidy testifies that Dr. Morin has inappropriately relied on the CAPM model which, by its very theory[10], assumes a diversified portfolio rather than one which reflects comparable risk. Mr. Cassidy explains that the Bluefield[11] decision requires that equity returns reflect only companies of comparable risk. Mr. Cassidy concludes that, given the CAPM model always assumes a diversified portfolio, it should not be used for equity determination. (Tr. at 1059-1061) Mr. Cassidy testifies that, even if the Commission wishes to consider the CAPM as corroborative evidence, Dr. Morin's execution contains several flaws, including his use of an incorrect risk-free rate, his failure to use the true risk-free proxy which is the 3-month Treasury bill, and his failure to justify the use of the ECAPM. (Tr. at 1061-1063) Mr. Cassidy testifies further that, although the CAPM would yield an equity return of 10% if these errors were corrected, it is his opinion that the CAPM analysis is not a valid indicator of the required equity return for AWG. (Tr. at 1064-1066) Mr. Cassidy also testifies that Dr. Morin's reliance on the historical RP method is suspect as it is based upon a proposition[12] that is

[10]Mr. Cassidy testifies that "(p)roponents of the CAPM believe that the amount of company specific risk in a portfolio can be reduced to zero through diversification, leaving the portfolio exposed only to market risk...(t)herefore, the CAPM is valid only when applied to a diversified portfolio." (Tr. at 1059-1060)

[11] Bluefield Water Works and Improvement Company v. Public Service Commission of West Virginia, 262 U.S. 679 (1923).

[12]Mr. Cassidy states that Dr. Morin's historical risk premium analysis assumes that investors base their current risk premium on the average of historical results, but it is also generally accepted that an investor's actual return or realized return, when he sells his investment, is rarely the same as the return he expected, or the required return, at the time he purchased that investment. (Tr. 1065-1066)

impossible to prove or disprove. Further, he notes, that should the Commission give consideration to the RP, it is more appropriate to use current bond yields rather than "expected" bond yields, given the unreliability of those "expected" yields. (Tr. at 1066-1067) Third, Mr. Cassidy testifies that Dr. Morin's DCF model inappropriately relies completely on certain short-term growth rates, which are not representative of the market consensus. (Tr. at 1067-1068) Fourth, Mr. Cassidy testifies that he supports recovery of flotation costs as costs appropriately used to measure required returns, but, that those costs are only related to issuance of new stock. Absent that proof of a new issuance, the cost should not be included. (Tr. at 1068-1069) Finally, Mr. Cassidy testifies that he disagrees with Dr. Morin's contention that a premium should be included to recognize that, as a smaller company, AWG is a riskier investment than other distribution companies. Mr. Cassidy testifies that AWG resembles a large, less risky company and therefore no 'premium' is needed. (Tr. at 1070-1071)

Dr. Morin criticizes Staff's equity calculation (1) for its reliance on the single DCF method, which he contends understates equity returns because it fails to adjust for any book to market difference in the price of stock (Tr. at 479-484), (2) for Mr. Brown's use of understated dividend yields (Tr. at 484-488), (3) for his mismatch of stock price and growth (Tr. at 489), (4) for Mr. Brown's use of stale data (Tr. at 489), (5) for his failure to reflect, in his risk premium check, the inverse relation of interest to risk premium (Tr. at 496-497), and (6) for his failure to include flotation costs (Tr. at 490-492).

Dr. Morin also defends his analysis against certain of the criticisms of AG witness

Marcus, noting that, use of historical market risk premiums ("MRP") to determine expected MRP is well supported by current financial literature, common practice, and by review of the implicit return on equity allowed by regulators. (Tr. at 513-515) Dr. Morin also disputes Mr. Marcus' contention that use of RP is circular. Dr. Morin testifies that neither the risk-free rate nor the beta risk measure, required components of the RP method, are subject to regulatory determination but are, rather, market driven and set by supply and demand. Dr. Morin continues that it is actually the DCF model which suffers from circularity, given the expected growth rates applied are, by and large, determined by regulatory treatment. (Tr. at 516) Dr. Morin also rebuts the AG's recommendation that the Commission consider the current higher gas utility realized earnings returns when setting a utility's required return, noting that Mr. Marcus relies too heavily on short term market information rather than periods which are long enough to smooth out aberrations and encompass several business and interest cycles. (Tr. at 517-518) And, finally, dismissing the AG's observation that, given lower tax rates, required returns would also be less, Dr. Morin notes that not all investors are taxable. (Tr. at 518)

Dr. Morin also dismisses Mr. Marcus' analysis and recommended equity return, stating that Mr. Marcus conducted very little independent analysis, did not develop any of his own comparable company samples, performed no independent RP analysis, and provided a CAPM analysis in which he has used inappropriate inputs. (Tr. at 508-510) Further, Dr. Morin questions whether pension fund data assumptions, extracted from only specific companies, are appropriate to use in determining market risk premium. (Tr. at 510)

Dr. Morin also defends his use of the CAPM and Historical Risk Premium against Mr. Cassidy's criticism. (Tr. at 528-529, 533-536) Dr. Morin criticizes Mr. Cassidy for using only the DCF method in arriving at an equity return recommendation and for the limited scope of Mr. Cassidy's analysis which, he notes, is based on Dr. Morin's evaluation, not Cassidy's. (Tr. at 519, 480-522) Dr. Morin also criticizes Mr. Cassidy's application of the sustainable growth assumption in two of the three DCF models run by Mr. Cassidy. Dr. Morin asserts that (1) Mr. Cassidy's growth assumption does not consider external stock financing, (2) Mr. Cassidy's growth rates applied to the sample companies reflect higher equity returns than Mr. Cassidy recommends, (3) his method is not supported by financial literature, (4) Mr. Cassidy relies too much on Value Line for the analysis, and, (5) Mr. Cassidy's expected return is based on end of period book equity rather than the average. (Tr. at 523-528)

In surrebuttal, Staff witness Brown continues to support DCF as the preferred approach to measuring required equity return. And, despite Dr. Morin's contention that he did otherwise, Mr. Brown states that he also conducted multiple analysis using other methods to test for reasonableness. He asserts that the results of those differing methods served as a reasonableness check against the DCF method and appropriately reflected, as Dr. Morin's analysis did not, similar levels of equity return. Witness Brown testifies that, had Dr. Morin applied more reasonable and less flawed inputs into his models, his results would have also reflected equity ranges which were similar across all methods. (Tr. at 684-685) Noting Dr. Morin's recommendation to consider the market to book ratio for return

measurement, Mr. Brown states that Dr. Morin inappropriately faults Staff for not doing so in its analysis. (Tr. at 685-686) Witness Brown contests Dr. Morin's assertion that the DCF model understates equity return requirements, pointing out that the DCF is the most widely accepted method used by commissions. Mr. Brown states that if Dr. Morin's contentions were true, and given its acceptance and widespread application, utilities would have over the years had significant difficulty in attracting capital. That has not occurred and, in fact, utility external capital has increased significantly. (Tr. at 686) Mr. Brown testifies that Dr. Morin is also mistaken that use of a quarterly, rather than an annual, dividend payment schedule understates dividend yield and, therefore, understates the resulting return. The dividends are paid quarterly and the model Mr. Brown uses, therefore, appropriately captures the time value to investors of that payment schedule. (Tr. at 687) Mr. Brown also contests Dr. Morin's inference that Staff inappropriately used non-current or 'old' stock prices and that the prices used were not from the time period from which growth rates were taken. Mr. Brown testifies, first, that he appropriately used a 13-week average[13] in contrast to Dr. Morin's use of only current prices and, second, that the growth information corresponded directly with the first week included in that average. (Tr. at 687-688) Mr. Brown testifies that he continues to recommend disallowance of both Dr. Morin's flotation cost adjustment and risk adjustment. Mr. Brown testifies that Dr. Morin's flotation cost request includes, not only costs related to expected future issuances of stock, but also all cumulative past,

[13]Mr. Brown testifies that the 13-week average should be used to "eliminate the influence of random stock market fluctuations . . . , " in which stock prices can vary widely, given utility rates are set to be in effect for a much longer period of time. (Tr. at 688)

unrecovered amounts. Mr. Brown testifies further that Dr. Morin provides no new evidence to support his contention that investment in AWG represents a higher relative risk than the sample average. (Tr. at 690, 692)

AG witness Marcus testifies that Dr. Morin has failed to address or provide support for his excessive estimates for stock or income growth at 13.5% and 16.7%, respectively. (Tr. at 121) Mr. Marcus defends his own analysis against Dr. Morin's criticism regarding the AG's use and source of the actuarial data. Mr. Marcus testifies that his analysis provides an appropriate perspective of a large group of equity market investors who, as utility pension fund investors, are not offering testimony in utility rate-of-return proceedings. (Tr. at 122) Mr. Marcus notes that, in addition, he received his information, not from a 'selective' group of companies, but rather from all Arkansas utilities from which the AG has requested this information and, more importantly, from all companies included in Dr. Morin's sample proxy. (Tr. at 122-123) Mr. Marcus also provides current articles related to expected equity returns which indicate returns will likely be less than 10%. (Tr. at 123, Ex. at 57-67)

NWAGC witness Cassidy defends his use of DCF as the preferred method used in determining his recommended return on equity. Mr. Cassidy rejects Dr. Morin's contention that the DCF method understates the cost of capital and also rejects Dr. Morin's contention that any proposed return on equity is not valid if it is less than the current earnings of the proxy companies used to calculate that equity cost. (Tr. at 1075-1085) Mr. Cassidy continues to recommend the DCF method and defends his criticism of the CAPM and the ECAPM. He reiterates that these methods are applicable only to samples of large,

diversified companies and, therefore, not appropriate for setting regulated rates for which risk-comparable companies must be used. (Tr. at 1075-1085) Mr. Cassidy reiterates his view that the RP, as applied by Dr. Morin, does not appropriately measure the required return on equity. Mr. Cassidy states that, for RP to be applied correctly, Dr. Morin must show that the spread between earned returns on stocks and those on bonds is the same as the spread between the required returns on stocks and those on bonds, which he has not. (Tr. at 1086) Mr. Cassidy defends his acceptance of DCF as the most valid method and rebuts Dr. Morin's criticism that Mr. Cassidy has not given full consideration, in calculating an appropriate equity return, to the earned returns and the book to market ratio of stock. Mr. Cassidy explains that the DCF model, in fact, "provides a logical framework to analyze the cost of capital and the appropriate allowed return on equity. . ." and that its proper implementation will actually push the market value to the book value of stock. (Tr. at 1074-1075) He explains that "(t)he fact that the stock prices are currently in excess of book value simply indicates that the utilities in (the) proxy group. . . are earning returns on book value that exceed the investors' required returns. It is only natural that investors will bid the price of these stocks to a level higher than their respective book values." (Tr. at 1074) Mr. Cassidy provides an illustration of the impact on market price of setting regulated equity at different levels. He explains that:

> . . . the relationship of the earned return and required return and how they affect the price/book ratio show that the expected return used in the growth rate of the DCF model will be equal to the return that investors require for an investment only when the market price and book value are equal . . . that the expected return is different from the required return is not an indication that the DCF model is invalid. It

> merely indicates that the market price and book value are different . . . the return required by investors is the same before and after a rate case that sets a new allowed rate of return. The only change will be the movement of the stock price toward book value.

(Tr. at 1081-1082)

Mr. Cassidy also responds to Dr. Morin's criticism regarding Mr. Cassidy's failure to adjust for growth. Mr. Cassidy testifies that his computation of the effect of new stock sales on growth indicated either very limited or negative growth and, therefore, he continues to recommend no growth adjustment. (Tr. at 1083-1084)

Commission Finding

The Commission finds that AWG's proposed return on equity of 11.0% is excessive. The Commission has reviewed the analysis which AWG proffers as support for its equity return, noting the Company's heavy reliance on the CAPM and RP results, which produce significantly higher returns than the DCF model. (Tr. at 424-431) The Commission has also reviewed AWG's contention that it faces greater risk than other gas distribution companies and, therefore, needs a higher return to reflect that risk - in this case - an additional 30 basis points. (Tr. at 441) Finally, the Commission has reviewed and considered AWG's request for another 30 basis points Dr. Morin recommends as an appropriate flotation cost adjustment. (Tr. at 433-434)

The Commission finds, first, that an appropriately produced DCF analysis provides a more accurate and independently determined required return on equity than does a RP analysis, which may be subject to fluctuating and unstable results as reflected by AWG's own analysis. The Commission notes the width of the risk premia spreads of Dr. Morin's sample companies ranging from negative 27.89% to 61.21% for his gas utility sample and from negative 37.34% to 71.96% for

his electric company sample. The basis point spread of these two sets of results is 8910 (61.21 + 27.89) and 10,930 (71.96 + 37.34) respectively. (Tr. at 666-667) Additionally, the Commission notes the superiority of the DCF method, which uses only data from companies which have the same business and financial risks as the company subject to analysis, while RP bases its analysis on market-wide data, incorporating into that analysis the risk profiles of companies "ranging from gold mining, to farming, to computer technology, to automobile manufacturing." (Tr. at 664) With regard to Dr. Morin's CAPM and ECAPM analyses, which are also variants of the RP methodology and subject to the same limitations, the Commission finds that this analysis is based upon an excessive risk-free rate and excessive earnings growth assumptions which are unsupported and which produce excessive equity return results. (Tr. at 668) Current 30-year U.S. Treasury Bond yields are 4.36%, while the lower end of AWG's proposed risk-free rate range is 4.5%. (Tr. at 685) AWG's analysis also assumes earnings growth of 16.4%, but the record does not reflect an adequate response to questions raised about whether such high estimates are sustainable and the unreasonable results which can be extrapolated if they are adopted. (Tr. at 58-60, 668, 684-685)

The Commission also finds Dr. Morin's criticisms of the DCF method are exaggerated, if not flawed. Dr. Morin contends that the DCF model understates the cost of equity if the market price for stock exceeds its per book cost and, alternatively, the DCF model overstates the cost of equity if the market price of stock is less than per book. (Tr. at 480) Dr. Morin states that this happens because "the DCF market return is applied to a book value rate base by the regulator, that is, a utility's earnings are limited to earnings on a book value rate base." (Tr. at 480) It is Dr. Morin's contention that the DCF formula does not properly account for differences in the book-to-

market ratio. (Tr. at 481-483) However, as demonstrated by the evidence before us, "(t)he fact that the stock prices are currently in excess of book value simply indicates that the utilities in (the) proxy group . . . are earning returns on book value that exceed the investors' required returns. It is only natural that investors will bid the price of these stocks to a level higher than their respective book values." (Tr. at 1074-1075) Mr. Cassidy provides an illustration of the impact on market price of setting regulated equity at different levels and explains "the relationship of the earned return and required return and how they affect the price/book ratio show that the expected return used in the growth rate of the DCF model will be equal to the return that investors require for an investment only when the market price and book value are equal . . . that the expected return is different from the required return is not an indication that the DCF model is invalid. It merely indicates that the market price and book value are different . . . [t]he return required by investors is the same before and after a rate case that sets a new allowed rate of return. The only change will be the movement of the stock price toward book value." (Tr. at 1081-1082) The Commission, therefore, finds that Dr. Morin's proposed market adjustment is not required. The Commission sets return based on book value, which represents the actual equity provided to AWG.

The Commission also finds that Staff's DCF model does not, as Dr. Morin claims, understate dividend yields simply because Mr. Brown employed a quarterly DCF calculation rather than an annual one. (Tr. at 484-488) Because such dividends are paid quarterly, it is inappropriate to impute those payments as if paid annually and Staff's choice of model appropriately recognizes the "time value of investors receiving their dividends quarterly. . .." (Tr. at 687) The Commission also finds that Staff has correctly used an average of returns and there is no "mismatch" of Staff's

stock prices with growth data as Dr. Morin asserts. (Tr. at 489-491) Staff witness Brown has appropriately used a 13-week average, which will reduce market fluctuations, and his growth information corresponds directly with the beginning of his 13-week period. (Tr. at 687-688) The Commission also finds that AWG's request for a flotation cost adjustment is excessive and the request for additional return to offset AWG's "higher" risk unsupported. AWG seeks not only for a prudent amount related directly to prospective stock issuances, but also for any "unrecovered" costs from prior issuances. (Tr. at 690) The Commission finds such treatment of prior "unrecovered" costs inappropriate in setting prospective rates. The Commission agrees that including some level of valid, sustainable, measurable, and material flotation costs in equity return is appropriate and finds, given Dr. Morin's agreement with the formula used in Staff's analysis, that appropriate recognition of flotation costs is provided by that analysis. (Tr. at 689, 1068-1069) As to AWG's request for a "risk adjustment" of an additional 30 basis points, the Commission finds no credible evidence to support AWG's contention that it faces above average risk to its demand because of lower electric prices in competition. As noted in testimony, while electric prices may be lower in AWG's territory, so are gas prices. Nor is there any demonstrative evidence that AWG's size requires a risk adjustment. As noted by Staff witness Brown, were AWG publicly traded, it would likely trade as a small cap company. Mr. Brown's sample includes such companies and he has, therefore, appropriately captured the impact of that level of risk in his cost of equity calculation. (Tr. at 668-669)

In view of the foregoing, the Commission finds that Staff's equity range of 9.2% to 10.1% is reasonable and supported by substantial evidence of record. The Commission notes that the equity

returns recommended by the other parties, ranging from 9.24% to 9.9% based on different approaches and methodologies, all fall within Staff's equity range. Further, we find that Staff's equity range has been based on an appropriately executed DCF, as measured against the results of Staff's own RP analysis. Mr. Marcus recommended that his CAPM analysis, reflecting pension fund managers' expected returns and producing an equity range of between 8.5% to 9.9%, be used as a check for the reasonableness of the DCF results. (Tr. at 65-66) The Commission, therefore, finds no dispute from the AG regarding Staff's recommendation in this regard. Mr. Tinsley originally recommended the Commission adopt the last approved equity return of 9.9% as a maximum for AWG, testifying that AWG had not justified its return on equity request. (Tr. at 1162) In Surrebuttal, Mr. Tinsley recommends that the Commission set the equity return giving consideration to all models, to current industry risks, and to any offsetting risk mitigating tariffs or treatment, and giving effect for flotation costs. (Tr. at 1239) The Commission, in accepting Staff's equity range of 9.2% to 10.1% as reasonable, has given consideration to those areas as recommended by CEUG and finds no dispute by Mr. Tinsley of Staff's recommended equity return of 9.7%. Finally, Mr. Cassidy proposes an equity return of 9.24% based upon his own DCF analysis under three different assumptions. Equity returns resulting from these three analyses, range from 7.91% to 11.24%. (Tr. at 1054-1057) Given that Staff's recommended return on equity of 9.7% would fall within that range, the Commission finds that Mr. Cassidy's model and evidence generally supports, and does not contradict, Mr. Brown's analysis or his conclusions.

The Commission also notes Mr. Tinsley's recommendation that consideration be given to a standardization of the process by which overall return is determined in order to simplify and

streamline the process. (Tr. at 1162) The Commission finds that the evolutionary nature of regulation coupled with the reservation of parties' rights to pursue differing positions in view of changes in markets and other circumstances make standardization of the most esoteric of rate setting components not feasible at this time.

Operating Expenses

Issues still in dispute regarding AWG's operating expenses relate to: *advertising, dues and fees*; *payroll and payroll taxes*; *fringe benefits*; *officers and directors insurance*; *uncollectible accounts expense*; and *revenue conversion factor.*

A. Advertising, Dues, and Fees-Market Penetration Study

AWG's original filed revenue requirement eliminated certain promotional advertising, dues and fees, and lobbying expenses and contributions to various organizations. Staff witness Hilton[14] proposed additional adjustments removing other lobbying expenses, business gifts, additional contributions, private club fees, certain professional dues and subscriptions, certain trips, and unsupported expenditures. (Tr. at 1390) AWG witness Morgan objects to the removal of $19,700 in costs related to AWG's biannual survey, testifying that the survey, conducted since 1987, "helps AWG better understand and track household penetration, appliance saturation and customer satisfaction." Mr. Morgan states that "(t)racking these trends, helps AWG understand how to focus and utilize our marketing assets more efficiently to maintain market share and preserve base load." Further, Mr. Morgan notes that Staff allowed the recovery of those costs in its last rate case. (Tr. at 335-336) Mr. Hilton notes that Ark. Code Ann. §23-4-207 allows, for ratemaking treatment,

[14]As previously noted, Mr. Hilton adopted the pre-filed testimonies of McGarity. (Tr. at 1376 -1378)

advertising which provides information on utility service or ways consumers can conserve energy or reduce peak demand or information regarding rates and rate structures or economic development in the state and specifically excludes "Promotion Advertising" designed to encourage consumers to select or use a utility service. Mr. Hilton testifies that, given the rationale provided for the study, it appears that the study is "focused on perceived corporate image, local visibility and competition." (Tr. at 1405)

The Commission finds Staff's adjustment appropriate. Costs of a survey conducted to determine the penetration of gas appliances owned by and customer satisfaction of captive utility customers are not appropriately borne by those captive customers. The Commission also notes Mr. Morgan's own testimony specifically advises that the survey's purpose is to encourage customers to use utility service, or, as he testified, "to maintain market share." (Tr. at 335-336) The Commission finds no evidence that the Study relates to those areas addressed in Arkansas statutes and which are allowed for recovery in rates. The Commission, therefore, finds Staff's adjustment to remove these costs from revenue requirement consideration appropriate.

B. Payroll and Payroll Taxes

Staff and the Company differ on the appropriate payroll and payroll taxes related to SWN to include in revenue requirement. Although sharing the same method to calculate base payroll, these parties differ in their calculation of bonuses. In addition, the AG states that AWG bonuses are calculated incorrectly and that any corrected levels should be shared equally between AWG stockholders and AWG ratepayers. The AG's adjustments would also impact related payroll tax levels included in revenue requirement.

1. **Bonuses:**

In calculating its expected level of SWN bonuses to be included in pro forma payroll, Staff witness Williams[15] used a three year average of bonuses paid in 2002 through 2004 but excluded 50% of the total from revenue requirement. Ms. Williams states that, because, as described in pertinent proxy shareholder meeting reports, "most of the SWN bonuses criteria relate to profits, cash flow, net operating income, and meeting certain operating expense budgets", it is proper to have the expense of those bonuses shared equally between ratepayers and stockholders. (Tr. at 1432-1433) AWG witness Morgan recommends that the Commission allow 100% of the SWN bonuses as part of revenue requirement, noting that Staff does not propose that these bonuses are either excessive or imprudent or that the allocation is unreasonable, that these bonuses attract and retain quality personnel who support AWG through executive guidance and shared services, and, therefore, that they should be treated no differently than are the bonuses for AWG which Staff allowed. (Tr. at 341-342) Staff witness Williams states that the adjustment is not premised on whether the bonuses are imprudent or unreasonable, but rather because the incentive pay is directly dependent upon those financial performance goals which are appropriately shared by ratepayer and shareholder. (Tr. at 1417)

AG witness Marcus testifies that (1) an arithmetic error of $4,392 in AWG's spreadsheet should be corrected, (2) AWG included $100,000 in pro forma bonuses for the new Executive Vice President position, but had actually paid only $60,000 in 2004, reducing

[15] As noted earlier, Staff witness Williams has adopted the testimony of witness Kersten.

the prorated amount to be included to $72,000, and (3) he recommends that, given the benefits provided the stockholder as well as the ratepayer, SWN and AWG bonuses should be shared equally between stockholders and ratepayers. Mr. Marcus notes that such disallowance is generally consistent with his and Staff's recent recommendations in this regard. (Tr. at 68-70) AWG witness Morgan initially disputes any arithmetic errors, testifying that Mr. Marcus has misinterpreted the spreadsheet and failed to recognize that the $100,000 bonus for the Executive Vice President is, in fact, a three year average. Finally, Mr. Morgan reiterates his objection to any disallowance of the prudently incurred bonuses, claiming that Mr. Marcus provides no reason for disallowance other than it is not good public policy to allow 100% of bonuses. (Tr. at 348-349)

The Commission finds Staff's exclusion of 50% of SWN bonuses to be appropriate. As noted in its own proxy statement, bonuses paid to SWN executives are not directly tied to any service criteria specifically for AWG utility service but rather are more focused on areas of benefit for stockholders. However, given that some of these same areas of focus may provide indirect benefits to AWG and, consequently its ratepayers, it is appropriate to include some portion of those bonuses as part of AWG's revenue requirement. In this regard, the Commission approves Staff's proposed inclusion of 50% of the SWN bonuses in revenue requirement.

The Commission finds that Mr. Marcus has erred in his interpretation of AWG's worksheet and in the setting of the Executive Vice President's bonus level and that no adjustment is necessary. In addition, the Commission finds that AWG bonuses are tied directly to AWG utility service and, thus, are appropriately included in revenue requirement. In addition, the Commission notes that the

operating results for which bonuses are provided AWG employees differ from those of SWN. Cost savings and increased efficiencies on AWG's system directly benefit ratepayers prospectively, through delays in rate case filings or lower rates. The Commission, therefore, finds that disallowance of bonuses for AWG's personnel is not appropriate given the direct benefits provided ratepayers.

2. **Restricted Stock Rights**:

AG witness Marcus has also asked for disallowance of the stock benefits AWG requests, citing the significant increase in those amounts and the increased allocation from SWN to AWG. Mr. Marcus argues that such bonuses, in view of a $10 million rate increase request, reflect benefits, not to ratepayers, but to stockholders and, as such, all such stock benefits should be paid by those stockholders. (Tr. at 71-72) Mr. Morgan rebuts Mr. Marcus' characterization of stock benefits, testifying that these expenses are, in fact, simply part of a complete compensation package and should be included in total in revenue requirement. (Tr. at 348-349)

The Commission, as with its finding for cash bonuses, finds that such benefits for AWG employees are also of direct benefit to AWG ratepayers, but also finds that, given the criteria outlined for SWN employees, a sharing between ratepayer and stockholder is appropriate and that Staff's proposed 50% adjustment is appropriate.

3. **Payroll Taxes**:

Differences between Staff's and the Company's calculation of payroll taxes and that of the AG relate entirely to the differences between the parties regarding the appropriate level of payroll to include in revenue requirement.

In view of the foregoing findings on payroll, the Commission finds that Staff's adjustments for FICA and other payroll taxes is appropriate and should be adopted.

C. Fringe Benefits

As with payroll taxes, any differences among the parties for fringe benefits, including worker's compensation, medical insurance, pension expense, and employee savings plan/life insurance relate to the level of proposed payroll. Therefore, as with payroll taxes, in view of the foregoing findings on payroll, the Commission finds that Staff's adjustments for any fringe benefits should be adopted.

D. Directors and Officers Insurance ("D & O")

The AG and AWG also disagree about inclusion in revenue requirement of 100% of the liability insurance provided by AWG and SWN for its directors and officers. Mr. Marcus argues that the major beneficiaries of this type of insurance will be the stockholders and its issuance provides no assurances of better management or decision making by officers and directors for the benefit of ratepayers. He also testifies that, in AWG's last rate case, Docket No. 02-227-U, the Commission approved a sharing of the cost between ratepayers and stockholders and he recommends that the Commission require equal sharing here. (Tr. at 72-73) Mr. Morgan disputes the AG's view of the benefits provided by this expense, noting that this type of insurance is essential

to the operation of AWG, without which it could not attract the necessary management personnel to operate the Company. (Tr. at 350)

As it has held in previous rate cases, most notably in AWG's last rate case in Docket No. 02-227-U, the Commission finds that D&O insurance benefits both stockholders and ratepayers. Therefore, as recommended by AG witness Marcus this expense should be split 50/50 between stockholders and ratepayers.

E. Uncollectible Accounts Expense

Uncollectible accounts expense has been calculated by the parties, each using a percent of uncollectible accounts to revenues applied to pro forma operating revenues as explained by Staff witness Williams. (Tr. at 1442) As discussed in the following section on the revenue conversion factor, the calculation of that percent remains in dispute. The Commission has found in its discussion of the revenue conversion factor that Staff's calculated factor for uncollectible accounts expense is appropriate. In view of that finding, the Commission, therefore, also approves Staff's calculated level of uncollectible accounts expense.

F. Revenue Conversion Factor

Revenue conversion factor issues still in contention among the parties include: the term over which uncollectible accounts as a percent of revenues are averaged in order to estimate a normal level; a proposal to incorporate late payment charge revenues in the conversion factor as a percent of revenues; and a proposal to calculate and apply separate conversion factors by class to recognize each class's distinctive level of uncollectible accounts.

1. **Uncollectible Accounts - *Normalization***:

Staff, AWG, and CEUG propose to include as part of the revenue conversion factor the latest five year average percentage of uncollectible accounts to revenues, which the parties contend represents a more normal level for that component, taking into account the "volatility in gas prices and changing weather." (Tr. at 362-363, 1294, 1446) Mr. Marcus proposes that a three year average excluding the years 2000 and 2001 represents a more reasonable percentage, testifying that the year 2000 includes an uncollectible accounts level which is atypically low, while the year 2001 includes one which is atypically high. (Tr. at 129) Alternatively, should a 5-year average be adopted by the Commission, Mr. Marcus recommends that the Commission not accept Staff's updates to the time periods over which the five years will run. Mr. Marcus testifies that use of the more current time period skews further the resulting 5-year average by removing the year containing the atypically lower balance without also excluding the year with the atypically higher one. (Tr. at 129-130)

The Commission finds that the most current average of actual uncollectible write-offs represents the most known and measurable level available and should be adopted. Further, the Commission finds that the basis for adopting averages over a contemporary and sufficient time period is to both capture the most current information while smoothing the variations from year to year. The assumption made in using averages is that both normal and extreme activity will be randomly captured by use of the unadjusted average. Mr. Marcus proposes to remove completely certain chosen years because the activity in those years was "atypical", leaving him with only three remaining years upon which to calculate the balance. The Commission first finds that the three year

average proposed by Mr. Marcus does not contain sufficient data. In addition, the Commission finds that Mr. Marcus' attempt to 'cherry-pick' the years to be included, excluding any he finds 'atypical', undermines the reason for using the average of several years' actual data, randomly chosen. The Commission, therefore, rejects Mr. Marcus' proposals and finds that Staff's proposed updated five-year average should be incorporated into the revenue conversion factor.

2. Other Revenues - *Late Payment Charge Revenue:*

AG witness Marcus recommends, with the support of CEUG witness Tinsley (Tr. at 75-76, 1294), that the revenues for late payment charges ("Late Payment Charges"), as a percent of total revenues, should also be included in the conversion factor and used to calculate revenue requirement. Mr. Marcus testifies that this factor for Late Payment Charges, similar to uncollectible accounts, is tied to revenues. Further, he notes that adding it to the conversion factor recognizes that, as overall revenues and rates increase, customers who pay their bills late will increase; thus, revenues for Late Payment Charges will increase. Mr. Marcus testifies that the increase in Late Payment Charges would be 0.6329% of total revenues. (Tr. at 75)

As support for including Late Payment Charges in the revenue conversion factor, Mr. Marcus first notes that Late Payment Charges have been stable as a percent of revenues over recent years. Second, AWG's proposal to set these charges as a fixed amount in revenue requirement effectively assumes that these Late Payment Charges will remain fixed at current levels, even with increasing rates and higher customer bills. That assumption, Mr. Marcus asserts, is not logical. (Tr. at 130)

Mr. Morgan testifies that revenues from Late Payment Charges are generated from two different types of customers: those customers who cannot pay their bills, and are written off, the largest group; and the other smaller group of customers who are simply late in paying their bills. Mr. Morgan testifies that, while Late Payment Charges related to customer balances written-off may be predictable, Late Payment Charges tied to those customers only paying late is not. Mr. Morgan contends that, absent a direct relationship between revenues and these charges, Late Payment revenues do not lend themselves to inclusion in the factor tied to revenue changes. (Tr. at 354-355)

For the reasons argued by AG witness Marcus and CEUG witness Tinsley, the Commission agrees that late payment revenues, as a percent of total revenues, should be included in the conversion factor. The AG has testified that Late Payment Charges Revenues, as proposed by AWG, are 0.6329% of revenues. (Tr. at 75) The Commission finds that percent reasonable. Therefore, the conversion factor should be changed accordingly and used in the calculation of the revenue requirement.

3. **Uncollectible Accounts - *By Rate Class*** :

CEUG witness Tinsley recommends that AWG should be ordered to calculate and apply conversion factors on a class by class basis because the percent of uncollectible accounts varies from class to class, with the larger customers experiencing significantly smaller accounts receivable write-offs as indicated by AWG witness Campbell. Mr. Tinsley also proposes that, if the data is limited, the Commission should still require conversion factors set by class, using the data available to estimate each class. (Tr. at 799, 1294-1295)

Ms. Campbell testifies that AWG has been keeping this data by class, but only for a very short time, and that it would be inappropriate to assign these costs directly to class on that limited data. (Tr. at 799-800)

The Commission finds that, given the lack of data, it would be inappropriate to substitute the current average, total-company revenue conversion factor, which is based on known and measurable activity, with several individual class conversion factors based on either too little data or an unsubstantiated estimate. Mr. Tinsley's proposal is hereby rejected and the Commission finds that Staff proposed total-company approach should be used.

In view of the foregoing, the Commission finds that the revenue conversion factor as proposed by Staff, with the exception of the inclusion of late payment revenues, shall be incorporated into the calculation of revenue requirement in setting prospective rates.

Cost of Service
Allocation of Revenue Requirement to Rate Class

The following elements of AWG's cost of service continue to be contested: *Billing Determinants* - Weather Adjustment and Growth Adjustment, *Functional*[16] *Allocation of Plant and Plant-related Revenue Requirement Elements*, Production/Gathering Plant, Storage Plant, Transmission Plant, Distribution Plant, General Plant, and, specifically, *Gas Stored Underground*, *Meters - B-4 Customers*, *Account 336 - Purification Equipment*, and *Uncollectible Accounts*.

[16]Current functions related to AWG's system include: Gathering/Production, Storage, Transmission, Distribution, and General.

Additionally, still outstanding are the parties' differences with regard to the appropriate calculation of the *Coincident Demand* and the *Non-Coincident Demand.*

A. Billing Determinants

Staff, AWG, and the AG have adopted the billing determinants as proposed by Staff. CEUG, however, recommends (1) an adjustment should be made to weather adjust the determinants for the B-4 and B-5 rate classes, and (2) that, absent adoption of combined billing guidelines, billing determinants be adjusted to add all meters held by combined billing customers. CEUG also proposes that separate rates for sales customers and transportation customers be set, which will require a reapportionment of billing determinants between the two.

1. <u>B-4 and B-5 Rate Classes:</u>

CEUG witness Tinsley proposes that rate schedules B-4 and B-5 be adjusted for weather in the same manner that residential and the other business classes have been adjusted which, irrespective of how minor, is easily accomplished. (Tr. at 1173-1175) AWG witness Campbell, with support of Staff witness Swaim, objects to the adjustment as inappropriate, noting that these customers are not materially affected by weather, with changes for B-4 limited to just .86% and for B-5, just .28%. (Tr. at 772-773, 1475-1476) Mr. Tinsley responds that Ms. Campbell has already calculated the adjustment and to not treat these customers consistently would result in discriminatory and non-uniform treatment of classes. (Tr. at 1287-1288)

The Commission finds that, given the immateriality of any adjustment to be made, it is unnecessary to adjust usage for weather for these large customers. The Commission notes that the

rate making process is not precise and that, because of this, consideration must be given to the materiality of any proposed change. In this regard, the Commission finds adjustments to billing determinants of less than 1% and less than ½ of 1% immaterial and, as they relate to the entire process, the Commission finds them significantly immaterial. The Commission also finds that its charge is to set rates for the classes that are not unduly discriminatory and, in this instance, failure to apply an immaterial adjustment does not constitute undue discrimination.

2. Master Metering and Combined Billing:

CEUG recommends adoption of guidelines to effect a policy covering master metering and combined billing which will be applied consistently to all qualifying customers. (Tr. at 1154-1157) Mr. Tinsley recommends, however, that, should the Commission not adopt his proposed guidelines, it is appropriate to include all the meters held by combined billing customers in the total count of billing determinants. Mr. Tinsley testifies that, because combined billing is not offered on a consistent basis to all customers, it is stockholders, not ratepayers, who should be required to absorb any unrecovered costs resulting from providing combined billing service. (Tr. at 1177-1179, 1288-1289)

The Commission finds no evidence in this proceeding which indicates that AWG provides this service absent economic rationale or in a discriminatory manner. Therefore, the Commission finds no need to adjust billing determinants to reflect additional meters held by combined billing customers.

3. **Sales Rates and Transportation Rates:**

CEUG recommends separation of transportation service from sales for purposes of allocation, with billing determinants recognized for the separate service.

The Commission finds that, as discussed later in this Order in our findings regarding Tariff Provision and Rate Design, stand-alone calculation of a transportation service rate is not appropriate and, therefore, there is no need to adjust billing determinants. In view of the foregoing, the Commission finds that the billing determinants, as adopted by Staff, with support of AWG and the AG, appropriate and orders adoption of those determinants for AWG's cost of service and rate design in this docket.

B. Functional Allocation of Plant and Plant-related Revenue Requirement Elements

AWG and Staff have both recommend a Cost of Service ("COS") using the cost classifications and allocation methodologies which reflect the COS to which the parties agreed in the Stipulation and Settlement Agreement filed in AWG's last rate case, Docket No. 02-227-U, and which the Commission approved. (Tr. at 1529, 1544) Staff witness Green testifies that she has some corrections to Ms. Campbell's proposed COS (Tr. at 1536-1537), which Ms. Campbell has incorporated into her recommendation. (Tr. at 782, 788, 793, 796) No other parties provided a detailed COS. (Tr. at 1544) The AG, NWAGC, and CEUG each provided isolated recommendations regarding appropriate classification and allocation on a function by function basis. The classification of costs as customer, demand, or commodity will have a direct impact on the level of costs allocated to each customer class and the amount set for the customer charge for each class. (Tr. at 1546)

1. **Production and Gathering Functions:**

AWG witness Campbell and Staff witness Green have classified costs on an account by account basis. They allocate each account (1) using only a commodity, or volumes factor, (2) using only a demand factor, or (3) equally to demand and commodity and applying an appropriate factor. (Tr. at 1553) Plant designed for peak but used throughout the year was classified as demand and allocated on the average and peak method[17] by Ms. Campbell and Ms. Green. (Tr. at 777) Ms. Campbell and Ms. Green classified producing land, rights of way, other land and rights, and field lines as commodity and allocated those costs on total volumes. (Tr. at 777) As the physical location of assets move further from the wells, these assets are classified by Ms. Campbell and Staff witness Green as 50% demand/50% commodity and are allocated on average and peak for demand and volumes for commodity. (Tr. at 777-778) Finally, Ms. Campbell and Ms. Green have classified assets as they move closer to transmission as demand related and are allocated on average and peak. (Tr. at 778) AG witness Marcus recommends that essentially all plant be classified as commodity and allocated on volumes, with an alternative recommendation that any demand classification be allocated on a "coincident demand factor to include the loads of curtailed customers on either a 100% load factor or a normal winter basis." (Tr. at 1553) NWAGC witness John recommended that all production and gathering be classified as demand and be allocated on a curtailed peak demand factor. (Tr. at 1553) Mr. John testifies that the gathering and

[17] "The average and peak allocation factor for each class was calculated by weighing the average demand by the system load factor and the peak demand by one minus the system load factor. . .." (Tr. at 750-751)

production costs at issue are fixed costs, incurred to meet the peak demand requirements of AWG customers, and, as such, are more appropriately classified as 100% demand and should be allocated on curtailed peak. (Tr. at 1112-1113) Further, he testifies that allocation of demand costs should reflect that transportation customers, supplying their own commodity, will use gathering and production very little. Further, he testifies that interruptible, or curtailment[18], customers have no rights to the system at peak load, and, therefore, should be allocated based on peak less those interruptible customers.[19] (Tr. at 1113) CEUG witness Tinsley recommends recovery of production plant through the Cost of Gas Adjustment Clause ("CGA") (Tr. at 1316-1317) and that Fuel and Lost and Unaccounted For Gas ("LUFG") should be allocated based on demand, recommending use of curtailed peak. (Tr. at 1313-1314) Mr. Tinsley testifies against AWG's use of an average and peak method, stating it inappropriately assigns fixed cost to the commodity charge, violating the principles of cost-causation and resulting in subsidy of low-load factor customers. (Tr. at 1186-1187)

Ms. Green and Ms. Campbell oppose both Mr. Marcus' proposed classification of production and gathering as commodity to be allocated all volumetrically and his alternate proposal that, if any is classified demand, that the peak factor used to allocate be adjusted to include curtailment loads at 100% or be calculated on a normal winter basis. Both witnesses note that allocating only on volumes fails to recognize the operation of the system, which is

[18]Curtailment and Interruptible are used interchangeably and refer to those customers or services subject to AWG's curtailment policy contained in their tariffs. (Application, Proposed Tariffs, Policy Schedule 4.1)

primarily used in winter and on peak and is more appropriately allocated recognizing that use. Ms. Campbell states that it is also not appropriate to classify all of the fixed costs for these functions as demand, noting that such classification also fails to recognize the use of the system, which serves to meet peak but also serves off peak needs. In addition, Ms. Campbell testifies that Mr. Tinsley's recommendation to recover these costs through the CGA is not appropriate given that (1) such treatment effectively classifies the plant as all commodity, which would not recognize the use of this plant, and (2) these costs do not fall within the Commission's policy for automatic adjustment, exhibiting no extreme volatility or unpredictability, or being outside company management control. (Tr. at 778-780, 781-782, 1553-1554)

In general, with regard to allocations of costs to customer classes, the Commission finds that an appropriate cost of service should be conducted looking at each function on an individual account basis as both Staff and AWG have done. Additionally, as both Staff and AWG have done, interpretation of 'cost causation' relates directly to a fair allocation of cost to reflect the use of the plant by the customers who benefit. The Commission finds that any interpretation of "cost causation" which assigns all fixed cost to demand and peak allocation, simply because the costs do not vary directly with volumetric use, fails to reflect the use of the system nor does that interpretation appropriately assign costs to those customers who benefit by that use.

With regard to the classification and allocation of production and gathering, the Commission finds Ms. Campbell's and Ms. Green's analysis of plant, done on an account by account basis to

---

[19] Peak load less the peak load of curtailment customers is Mr. Tinsley's defined "curtailed peak."

determine the function and use of each plant component, the most supportable method in determining appropriate classification of this plant. The Commission finds the resulting determinations both reasonable and supported by the descriptions of those functions in testimony. The Commission finds that AWG and Staff have appropriately recognized each component as either related to commodity, to demand, or to both. In this regard, those functions which related specifically to certain production and gathering systems have been classified as commodity and allocated as such.

The Commission also notes that many system components for gathering and production are designed to meet peak day and should appropriately be allocated to recognize the use and benefits enjoyed by customers who are guaranteed service on peak day. (Tr. at 778-780, 1553-1554) However, the Commission also finds that any off-peak use and benefits enjoyed by customers of the same system components dictate a fair allocation of costs to those customers as well. (Tr. at 778-780, 1553-1554) It is therefore the Commission's finding that neither Mr. John, who recommends allocation solely on demand, using a peaking factor, nor Mr. Marcus, who recommends allocation solely on commodity, propose methodologies which appropriately recognize the use of the system by allocating fairly to the customers who benefit.

Neither does the Commission find appropriate Mr. Tinsley's proposal to have these costs recovered strictly through the CGA. The Commission finds that gathering and production represent functional support of the entire system. By moving recovery of these costs to the CGA, Mr. Tinsley ensures that no transportation customers will be held responsible for their use of the production and gathering system. In addition, the Commission finds, under its consideration of costs which would

qualify for recovery under an automatic adjustment clause, (see the Commission findings on the REP), wholesale automatic recovery of all individual costs related to these functions is not appropriate. The Commission, therefore, finds that the classification and allocation of costs as proposed by Staff and AWG for production and gathering are both reasonable and supported by the record and should be used in the cost of service.

2. **Storage Function**:

The parties to this docket, other than CEUG, agree on the classification and allocation of storage as proposed by Staff witness Green and supported by AWG witness Campbell. CEUG witness Tinsley alternatively recommends that no transportation customer should be allocated storage, given that the Company cannot delineate the level at which storage supports transportation service imbalances. It is his overall recommendation that storage costs be recovered as part of the CGA, effectively eliminating all transportation customers from storage cost responsibility. (Tr. at 782-784, 1317) Ms. Campbell testifies that, in fact, transportation customers do heavily utilize storage and provides documentation (Ex. at 451-456) indicating that transportation customers' "nominations do not match hourly volumes and, therefore, must utilize storage." (Tr. at 783)

First, with regard to Mr. Tinsley's request to also roll storage costs into the CGA, the Commission finds, as it did for gathering and production plant, Mr. Tinsley's proposal inappropriate and rejects it. The Commission also finds that, based on the evidence provided regarding the imbalance activity of transportation customers, it is clear that these customers rely heavily on this service on a daily basis. The Commission additionally notes that, as an integral part of AWG's

system, storage, as does transmission, supports the overall operation of that system. The Commission finds that allocation as proposed by Staff and AWG appropriately recognizes and assigns costs to transportation customers, both for their balancing needs and as part of the storage function's overall support of the system.

3. **Transmission Function**:

As noted by AWG witness Campbell, and accepted by Staff witness Green, AWG and Staff classified transmission plant as demand related and allocated the costs on an average and peak method, which gave greater weight to peak use. Ms. Campbell testifies that she allocates the peak using her calculated coincident peak demand factor. (Tr. at 752-753, 1544, 1555-1556) Ms. Campbell testifies that the average and peak method reflects that transmission plant was built to meet the peak load but is also used to meet the daily demands of all customers. (Tr. at 752-753) Further, she testifies that the average and peak method is an accepted method of allocation. (Tr. at 785-786) Ms. Campbell testifies that it is not appropriate to classify and allocate 50% of transmission based on commodity, as proposed by the AG, noting that the system is not built for individual customer demand but rather for a maximum simultaneous peak day. (Tr. at 786) Nor, she testifies, is it appropriate to allocate all of transmission plant on a curtailed coincident peak, as proposed by NWAGC witness John, which fails to capture the off peak use of the system (Tr. at 785)

AG witness Marcus recommends that the Commission allocate 50% of transmission plant on peak and 50% on the commodity factor, testifying that this would follow the lead of Arkansas Oklahoma Gas Company and recognize that transmission plant is sized to meet

peak demand but it is used on a sustained basis. (Tr. at 92-93) Mr. John and CEUG witness Tinsley both testify that all transmission plant is fixed cost and should be classified to demand and allocated on curtailed peak load, not commodity, and further recommend that any variable transmission function costs be assigned to commodity and allocated on that basis. (Tr. at 1103, 1114, 1206-1207)

The Commission finds that Staff's and the Company's classification and allocation of the transmission plant appropriately recognizes the design of the system, which is built to meet the system peak and is also designed to meet daily demand. The average and peak method adopted has assigned a more heavily weighted portion of transmission plant to the peak allocator which appropriately recognizes that the system is primarily designed to meet the peak day. The remaining allocation to customers using the average allocator assigns the less weighted cost to the transmission plant's daily demand. The Commission rejects the AG's assignment of a portion of costs to commodity, noting that, classification as demand and application of the average and peak method more accurately reflects the weight to be given the system design and use. The Commission also rejects, as discussed previously, equating fixed cost with peak-only usage and, thus, peak-only allocation. We therefore reject both Mr. John's and Mr. Tinsley's recommendation to allocate all fixed transmission cost on peak. Their proposal simply fails to appropriately recognize the customer use of and benefits provided by that plant. Therefore, the Commission orders the use of the average and peak method as proposed by Staff and AWG for transmission plant allocation of costs.

4. <u>Distribution Function/Mains</u>:

Items of classification and allocation of distribution mains which remain in dispute

are principally (1) the method by which distribution mains will be classified between demand-related and customer-related and (2) the allocation methods which should be used to assign mains to each class.

a. Classification:

Both the Company and Staff, with support of CEUG witness Tinsley, have classified distribution mains to demand and customer, using AWG's proposed zero load main method, resulting in allocation of 42.5% of Mains as customer-related and 57.5% of mains as demand-related. (Tr. at 1547) AWG witness Campbell explains that she has used what she describes as the zero load method[20] in place of the more commonly used zero intercept method given that the data necessary to use the latter is not available and given the zero load's simplicity. While the zero intercept method relies on regression analysis, the zero load method only requires that the costs of pipe, adjusted for pipe-related material, be identified. The average cost for each pipe size is calculated and, in this instance, with 80.77% of all pipe installed over the last three years being 2-inch pipe, Ms. Campbell used the net cost of 2-inch pipe to set the customer component. Mains were classified to the customer component at 42.5% and the remainder classified to demand. (Tr. at 752-756, 787-789)

AG witness Marcus proposes that all mains be classified as demand, or, as an alternative, set the cost per foot of mains at a lower level to reflect the results of other

[20]Ms. Campbell has expanded her definition to deduct more pipe-related material cost, as proposed by Ms. Green, which reduces the estimated cost per foot of pipe and the amount to be classified as customer. (Tr. at 788)

classification methods, including his proposed minimum connection method. (Tr. at 96-103, 132-134) Mr. Marcus testifies that mains are a common cost, not assignable to individual customers, and that the method AWG proposes is flawed, assigning too much cost to small customers. (Tr. at 97-100) Further, he notes that, irrespective of any flaws in data used by AWG to perform its own zero intercept analysis as discussed by Ms. Campbell (Tr. at 789-790), the results would provide a reasonable 35% classification of main costs to the customer component. (Tr. at 133-134)

NWAGC witness John recommends rejection of Mr. Marcus's proposal to recognize no customer costs because it significantly departs from prior Commission treatment, which recognizes that costs which are set, irrespective of pipe size and not related to throughput or demand, are customer related. (Tr. at 1115-1117) Further, both Ms. Campbell and Mr. John note that the zero intercept study recommended by Mr. Marcus has inappropriately excluded the northeast region and excluded plastic pipe and should not be used. (Tr. at 790, 1117)

The Commission finds that AWG's proposed alternative method, the zero load method, as further refined by Staff witness Green's adjustment for pipe-related material, is a reasonable replacement for the use of the zero intercept method, given the limitations outlined by Ms. Campbell. (Tr. at 754-755) That finding is also supported by the fact that the zero load method's results reflect, in close proximity, the "customer-related classification (which) . . . would result from using the "Handy-Whitman Index of Public Utility Construction Costs" to index the installation cost per foot (used) . . . in the last rate case." (Tr. at 1549-1550) The Commission rejects Mr. Marcus's

proposal to recognize no customer related costs for distribution mains and his proposition that these costs reflect, more appropriately, only demand. The Commission notes that the AG's proposal fails to recognize the use of mains, which is in part to meet customer's peak, but must also reflect the initial design and installation, which effected service to those customers served directly from the line. The Commission also rejects the alternative classification assignment methods which the Commission finds all rely heavily on limited data. (Tr. at 753-754, 789-790)

b. Allocation:

Both Staff witness Green and AWG witness Campbell have allocated distribution mains, classified as customer, on an annual customer count basis. (Tr. at 1536, 755) There appears to be no dispute regarding that method. In addition, both Ms. Green and Ms. Campbell, as supported by CEUG witness Tinsley, (Tr. at 1252), have allocated distribution mains classified as demand on the non-coincident peak basis. (Tr. at 1536, 756) Ms. Campbell explains the demand allocation using the non-coincident peak, testifying that the main is designed "to meet a specific customer's maximum demand or a specific group of customers' maximum demand in a certain area." (Tr. at 756) Further Ms. Campbell testifies that non-coincident peak reflects that mains are sized to meet the "customers' peak loads and not the system's peak load . . ." which means that distribution mains must be correctly sized regardless of when the customer experiences peak. (Tr. at 792)

AG witness Marcus recommends that all mains be allocated on the average and peak method. He explains that, while off peak users should be assigned less

cost, to allocate these costs only on peak effectively provides service to off-peak at no cost. (Tr. at 98-99) NWAGC Witness John recommends that the demand costs of distribution plant be allocated on the curtailed non-coincident peak, testifying that the capacity related portion of the plant was built to meet peak day and, given that curtailment customers have no rights to that plant at peak, they should be assigned none of the demand costs. (Tr. at 1119)

The Commission finds the allocation of demand for distribution mains on a non-coincident peak basis, capturing all customers' peak, including curtailment customers, is appropriate. As discussed by Ms. Campbell, mains are designed to meet the peak of all customers served by the main at anytime those customers call on the system. As such, each customer should be allocated full cost of that demand on the system. The Commission rejects Mr. Marcus' proposed allocation of mains on the average and peak method. His rationale for its adoption, to assign cost to off-peak users, is fully addressed in the more appropriate method proposed by Staff and AWG. That method allocates costs based on the design of the main which allows each customer to make full demand for service at any time. For this same reason, the Commission rejects Mr. John's proposed allocation which excludes curtailment customers. The Commission finds that AWG's and Staff's proposed non-coincident peak for allocation of the demand component of distribution mains should be used in calculating the cost of service in this docket.

C. Working Capital Assets/ Storage Gas

AWG witness Campbell testifies that she has classified and allocated gas stored underground, a working capital asset, in the same manner as storage plant. (Tr. at 758) CEUG

Witness Tinsley, referring to his testimony regarding classification and allocation of Storage Plant as support, recommends that gas stored underground (1) should be recovered through the CGA, (2) should not be allocated to transportation customers, and (3) should not be allocated to customers whose billing determinants have not been weather adjusted. (Tr. at 1208-1209) Ms. Campbell, as supported by Staff witness Green (Tr. at 1554-1555), refers to her testimony regarding storage plant and testifies that transportation customers do use storage and, therefore, recovery of gas stored underground using the CGA is not appropriate because it does not assign any of these storage costs to transportation customers. Further, she notes that these costs also do not meet the criteria for recovery of costs through an automatic adjustment clause. (Tr. at 793-794)

Consistent with our findings as to CEUG's recommendations to recover production and gathering and storage plant costs through the CGA, the Commission finds Mr. Tinsley's proposal for recovery, through the CGA, of costs related to gas stored underground also inappropriate and rejects it. The Commission again notes that this revenue requirement item does not meet the criteria for automatic treatment, given that it is not a significant cost, exhibiting extreme volatility and trending in one direction. Nor is it outside the control of management. The Commission, again, finds that, as seen by their imbalance record, transportation customers utilize AWG's storage system and appropriately should bear a share of those costs. The Commission finds that gas stored underground should be classified and allocated as recommended by AWG and Staff.

D. Meters - B-4 Customers

In his testimony, CEUG witness Tinsley observes that the average cost of meters for B-4 customers, resulting from the meter study performed by AWG witness Campbell and used to assign

costs to meters, are higher than the average meter cost for B-5 customers and labels the difference as "an obvious anomaly" which should be corrected. (Tr. at 1314-1315)

The Commission finds nothing in the record to support Mr. Tinsley's conclusion that the costs are incorrect nor does Mr. Tinsley provide any evidence in support of his supposition that a correction is needed. The Commission, therefore, finds that no correction is necessary and there are no changes to the cost of service required because of B-4 customer meter cost.

E. Account 336 - Purification Equipment

Based on the function of purification equipment which removes impurities from and conditions gas, Staff witness Green recommended a change in AWG's original classification of this account as demand-related and its allocation on the average and peak method to classification as commodity and a volumetric allocation. (Tr. at 1537) AWG witness Campbell agreed with the change. (Tr. at 782) However, CEUG witness Tinsley disagrees with classification of this equipment as commodity related, testifying that the cost of this equipment is a function of capacity, and, while it should actually be allocated to customers based on coincident peak, he would, alternatively, recommend AWG's original allocation on average and peak. (Tr. at 1314)

Mr. Tinsley adopted the position that all fixed costs must be demand costs and assigned to customers only on their peak simply because those costs do not vary with throughput. The Commission, as discussed previously, adopts allocation methods which recognize the appropriate matching of any cost to those customers benefiting from that cost. The Commission finds that the use of the equipment which purifies natural gas benefits all customers receiving that gas and that the benefit is equally applicable to each unit taken. Therefore, the Commission finds Staff's proposed

classification as commodity, with allocation based on delivered volumes, wholly appropriate and approves that treatment.

F. Uncollectible Accounts Allocated to Class

CEUG witness Tinsley recommends that uncollectible accounts be directly assigned to each customer class, noting that current information indicates that the percent of uncollectible accounts varies from class to class, with the larger customers experiencing significantly smaller accounts receivable write-offs as indicated by AWG witness Campbell. Mr. Tinsley acknowledges that data may be limited but recommends that the Commission require direct assignment based on the information available. (Tr. at 1294-1295, 1320, 799) Ms. Campbell testifies that the Company has been keeping this data by class, but only for a very short time, and, thus, it would be inappropriate to assign these costs directly to class based on that limited data. (Tr. at 799-800)

As found with regard to uncollectible accounts used in the calculation of the conversion factor, the Commission finds that it would be inappropriate to allow direct assignment of a 'level' of costs which may not be representative of a normal and expected level in view of the limited time period over which these costs have been kept on a separate class basis. Given that these costs have been accumulated for less than a year, the Commission finds that AWG's and Staff's proposed allocation, based on historical data, is a more reliable representation of the costs expected to be incurred. The Commission, therefore, orders Staff's and AWG's proposed allocation of uncollectible accounts to rate class be used in the final cost of service.

G. Coincident Demand Calculation

The appropriate calculation of the coincident peak demand allocator, which is used in

allocation of demand under different methods, remains in dispute. At issue is the treatment of the load of interruptible or curtailment, customers[21] in determining the peak assigned to each rate class, the basis for the allocator. AWG and Staff support AWG witness Campbell's calculation, with each of the other parties proposing alternative approaches. Ms. Campbell testifies that she has adjusted the coincident peak load calculated for rate schedules B-4 and B-5 by removing one-half of the interruptible or curtailment volumes for those customers. Ms. Campbell notes that she makes this adjustment to reflect that these classes of customers were curtailed on the record peak day[22] used in making the coincident peak calculation and, therefore, an adjustment to recognize the curtailment should be made. She notes that she has removed only 50% of those volumes, recognizing that many of these customers will not experience complete curtailment, given that they will continue to receive some service in order to maintain the integrity of their plants and operations. She also testifies that, prior to adjusting the B-4 and B-5 loads, she recognized and corrected for customers in those rate classes who are deemed to be "human needs" customers, who will not be curtailed, and, therefore require no adjustment. (Tr. at 750-753)

AG witness Marcus recommends that, in calculating coincident peak, the Commission reject the Company's adjustment to remove 50% of interruptible or curtailment loads from the demand allocator. (Tr. at 89) Mr. Marcus testifies that removing these loads from the allocator fails to recognize that "interruptions (of these customers) are extremely rare." Mr. Marcus states that the

---

[21] Interruptible or Curtailment Customers on AWG's system are those customers subject to curtailment should system capacity be reached.

[22] In calculating coincident peak, Ms. Campbell adjusts her peak calculation to reflect the 25 year peak experienced on December 25, 1983, on which the HDD ("Heating Degree Days") was 71. The actual HDD for highest peak in the test

system appears to be more reliable with less likelihood of interruption, citing the fact that interruptions were called with Heating Degree Days ("HDD") of between 47-57 during 1996 but, since that time, no interruptions were called, although there were some 20 days equal to or exceeding 47 HDD. He further testifies that the impact of removing these loads from the allocator is to effect steep (up to 75%) discounts for essentially firm service, with interruptions occurring once in 10 years. (Tr. at 89) Mr. Marcus testifies that there is also another reason not to adjust for interruptible load. He notes that all customers, firm and interruptible, are within the same rate class and both benefit from the allocation reduction made for interruptible service. Thus, he states, the interruptible discount serves to have smaller firm customers subsidize those firm customers in the larger industrial classes. (Tr. at 90) As an alternative, Mr. Marcus recommends that the Commission should either not reduce interruptible load and estimate a test-year demand reflective of a normal winter or set the demand for these customers based on a 100% load factor basis. (Tr. at 90)

NWAGC witness John recommends that the coincident peak factor, upon which demand is to be allocated, should be based on coincident peak with all interruptible or curtailment customers' volumes removed from the peak in each class, referring to that calculation of peak as curtailed coincident peak. He testifies that "(t)he term demand (or capacity) refers to that aspect of utility service that must be available upon the customers' demand" (Tr. at 1101) and must be available to customers with priority use on peak day. Mr. John testifies that, therefore, the allocations should reflect the fact that interruptible customers do not have priority and may, in fact, be curtailed. (Tr.

---

year was 54 HDD. (Tr. at 751, 756)

at 1101) Mr. John also testifies that customers who are curtailed should not be allocated demand costs. He testifies that, because these customers do not have access to the system at peak, to assign peak costs to those customers would result in interruptible customers subsidizing firm customers, who do have access to peak. (Tr. at 1114) Additionally, because many of the customers in the rate classes at issue are transportation customers, it is appropriate to allocate using curtailed peak day because of their lower priority rights to the system, resulting in better aligning cost with cost causation. (Tr. at 1113)

CEUG witness Tinsley concurs with Mr. John's recommendation to use curtailed coincident peak, testifying that it is not appropriate to include curtailment customers in the peak allocation. (Tr. at 1206-1207, 1318). Further, Mr. Tinsley testifies that AWG also inappropriately includes in allocating cost the loads of those customers labeled "human needs" customers who already have installed back-up energy systems. These customers, Mr. Tinsley states, may, under the tariff, waive their rights and release AWG from liability and allow themselves to be subject to curtailment. Further, he states that they are willing to do so. (Tr. at 1189-1191) He testifies that these customers have not yet agreed to waive their rights because, in the last rate case, their loads were included for purposes of demand cost allocation. Mr. Tinsley states that because they were allocated these demand costs and are paying for firm service, they have had no incentive to become interruptible. (Tr. at 1191) He recommends that appropriate adjustments be made to the peak loads of the B-4 and B-5 customers to recognize those "human needs" customers willing to sign affidavits agreeing to curtailment. (Tr. at 1193)

The Commission adopts, as just and reasonable and based on the design and historical use of

the system, Staff's and AWG's adjustment to the peak factor to exclude only 50% of the non-human needs curtailment customer peak load. The Commission finds that the 50%-only reduction appropriately recognizes that part of the load is not curtailed on peak for purposes of maintaining customer plant integrity. The Commission rejects AG witness Marcus' proposal to include all curtailment customers at 100% load factor, noting that, irrespective of current history, curtailment customers do not have service rights at peak and allocation of costs should reflect that. The Commission also rejects Mr. Tinsley's and Mr. John's proposal to exclude all curtailment load from the allocator. Such an allocator would fail to appropriately recognize that many of these customers have rights to service to preserve customer plant integrity.

In addition, the Commission rejects Mr. Tinsley's recommendation to exclude from peak the load of current human needs customers who qualify under the tariff to waive firm service and essentially become curtailment customers. (Tr. at 1227-1228) The Commission would note that, as discussed by Ms. Campbell, the system has been designed to include and serve these human needs customers at peak. (Tr. at 779) Second, it is apparent that these customers have been enjoying firm service paying the same rate as interruptible customers. Third, the tariff provisions (Application, Tariffs, Policy Schedule 4.1) indicate that exclusion from interruption is an exception provided for the benefit of human needs customers and that these same customers will continue to have the rights to and benefits of firm service at essentially interruptible rates, irrespective of how costs are allocated in this docket. Finally, the majority of the qualifying human needs customers have not yet opted to waive firm service, choosing not to declare themselves interruptible, in spite of their right to do so. (Tr. at 1191) The Commission finds that the record does not support adjusting the cost

allocation in this case based on the assumption that these same customers will, in the future, chose to forego firm service which they can continue to receive at interruptible rates. These customers are, however, free to waive their exemption and begin to take service as curtailed customers so that, in the future, they will be allocated less cost and will garner lower rates. The Commission, therefore, finds that, based on (1) these customers' historical firm use, (2) the tariff provisions under which they may continue to take that firm service at essentially interruptible rates, and (3) their incorporation into system design for peak day, it is appropriate to include human needs load in peak for allocation purposes. The Commission orders that the definition and calculation of curtailed peak demand as proposed by AWG and Staff be used in the calculation of the cost of service.

H. Non-Coincident Demand Calculation

AWG and Staff witnesses Campbell and Green concur on the appropriate calculation of non-coincident peak demand with an alternate recommendation provided by NWAGC witness John. Ms. Campbell testifies that, because residential, B-1 and B-2 customers peak during the winter months and are not curtailed, their non-coincident peak is the same as their coincident peak. For other classes, she has calculated a non-coincident peak, based on historical HDD and has made no adjustments for curtailment load. (Tr. at 756-757) Ms. Campbell explains that mains are designed, not to meet the system peak, but rather to meet the peak of all customers served by the main anytime those customers call on the system. As such, each customer should be allocated full cost of that demand on the system, including interruptible loads. (Tr. at 756-757)

Mr. John renews his objection to the inclusion of any interruptible customers' load in determination of a peak allocator for these fixed costs. (Tr. at 1119)

The Commission finds that, as discussed by Ms. Campbell, distribution mains are designed to meet the customers full demand, whenever that may occur. Therefore, the non-coincident peaks of all customers must be considered and used in calculation of peak. Mr. John's proposed calculation, which eliminates all curtailment loads, fails to account for that design and use of Distribution Mains and is, therefore, rejected. The Commission finds that AWG's proposed non-coincident peak demand calculation should be used in determining the cost of service in this docket.

Tariff Provisions/Rate Design

Two tariffs for which the design or terms of use remain contested are the *Weather Normalization Adjustment Clause* ("WNA"), with its terms or continued applicability in dispute, and the *Transportation Service Tariffs*, which CEUG recommends be set on a basis separate from the non-gas portion of the sales rates. Additionally, CEUG recommends adoption of *Demand Based Rates* for transportation customers and *Declining Block Rates* for sales customers. CEUG recommends that tariff provisions for *Combined Billing and Master Metering* be set out and that *Standby Service* be defined to eliminate potential misinterpretation.

A. Weather Normalization Adjustment Clause

CEUG witness Tinsley has recommended that rates for transportation customers be designed as demand-based and that rates for sales customers be designed using a declining block structure. Because the WNA is designed to adjust for under- or over-collection of fixed costs due to weather variations, should the Commission adopt the design changes, which will effectively collect

those fixed costs, the WNA should be abolished. However, absent adoption of these rate design changes, Mr. Tinsley recommends that certain changes be made to the WNA. (Tr. at 1171)

Mr. Tinsley testifies that the WNA fails to account for a myriad of reasons other than weather which result in differences in customer usage levels, including customer growth or loss, facility expansion or use, fuel switching, and energy consumption. (Tr. at 1168) He illustrates his concern with this failing, noting that when coupling load growth with warmer than normal weather under the current rate design, the company will experience a windfall. He testifies that not only will the WNA adjust to normal levels revenues from current customers, but with load growth, will enjoy new revenues from that customer growth and additional revenues as those customers' bills are also adjusted under the WNA. (Tr. at 1168) Mr. Tinsley recommends that the Commission should therefore change the WNA so that each year's volumes are compared to the original pro forma level and adjusted accordingly. (Tr. at 1171) If the Commission chooses not to redefine the basis for the WNA, Mr. Tinsley makes other recommendations applicable to the current WNA. (Tr. at 1171)

Mr. Tinsley additionally testifies that usage, across all rate classes, exhibits some form of weather sensitivity, a fact to which Ms. Campbell admits in her testimony. (Tr. at 1169) Mr. Tinsley states that all rate schedules should be included under the WNA, noting that rate schedules B-3, B-4, and B-5 are excluded. (Tr. at 1168-1170) At a minimum, B-3 customers should be included under the WNA to be consistent with the fact that these customers' billing determinants were weather adjusted to set base rates. (Tr. at 1169-1170)

In addition, Mr. Tinsley testifies that the volumetric rates currently subject to adjustment under the WNA include variable costs, which will vary directly with usage, and therefore should not

be subject to any weather normalization under the tariff. He recommends that all variable costs be removed from the rates subject to the WNA. (Tr. at 1172)

Mr. Tinsley also objects to the exemptions from the WNA allowed for cotton ginning and grain drying customers, observing that AWG provides no evidence indicating that these customers do not use gas for weather sensitive activities. Mr. Tinsley testifies that his experience with grain drying customers reveals that these customers do use their gas service for many activities, including those which may vary with weather. (Tr. at 1170-1171) Mr. Tinsley also asserts that the fact these customers may exhibit usage outside of the winter peaking months indicates only that there may be other things affecting their usage and is not necessarily indicative of a lack of weather sensitivity. (Tr. at 1284-1285) Mr. Tinsley, therefore, recommends that these customers no longer be exempt from the WNA or that, in the alternative, AWG adopt a standard by which other customers with similar usage patterns can be eligible for exemption. (Tr. at 1172)

Both Staff witness Swaim and AWG witness Campbell testify that the purpose of the WNA is to address the impact to revenues of deviations from normal weather and not other possible reasons for deviations in customer usage. (Tr. at 808, 1476) Mr. Swaim testifies that this limitation should also be noted with regard to Mr. Tinsley's concern about "double recovery" for variable cost under the WNA, which actually is more of a concern for rate design and not the limited scope of the WNA. (Tr. at 1478)

Ms. Campbell addresses Mr. Tinsley's proposal to abolish the WNA as unnecessary in the event the Commission adopts his changes in rate design. First, as for adoption of demand based rates, only large customers' rates are appropriate for a demand-based design and they are not subject

to the WNA. As for adoption of declining block rates to effect fixed cost recovery, rendering the WNA unnecessary, she testifies that no rate design can ensure complete fixed cost recovery. (Tr. at 807-808)

Ms. Campbell further testifies that CEUG's proposal to change the WNA to tie variations in customer usage back to pro forma levels may have some merit as a way to address current reductions in customer usage. She also notes, however, that the proposal would discourage AWG from extending new service, because AWG would not receive additional revenues for new customers. (Tr. at 808-809) Additionally, Ms. Campbell notes that the adjustment clauses under Commission policy are designed to address only those circumstances outside the utility's control, with weather as the only component under which the WNA meets this requirement. (Tr. at 809)

In responding to Mr. Tinsley's recommendation to place the B-3, B-4, and B-5 customers under the WNA, Ms. Campbell testifies that these rate class exhibit very little sensitivity to weather and, as such, AWG continues to concur with Staff that they be exempt from the tariff, a recommendation shared by Mr. John. (Tr. at 810, 1120-1121, 1477) Mr. Swaim acknowledges that including B-3 customers under the WNA may be appropriate; however, he also testifies that a detailed study of customers in this class is needed to determine which are weather sensitive. Therefore, Mr. Swaim recommends that AWG be ordered to perform a detailed analysis of B-3 customers to see which customers should be included under the WNA and, if appropriate, changes can be addressed in the next rate case. (Tr. at 1477)

Finally, Ms. Campbell and Mr. Swaim address CEUG's recommendation to remove from exemption the cotton gin and grain drying customers. Ms. Campbell testifies that usage patterns of

these customers do not vary with HDD and are properly exempt from the WNA. (Tr. at 810-811, Ex. at 460) Mr. Swaim testifies that, in his recommendation for billing determinants, he did not weather adjust either set of customers, having found after review, that neither were materially impacted by weather and, consistent with his adjustment for rate setting purposes, these customers should be exempt from the WNA. (Tr. at 1478)

As discussed in the following sections, the Commission has found that CEUG's proposed rate design changes related to demand based and declining block structures are not in the public interest. Given that CEUG's recommendation to abolish the WNA is contingent upon implementation of those changes, the Commission rejects CEUG's proposal to abolish the WNA.

The Commission also finds CEUG's proposed expansion of the WNA to adjust for any usage variance from pro forma levels beyond the scope of appropriately applied automatic adjustment clauses. This proposed change to the WNA effectively fixes recovery of the entire last revenue requirement used to set commodity rates. Such a tariff not only fails to target a highly volatile material cost, but targets no single cost, allowing for set recovery of the last commodity revenue requirement irrespective of actual costs. As such, it fails for consideration for automatic treatment. Additionally, its effect mitigates the benefits now allowed by the lag between rate filings, including load growth revenues and efficiency incentives. One effect of such an adjustment would, as noted by Ms. Campbell, discourage customer growth as changes in usage are adjusted back to pro forma levels. With suppressed customer growth, there will also be a loss of the efficiencies that growth can provide by spreading fixed costs over a larger number of customers. Additionally, this will create an incentive to file for increases in rates because any increases in cost would not be

balanced by the increases in revenues from new customers. In addition, the Commission notes also that, if revenue losses occur from reduced deliveries, those lost revenues will automatically be collected from all other customers. This will guarantee AWG recovery of the last commodity revenue requirement used to set its non-gas rates. That recovery will occur irrespective of the reasons for the reduction in deliveries or of any corresponding cost decreases that reduction may have provided. The Commission finds that the results of Mr. Tinsley's proposal, in either scenario, are not reasonable nor in the public interest.

The Commission also finds CEUG's proposed amendments, adding all rate classes to and eliminating certain customer exemptions from the WNA, unnecessary as the changes proposed reflect no material benefit. The Commission finds that the impact of weather on rate classes B-4 and B-5 and the cotton ginning and grain drying customers is, as shown in Ms. Campbell's testimony, not material and coverage under the WNA is not necessary. Although B-3 customers currently are subject to a weather adjustment, Mr. Swaim's proposal to isolate and measure the impact of weather on these customers before covering them under the WNA is prudent and, therefore, his recommendation is approved. Mr. Tinsley's proposal to include in the WNA a written standard outlining qualification for exemption is unnecessary given the few customers to which it will apply. The Commission therefore finds, in view of the limited impact, there is no reason to expand the tariff to other rate classes or to those customers currently exempt and there is no need to incorporate exemption standards in the tariff. However, in view of Mr. Swain's testimony, the Commission orders AWG to track usage patterns of its B-3 customers so that the issue of whether any of these customers should be covered by the tariff may be addressed in AWG's next rate filing.

Finally, the Commission rejects CEUG's proposal to establish separate commodity rates, containing no variable costs, for use exclusively in the WNA. In this regard, while there will be an upward adjustment to the variable costs in the rate when weather is warmer than normal, there will also be a downward adjustment to those same variable costs when weather is colder than normal. The limited benefits such precision will add are outweighed by the additional complication to the calculation of the cost of service and complication and confusion added to the resulting tariff. The Commission, therefore, finds that no change to the make-up of the base rates used in the WNA is appropriate and rejects CEUG's proposal in this regard.

B. Transportation Rates/Demand Based, Sales Rates/Declining Block, Separate Rates for Transportation and Sales

CEUG recommends that the Commission order separation of sales and transportation rates, with new and different rate structures applied to each. CEUG recommends, first, that transportation rates be designed with all demand costs collected in the demand.[23] CEUG also recommends that declining block rates be designed for sales customers and that the demand costs that are currently included in the commodity rate now be recovered in base consumption. For transportation customers, all variable costs will be collected in the commodity rate and variable costs for sales customers will be collected in the remaining blocks. (Tr. at 1217-1218, 1325-1326)

CEUG witness Tinsley explains that he is recommending declining block rates for sales customers given that most of these customers do not have the meters necessary to use demand

[23] CEUG Witness Tinsley, in his testimony on cost classification and allocation, recommended that all fixed costs should be classified as demand and allocated on that basis. It is assumed that it is his preference here to have all such fixed costs already classified as demand. His actual recommendation as to rate design, however, is to include all fixed costs which are classified as demand in the demand rate. It can be inferred that, to the extent a fixed cost has been classified as commodity, under his proposed demand rate structure that fixed cost will be recovered in the commodity rate.

billing. (Tr. at 1218) Mr. Tinsley testifies that these rate structures will minimize intra-class subsidies, reduce incentive for high-load factor customers to bypass, reduce working capital needs and resulting rate base, encourage natural gas cooling, reduce potential utility under- and over-recovery of fixed costs, send more accurate price signals, and provide an incentive to reduce consumption during peak periods. (Tr. at 1218-1219) In addition, Mr. Tinsley asserts that separate rate structures for sales customers and transportation customers minimizes the potential for subsidization given cost of service differences for accounts receivable, storage plant production plant, storage gas, and pooling services. (Tr. at 1219) Mr. Tinsley also notes that, although there are some customers in the business classes which do not have the metering capability to use demand billing, AWG has daily flow information on all transportation customers. Therefore, Mr. Tinsley recommends that demand billing be implemented for those customers in the case. (Tr. at 1323-1329)

Ms. Campbell testifies that demand billing is essentially the norm in the electric industry, given the metering technology which can accurately measure the electric customers' monthly maximum demand. Further, she states that, because technology has improved in gas metering, AWG can now measure daily flow information for all of its B-5 customers and all but 4 of it B-4 customers, with some of that information available for its B-3 customers. She testifies further that monthly demand must be measured in order to design a demand based rate. Further, she states that these demand billing determinants have not yet been measured and analyzed and no design for that type of rate was made in this filing. Additionally, she testifies that any change in rates should be tested for customer impact, as required per Schedule H-3. She notes that adoption of a declining

block rate would result in low usage customers absorbing a greater rate increase than those with greater usage. (Tr. 805-806)

Although acknowledging that customers providing daily load information will receive a correct price using a demand based rate, Ms. Campbell also recommends that these rate design changes not be effected in this proceeding. (Tr. at 805-806) Ms. Campbell acknowledges that separate rates for transportation customers could be set for customers in each rate class, with a savings for those customers. However, she also testifies that separate rates would put AWG at risk for recovery of its revenue requirement. And, although Mr. Tinsley purports that the rate design change would provide offsetting cost savings to AWG, he fails to quantify them. Finally, Ms. Campbell notes that, should customers be allowed to switch between services, there would be an additional administrative burden to AWG. (Tr. at 806-807) Ms. Campbell recommends that, for the next rate filing, AWG assess the possibility and evaluate the customer impact of implementing a three part rate design for B-4 and B-5 customers, with a demand, customer, and commodity charge. (Tr. at 807)

Staff witness Green notes the lack of analysis performed to date and concurs with Ms. Campbell's conclusion that, prior to any rate structure changes, a full customer impact study should be done, something which Mr. Tinsley did not provide in conjunction with his recommendation. Ms. Green also concurs with Ms. Campbell that setting separate rates for transportation and sales customers is not appropriate absent a complete analysis of the costs and revenues associated with the separate services, an analysis which has not been completed in this proceeding. (Tr. at 1560-1561)

NWAGC witness John also recommends no rate design changes, given the lack of data and lack of analysis. He notes the lack of detail from Mr. Tinsley regarding the source of the demand billing determinants, the lack of evidence as to the customer impact, both intra-class and interclass, and Mr. Tinsley's lack of specifics regarding the implementation of declining block billing and the impact that rate structure would have on customers. (Tr. at 1120-1123) Mr. John also disagrees with Mr. Tinsley's assertion that these two rate designs will minimize intra-class subsidization of low load factor customers by high low factor customers. He testifies that Mr. Tinsley fails to provide threshold levels for his block rates, which makes it impossible to measure the impact on individual customers. Further, he also points out possible intraclass inequities given that, under declining block rates, low load factor customers with high usage may experience reduced rates while high load factor customers with low usage would experience increases. (Tr. at 1122-1123)

The Commission finds CEUG's recommendation to substantially change the overall design of business class rates both for transportation customers and for sales customers premature. The proposal lacks supporting data and nothing in the record reflects the impact to rates or the bills of customers in each class. The Commission finds that, although almost all customers in the B-4 and B-5 class have meters which lend themselves to demand billing, such is not the case for those transportation customers in the B-3 class, rendering it impossible to set a demand rate for those customers. The Commission finds that the purported benefits of these rate designs proposed by CEUG's are wholly unsubstantiated. Absent an understanding of how these two rate designs could realign the rates and bills of customers now served under the current structure, the Commission cannot make a finding that the resulting rates from those designs would be just and reasonable. The

Commission, therefore, finds that the current rate design for transportation customers and sales customers should not be changed to demand and block billing, respectively.

The Commission finds that CEUG's underlying proposal to set rates separately for transportation customers and for sales customers is premature. The Commission notes that CEUG fails to quantify, under any rate design, the impact this change will have either on AWG or on the customers under the services. Mr. Tinsley also fails to address any administrative costs which may occur due to customer switching. The Commission finds, therefore, that the transportation rate should continue to be based on the non-gas rate for sales customers.

However, the Commission orders AWG to begin to keep the data necessary to address CEUG's proposed rate design changes, including providing separate rates for sales customers and transportation customers, and be prepared to provide at their next rate filing the analysis necessary to measure the impact of each on customers in the various classes.

C. Standby Service

CEUG witness Tinsley recommends that, for purposes of clarification within the filed tariffs, the Term "Standby Service" be defined. (Tr. at 1222) The parties to the docket appear to agree that a definition is appropriate and made efforts during the proceeding to come to an agreement. However, at this time no agreed-upon amendment to the tariff has been filed. Therefore, the Commission approves the tariff language without the proposed definition. However, the Commission directs the parties to continue discussions to reach an agreement with regard to that definition. Upon consensus, AWG is ordered to file the appropriate amendment to its tariffs.

New Tariff/Guidelines

A set of guidelines to offer a new service and a new rider have been proposed for approval and remain in dispute. The issues disputed relate to *Master Metering* and *Combined Billing* and the *Rate Evaluation Plan* ("REP").

A. Master Metering and Combined Billing

A recommendation by CEUG witness Tinsley for the establishment of a consistent policy to provide service for *Master Metering* and *Combined Billing* customers (Tr. at 1236) remains in dispute. Mr. Tinsley recommends that the Commission compel AWG to adopt the guidelines for master metering and combined billing which he proposes. (Tr. at 1236) One of the provisions of the Stipulation and Agreement approved in Docket No. 02-227-U ("Stipulation") required "Staff to facilitate a meeting including Staff, Intervenors, and the three gas distribution companies for the purpose of developing a uniform master metering and combined billing policy. The meeting will begin by January 1, 2004, with an attempt to complete a policy by April 1, 2004. Any policy adopted will be consistent with the General Service Rules, Rule 5.20." (Tr. at 1264) Mr. Tinsley contends that, because no final agreement was reached and presented to the Commission, the parties have failed to comply with the Stipulation. (Tr. at 1264-1265)

AWG witness Gunter contends that, under the correct interpretation of the Stipulation, the parties have complied with its requirements. It is his contention that the Stipulation required only that the parties meet and try to work out a Master Metering/Combined Billing Policy and that such a policy would be in compliance with General Service Rule 5.20, and that the Stipulation did not require that the parties reach agreement. Mr. Gunter and Staff witness Booth both contend that the

required meetings took place, although no policy was adopted. (Tr. at 943-944, 1619-1620) Mr. Gunter and Mr. Booth recommend that a more appropriate forum in which to address these proposed service offerings and guidelines would be a generic proceeding. (Tr. at 944, 1620)

In this regard, Mr. Booth testifies Staff continues to have concerns that costs will be shifted to other customers and rate classes if CEUG's proposal is adopted, even with an appropriate payback period for costs related to customer switching. (Tr. at 1620-1621) Mr. Gunter recommends a 3-year payback period as appropriate. (Tr. at 944-945) Mr. Tinsley testifies that, because the "economic viability of combined billing is highly sensitive to rate design and customer charge," and, given that all three gas companies have filed for changes in rates, it is both more appropriate and more timely to address these service changes as part of this current rate proceeding. (Tr. at 1265-1266) In addition, Mr. Tinsley testifies that the 3-year payback to determine economic viability for converting customers is actually closer to 4.5 years, once adjusted to pre-tax impact and that, in view of this and although he had originally recommended a payback period of 6.3, he would now recommend only 5 years for payback. (Tr. at 1266-1267)

The Commission finds that a generic rulemaking proceeding should be established to address this issue. Given the potential for cost shifting and the need to establish a payback period which will be neither too restrictive, rendering the offer of this service meaningless, or too generous, resulting in subsidization of an uneconomic alternative, it is incumbent upon the Commission to address this issue in a generic docket in which a more thorough review of the service offer impact on multiple parties can be considered. The Commission, therefore, finds that a generic proceeding

should be established and directs Staff to file, within 45 days, a proposed procedural schedule to address this proposed change to gas service.

B. Rate Evaluation Plan

AWG proposes to supplant the current general rate case procedure with a streamlined and limited annual procedure, which it has styled the Rate Evaluation Plan, or REP. The REP continues to be supported by AWG and CEUG, subject to certain modifications, and opposed by Staff, the AG, and the NWAGC.

AWG witness Gunter testifies that the Company seeks approval of the REP because it will allow streamlined annual filings that will adjust the rates either up or down, matching current costs with rates and allowing stockholders a better opportunity to earn their allowed rate of return. (Tr. at 896) Mr. Gunter asserts that, under the current procedures and time-line for establishing rates, it is likely that any rates just established will not recover the utility's costs within a few months of being in place. (Tr. at 898) Mr. Gunter states that the REP will simulate the current rate case process using rate base, expenses and rate of return to calculate revenue requirement which could result in either an increase or a decrease[24] in rates. (Tr. at 897)

The REP will be based on a test year of actual data, ending each April 30, with pro forma adjustments allowed through the adjusted test year, ending in the following year on April 30. (Tr. at 899) AWG will file each year on August 1 to be effective November 1 and Staff will have until September 15 to object to any part of the filing. (Tr. at 903) The REP will differ in that it will

[24]Under the REP, AWG will be allowed an increase only to the extent that its earned return on equity falls more than 50 basis points below its allowed equity return and will be required to reduce its rates only to the extent that same return exceeds by 50 basis points its allowed equity return. (Tr. 901-902)

require no application, will use a range of currently-established equity returns,[25] outside of which annual rate changes will be allowed, will only include pro forma adjustments to certain accounts,[26] and will require no cost of service, with any excess or deficiency allocated to rate class based on the last approved revenue requirement by class and, once allocated, be divided by the class billing determinants to be added or subtracted from the current rate. (Tr. at 898-899) According to Mr. Gunter, adoption of the REP will make the ratemaking process more efficient and effective, extend the time between costly rate cases, help the Commission balance interests of ratepayers and stockholders by improving fairness of AWG rates and allowing each to share in the benefits of greater efficiency, cost reductions, and increased revenues, facilitate conservation, levelize Staff workload, and improve communications between the Commission and AWG. (Tr. at 904-907)

Responding to criticism by Staff, NWAGC and CEUG witnesses, Mr. Gunter testifies that AWG's proposal's purpose is simply to streamline the current process which, by its requirement to have a rate case each five years, will provide a better rate making mechanism. (Tr. at 920) He also testifies that the REP is not the type of clause to which criteria to measure the need for an automatic adjustment should be applied and, further, that such criteria are not required by either rule or statute, but are simply guidelines against which the Commission has measured other clauses in the past.

---

[25]The allowed return on common equity ("ARCE") will be established each year using the same methodology as that which was used and approved in the last general rate filing and once established the allowed range of equity returns, 50 basis points above and 50 basis points below, will be set. (Tr. 901)

[26]Proposed adjustments allowed will include: rate base adjustments for pro forma plant which will be placed in service through the end of the adjusted test year and related accumulated depreciation; revenue adjustments to eliminate cost of gas revenue, adjustments for customer growth and for weather, annualize REP revenues, and incorporate changes in Ccf use by customer; and, expense adjustments to eliminate certain non-utility expenses, update payroll and payroll taxes for raises, new hires, and retirements, update pension costs, and update employee medical insurance costs. (Tr. 899-900)

(Tr. at 920) Mr. Gunter notes that, unlike automatic clauses, such as the cost of gas clause, the REP will be reviewed prior to implementation, will allow regulatory review for disputed items, and will not allow an increase absent AWG's earned equity return falling below 50 basis points of its Allowed Return on Common Equity or ARCE. (Tr. at 921)

Under the proposed process, Mr. Gunter states that Staff would require less time for review and, having already conducted a full rate case, Staff should be fully informed of AWG's financial condition, will be required to review only the major adjustments allowed under the tariff, and will benefit by the ongoing familiarity with AWG which annual REP filings would provide. He testifies further that, to the extent that other utilities also put in place similar mechanisms, the Commission could stagger such filings to allow Staff to best utilize its time and resources. (Tr. at 921-922)

In response to NWAGC witness John's concerns that the REP fails to include all elements of revenue requirement, Mr. Gunter testifies that, in order to provide the streamline process, the REP excludes some elements but does include those items which will have a material impact. Mr. Gunter states that the Company is open to suggestions as to any other items which the parties may deem likely to materially affect the resulting revenue requirement. (Tr. at 923) Mr. Gunter also responds to CEUG witness Tinsley's concerns regarding the tariff's provisions which allow only Staff as part of the review process. Absent that limitation, Mr. Gunter states that the process will not work in the streamlined manner for which it is designed and Staff's review and ability to object, with such objections slowing the process, should ensure that AWG does not make inappropriate requests. (Tr. at 924-925)

Mr. Gunter also testifies that the equity range provision of the REP will provide AWG the proper incentive to control its costs, given that it will be allowed to retain earnings up to 50 basis points in excess of its ARCE and will, in turn, be required to absorb costs which reduce its earned return up to 50 basis points less than its ARCE. (Tr. at 925-926) Mr. Gunter and AWG witness Stewart testify that, in addition, none of the parties have addressed the REP's elimination of the current process's disincentive for AWG to offer beneficial conservation programs. Absent the REP process, AWG would lose substantial margins should it successfully promote conservation on its system but, with the REP, the nexus between reduced use of gas by customers and the margins allowed AWG will be eliminated, allowing conservation to bring substantial long term ratepayer benefits. (Tr. at 926-927, 226-230, 231-235) Those benefits, Mr. Stewart testifies, include general benefits such as reduced natural gas demand (Tr. at 227-228), reduced cost of gas (Tr. at 228-229), and better utility financial performance with resulting lower costs. (Tr. at 229-230)

Mr. Stewart testifies that the process should also bring direct AWG-customer benefits such as reducing a customer's total bill, eliminating delay by AWG in investing in its system, reducing peak needs using programs such as weatherization, and putting downward pressure on gas prices in the market from which AWG purchases its supply. (Tr. at 230) Mr. Stewart also testifies that, if the Commission wishes to pursue implementation of conservation by its jurisdictional utilities, it will have to use the REP or something similar, given that, under Arkansas' Energy Conservation Endorsement Act of 1977, utilities must also benefit. (Tr. at 231-232, 238-239) Mr. Stewart also rebuts Staff witness Brown's testimony calling for a reduction in the equity return should the REP be approved. Mr. Stewart testifies that no reduction in the cost of equity is needed because, absent

the REP, the current rate case process does not afford AWG an opportunity to earn its approved return, as required by the "constitutional standards" under which the Commission regulates. (Tr. at 238-239)

Staff, NWAGC, and the AG all recommend that the Commission reject the REP. Staff witness Booth testifies that, while the Commission has full authority to do so, Staff opposes implementation of the REP given that it does not appropriately balance stockholder and ratepayer interests. (Tr. at 1599-1600) Mr. Booth notes that the REP is a significant departure from current ratemaking in Arkansas and he fails to see the ratepayer benefit or public interest of having AWG increase rates to its customers from its expected 18-20 month schedule to every 12 months, with those annual rate increases subject to significantly less review. (Tr. at 1600-1601, 1609) Mr. Booth also testifies that, although AWG asserts the current rate process is a failure, AWG has not yet fully availed itself of that process. (Tr. at 1609) Nor is there, according to Mr. Booth, any enhanced incentive for "greater efficiency, cost reductions, and increased revenues" under the REP's provisions which allow AWG to keep up to 50 basis points in excess earnings or be required to absorb up to 50 basis points in under earnings, given that, under current rate treatment, AWG may keep all earnings in excess of its last approved equity return, as it also must absorb all earnings shortfalls. (Tr. at 1611)

In addition, Mr. Booth contends that the REP is essentially an automatic adjustment clause, which, he notes, fails to meet the criteria[27] for which such clauses are deemed in the public interest.

[27]The criteria usually used to measure the public interest of allowing implementation of automatic adjustment clauses are: (1) the cost subject to automatic adjustment is a significant portion of the utility's operating costs; (2) the cost exhibits extreme volatility and unpredictability, with the volatility trending either upward or downward; and, (3) the cost

Mr. Booth testifies that the REP is similar to a proposed automatic mechanism filed by Arkla in a recent docket, which the Commission rejected, and, similarly, the AWG proposed REP should also be rejected. (Tr. at 1601-1603) Mr. Booth testifies that, just from an administrative position, the Staff would oppose the REP in view of the extraordinarily limited period allowed under the tariff for Staff review and the precedent set for other utilities to ask for similar treatment. (Tr. at 1603-1604) However, should the Commission approve the REP, Staff witness Brown testifies that his current recommendation with regard to cost of equity would need revisions downward to incorporate the significant reduction in business risk the REP would afford AWG. (Tr. at 661)

Mr. Marcus testifies that the REP is too far reaching and that AWG's representation of it as a method to remove conservation disincentives is over-stated and that it should be rejected. (Tr. at 120-121)

Mr. John also recommends disapproval of the REP, testifying that, while he sees substantial benefits for AWG, he sees none for ratepayers, noting as an example that, while the REP will allow AWG to increase certain costs, it provides for none of the offsetting reductions found when all costs are considered under the current rate making process. (Tr. at 1125-1126)

Mr. Tinsley currently recommends that the Commission approve the REP, having been persuaded that it will benefit ratepayers, will appropriately streamline the rate setting process, and will aid to foster conservation and thereby lower gas costs. (Tr. at 1280-1281) Initially, however, CEUG witness Tinsley recommended disapproval based on his concerns regarding the REP's (1) lack of adequate representation by other parties, (2) disincentives to control costs, and (3)

---

is outside the control of the utility's management. (Tr. at 1601-1602, 1610-1611)

guaranteed return with no commensurate performance requirements. (Tr. at 1163) Mr. Tinsley had objected to the REP, testifying that it was simply an over- or under-collection mechanism, which allowed no intervenor participation, guaranteed a return, provided no incentive to control costs, failed to consider all costs, and was not tied to any performance requirements for the utility. (Tr. at 1163-1165) His current recommendation for the REP's approval is, however, subject to (1) including all costs in the evaluation, (2) eliminating the WNA and setting demand based rates for B-4 and B-5 customers, (3) reducing equity cost given the reduced risk, (4) be open to all parties, and (5) limiting rate case filings to once in every five years. (Tr. at 1280-1281)

The Commission finds that AWG's assertions regarding its inability to "earn a constitutionally adequate return" under the current process is not supported by evidence or analysis indicating that AWG has not earned a sufficient return or has not been afforded the opportunity to earn that return. AWG, by law, may file for rate relief as often as every 10 to 11 months, but the record of AWG's rate requests indicates that it has not taken advantage of that opportunity. (Tr. at 1609) More importantly, however, the rates under which AWG provides service have been found to be just and reasonable. Once prospective rates have been established those rates are deemed just and reasonable until such time as they are changed by order of the Commission. In this proceeding AWG has failed to establish by substantial evidence that an REP is necessary to protect its rights to collect just and reasonable rates. Therefore, the REP is rejected.

Miscellaneous

The parties also remain divided with regard to the recommendation that, for AWG's next

rate case, the Company be required to file, concurrently with any total company rate proposal, proposed rates, revenue requirements, and cost of service studies for its *Northeast and Northwest* operations. The parties also remain divided with regard to the rate for *Fuel and Lost and Unaccounted for Gas* ("LUFG"), proposed monthly updates for those costs, and the treatment of this item for Order 63 service. Finally, the parties disagree on the appropriate treatment of *Transportation Balancing Revenue.*

A. Northeast and Northwest Separation

CEUG witness Tinsley initially recommended that, absent a showing of the benefits of the original consolidation, AWG be required to separate its Northeast and Northwest regions for rate purposes. Mr. Tinsley contends that AWG has never provided appropriate justification for that consolidation. Alternatively, Mr. Tinsley proposed that AWG be required to track the data necessary to file separate costs of service for each region (Tr. at 1182) and subsequently recommends that AWG, with its next rate case filing, be required to file both combined and separate costs of service for its Northeast and Northwest regions (Tr. at 1334)

As noted by AWG witness Gunter, the Commission approved, with no restrictions, the consolidation as part of a Settlement submitted by the parties in Docket No. 02-227-U (Tr. at 947) and, absent some evidence to support his contention that there is interregional subsidization (Tr. at 1290) with a material impact, which Mr. Tinsley has not provided, the Commission rejects his recommendation in this regard.

B. Fuel and Lost and Unaccounted For Gas ("LUFG") - Rate Design/Allocation

CEUG witness Tinsley recommends that AWG's allocation of fuel and LUFG charges to its retail ratepayers be changed. (Tr. at 1199) Mr. Tinsley notes that fuel and LUFG charges under its retail transportation tariff are currently set as an 'in-kind' gas delivery of 4.62% of the volumes AWG delivers to the customer. (Tr. at 1194) Additionally, he recommends that AWG's collected FERC jurisdictional charges for fuel and LUFG, charged to its FERC Order 63 customers, be used to reduce the retail Fuel and LUFG allocated cost. (Tr. at 1198) Mr. Tinsley testifies that, as was indicated in APSC Docket No. 02-024-U,[28] fuel and LUFG are independent of the level of volumes flowing through the system, arising rather from the system's characteristics, condition, and pressure. (Tr. at 1195-1196) Therefore, he recommends that fuel and LUFG charges be billed to sales and transportation customers up to a reasonable amount of actual cost (a cap set on cost), allocated to each rate class at 50% coincident peak and 50% on volumes, and collected in a separate line item from sales customers and in an 'in-kind' exchange from transportation customers. (Tr. at 1198-1199)

AWG witness Stevens testifies in response that (1) LUFG levels are based on more than just pressure,[29] (2) pressure on AWG's system varies constantly, and (3) the level of throughput directly impacts pressure and, as such, it is more appropriate to allocate these costs on a volumetric basis rather than coincident peak as Mr. Tinsley proposes. Mr. Stevens notes that allocation of LUFG and

[28]Docket No. 02-024-U was a rate filing by Arkansas Oklahoma Gas Company ("AOG") and Mr. Tinsley references the initial testimony of Russell Feingold, page 33, lines 16-17. (Tr. at 1196)

[29]Mr. Stevens lists among others: input/output measurement differences, theft of gas, cycle billing effects, and purge and pack of new gas lines during maintenance. (Tr. at 862)

fuel on coincident peak effectively allocates that cost on only .3% of fuel used in the entire year. (Tr. at 862-864) Mr. Stevens also testifies that, given the relationship of pressure to volumes, it is still appropriate to collect the costs as a percent of those volumes for transportation customers and as part of the cost of gas for sales customers. Mr. Stevens further testifies that changing billing so that these charges are reflected as a line item charge will only serve to confuse customers and should be rejected. (Tr. at 864) Nor is it appropriate, Mr. Stevens states, to set a cap on recovery of LUFG and fuel for AWG, given that AWG appropriately attends to its operations and maintenance and given that its activities in this regard are monitored by the Commission. (Tr. at 864)

The Commission finds that CEUG's proposal to capture actual costs of fuel and LUFG for recovery from sales customers as a line item is not necessary. As part of the cost of gas, actual costs for both will be recovered. The Commission also finds that CEUG's proposed allocation of a portion of these costs on coincident peak fails to properly recognize the relationship between volumetric activity, pressure, and leaks as discussed by Mr. Stevens. (Tr. at 862) Given the nexus discussed by Mr. Stevens in this regard, the Commission also finds that, for transportation tariffs, use of a factor or percent of volumes delivered to measure fuel and LUFG[30] is appropriate. The Commission notes that, other than Mr. Tinsley's proposed methodology change already rejected by the Commission, no party provides evidence in support of or recommends a change to operation of that factor or the factor itself. The Commission, therefore, approves the transportation service's fuel and LUFG factor currently in effect and as previously approved by the Commission.

[30]For transportation service, the factor is applied to delivered volumes and the transportation customer provides payment in the form of like-kind deliveries. (Tr. at 1193-1194)

3. Transportation Balancing Revenue

Remaining in dispute is the appropriate allocation of revenues related to transportation customers' imbalances. CEUG witness Tinsley recommends that "(a)ll revenues associated with imbalance penalties . . . be allocated directly to the transportation customers." (Tr. at 1214) He asserts that these "imbalance fees" are assessed to cover the cost of imbalances, not to penalize the customers, and it is therefore appropriate that these revenues be allocated back to the transportation customers. AWG witness Campbell disagrees and testifies that these charges are penalties charged to transportation customers for failing to adhere to the balancing provisions of the tariff. (Tr. at 803)

The Commission finds that Ms. Campbell's definition of these charges as penalties is correct. Based on the terms of the tariff, the charges made for over- or under-deliveries, or being out of "balance" are labeled "penalties", are administered after the fact, and increase disproportionately to increased imbalance. (Application, Tariffs, Rate Schedule 2.7, pp. 7-15) The Commission finds the terms of the tariff are, in fact, intended to discourage imbalances by applying penalties, not charging "fees." The Commission, therefore, rejects Mr. Tinsley's request to allocate these revenues directly to Transportation Customers, and approves the allocation proposed by AWG.

Conclusions

(1) Although we have rejected AWG's proposed REP within the context of this company-specific proceeding, the Commission is inclined to consider a new rate case approach that would have the effect of streamlining the existing and long-standing rate case process. Based upon the

evidence presented in this case and in previous rate cases, the Commission is not prepared to find that the REP mechanism, as proposed, is the appropriate substitute process. However, the Commission is willing to consider proposed changes to the rate case process in a generic proceeding. Also, the Commission is willing to consider in a generic proceeding a decoupling mechanism designed to encourage efficiency and conservation. Further, the Commission is willing to consider in a generic proceeding a performance-based methodology designed to allow a variable return on equity adjustment, based on utility performance, customer service and other metrics, within a reasonable equity return range.

(2) Based upon the findings set forth hereinabove, the Commission rejects the rates and charges proposed by AWG and directs it to file new rates and charges in compliance with the provisions of this order.

BY ORDER OF THE COMMISSION

This 31st day of October, 2005.

Sandra L. Hochstetter, Chairman

Daryl E. Bassett, Commissioner

Separate Opinion of Commissioner Randy Bynum

With the following exception, I concur in the foregoing opinion of my colleagues. As I did in AWG's last rate case in Docket No. 02-227-U, I am again obliged to take issue with the Commission's decision in that case to allow AWG to consolidate its Northwest ("NW") and Northeast ("NE") divisions and to implement one set of rates and tariffs for the combined divisions. Prior to that decision each of AWG's two divisions had its own set of rates and tariffs. In Docket No. 02-227-U AWG witness Gunter testified that both AWG and its ratepayers would benefit in several ways if the consolidation was approved. Although the benefits of consolidation put forth in that docket by AWG may have appeared meritorious on their face, AWG did not in that docket or in the current docket provide substantial evidence that persuades me the consolidation would be or has been beneficial for AWG's ratepayers. Accordingly, I remain concerned that the benefits asserted by AWG may not outweigh the cost impacts of consolidation on the ratepayers of the two regions.

In the present case, CEUG witness Tinsley recommends that, absent a showing of the benefits of the original consolidation, AWG be required to separate its NW and NE regions for rate purposes. Mr. Tinsley contends that AWG has never provided appropriate justification for that consolidation. Alternatively, Mr. Tinsley recommends that AWG be required to track the data necessary to file separate cost of service studies for each region; and subsequently recommends that AWG be required to file both combined and separate cost of service studies for its NW and NE regions at the time of its next general rate application. I agree with Mr. Tinsley's recommendations.

As I stated in my separate opinion in Docket No. 02-227-U, I continue to have significant concerns, not just with the obvious inter-regional subsidization of gas costs, but also with the

likelihood that the consolidation will also cause inter-regional subsidization of non-gas costs. However, given that AWG did not file separate non-gas cost of service studies and rates for the two regions in the instant case, again I have little choice but to voice my continuing concerns. In the absence of compelling evidence that consolidation has produced essentially equivalent cost savings and lower rates for the ratepayers of both regions I continue to oppose the consolidation.

Randy Bynum, Commissioner

Diana K. Wilson
Secretary of the Commission

I hereby certify that the following order issued by the Arkansas Public Service Commission has been served on all parties of record this date by U.S. mail with postage prepaid, using the address of each party as indicated in the official docket file.

Diana K. Wilson
Secretary of the Commission
Date 10/31/05

FINAL DECISION

I. INTRODUCTION

A. SUMMARY

In this Decision, the Public Utilities Regulatory Authority reviews The Connecticut Light and Power Company's request for a rate increase pursuant to an Application filed on June 9, 2014 requesting an increase in revenue of $231.582 million and a 10.2% return on equity. On September 22, 2014 the request was revised to an increase in revenue of $221.098 million. The Public Utilities Regulatory Authority approves an increase in revenue of $134.076 million[1] and a base return on equity of 9.17%. This is an increase of 13.9% to distribution rates and approximately 3.3% to total rates.

In granting the revenue increases, the Public Utilities Regulatory Authority allows The Connecticut Light and Power Company sufficient funds to engage in significant capital improvements to upgrade its distribution system and modernize its systems, processes and workforce. The approved increase in revenues, the return on equity and the rate mechanisms described within this Decision, along with other determinations made in this Decision, will result in just and reasonable rates. It will provide The Connecticut Light and Power Company with sufficient revenue to maintain and operate an electric distribution system and provide a safe, adequate and reliable service to customers, while providing it an opportunity to earn a reasonable profit.

The Connecticut Light and Power Company must have the resources to be able to maintain and operate its distribution system in a manner that provides safe and reliable electric service to about 1.2 million customers in Connecticut. In addition, it must provide satisfactory customer service and provide a fair return to its investors.

The Public Utilities Regulatory Authority rejects The Connecticut Light and Power Company's request for an allowed return on equity of 10.2% and has determined that an allowed base return on equity of 9.17% is fair and reasonable. In regulating CL&P to allow a return commensurate with the current economic conditions, the Authority has determined that investors expect less of a return today than in 2010, when the return was established at 9.40%. The base allowed return on equity has been decreased by 15 basis points to 9.02% for a period of one year to reflect a penalty for The Connecticut Light and Power Company's poor performance in preparing for and restoring service from Tropical Storm Irene in 2011 and the major snowstorm that occurred in late October, 2011.

This Decision approves the proposed level of $257 million in capital spending, finding that this level of spending is necessary for safety, reliability and maintenance of the franchise. This Decision also includes past system resiliency spending in rates, which is expected to reduce the severity and frequency of outages to customers in

[1] As discussed below, the Public Utilities Regulatory Authority finds a one year return on equity penalty of 15 basis points appropriate. This penalty reduces the initial revenue increase to $129.679 million.

future weather related events, and authorizes the initiation of new resiliency programs, subject to Public Utility Regulatory Authority review and approval of spending levels in a future proceeding. Further, this Decision includes in rates the costs incurred by The Connecticut Light and Power Company in preparing for and restoring service from major storms in 2011 and 2012, as determined in previous proceedings. This Decision also approves funding for an expanded troubleshooter organization, which is expected to reduce the duration of outages at nights and on weekends.

Major reductions to revenue requirements requested by The Connecticut Light and Power Company include reductions in the requested return on equity, cash working capital of $1.869 million, $7.44 million in the requested level of depreciation expense, and $22 million in operations and maintenance expenses.

The Authority approves certain changes to The Connecticut Light and Power Company's rates and revenues. This Decision makes certain adjustments to pole attachment revenue. The Decision accepts the Company's proposed sales forecast and revenue allocation methodology as reasonable for setting rates. The Decision lowers the proposed increases in fixed charges proposed for the residential and small commercial rates. The Street Lighting rates have been unbundled into system and equipment components and the proposed LED lighting options are approved. The Authority recalculates the Company's pole attachment rates as outlined herein. This Decision also approves a revenue decoupling mechanism as outlined herein. The approved revenue requirements, revenue allocation and rate design changes discussed above will result in an increase of approximately $7.12 per month for the average residential customer bill.

B. BACKGROUND OF PROCEEDING

The Connecticut Light and Power Company (CL&P or Company) is a public service company within the meaning of §16-1 of the General Statutes of Connecticut (Conn. Gen. Stat.). CL&P is a subsidiary of Northeast Utilities (NU). The Company currently provides electric service in 149 towns and cities in Connecticut. Application, p. 3.

By letter dated May 9, 2014, CL&P provided notice of its intention to file an application for approval to amend its rate schedules (Application) to the Public Utilities Regulatory Authority (Authority or PURA), the Governor of the State of Connecticut, the Chief Executive Officer of every municipality located within its franchise area, the Office of Consumer Counsel (OCC) and the Office of the Attorney General (AG). In addition, the Company requested waiver of certain provisions of the Standard Filing Requirements (SFRs).

By letter dated May 20, 2014, the Authority granted the Company's request for waiver of certain portions of the SFRs for Large Public Utility Companies. The Authority also approved the Company's request for allowance to submit data required in Schedules F-1.0 through F-9.0 on a calendar year basis reflecting the 12-month period ending December 31, 2013.

By Application dated June 9, 2014, CL&P requested to amend its existing rate schedules pursuant to Conn. Gen. Stat. §§16-19 and 16-19e and §§16-1-46 and 16-1-53 *et seq.* of the Regulations of Connecticut State Agencies (Conn. Agencies Regs.), and the SFRs. The Company indicated that this increase is necessary to address a distribution operating deficiency of $116.7 million, and to implement recovery of $89.5 million of storm costs and $25.3 million of system resiliency costs approved by the Authority in prior dockets.[2] In total, the Company proposed rates designed to recover additional costs of $221.098 million during the period from December 1, 2014 - November 30, 2015 (Rate Year). Application, pp. 2 and 3.

C. CONDUCT OF PROCEEDING

On June 3, 2014, pursuant to Conn. Gen. Stat. §16-19(a), the PURA notified all admitted parties and intervenors that it would extend the 150-day period, directed by Conn. Gen. Stat. §16-19(a), to render a final Decision in this docket by 30 additional days.

By Notice of Audit dated June 13, 2014, the Authority conducted an audit of CL&P's books and records at the Company's offices located at 107 Selden Street, Berlin, Connecticut, 06037, beginning on June 23, 2014. The Authority conducted a separate audit of the Company's rates and revenues at the same location on July 10, 2014, pursuant to a Notice of Audit dated July 2, 2014.

Pursuant to a Notice of Pre-Hearing Conference dated June 3, 2014, the Authority conducted a Pre-Hearing Conference on June 19, 2014, to discuss procedural issues with all admitted parties and intervenors, at the Authority's offices located at Ten Franklin Square, New Britain, CT, 06051. At the Prehearing Conference, the Authority and all Parties agreed that the schedule would be extended to provide for a Final Decision by December 17, 2014, with rates to go into effect on December 1, 2014.

By Notice of Hearing dated July 21, 2014, pursuant to Conn. Gen. Stat. §§16-11, 16-19 and 16-19e, the Authority conducted daytime hearing sessions at its offices on August 27 and 28, 2014 and September 2, 3, 4, 5, 8, 9, 10, 11 and 12, 2014. The hearings were continued to September 24 and 25, 2014.

In addition, the Authority held evening sessions solely for the purpose of receiving public comments. The hearings commenced at 6:30 p.m. on the following dates, at the following locations: August 27, 2014, at the Authority's offices; August 28, 2014, at the Stamford Government Center, 888 Washington Boulevard, Stamford, Connecticut; and September 3, 2014, at New London City Hall, 181 State Street, New London, Connecticut.

---

[2] In the Decision dated March 12, 2014 in Docket No. 13-03-23, Petition of The Connecticut Light and Power Company for Approval to Recover Its 2011-2012 Major Storm Costs, the Authority approved cost recovery of certain major storm related costs. In its Decision dated January 16, 2013 in Docket No. 12-07-06, Application of The Connecticut Light and Power Company for Approval of Its System Resiliency Plan (Resiliency Decision), the Authority approved cost recovery of costs related to system resiliency initiatives.

The Authority issued its Proposed Final Decision in this matter on December 1, 2014. All parties and intervenors were granted an opportunity to file Written Exceptions to the draft Decision and to present Oral Arguments.

D. PARTIES AND INTERVENORS

The Authority designated The Connecticut Light and Power Company, 107 Selden Street, Berlin, Connecticut 06037; Office of Consumer Counsel, Ten Franklin Square, New Britain, Connecticut 06051; and Department of Energy and Environmental Protection Commissioner Robert F. Klee, 79 Elm Street, Hartford, CT 06106-5127 as Parties to this proceeding.

Intervenor status was granted to: Office of the Attorney General; Environment Northeast; Cablevision of Connecticut, LP; International Brotherhood of Electrical Workers; New England Cable and Telecommunications Association, Inc.; Fiber Technology Networks, LLC; and Wal-Mart Stores, Inc.

E. PUBLIC COMMENT

The Authority conducted evening public comment hearings within the CL&P service territory for the purpose of receiving comments from the general public concerning the Application. CL&P's notice to customers regarding the hearings, submitted by the Company on June 16, 2014, was approved by the Authority on June 17, 2014.

A total of 203 persons attended the public comment hearings and 64 of those persons provided testimony to the Authority. U.S. Senator Richard Blumenthal urged the Authority to consider how a 59% increase in the residential customer service charge would affect the poor and elderly. Tr. 8/27/14, pp. 251-253. State Representative Lonnie Reed stated that CL&P's proposed rate increase seemed to be working at cross purposes to public policy, which supports a focus on conservation and renewable energy. Id., pp. 254-257.

Public comments mirrored those provided by the public officials. Residential customers were particularly opposed to the proposed $9.50 increase in the customer service charge. Tr. 8/27/14, pp. 263-265, pp. 269-277 and pp. 284-291; Tr. 8/28/14, pp. 563-565 and pp. 582-591; Tr. 9/3/14, pp. 1099-1118 and pp. 1134-1138. Overall, most Connecticut residents and businesses that spoke or submitted written comment were not supportive of CL&P's Application. Many cited the state's current economic condition and the financial impact of a rate increase.

Several organizations spoke in favor of CL&P's Application, stating that reliability of electric service was very important. The Windham Region Chamber of Commerce noted improvements in CL&P's quality of communications and coordination of staff and technology than it had presented before the last rate case. Tr. 9/3/14, pp. 1094-1098.

The Authority also received approximately 2,000 letters and emails regarding the Application. There were approximately 25 letters in support of the Application; however,

nearly all of the persons who wrote opposed CL&P's rate increase request, stating reasons similar to those offered at the evening public hearings.

II. AUTHORITY ANALYSIS

A. TEST YEAR / RATE YEAR

It is the practice of the Authority in utility rate cases to establish rates prospectively upon review of a historical Test Year. Revenues and certain expenses were adjusted for known changes or to reflect a normalized, annualized test year, known as the pro forma test year. In this case, the Company used the operating results for the 12 months ending December 31, 2013, as its Test Year. Schedule A-1.0. The Authority, with these adjustments, accepts this time period as the Test Year. The Rate Year is the period from December 1, 2014 to November 30, 2015, as proposed by the Company.

B. RATE BASE

1. Capital Expenditures

CL&P's proposed capital expenditures for the Rate Year are as follows:

Table 1

Proposed Capital Program

Year	Category of Capital Expenditure	Amount (in millions)	Rate Component for Recovery in 2015
2015	Traditional Capital Program	$257	Distribution Rate
2015	Pre-Approved System Resiliency Plan	$52	Distribution Rate
2015	New System Resiliency Programs	$44	NBFMCC
Total		**$353**	

Bowes PFT, p. 11.

The Traditional Capital Program consists of expenditures for programs that address routine infrastructure issues such as those necessary to supply new customer load, meet peak loads, meet basic business requirements, meet regulatory commitments, and reliability related projects. The Pre-Approved System Resiliency Plan consists of system resiliency expenditures for programs that were approved in the Resiliency Decision, and whose recovery was allowed through the Non-Bypassable Federally Mandated Congestion Charge (NBFMCC) until the following rate proceeding. The New System Resiliency Programs are system resiliency expenditures for programs that were not approved in the Resiliency Decision, which the Company contended would have a long-term impact on customer reliability. The New System Resiliency Programs expenditures would not be included in rates. Rather, the Company requested that the Authority authorize them subject to a future reopening of Docket No. 12-07-06 to review their costs and authorize recovery through the NBFMCC.

a. Traditional Capital Program

CL&P stated that it proposed to spend $257 million on its Traditional Capital Program in the Rate Year, and noted that it spent $268 million for the same types of programs in 2013. At the requested level of spending, the Company expects to be able to improve day-to-day reliability while decreasing capital spending due to the combined effect of the following three factors: 1) efficiencies achieved through reorganization and consolidation initiatives; 2) improvements achieved as a byproduct of system resiliency programs; and 3) implementation of the new troubleshooter organization. Bowes PFT, pp. 11 and 12.

CL&P's Traditional Capital Program, disaggregated by focus area, is shown in the table below.

Table 2

CL&P Capital Program 2013-2015
($ in Millions)

Focus Area	Description	2013 Actual	2014 Forecast	2015 Forecast
New Customer	Customer-driven projects	48.6	38.5	40.5
Peak Capacity	Distribution/substation capacity projects	24.4	22.3	21.1
Basic Business	Equipment failures/facilities/IT/vehicles/ environmental/lighting/miscellaneous	106.5	109.8	114.9
Regulatory	Grounding/double poles/high-over-low voltage/cable replacement/worst circuits	25.5	20.1	12.0
Reliability	Enhanced trimming/distribution line reliability/substation reliability/network reliability	66.7	65	68.2

Response to Interrogatory EN-2.

No party or intervenor opposed any Traditional Capital Program specific capital expenditure or project to be added to plant-in-service.

The OCC stated that data provided by CL&P shows that actual plant additions during the years 2008 through 2013 were 4.21% lower than budgeted. According to the OCC, forecasted plant additions should be reduced by this amount to determine the appropriate level to be included in rates. The OCC also criticized CL&P for providing a forecast for plant-in-service but basing its analyses on capital expenditures. Finally, the OCC questioned whether the Company's Board of Directors authorized the expenditures, and asserted that unsuccessful efforts to compel CL&P to produce a capital expenditure approval policy casts doubt on the Company's capital plans. OCC Brief, pp. 39-44.

CL&P stated that capital expenditures do not equate to plant-in-service due to timing differences. For example, large multi-year projects involve capital expenditures each year, but are not included in plant-in-service until the projects are complete. Furthermore, during the period 2008-2013, CL&P spent the capital expenditures forecasted in prior rate cases. Finally, CL&P observed that the OCC selectively included 2008 and 2009 in its comparative analysis, when the variances were

abnormally large due to the unforeseen severe global recession, which reduced capital deployment. When those years are removed, plant-in-service was 99.86% of the Company's budgeted level, or almost precisely equal to forecast. CL&P Joint Rebuttal Testimony of Kenneth Bowes and Jeffrey Michelson, pp. 4-7.

The Authority examined the issue of plant-in-service forecasting for the purpose of adjustments to rate base in its Decision dated February 4, 2006 in Docket No. 05-06-04, Application of The United Illuminating Company to Increase Its Rates and Charges (UI Decision). In that Decision, the Authority found as follows:

> The Department believes construction programs should be analyzed by examining the needs the programs are intended to address, and the reasonableness of the solutions to those needs. Comparisons to historicals are useful to assist in determining whether the total expenditures are within a range of reasonableness, but even if projected expenditures vastly exceed historicals, to rationally analyze a company's proposed expenditures the Department must analyze them on a project-specific basis. Therefore, any adjustments based on gross comparisons to historical levels alone are not sufficient. Regarding the OCC's assertion that projected plant additions are much higher than historical, the Department notes that the plant additions are netted against retirements. Because additions can vary largely from one year to another, and because large amounts of retirements can offset the additions leading to a low net number, it is not valid to compare net plant additions between years… The Department therefore believes that comparisons to historical additions are not a valid determinant of future plant additions.
>
> UI Decision, p. 24.

The Authority reiterates these findings, as the premises have not changed. Although it is appropriate to consider plant additions in forecasting, a plant addition forecast should be based on capital expenditures. The Authority closely examined capital expenditures in this proceeding. Furthermore, in the past several CL&P rate proceedings, the Authority has required the Company to report on capital expenditure variances each year, which allows the PURA to closely monitor spending. Over the three years since CL&P's last rate proceeding in Docket No. 09-12-05, Application of The Connecticut Light and Power Company to Amend Its Rate Schedules (2009 CL&P Rate Case), CL&P's actual and forecasted capital expenditures were as follows.

Table 3

CL&P Capital Expenditures 2010-2012
($ in millions)

	Forecast	Actual
2010	310.8	305.4
2011	332.6	338.5
2012	315.4	312.8

Decision dated June 30, 2010 in Docket No. 09-12-05 (2009 CL&P Rate Case Decision); Order No. 2 Compliance Filings dated March 31, 2011, March 30, 2012 and March 26, 2013.

Total capital spending over the years 2010-2012 was $956.7 million, which is within approximately 0.2% of the 2009 CL&P Rate Case forecast amount of $958.8 million. This historically accurate capital spending forecast gives high confidence to CL&P's planned capital spending presented in this case. Therefore, the Authority will not make any adjustment to CL&P's proposed capital spending/plant-in-service on the basis proposed by the OCC.

The Authority reviewed CL&P's proposed capital program and concludes that the expenditures are reasonable and necessary for safety, reliability, and maintenance of the franchise.

The Company will be required to report on its capital spending as follows: by November 30 of 2015, 2016 and 2017, with a budget/forecast of spending by initiative or category for the following year; and by March 31 of each year 2014, 2015 and 2016 showing actual spending by initiative or category for the preceding year. These reporting requirements recognize that CL&P is required by the NSTAR merger settlement agreement,[3] to apply to the Authority for a rate proceeding in 2017; therefore, the PURA will remain apprised of capital spending and have a history of such spending in its records when the 2017 application is made. The Authority recognizes that plans may change for good reason over the next two years. Accordingly, if the budgeted amount for any initiative or category changes by more than 10% from that represented in this proceeding and as modified by the Authority, the Company must provide an explanation in the annual budget report due each November 30. Further, if actual total spending varies from budgeted spending in any year, the Company must provide an explanation in the annual spending report due March 31 of each year.

b. Pre-Approved System Resiliency Costs

The Resiliency Decision allowed the Company to flow the costs of the System Resiliency Plan through the NBFMCC until the Company's next rate case, at which time the costs would be factored into the Company revenue requirements. The Authority

[3] Approved by the Authority in its Decision dated April 2, 2013 in Docket No. 12-01-07, Application for Approval of Holding Company Transaction Involving Northeast Utilities and NSTAR (Merger Decision).

finds that the Company has complied with the ratemaking treatment as allowed in the Resiliency Decision in this filing. Resiliency spending, in the amount of $25.343 million, for the years 2013-2014 is added to the Company's rate base and removed from NBFMCC revenue requirements.

The Resiliency Decision allowed forecasted spending through 2017 for resiliency measures. The table below lists amounts for resiliency spending 2014-2017.

Table 4

Year	Estimated Capital	Estimated Expense	Total Spending
2014	45,000	8,000	53,000
2015	52,000	9,000	61,000
2016	68,000	9,000	77,000
2017	68,000	9,000	77,000

Resiliency Decision, p. 6.

If the PURA allows the proposed 2014-2015 resiliency expenditures in revenue requirements, the OCC recommended the Authority should order an audit of the actual costs on an annual basis to determine whether the expenditures made are supported by real cost documentation, and that the costs were prudent and specifically related to system resiliency.

The Authority finds that the orders contained within the Resiliency Decision address the OCC's concerns.

c. Proposed New System Resiliency Costs

CL&P stated that it achieved improvements in service reliability in 2013 primarily through the implementation of best practices and an enhanced vegetation management program. According to the Company, there are other initiatives that are recognized within the industry as having a significant impact on building system resiliency to the long-term benefit of customers. CL&P identified certain core initiatives that, if implemented, would have the greatest long-term impact on system resiliency, and an important secondary impact on system reliability. The Company asserted that these initiatives are necessary to modernize the system and provide its customers with the level of service that they should expect from CL&P. The Company requested authorization to start these programs, subject to a future reopening of Docket No. 12-07-06 to review and approve specific program budgets and to recover the costs of the program through the NBFMCC. None of the new system resiliency costs are included in this case. Bowes PFT, pp. 19 and 20.

CL&P's proposed new resiliency program expenditures in 2015 are as follows.

Table 5

CL&P New Resiliency Programs
($ in Millions)

Program	Description	Proposed Spending ($ millions)
Pole Integrity	Increase resiliency of utility poles	$13
System Automation/ Grid Modernization	Increase system monitoring and control capabilities	$14
Substation Security	Increase physical security of substations	$ 4
Substation Flood Mitigation	Increase the resiliency of selected substations to flood events	$ 2
Infrastructure	Address islanded substations and improve Right of Way lines	$11
Total		$44

Bowes PFT, pp. 19-33.

The OCC stated that the Company is proposing new resiliency spending totaling an additional $368.3 million over the years 2014-2019. This amount more than doubles the $300 million program approved in the Resiliency Decision, and the OCC asserted that that the Authority should wait until after 2017 when more information is known about the efficacy of the existing resiliency program. Furthermore, the OCC objects to using the NBFMCC as a collection method for any new resiliency expenditures; rather, the OCC believed a rate-based collection method should be used. OCC Brief, pp. 149-152.

The Authority shares the OCC's concern regarding the impact of the proposed spending on ratepayers; however, the Company has not requested, nor has the Authority approved, funding levels or cost recovery in this proceeding. The Company only requested Authority permission to proceed with the new resiliency programs, subject to review of proposed spending in an anticipated reopening of Docket No. 12-07-06. Because several of the new resiliency programs address known vulnerabilities in the electric distribution system, the Authority will authorize the program to go forward. However, the Company should be prepared to do so at a level of funding below the levels it is anticipating, subject to the Authority's determination in the reopened Docket No. 12-07-06 proceeding.

The Authority notes that CL&P plans to recover new resiliency spending in the NBFMCC. The NBFMCC was an appropriate vehicle for prior resiliency spending, because the spending was mandated by the NSTAR merger agreement and initiated outside of a rate proceeding. The Authority will allow NBFMCC recovery subject to the budgets approved in the reopened Docket No. 12-07-06 proceeding as a transition until the Company's next rate proceeding. After that time, resiliency spending should be included in rate base. If the Company desires to continue to recover resiliency spending outside of conventional rates, it should seek a legislative solution.

2. Accumulated Deferred Income Taxes

CL&P reported accumulated deferred income taxes (ADITs) of $655.417 million as an offset to rate base for the Test Year, $760.36 million for the proforma period ending December 31, 2014, and $819.14 million for the Rate Year. Schedule B-1.0, p. 2. The Company reported average ADITs of $789.75 million for the Rate Year. Id.

CL&P reported plant related non-FAS 109 ADITs of approximately $461.429 million, $553.453 million, $567.297 million, $674.02 million, and $658.815 million for calendar years ending December 31 in 2009, 2010, 2011, 2012 and 2013, respectively. Response to Interrogatory AC-9, Attachment 1. The Company projected ADITs of $763.758 million and $822.537 million for December 31, 2014 and 2015, respectively. Id. The 2011 ADITs balance was net of deferred taxes of $85.477 million related to the ensued net operation losses (NOL). Otherwise, the ADITs' balance as of December 31, 2011, is $652.774 ($567.297 + $85.477) million. Id. CL&P indicated that ADITs associated with NOL of $3.46 million, $30.46 million and $51.025 million are utilized in 2012, 2013 and 2014, respectively. Id.

The Authority reviewed all exhibits submitted by the Company in this proceeding regarding the average plant related ADITs proposed for the Rate Year. The Authority has several issues with the average ADITs that CL&P used to calculate the average rate base for the Rate Year as discussed below.

a. Repair Tax Deductions

Regarding the repair tax deduction (RTD) proceeding in Docket No. 13-07-06, Joint Petition of George Jepson, Attorney General for the State of Connecticut and Elin Swanson Katz, Consumer Counsel, for an Investigation into the Response of Connecticut's Public Service Companies to Certain Changes to IRS Accounting Regulations (RTD Proceeding), CL&P indicated that this proceeding rather than a generic RTD proceeding is the proper venue to review the regulatory impacts of costs incurred for repair and maintenance of tangible property. Mahoney PFT as Adopted by Michelson, p. 24. Also, the Company stated that the deferred tax liability created by the permanent RTD regulations will reverse over the same time period as the related assets capitalized on its books are depreciated, thereby reversing the deferred tax liability as the remaining book depreciation is realized. The treatment of the RTD is similar to that of any other normalized deduction for tax and regulatory purposes. Id.

In its normalized plant-related ADITs, CL&P included deferred taxes of $40.85 million in 2014 and in 2015. These levels of ADITs are based on RTD allowances of $100 million in each year. Mahoney PFT as Adopted by Michelson, p. 25; Schedules B-7.0 and WPC-3.38, p. 2. CL&P asserted that there are no additional RTD tax benefits in 2012 and 2013 because both years' tax returns showed taxable losses. Mahoney PFT as Adopted by Michelson, p. 25.

In its response to the Authority's request to quantify the RTD amounts available in 2012 and 2013 that were not deducted because of the Company's NOL positions in both years, CL&P stated that any attempt to hypothetically measure the RTD amounts for 2012 or 2013 is meaningless given its NOL positions for these years. Response to

Interrogatory AC-86; Tr. 09/25/14, pp. 2746-2748. The Company stated that its tax planning appropriately seeks to maximize the cash benefits associated with deductions, with minimum risk of audits and disallowances by the Internal Revenue Services (IRS). As a result, the Company did not adopt the RTD temporary regulations and plans to adopt the repairs deduction, using the final regulations in its 2014 tax return. Response to Interrogatory AC-86-SP01, pp. 1 and 2. Simultaneously, CL&P concurred that the benefit associated with potential deductions from 2012 and 2013 will be included in the 2014 adjustment required when its elects to adopt the final RTD regulations. CL&P stated that its 2014 tax returns would include a cumulative RTD adjustment containing amounts that would have been deducted in 2012 and 2013 and that the resulting tax benefits of the method change will be calculated and recorded in its books. Id.

While CL&P reiterated its argument about its NOL positions in 2012 and 2013, it agreed that the benefit associated with prior years, encompassing the amounts that are in question from 2012 and 2013, will be captured as part of a cumulative adjustment deduction in its 2014 tax return. Nevertheless, CL&P argued that the Authority should not make any adjustment to its proposed revenue requirement pertaining to the RTD. The Company asserted that customers are receiving the benefit associated with formal and finalized IRS tax rules and regulations. CL&P Brief, pp. 48 and 49.

The Company's argument is based on the premise that it did not adopt the RTD regulations prior to 2014 because it was in NOL positions in 2012 and 2013 and it would be risky to adopt temporary regulations that not are finalized. The Authority agrees that an earlier adoption of the temporary RTD regulations would have further increased the Company's NOL positions in 2012 and 2013. The Authority's initial inquiry was for CL&P to quantify the RTD amounts available in 2012 and 2013 regardless of whether the amounts were deducted or not. CL&P's response was that based on its tax position or liability it would be meaningless to calculate a hypothetical number for 2012 or 2013, which are tax years prior to the effective date of the finalized RTD regulations. Response to Interrogatory AC-86. Based on its tax strategy, CL&P waited until the RTD regulations were finalized to adopt and avail itself of the benefit of the RTD allowances. Effective with the adoption of the permanent RTD regulations in 2014, there are additional look-back periods for which costs incurred for repair and maintenance of tangible property can be deducted in the 2014 federal income tax return.

The Authority's position is that the Company failed to incorporate the additional deferred tax benefits for the look-back RTD periods, which included 2012 and 2013, in its estimated deferred taxes for 2014. CL&P finally agreed that its 2014 tax return would include a cumulative RTD adjustment for prior periods. CL&P stated that "When the Company adopts the Regulations for its 2014 tax year a cumulative adjustment as a result of the method change will be calculated. Any benefit from the change will be recorded by the Company. Any amounts which would have been deducted in 2012 and 2013 will be included in that cumulative adjustment in the Company's 2014 tax return." Responses to Interrogatories AC-86 and AC-86 SP01; CL&P Brief, p. 48. The Company agreed that 2012 and 2013 RTD allowances to be included in its 2014 cumulative amounts would garner additional normalization deferred tax liabilities that would be recorded on its books. However, the Company only included the deferred taxes associated with RTD allowances in 2014 and 2015 in this proceeding. It failed to include the deferred tax benefits for the 2012 and 2013 RTD expenses that would be

included in tax depreciation deductions in its 2014 tax returns as a result of the adoption of the finalized RTD regulations. The question now is what meaningful number would be reflected in the Company's 2014 tax return as the amount representing RTD expenses for the look back periods of 2012 and 2013. The Company initially stated that such figure would be hypothetically meaningless.

The Authority estimated that at a minimum, the total RTD allowances for 2012 and 2013 should be at least 50% of the amount the Company estimated for 2014 and 2015. Thus, the Authority estimated $100 ($100 x 50% x 2) million of RTD for 2012 and 2013. Consequently, the average ADIT amount is increased by $40.85 ($100 x 40.85%) million. Accordingly, the Authority will reduce Company's proposed average rate base by $40.85 million. This amount represents a reasonable amount of tax benefit for the 2012 and 2013 RTD that the Company will include in the total RTD to be deducted in its 2014 tax return.

In its Written Exceptions, CL&P stated that the Authority's determination to reduce its proposed average rate base by $40.85 million for the tax benefit of RTD is a mistake. The Authority made this determination based on the Company's testimony that any RTD amounts that would have been deducted in 2012 and 2013 will be included as part of accumulative RTD amount in its 2014 tax returns. CL&P stated that the Authority confused the principles of its re-computation of its actual tax position in 2012 assuming that the RTD would have been taken with that of the computation of the cumulative "look-back" RTD adjustment allowable under the final IRS regulations in 2014. CL&P Written Exceptions, pp. 23 and 25. According to the Company, the reported $100 million associated with the RTD in 2014 and $100 million in 2015 are not the RTD deductions for each year. The total $200 million represents the cumulative RTD adjustment for all prior years through 2013 and the estimated RTD for 2014. The Company shows the combined amount of $200 million over two years to indicate the cash flow impact of the RTD "catch-up" adjustment in addition to the actual tax accounting impact. Id., p. 26. Furthermore, CL&P stated that the cumulative one-time RTD adjustment for the look-back periods is estimated to be $178 million and that the annual RTD for 2014 is approximately $22 million. Id.

The OCC stated that the Authority's determination related to RTD look-back periods was proper and appropriately recognizes that CL&P will adopt these changes in its 2014 Federal Income Tax return. These tax changes will impact the income taxes paid for 2014 and in the Rate Year as well as ADIT balances. However, the OCC stated that the Authority did not make an adjustment to the Company's Federal income tax expenses. The OCC indicated that, because of CL&P's large annual budgeted capital expenditure associated with infrastructure replacement, a significant portion of the associated infrastructure repair and maintenance costs is likely to qualify as a deduction to its federal tax liability. According to the OCC, in between rate cases, there is the possibility the lower tax expense would increase the Company's earnings. The potential tax refund, increased federal income tax deductions and reduction of income taxes for 2014 and thereafter should be used to reduce the rate increases for the Rate Year in this proceeding. OCC Written Exceptions, pp. 40 and 41. Furthermore, the OCC stated that the RTD adjustment for the look-back periods that is based on only 50% of the Company's estimates for 2014 and 2015 is conservative and would not prevent a windfall to CL&P shareholders when the tax election is made between rate

cases. The OCC recommends that, subsequent to CL&P's compliance to Order No. 10 in this Decision, the Authority should have a limited reopener of this proceeding in 2015 to true-up the impact of reduced taxes and tax refunds associated with the new RTD regulations. Id., pp. 41 and 42.

In its Written Exceptions, the AG argued that the RTD adjustment for the look-back period is "extremely conservative" if costs related to system "hardening" for the years subsequent to Tropical Storm Irene, the October 2011 Nor'easter and Super-storm Sandy in October 2012 qualify as RTD investments. AG Written Exceptions, p. 8. Additionally, the AG indicated the actual RTD credits for the look-back periods would not be known until the Company files its 2014 tax returns. The AG suggested that the Authority should hold ratepayers harmless for any errors in RTD estimates and urged the PURA to apply the most reasonable and accurate estimates of the likely qualified RTD amounts. The AG also urged the Authority to assume that the actual qualified investments in years 2012 and 2013 are the same as the $200 million that the Company estimated for 2014 and 2015. The AG further proposed an additional average RTD deferred tax increase of $9.1 million. Finally, the AG suggested that a limited reopening of this proceeding be conducted in September 2015 to reconcile any discrepancies between its estimated RTD credits of $81.7 million and the deferred tax effect of the actual RTD amounts provided in the Company's 2014 Federal income tax return. Id., p. 9.

CL&P testified that "[A]ny amounts which would been deducted in 2012 and 2013 will be included in that cumulative adjustment in the Company's 2014 tax return." Response to Interrogatory AC-86. No information was provided in response to interrogatories, pre-filed testimony or during the hearing to suggest that the reported $100 million RTD in 2014 and $100 million in 2015 represented the total for the look-back-periods and the 2014 annual amounts. The first time CL&P presented this information was in its Written Exceptions. Also, there was no exhibit or testimony in this proceeding that supports the derivations of the total prior periods RTD of $178 million and 2014 annual amount of $22 million that CL&P claimed in its Written Exceptions.

It is important to make the correct determination regarding the appropriate amount of ADIT, including the estimated 2014 RTD amounts, in order to calculate CL&P's allowed rate base. The Authority is concerned withthe discrepancy between the evidence and analysis in the record and CL&P's representations offered in its Written Exceptions. The Authority concludes that it is necessary to reopen this proceeding for the purpose of ensuring that the amount of ADIT is properly calculated. In the reopened proceeding, the Authority will receive evidence on the issue of whether the reported $100 million RTD in 2014 and $100 million in 2015 in total represent the total for the look-back-periods and the 2014 annual amounts. The reopened proceeding will afford all parties and intervenors an opportunity to properly review this new evidence, the potential revenue requirement impact of the new evidence and related issues.

In the meantime, the Company is directed to track and create a regulatory asset for the revenue impact of the RTD adjustment based on its proposal. The Authority will true-up the Company's estimated revenue impact to reflect the proper RTD estimates for 2014 that will be determined in the reopener. Additionally, the Authority will reopen

this proceeding for the limited purpose of reconciling the estimated RTD allowed in the initial reopener to the actual amount reported in the Company's 2014 Federal income returns submitted as a compliance filing in this docket.

b. Account 28200 True-Up Adjustments

Unlike other periods with substantial year-over-year increases, the Authority noticed a significant decrease in the ADITs balance in Account 28200 as of December 31, 2013, as compared to the December 31, 2012 balance. The Authority identified and questioned the August 2013 adjustment to reduce the ADITs balance in this account by $124,742,248. Response to Interrogatory AC-128, Attachment 1, Revision 1, p. 33. The Company stated that the August 2013 adjustment, which reduced the deferred tax balance in Account 28200, is related to a true-up adjustment made in its 2012 tax returns and subsequently recorded in its accounting books in August 2013. Late Filed Exhibit Nos. 78 and 79. Specifically, during the course of a year, CL&P books deferred taxes based on a budget projection and such budget projections make certain assumptions. Those assumptions could include any number of different items.

At the end of the year, the Company prepares and files its corporate income tax and then trues up to the corporate income tax at the actual level. The book balance in the 28200 Account at the end of the year should incorporate the actual amount that is reflective of the Company's tax filings. Issues that could cause differences between projected and actual amounts can be anything. CL&P testified that its projected tax deductions for items such as storm activity, bonus depreciation, and repairs may not have occurred for some reason or because some other items on an actual basis precluded them from occurring. So the Company's actual tax return overrules its projections and CL&P corrects to the actual tax return. CL&P averred that it made an adjustment in its 2012 tax return that makes the true-up adjustments to its accounting books necessary. As such, the Company made a $124.742 million reduction to the deferred taxes in August 2013 in Account 28200 which represents a subsequent true-up of estimates that CL&P made during 2012 based on an adjustment in its 2012 tax return. Tr. 09/25/14, pp. 2731-2741.

In its Brief, the Company stated that the amounts in Account 28200 as of December 31, 2012, were estimated based on recognition of transactions related to plant asset retirements, additions and basis adjustments, and the expected deductions under the tax law related to those assets. CL&P stated that its computation of depreciation expense deductions for tax purposes assumed a relatively shorter retirement schedule for certain asset categories. A shorter retirement schedule increases the deduction for depreciation expense for a particular calendar period. In July 2013, when the Company was preparing to file its 2012 federal tax return, it was clear that the combination of actual operating income, increased system investment and the existence of an NOL had eliminated federal tax liability for 2012. There was no federal tax liability to reduce depreciation expense generated by the shorter retirement schedule. Therefore, the Company made a decision to extend the retirement schedule for certain asset categories, which effectively decreased deductions for 2012, and increased depreciation expense for future years. Furthermore, CL&P stated that under IRS tax law, businesses may automatically change from one permissible method of computing depreciation expense for tax purposes to another permissible method upon

the filing of a Form 3115. Therefore, the Company submitted a Form 3115 to the IRS, and adjusted the amounts in Account 28200 to match the filed tax return. If the Company had not taken this action, the NOL would have increased and customers would not have realized any tax benefit of the depreciation expense deduction. Also, the change in retirement schedule was made only for tax purposes, which does not require approval by the Authority. Response to Interrogatory AC-97-SP02, pp. 1 and 2; CL&P Brief, pp. 52-54.

The Authority finds that CL&P's August 2013 adjustment to reduce non-FAS 109 ADITs balance in Account 28200 by $124,742,248 is unsupported. The Authority reviewed distribution plant additions and retirements exhibits and determined that actual distribution plant-in-service as of the end of 2008 was approximately $3,757.116 million. Response to Interrogatory OCC-46 Attachment 1, p. 1. The additions and retirements since 2008 are summarized below:

Table 6

Year	Plant Additions (Million)	Retirements (Million)
2009	$256.891	$ 74.479
2010	$287.992	$ 66.550
2011	$287.791	$ 50.040
2012	$324.484	$ 52.149
2013	$289.038	$ 54.455

Response to Interrogatory OCC-46, Attachment 1, p. 1.

Beginning in 2001, several tax law changes allowed corporations special tax deductions, "bonus depreciation" allowances, above the normal Modified Accelerated Cost Recovery System (MACRS) amounts. The levels of recently allowed bonus tax depreciation deductions are summarized below:

Table 7

Periods Covered	Amount (%)
January 1, 2008 through September 8, 2010[4]	50%
September 9, 2010 through December 31, 2011[5]	100%
January 1, 2012 through December 31, 2013[6]	50%

Since 2008, the deferred tax liability amounts resulting from normalization of tax/book differences have grown exponentially for regulated public utilities. Pursuant to the Uniform System of Accounts as codified in Conn. Gen. Stat. §16-2, Account 282 is credited and Account 410 is debited with an amount by which income tax is lower. This is because liberalized depreciations, such as ACRS, MACRS and/or Bonus deductions,

[4] The Economic Stimulus Act of 2008; the Small Business Jobs Act of 2010; and the American Recovery and Reinvestment Act of 2009.

[5] The Tax Relief, Unemployment Compensation Reauthorization, and Job Creation Act of 2010.

[6] Id.; and the American Tax Relief Act of 2012.

are used for income tax purposes, as compared to straight line depreciations for book purposes. Likewise, Account 282 is debited and Account 411 is credited with an amount by which income tax is greater because liberalized depreciations, such as ACRS, MACRS and/or Bonus deductions, are used for income tax purposes in prior years, as compared to straight line depreciations for book purposes. The amount debited to Account 282 and credited to Account 411 represents current income taxes payable due to smaller amounts of tax depreciation currently permitted for property which liberalized tax depreciation was applied in prior years, as compared to regulatory straight-line book depreciation. There is no evidence provided in this proceeding that would suggest that the deferred taxes accrued and recorded in Account 28200 were overstated and above that permissible by current tax laws. The non-FAS 109 ADIT balances in Account 28200 and annual accretion since 2009 are summarized in the table below:

Table 8

Year	Account 28200 Balance (Million)	Net Change (Million)
2009	$422.736	N/A
2010	$510.410	$ 87.674
2011	$606.298	$ 95.888
2012	$706.560	$ 100.262
2013	$664.267	($ 42.293)

Response to Interrogatory AC-128, Attachment 1 Revision 1, pp. 8, 24 and 33.

Also, annual accretions to the ADITs balances in Account 28200, exclusive of true-up adjustments, are summarized below:

Table 9

Year	Annual ADITs Accretions (Million)
2010	$ 81.039
2011	$ 95.888
2012	$101.330
2013	$ 82.449

Id.

The Company's testimony that the $124,742,248 reduction to the deferred taxes recorded in Account 28200 was a subsequent true-up for an adjustment made in the 2012 income tax return is not supported by the information provided in this proceeding. CL&P's assertion that prior years' tax estimates used to calculate the deferred tax balance are being trued-up by the August 2013 $124,742,248 reduction to the balance in Account 28200 belies tax information provided in this proceeding and is improper. The Authority's review of the Company's distribution unit annual balance sheets for the period 2010-2013, showing that the Company made adjustments to the balance in Account 28200 in August of each year as detailed below:

Table 10

Year	Annual August Adjustment to Account 28200
2010	$6.635 million Increase
2011	Zero Adjustment
2012	$1.1 million Decrease
2013	$124.742 million Decrease

Response to Interrogatory AC-128, Attachment 1 Revision 1, pp. 8; 24, 33; and Revision 2 Attachment, p. 33.

As the tables above indicate, the increase to the ADITs balance in 2012 of $101.33 million does not support the recording of over-estimated amounts requiring a subsequent true-up adjustment of approximately $124.742 million in August 2013. Using the Company's current tax composite rate of 40.85%, the total combined federal and state tax depreciation erroneously estimated for 2012 requiring subsequent revision would be approximately $305.4 million ($124,742,248 / 40.85%). This estimate is very conservative because the federal bonus depreciation allowances cannot be claimed for the calculation of Connecticut corporate taxable income. In its federal tax returns, the Company reported tax depreciation deductions of $541,275,640 in 2011 and $586,677,407 in 2012. The distribution portions of the 2011 and 2012 tax depreciation amounts are $359,956,682 and $384,142,472, respectively. Late Filed Exhibit No. 1-PURA AR-13 Attachment.

The increase in the 2012 tax depreciation amount as compared to 2011 does not support overstatement of estimated tax depreciation amounts based on changes to the retirement schedule for certain asset categories. It is more suggestive of an increase to the regulatory deferred liability associated with book/tax timing differences. Additionally, the retirements recorded in the Company's books in 2012 is $52.149 million. This is based on the Company's testimony that the August 2013 reduction to the ADITs balance in Account 28200 was a true-up adjustment related to its proposed changes to its tax retirement schedule. The estimated increase to the total tax depreciation deductions would be approximately $305.4 million in 2012. This would be in addition to the actual total federal tax depreciation deduction of $384,142,472. The Authority estimated that the additional ADITs that would be recorded in the Company's books in Account 28200 in 2012 would be in excess of $200 million to account for CL&P's proposed changes to its tax depreciation schedule, 100% and 50% bonus depreciation deductions for plant additions in 2011 and 2012, respectively, and MACRS depreciation on pre-2012 vintages. Also, the Authority thoroughly reviewed CL&P's proprietary tax returns filed for 2011 and 2012. Response to Interrogatory AC-10. No information in those returns support any prior period adjustments that would warrant the August 2013 reduction to deferred tax balance in Account 28200.

The Authority is aware of the Company's compliance filing dated August 1, 2013, in which CL&P requested an automatic change to its method for accounting for certain retirement costs by filing Form 3115. This automatic election request was filed on July 10, 2013, with the IRS. CL&P stated that the request for an automatic change in accounting method is to simplify its tax accounting of certain retirement costs through a general asset account election. Response to Interrogatory AC-97 Second

Supplemental, Attachment 2. The Form 3115 referenced was filed protected and not entered into the record in this proceeding. Nevertheless, the Authority evaluates the non-public data and is concerned that the information contained therein actually contradicts the Company's testimony that a change in accounting method did not occur in 2012. According to the Company, the August 2013 true-up adjustment that reduced the ADIT balance in Account 28200 was to reverse estimated deferred taxes recorded in 2012 to reflect a change to a shorter retirement schedule that did not occur.

The Company testified that it recorded larger deferred taxes in Account 28200 in 2012 under the assumption that the tax retirement schedule would be decreased thereby increasing tax depreciation deductions in its 2012 tax returns. In actuality, the Company did the opposite by extending the retirement schedule for certain asset categories and hence, reduced tax depreciation deductions in its 2012 tax returns. The Authority finds it improbable that the Company would forecast and booked additional deferred taxes using a shorter retirement schedule for 2012, which is known to have 50% bonus depreciation and also subsequent to 2011 with 100% bonus tax depreciation deduction. As previously stated, the Authority finds that the additional deferred taxes recorded in Account 28200 in 2012 was in line with expectations, was not overstated and did not warrant the August 2013 reduction adjustment. Also, the Authority determines that the information in the non-public Form 3115 not only contradicts the Company's assertion, but the figures therein are applicable to transmission as well as to distribution operations. Furthermore, the Authority finds that the level of taxable income adjustment made therein did not support the August 2013 true-up adjustment to the distribution ADIT recorded in Account 28200.

A review of an exhibit showing the actual income taxes that the Company paid shows that CL&P's NOL position grew to $118.004 million in 2012 compared to $19.939 million in 2011. Response to Interrogatory OCC-260, Attachment 1. This does not support the position that deferred tax estimates for 2012 were overstated and need to be adjusted in August 2013. Conversely, the exhibit supported the position that a significantly higher tax depreciation was deducted in 2012, which is supported by the 2012 tax return filed under protective order and the PURA AR-13 Attachment. The Authority opines that the higher tax depreciation deductions in 2012 support the booked ADITs increase in 2012. The Authority therefore considers the August 2013 true-up adjustment reducing the deferred tax amount in Account 28200 to be improper and should be reversed.

Based on its review of information provided in Response to Interrogatory OCC-46 Attachment 1, the Authority performed its own analysis of ADIT related to distribution plant for 2012 and 2013 as depicted in the table below:

Table 11

Analysis of Distribution Plant ADIT for 2012 and 2013
($000)

Descriptions	CYE 2012	CYE 2013
Gross Distribution Plant	4,670,378	4,915,903
New Plant Additions	324,484	289,038
Existing Gross Plant	4,345,894	4,616,865
Federal Tax Depreciation – New Additions*	124,115	110,557
Federal Tax Depreciation – Existing Plant**	202,805	210,775
Total Federal Tax Depreciation	327,020	321,332
Less Book Depreciation***	(76,568)	(85,972)
Federal Timing Differences	250,452	235,360
Federal Deferred Taxes (35%)	87,658	82,376
State Total Tax Depreciation (5% of Gross Plant)	233,519	245,295
Less Book Depreciation***	(76,568)	(85,972)
State Timing Differences	156,951	159,323
State Deferred Taxes (9%)	14,126	14,339
Total Deferred Taxes - Federal Plus State	101,784	96,715
Reported ADIT Activities Per AC-9 Attachment 1	103,246	(46,113)
Variances	(1,462)	142,828

*Assumes 70% of new plant additions qualify for 50% bonus depreciation allowances in 2012 and 2013.
**Assumes 5% tax depreciation rate for existing plant not subject to bonus depreciation deductions in 2012 and 2013.
***Cost of Removal was removed from the total book depreciation activity amounts.

Based on the conservative assumptions that only 70% of the new plant additions qualified for bonus tax depreciation deductions and a normal tax depreciation rate of 5%, the Authority calculated a federal tax depreciation deduction of approximately $327.020 million for 2012. This amount is significantly less than the $384,142,472, which the Company reported as the actual distribution plant-related tax depreciation deduction for 2012. Using these cautious assumptions, the Authority also determined total deferred tax accretion of approximately $101.784 million for 2012. The amount aligns with the $103.246 million of additional ADIT that CL&P reported for 2012 and does not support the assertion that excess deferred taxes were recorded in Account 28200 in 2012. For the existing distribution plant and the total new plant additions of approximately $613.522 million in 2012 and 2013, the Authority establishes total additional deferred taxes of approximately $198.499 million. For these two years, with 50% bonus tax depreciation allowances, CL&P reported a total deferred tax increase of approximately $57.133 ($103.246 - $46.113) million. Based on its analysis and discussions above, the Authority concluded that the August 2013 entry that reduced the ADIT balance in Account 28200 by $124,742,248 is incorrect and unsubstantiated.

In its Written Exceptions, CL&P stated the PURA's adjustment to reverse the Company's August 2013 plant-related ADIT adjustment of $124,742,248 in Account 28200 is a mistake because the Authority made incorrect assumptions or followed incorrect accounting practice in assessing the purpose and effect of the adjustment.

According to the Company, the Authority misunderstood the election made by CL&P under IRS regulations in 2013 that actually resulted in a longer tax depreciation period and the accounting treatment of the change. The Company indicated that it did not change to a shorter retirement schedule in 2012. CL&P Written Exceptions, p. 30.

The Company claimed that the balance in Account 28200 as of December 31, 2012, estimated based on transactions occurring in plant assets (retirements, additions and basis adjustments), and the expected deductions under the tax law related to those plant assets. The Company also stated that its computation of tax depreciation expense assumed the traditional retirement schedule, not a shortened retirement schedule, for all asset categories. According to CL&P, the Authority incorrectly assumed the Company used a shortened retirement schedule instead of its traditional retirement schedule in 2012. CL&P Written Exceptions, pp. 31-33.

Contrary to its testimony in this proceeding that the August 2013's true-up adjustment of $124,742,248 in Account 28200 was made so that the deferred taxes on the books agree with the final amounts in its 2012 tax returns, the Company stated that the adjustment amount is made up of the following items:

1. A $74 million reclassification from Account 28200 (deferred tax liability) to Account 28399 (deferred tax liability) to properly distinguish plant-related timing differences from other non-plant related timing differences. The amount transfer Account 28399 has no impact to customers as both accounts work as an offset to rate base. Regardless of the reclassification, this amount was included in rate base as of December 31, 2012.

2. A $47 million decrease to deferred tax liability in Account 28200, which is the result of the Form 3115 Method Change. This change extended the retirement period of certain asset categories for tax purposes creating a smaller depreciation deduction for tax purposes than was expensed for book purposes. The reduction in the liability amount in Account 28200 effectively reduced the timing differences between book depreciation and tax depreciation, but did not represent a negative impact to customers. If the Company had not taken this step, the deferred tax asset recorded in Account 190 related to the NOL would simply have increased by $47 million, resulting in the same rate-base impact as the Company's adjustment.

3. A total of $4 million in minor, routine adjustments that reflect other changes to the estimated liability to what was actually filed on the 2012 tax return.

CL&P Written Exceptions, p. 36.

Finally, the Company stated that the IRS accepted its Form 3115 accounting change. However, CL&P indicated that the Authority's determination to reverse the August 2013 true-up adjustment of $124,742,248 in Account 28200 contradicts the IRS acceptance of the method change and effectively provided deferred tax benefit liability to customers where no such liability exists on the Company's books. According to the Company, the Authority's determination would create a violation of the normalization rules under the Internal Revenue Code. The consequences include an IRS

determination that the Company cannot any longer claim accelerated tax depreciation or similar advantageous deductions permitted under the IRC. Therefore, CL&P requested that the determination in the Proposed Final Decision that reversed its August 2013 true-up adjustment of $124,742,248 in Account 28200 be reversed in the final Decision. CL&P Written Exceptions, pp. 37 and 38.

The Authority's determination is based on testimony provided in this proceeding. The Authority specifically asked the Company to provide the items that caused the August 2013 true-up adjustment of $124,742,248 in Account 28200. The Authority did not indicate that the Company changed to a shorter retirement schedule but that the deferred taxes recorded in Account 28200 was based on CL&P's reconciliation of projected or budgeted deferred taxes recorded in this account in 2012 to reflect the actual tax depreciation deducted in its 2012 tax returns. Tr. 09/25/14, pp. 2730-2734.

The information that the Company furnished in its Written Exceptions regarding the components of the August 2013 true-up adjustment of $124,742,248 in Account 28200 was never entered into record in this proceeding. Therefore, as part of the reopened proceeding discussed above, the Authority will afford the Company and other participants the opportunity to provide exhibits and testimony regarding each component of the $124,742,248 reduction to the ADIT in Account 28200. Similarly, the Authority will allow the Company to record as a regulatory asset the revenue impact of the $124,742,248 to be reconciled when it is finally determined if this amount will be allowed in rate base.

c. System Resiliency

The Authority finds that the revenue requirement proposed for the system resiliency plant additions was overstated. CL&P reported total system resiliency plant addition of $25.554 million in 2013. Schedule B-2.0 (A). The book depreciation related to this plant addition is $198,000. Schedule B-3.0 (A). For 2013, the Company reported ADIT associated with the system resiliency plant addition of only $252,000. Schedule B-7.0 (A). The Authority finds the 2013 ADIT amount related to system resiliency plant addition to be significantly low given that 50% bonus tax depreciation is applicable to 2013 plant additions. Thus, using the 15-year life tax schedule under the half-year convention, the Authority calculates the appropriate ADIT for the 2013 system resiliency plant addition as depicted in the table below.

Table 12

Calculations of ADIT for the 2013 System Resiliency Plant Additions ($000)

Gross Plant Additions*	$25,554,000
Federal Tax Depreciation, Including 50% Bonus Allowance	13,416,000
Book Depreciation**	198,000
Difference	13,218,000
Federal Deferred Tax Benefit at 35%	4,626,000
State Tax Depreciation	1,278,000
Book Depreciation**	198,000
Difference	1,080,000
Connecticut Deferred Tax Benefit at 9%	97,000
Total Deferred Tax Benefit	$ 4,723,000

* Schedule B-2.0 (A)
** Schedule B-3.0 (A)

The federal tax depreciation amount calculated above is 52.5% of the 2013 system resiliency plant addition of $25.554 million. It represents 50% of the 2013 system resiliency plant additions plus 5% of the remaining 50% plant additions not subject to the bonus depreciation allowance. The state tax depreciation amount calculated above is 5% of the 2013 system resiliency plant addition of $25.554 million. Based on the above calculation, the Authority determines that the average ADIT that the Company used to calculate average rate base was underreported by $4.471 ($4.723 - $0.252) million. Consequently, the Authority will similarly reduce the proposed rate base by $4.471 million for the underestimated ADIT connected with the 2013 system resiliency plant addition of $25.554 million.

In summary, the Authority will increase the Company's proposed average ADITs by $170.063 ($124.742 + $40.85 + $4.471) million. Thus, the Authority simultaneously reduces the proposed average rate base by the same amount. This adjustment will restore the normal unwinding of the plant-related deferred tax balance in Account 28200. This will occur as book depreciation deductions catch up and ultimately surpass tax depreciation deductions and fully restore the rate benefits of the increased ADITs derived from allowed significantly larger tax depreciation deductions.

3. Working Capital Allowance

a. Introduction

It is a customary regulatory practice to allow an adjustment to rate base in recognition of the timing difference between when revenues are received and when expenses are paid out. For larger utilities, the Authority typically prefers that a lead/lag study be conducted to determine the appropriate cash working capital allowance rather than using some rule of thumb approach or the utility's balance sheet result. In this proceeding, CL&P conducted such a lead/lag study and requests that the results of that study be used for determining its Rate Year rate base.

Schedule H-1.6 and its supporting Work Papers contained the results of and supporting calculations for the Company's lead/lag study. In conducting its study, CL&P used a stratified random sample of its retail accounts and calculated that it took an average of 40.95 days for CL&P to receive its revenues once service has been rendered based on data through December 31, 2013. WP H – 1.6a, p. 1. Included in this average revenue lag of 40.95 days is a service lag (time between service being provided and the reading of the meter) of roughly 15 to 16 days, a billing lag (time between the reading of the meter and sending out the bill) of two to three days and a payment lag (time between the bill being sent out and the payment being received by the Company) of approximately 23 days (41 days minus 15 days minus 3 days). Tr. 9/24/14, pp. 2444 and 2445. The Company also specifically studied and calculated the expense lead for payroll, payroll deductions, payroll incentives, CTA IPP's, non-bypassable federally mandated congestion costs (NBFMCC), conservation and renewable costs, uncollectible expense, other O&M, ten different categories of taxes, long-term debt, preferred stock and common equity. Based on these calculations and assumptions made regarding the expense lead for other expense categories such as depreciation and amortization, and pension, the Company calculated a cash working capital requirement of $17,230,000 based on a net lag of approximately 3.20 days for the Rate Year. Late Filed Exhibit No. 3, Schedule H-1.6 – Revised. The Authority reviewed CL&P's allowance for working capital request for the Rate Year and finds it acceptable except as discussed below.

b. Non-Cash Items

In its pre-filed testimony and brief, the OCC argued that non-cash expenses should not be part of the lead/lag study because they do not involve an outlay of cash and are excluded by some regulatory jurisdictions in the determination of a working capital allowance. Schultz PFT, pp. 12-15; Brief, pp. 46-49.[7] The OCC also argued that inclusion of non-cash expenses such as depreciation in the cash working capital allowance over compensates the Company by allowing it a double return on the expenses, even when such expenses reduce rate base. Brief, p. 48. To demonstrate

[7] The OCC also expressed concerns with the Company's calculation of expense leads for certain payroll check items, such as payroll taxes and employee deductions, and for income taxes, but made no adjustments related to these concerns. Schultz PFT, pp. 14 and 15, Exhibit_(L&A-1); Brief, p. 47, Schedule B-3, p. 1.

this, the OCC provided a hypothetical where a $100 asset is depreciated over a year. Id. In the hypothetical, the OCC contended that the Company is overcompensated if it gets a return on the average asset in rate base, recovery of the depreciation expense and a working capital allowance on the expense. In reviewing these assertions and contentions by the OCC, the Authority first considered whether ratemaking treatment creates a carrying cost for CL&P relative to the non-cash expenses. When these expenses reduce rate base, the Company is deprived of the return that investment in rate base affords. If there is a lag between the reduction in rate base and the receipt of revenues recovering the expense, a carrying cost is incurred by the Company for the time of the lag. As such, it is appropriate for these "non-cash" expenses to be part of a working capital allowance.

The Authority also considered whether inclusion in the lead/lag study as proposed by CL&P over-compensates the Company for the carrying cost of non-cash items. In order for the Company to be overcompensated, the inclusion of non-cash items in the lead/lag study would need to create a situation where a rate base item is still receiving a return after the item has been recovered from ratepayers. In the OCC's hypothetical and as understood by the Authority, the $100 asset is depreciated over the course of a year so that the Company does not fully recover its investment in the asset until the end of the year when it has billed for the last portion of the asset's depreciation expense. As such, it is appropriate for the Company to receive a return on the un-depreciated portion of the asset. In addition, if there is a lag between when the asset in rate base is reduced through depreciation and when the Company receives its cash from ratepayers, an additional return requirement is created. It is this additional return requirement that is provided by inclusion of the depreciation expense (and other non-cash expenses) in the lead/lag study. Finally, as the asset is removed from rate base it is necessary that the depreciation expense itself be recovered from ratepayers. As such, the three piece recovery through the asset in rate base, depreciation expense and as part of a working capital allowance is necessary to keep the Company whole and not overcompensated.[8] The lead/lag study proposed by the Company assumes and/or calculates that depreciation expense (and expense related to amortization and deferred taxes) results in a reduction to rate base after 15 days on average and that funds for this expense are received 25.95 days later. Late Filed Exhibit No. 3, Schedule H-1.6 – Revised. The Authority finds these assumptions and/or calculations appropriate and will allow non-cash items in the lead/lag study as proposed by the Company.

c. Revenue Lag on Costs Recovered through Adjustment Clauses that Use Billed Revenues

In developing the revenue lag for the Company, CL&P included a service lag to account for the time between service being rendered and meters being read. Tr.

[8] In its Written Exceptions, the OCC reasserted that inclusion of depreciation and other "non-cash" expenses in the lead/leg study constitutes a double counting since these costs are already in rate base and earning a return. OCC Written Exceptions, p. 39. In making this argument however, the OCC fails to realize that the lead/lag study only allows a working capital allowance for "non-cash" expense for the period of time when the expense is out of rate base and prior to recovery from ratepayers. As such, there is never a time when the "non-cash" expense is both in rate base and part of the working capital allowance.

9/24/14, pp. 2444 and 2445. While the Company did not specifically break out the service lag from its revenue lag of 40.95 days, based on billing cycles of 27 to 33 days and 12 months in a year, a reasonable estimate of the service lag would be 15.21 days [(365 ÷ 12) ÷ 2]. Tr. 9/24/14, p. 2445. While a service lag is appropriate for revenues associated with most expense categories, it is not appropriate for revenues associated with costs recovered through adjustment clauses that use billed revenues. These types of clauses recover costs based on sales billed during the month, not on sales accrued or delivered during the month. As such, meters are read during the month and trued up through the adjustment clause for service provided during the month. This action by these clauses effectively aligns meter reads with service rendered and eliminates the service lag. Tr. 9/24/14, pp. 2445-2451. The Company identified three of its adjustment clauses as using billed revenues to recover costs. They are: the Competitive Transition Assessment (CTA), the Systems Benefit Charge (SBC) and the NBFMCC. Late Filed Exhibit No. 67. These clauses recover $30,860,000, $41,418,000 and $189,702,000 in Rate Year costs, respectively. Late Filed Exhibit No. 3, Schedule H-1.6 Revised; Tr. 9/24/14, pp. 2441-2443, 2503 and 2504; November 5, 2014 Decision in Docket No. 99-03-36RE22, PURA Determination of The Connecticut Light and Power Company's Standard Offer – 2013 Reconciliation of CTA and SBC, p. 7. For cost recovered through these clauses, meter reads are centered on the midpoint of the month or billing cycle for service centered on the midpoint of the month or billing cycle. Tr. 9/24/14, p. 2446. Therefore, the Authority reduces the revenue lag associated with these costs by 15.21 days. This adjustment and the reasons for it are similar to an adjustment the Authority made in its Decision dated June 29, 2011 in Docket No. 10-12-02, Application of Yankee Gas Services Company for Amended Rate Schedules (June 29, 2011 Decision), for costs recovered through the purchased gas adjustment clause (PGA). June 29, 2011 Decision, pp. 36 and 37.

In its Brief, the Company attempted to distinguish the PGA from the CTA, SBC and NBFMCC by asserting that the latter clauses have a lack of consistency in the sales growth, a lack of monthly reconciliation, that the change from using accrued revenues to using billed revenues is onetime in nature, that they will operate with a decoupling mechanism and that there is a greater lag between when payment is received and when payment clears for CL&P. CL&P Brief, pp. 91 and 92. Based on these alleged differences, the Company concludes that there is no on-going beneficial timing difference to CL&P from using billed revenues to collect costs in three of its adjustment clauses. While the alleged differences may or may not apply, they do not impact the revenue lag difference between using billed revenues to recover costs vs. using accrued revenues to recover costs. This is because for any given period and on average, billed revenues are billed at midpoint of the period and accrued revenues are only accrued at the midpoint of the period to be billed at the end of the period. Relative to accrued costs, this means that billed revenues are 15 or so days closer to being received by the Company [30 (end of period) minus 15 (midpoint of period) equals 15 days (timing benefit from using billed revenues)]. This timing benefit is not impacted by the consistency of sales growth, the timing of reconciliations (provided carrying costs are included), the onetime nature of the change from accrued revenues to billed revenues (the benefits continue as long as billed revenues are used), the presence of a decoupling mechanism or the length of other lag components in the revenue lag. As such, despite the Company's objections, a 15.21 day reduction to the revenue lag associated with costs recovered by the CTA, SBC and NBFMCC is appropriate.

d. Adjustments to Expense Amounts

In addition to adjustments to the lag days for some expense categories, the Authority also made adjustments to the amount of expenses or income allowed for ratemaking purposes. These adjustments are detailed throughout this Decision and impact the working capital allowance the Company needs. The Authority adjusted the expense and income levels used to calculate the working capital needs of the Company to mirror the expense and income adjustments made by this Decision.

e. Conclusion

Based on the adjustments detailed above related to working capital, the Authority calculates a working capital allowance for the Company of $15,361,000 for the Rate Year, including the 15 basis point ROE penalty. This amount is based on a Rate Year net lag of 3.01 days and is $1,869,000 less than the $17,230,000 proposed by the Company. As such, the Authority reduces the working capital allowance $1,869,000 for the Rate Year. If and when the ROE penalty goes away as allowed by this Decision, the working capital allowance becomes $14,779,000, based on a net lag of 2.89 days, and is $2,451,000 less than the $17,230,000 proposed by the Company.

4. Reserves – Net of Deferred Income Taxes

In its Applications, CL&P reported total net regulatory liabilities or reserves of $37.148 million for the test year ending December 31, 2013, $36.915 million for the proforma period ending December 31, 2014, and $42.569 million for the proposed Rate Year ending December 31, 2015. Schedule B-8.0. Hence, the Company originally reported as an offset to rate base average total net reserves of $39.86 million for the Rate Year. Schedule B-8.0. In its updated filing, CL&P reported total net reserves of $37.728 million for the proforma period ending December 31, 2014, and $43.3829 million for the proposed Rate Year ending December 31, 2015. Late Filed Exhibit No. 3, Schedule B-8.0 Revised. The updated total average net reserves for the Rate Year is $40.555 million. Id., Schedule B-1.0 Revised.

The total average net reserves for the Rate Year included average net storm reserves of $7.689 million. Late Filed Exhibit No. 3, Schedule B-8.0 Revised. Based on the discussions in Section II.C.13, Storm Reserve, the Authority disallowed the recovery of $6 million of storm reserves in O&M expenses. Thus, the Authority will reduce the average net reserves by $1.775 ($6 / 2) X (1 - 0.4085)) million. Conversely, the rate base for the Rate Year is increased by $1.775 million.

5. Conclusion on Rate Base

The rate base approved in this Decision is $3.233 billion as identified in Section III.V.B.

C. EXPENSES

1. Depreciation

A depreciation rate study calculates the annual depreciation rate. The depreciation rate is then applied to the gross plant-in-service balance. The product of this calculation is the depreciation expense, which is a charge to a company's operating expense to reflect the annual recovery or amortization of previously expended capital investment. The Company stated that the Test Year depreciation expense was $107 million and the projected Rate Year 2015 plant depreciation and amortization expense is $140 million. Application, Schedule C-3.32. CL&P filed a depreciation rate study, conducted by Mr. Spanos of Gannett Fleming Valuation and Rate Consultants, LLC (Gannett Fleming), for utility plant owned and operated by CL&P as of December 31, 2013 (2013 Study).

a. General Concepts of Depreciation

Since the depreciation expense represents the annual recovery of the capital investment, the asset base of the utility is diminished with each year. The amount of depreciation that has been taken is booked in an account called the accumulated provision for depreciation, also known as the booked reserve.[9] All depreciation expense, retirements, cost of removal and gross salvage are booked in the booked reserve. The accumulated provision for depreciation, or booked reserve, serves as a "running total" of the extent to which individual assets or groups of assets have been depreciated. The theoretical reserve[10] is a calculation of what the depreciation reserve should be based on the current estimates of average service life (ASL), survivor curve and net salvage estimate. The comparison between the booked reserve and the theoretical reserve provides a metric of the accuracy of past depreciation rates.

In the case of a regulated utility, recovery of investor–supplied capital is dependent upon allowed revenues, which are dependent upon approved levels of the depreciation expense. Periodic reviews of depreciation rates are essential to the achievement of timely capital recovery for a regulated utility. Depreciation studies should be conducted periodically to assess the continuing reasonableness of parameters and accrual rates derived from prior estimates.

The ASL of a vintage is a statistic that will not be known with certainty until all units from the original placement have been retired from service. Therefore, a vintage ASL must be estimated initially and periodically revised as indications of the eventual ASL becomes more certain. A mathematical description of survival functions or survivor curves of retirement acting upon a plant category is determined from an estimation of service life statistics and an analysis of past retirement experience. The life indications obtained from an analysis of past retirement experience are blended with expectations about the future to obtain an appropriate projection life curve to predict the expected remaining life of property units still exposed to the forces of retirement. The amount of

[9] Booked reserve is also known as recorded reserve or actual reserve.
[10] Theoretical reserve is also known as required reserve.

weight given to the analysis of historical data will depend upon the extent to which past retirement experience is considered descriptive of the future. Service life indications derived from the statistical analyses were blended with informed judgment and expectations about the future to obtain an appropriate projection life curve for each plant category.

The level of asset grouping identified in the broad group procedure is the total plant-in-service from all vintages in an account. Each vintage is estimated to have the same ASL. The remaining life of each vintage is estimated from a projection life curve and the attained age of the vintage. The average remaining life for a broad–group plant account or rate category is a direct, dollar–weighted average of the remaining life of each vintage. The weights used in this calculation are the vintage survivors at the beginning of the study year.

Future net salvage rates and projection curves, which describe the expected distribution of retirements over time, are estimated parameters of a depreciation system that are subject to future revisions. Plant accounting data is utilized to conduct a statistical analysis of past retirement experience and analyzed to determine the relationship between retirements and realized gross salvage and cost of removal. An estimate of the net salvage rate applicable to future retirements is obtained from an analysis of the gross salvage and cost of removal realized in the past.

An analysis of past experience and trends over time provide a baseline for estimating future salvage and cost of removal. Consideration should be given to events that may cause deviations from net salvage realized in the past such as the age of plant retirements; the portion of retirements that will be reused; changes in the method of removing plant; the type of plant to be retired in the future; inflation expectations; the shape of the projection life curve; and economic conditions that may warrant greater or lesser weight to be given to the net salvage observed in the past. Judgment of historical cost of removal and salvage data, expectations with respect to future removal requirements and markets for retired equipment and materials were used in developing estimates of the future. 2013 Study, Exhibit JJS-2, p. IV-2. Average net salvage rates are estimated using direct dollar weighting of historical retirements with the historical net salvage rate, and future retirements of the surviving plant with the estimated future net salvage rate.

Included in the depreciation study is an analysis of the adequacy of the booked depreciation reserve. The purpose of such an analysis is to compare the current balance in the booked reserve with the balance required to achieve the goals and objectives of depreciation accounting if the amount and timing of future retirements and net salvage are realized exactly as predicted. The difference between the theoretical or required reserve and the booked reserve provides a measurement of the expected excess or shortfall that will remain in the depreciation reserve if corrective action is not taken to extinguish the reserve imbalance.

Although reserve records are commonly maintained by various account classifications, the total booked reserve in relation to the sum of account computed reserves is a good indicator of the adequacy, or inadequacy, of booked reserves. Differences between theoretical and booked reserves will arise as a normal occurrence

when service lives, dispersion patterns and net salvage estimates are adjusted in depreciation reviews. Finally, parameters estimated from service life and net salvage studies are integrated into an appropriate formulation of an accrual rate based upon a selected depreciation system.

b. CL&P 2013 Study

CL&P filed the 2013 Study to estimate the appropriate annual depreciation accruals for CL&P's plant-in-service as of December 31, 2013. Three elements – method, procedure and technique – are needed to describe a depreciation system. Since 2009, CL&P has been using a depreciation system composed of the straight line method, ASL procedure, and remaining life technique. This is a system widely used by regulated utilities. Depreciation accounting requires the estimation of several parameters or statistics related to a plant account. The remainder of this section describes the 2013 Study performed by Gannett Fleming.

A depreciation study was completed in 2009 for the 2009 CL&P Rate Case (2009 Study) for properties in service as of December 31, 2008. The Company's accounting policy has not changed since that study. The 2013 Study requests an annual depreciation expense of $138.8 million when applied to plant as of December 31, 2013. 2013 Study, pp. 6 and 7. Table 13 shows the results from the 2013 Study that includes the amortization approved to correct for the $380.5 million reserve imbalance seen in the 2009 Rate Case.

Table 13

Summary of 2013 Depreciation Expense ($000)

		ANNUAL ACCRUAL					
Function	Original Cost	Rate (%)	Amount	7 Year Amortization	Remaining Life Amortization	Total Adjusted	Adjusted Rate
(1)	(2)	(3)	(4)	(5)	(6)	(7)=(4)+(5)+(6)	(8)
Distribution	4,455,939	2.93	130,402	(10,305)	(8,491)	111,605	2.50
General Plant	231,658	3.34	7,733	(264)	(218)	7,250	3.13
Unrecovered Reserve Amortization			674			674	
Transportation Equipment	61,450						
Nondepreciable Plant	161,450						
Total Plant-in-service	4,910,498		138,810	(10,570)	(8,710)	119,530	

2013 Study, Exhibit JJS-2.

Table 14 provides a summary of the changes in annual rates resulting for total depreciable plant from adoption of the parameters and depreciation system recommended in the 2013 Study based on total plant investments of $4.7 billion.

Table 14

Current and Proposed Depreciation Annual Accruals

Account	Original Cost	Proposed Annual Accrual	Current Annual Accrual	Increase/(Decrease)
(1)	(2)	(3)	(4)	(5)=(3)-(4)
Distribution	$4,455,939,516	$111,605,156	$80,454,721	$31,150,435
General Plant	$231,658,093	$7,250,386	$7,674,419	($424,033)
Unrecovered Reserve Amortization		$674,989	0	$674,989
Total Depreciable Electric Plant	$4,687,597,608	$119,530,531	$88,129,140	$31,401,391

2013 Study, Exhibit JJS-3

As of December 31, 2013, the total booked reserve for the Company was $1.103 billion and the theoretical reserve is $1.17 billion, for a difference of $67 million. When the book reserve is less than the theoretical reserve as in the current case for CL&P, it means that the depreciation rates used in the past were too low. Plant was being depreciated at a slower rate than it should have been. Mr. Spanos stated that this level of reserve imbalance is insignificant relative to the level of reserve. Tr. 9/2/14, p. 715.

CL&P requested an increase of $30 million (Schedule C-3.32; LFE-3, Sch. 3.0 (revised) line 59). This increase was due to changes in life parameters, net salvage accruals, and resulting changes in reserve amortizations. CL&P Brief, p. 43. An increase in the depreciation expense in the amount of $18.5 million was caused by changes in net salvage. Further, the changes in life and net salvage parameters in the 2013 Study resulted in a $66 million deficiency in the reserve balance. For total depreciable plant, the actual book reserve is $1.103 billion and the theoretical reserve is $1.169 billion. 2013 Study, Exhibit JJS-4a. Therefore, a $16.2 million increase in expense was included to correct for the deficiency in the theoretical reserve. Spanos PFT, p. 15. CL&P testified that the $66 million reserve imbalance would be distributed to the individual vintages and recovered over the remaining life. Tr. 9/2/14, pp. 689 and 690.

c. Positions of the OCC and the AG

The OCC and AG recommended a reduction of $19.5 million in depreciation expense due to adjustments to ASL parameters, net salvage parameters and adjusting the amortization periods for six software accounts. OCC Brief, p. 81; AG Brief, p. 12. The OCC contended that multiple adjustments need to be made to CL&P's proposed depreciation expense. First, the OCC proposed adjustments to CL&P's analyses of mass property life parameters for two accounts: Account 362 – Distribution Station Equipment and Account 365 – Overhead Conductor and Devices. OCC Brief, pp. 91 and 95. Second, the OCC proposed adjustments to mass property net salvage values for four accounts: Account – 362 Distribution Station Equipment; Account 364 – Poles, Towers and Fixtures; Account 367 – Underground Conductors and Devices; and

Account 367 – Services. Pous Revised PFT, p. 31. Third, the OCC recommended extending the amortization period for 6 software systems from a 10-year amortization period to a 15-year amortization period and that any new software plant additions be amortized over a 15-year period. OCC Brief, p. 108. Based on these adjustments, the OCC recommended a total reduction of $19.5 million in depreciation and amortization expense. Pous Revised PFT, p. 6. In addition to these adjustments, the OCC argued that CL&P has not met the burden of proof required to support its depreciation expense request. OCC Brief, p. 82.

The AG claimed that the 2013 Study understates the ASL of its physical plant and overestimates its future negative net salvage costs. AG Brief, p. 12. The AG also supported the OCC's recommendation for extending the amortization period of specific software systems to 15 years. Id., p. 15.

d. Analysis

The accounts under dispute for mass property life parameters are Account 362 - Station Equipment and Account 365 – Overhead Conductors and Devices. The accounts under dispute for net salvage parameters are Account 362 – Distribution Station Equipment; Account 364 – Poles, Towers and Fixtures; Account 367 – Underground Conductors and Devices; and Account 369 – Services. These disputed accounts are addressed below.

i. Mass Property Life Parameters

There is no dispute that the calculation of annual depreciation expense based on the straight line method used in the 2013 Study requires the estimation of survivor curves. Both the OCC and the Company proposed to update survivor curves for Account 362 and Account 365 from the existing ones used to determine depreciation expense in the 2009 Study.

The OCC proposed adjustments to two mass property accounts, Account 362 - Distribution Station Equipment and Account 365 – Overhead Conductor and Devices. Table 15 shows a summary of the OCC and CL&P proposed survivor curves. The current survivor curves used for determining depreciation expense are 50-R2 for Account 362 and 50-SC for Account 365.

.

Table 15

OCC's Recommended Mass Property Life Adjustments

Account	CL&P Proposed	OCC Proposed	OCC Adjustment	Dec. 31, 2013 Impact
362	51S0	54S0	3	$1,084,726
365	44O1	48L0	4	$3,671,710
Total				$4,756,436

Pous Revised PFT, p. 10.

The OCC's witness indicated that these adjustments were based on: 1) an independent review of the actuarially derived life indications; 2) information provided by the Company's personnel; 3) information obtained during discovery; and 4) from previous experience in "performing hundreds of depreciation analyses." Pous Revised PFT, pp. 10 and 11.

(a) Account 362 – Station Equipment

Account 362 – Station Equipment includes the following facilities: control equipment such as transformers, batteries, remote relay boards and connections; primary and secondary voltage connections and associated equipment; switching equipment; switchboards; fixed and synchronous condensers; bus compartments; conduit; conversion equipment; fences; foundations and settings; and general station equipment.

The existing survivor curve used to determine the depreciation expense for this account is 50R2. The Company proposed a 51S0 survivor curve and the OCC proposed a 54S0 survivor curve. 2013 Study, Exhibit JJS-2, p. VII-13; Pous Revised PFT, p. 19.

The OCC argued that CL&P's proposed survivor curve of 51S0, understates the realistic ASL. Pous Revised PFT, p. 19. The OCC further contended that from an actuarial standpoint, historical data for experience bands of 1916-2013, 1964-2013 and 1998-2013 indicate a significant trend towards a longer ASL that is not accounted for by the Company's analysis. Pous Revised PFT, pp. 20-23.

The Company justified use of its survivor curve by saying that "there is a plan to upgrade substation equipment more aggressively in the next few years to handle load requirements and technology advancements" which supports an ASL of 50 years. Response to Interrogatory OCC-001. Further, while station equipment in general is experiencing slightly longer ASL, relay equipment will see a higher level of early retirements. Response to Interrogatory OCC-003. The OCC argued that relay equipment is only a 7% investment in this account and should not restrict "a realistic increase in ASL for this account." Response to Interrogatory OCC-022; Pous Revised PFT, p. 23. The OCC further argued that the early retirement of relay equipment is already reflected in the historical data. Pous Revised PFT, p. 23.

The Company contended that the overall experience band of 1916-2013 should be used in this case for determining the most appropriate survivor curve. Spanos Rebuttal, p. 20. The Company argued that the 1998-2013 experience band is not indicative of future trends for this account because from 1999-2003, there was a focus on retiring older assets which would cause the retirements as a relationship to exposure to be lower. The Company claimed that this trend will not continue since there will be a focus on substation reliability work in the next 5 years that will result in retirements of not only old assets, but also of assets in the 30- to 40-year range. Tr. 9/2/13, pp. 698 and 699. The Company also claimed that, in addition to the primary reasons for past retirements – such as failure, wear and tear, load and demand – reliability and system integrity have become the dominant causes of retirement and the more technology-based assets can cause a higher percentage of retirements. Response to Interrogatory

OCC-007. The Company also showed that retirements have increased annually in the 2009-2013 time period to an average amount of $3.8 million, as compared to an average amount in the prior five years of $1.3 million. Response to Interrogatory OCC-023; CL&P Reply Brief, p. 34.

The Authority concurs that the recent trends in the historical data for the 1998-2013 experience band data are not necessarily indicative of future retirements for this account. The Authority accepts the OCC's argument that there is an obvious trend in the data when all three experience bands are analyzed. In fact, the Company acknowledged that the 1964-2013 experience band is "representative of the database." Tr. 9/2/14, p. 695. Accordingly, the Authority determines that the historical data in the 1964-2013 experience band should be heavily weighted for this account. Therefore, the Authority finds the OCC's proposed 54S0 curve to be a better match to the 1964-2013 experience band as it best reflects the most accurate representation for life parameters for this account. This results in a $1,084,726 reduction in annual depreciation expense based on plant as of December 31, 2013. Pous Revised PFT, p. 23.

(b) Account 365 – Overhead Conductors and Services

Account 365 – Overhead Conductors and Devices includes the following facilities: Conductors; circuit breakers; ground wires and clamps; insulators; lightning arresters; railroad and highway crossing guards; splices; switches; and other line devices.

The existing survivor curve for this account is 50SC. The Company proposed a 4401 curve, which is a reduction in ASL of six years. The OCC proposed a curve of 48L0 which is a reduction in ASL of two years.

The OCC argued that its life curve combination is similar to the Company's curve, but that when "neither actuarial analysis nor information external to the historical data provides strong support for a change in ASL" then the existing parameter should be retained. OCC Brief, p. 95. Since the curve fits are similar, the OCC contended its curve is more appropriate since it does not result in a significant decrease in ASL. Pous Revised PFT, p. 25. The OCC further justified the use of its curve by noting that CL&P has not stated any changes in policies or practices that would warrant the six year reduction in ASL. The OCC also argued that the age of overhead conductors, with more than 50% over 40 years of age and at least 33% over the age of 50 years support the use of OCC's recommended curve. Finally, the OCC claimed that the recent storms experienced by CL&P may reduce the perceived ASL in the actuarial analyses. Id., pp. 27 and 28.

The Company argued that the L0 dispersion pattern for the OCC's proposed curve is unrealistic since its views overhead conductors as the longest lived asset for that account and that 90 to 100 years is an appropriate number for longest service life. Tr. 9/2/14, pp. 678 and 680. The OCC countered that insulator pins and posts have a longer service life than conductors and that "only $100 in assets out of a $1.2 billion account would need to live 160 years to validate an L0 dispersion pattern." Tr. 9/2/14,

p. 734. The Company stated that typically insulator pins and posts are replaced when the conductor is replaced. Tr. 9/2/14, p. 680.

The Authority finds that of the historical data for this account support the Company's statement that the longest lived assets range from 90 to 100 years. Spanos Rebuttal Testimony, p. 22. The Authority also finds that although the curves are similar, the Company's curve is a superior fit and the OCC's curve is only a better fit to the historical data for a portion at the tail end of the curve where neither party believes much emphasis should be placed. The Authority accepts the Company's life curve combination for this account.

ii. Net Salvage Parameters

The Company's net salvage estimates were based on "judgment which incorporated analyses of historical cost of removal and salvage data, expectations with respect to future removal requirements and markets for retired equipment and materials." Spanos PFT, Exhibit JJS-2, p. IV-2. A negative net salvage percent occurs when cost of removal is greater than salvage return. The Company compiled historical data from 1999 through 2013. Id. The OCC agreed with the Company that averages of the historical data are not always representative of future net salvage. Pous Revised PFT, p. 32. These figures are important since these costs were incurred in practice. The Authority will use these figures to ensure that these costs will not be shifted to future customers of the Company. Table 16 below displays the 15-year historical average and the five-year moving average for net salvage costs. Negative net salvage percentages are displayed in parentheses.

Table 16

Average Net Salvage Values

Account	Overall Average	5-Year Average
362	(58)	(61)
364	(138)	(100)
367	(83)	(81)
369	(222)	(450)

Spanos Rebuttal Testimony, p. 24

CL&P argued that from 2009 – 2013, the Company has incurred larger costs of removal than has been accrued. This data presented in Table 17 below is derived from Spanos PFT, p. 14.

Table 17

Incurred vs. Accrued Cost of Removal

Year	Incurred	Accrued
2008	30,761,664	9,795,406
2009	19,744,032	12,239,899
2010	21,368,525	12,944,564
2011	30,401,991	13,585,052
2012	31,826,451	14,603,464
2013	25,699,305	15,520,100

The Company further argued that it should at least accrue for as much as it incurs and since it is a growing company, it should be allowed to accrue more than what it has been incurring. Tr. 9/2/14, pp. 702 and 703. The Company argued that the goal with net salvage recovery in this proceeding is to correct for the under recovery seen in recent years and to gradually move the Company towards full recovery. CL&P Reply Brief, p. 36. The Company expected that the net salvage values will need to be more negative in the future. Tr. 9/2/14, p. 716.

The OCC proposed net salvage adjustments to four Mass Property Accounts: 362 – Distribution Station Equipment; 364 – Poles, Towers and Fixtures; 367 – Underground Conductors and Devices; and 369 – Services. Table 18 summarizes CL&P's proposals and the OCC's recommended adjustments and their impact on the Company's proposed depreciation expense.

Table 18

Proposed Net Salvage Adjustments

Account	CL&P Existing	CL&P Proposed	OCC Recommended	OCC Adjustment	Impact
362 – Distribution Station Equipment	(30%)	(35%)	(25%)	(10)	$1,437,561
364 – Poles, Towers and Fixtures	(50%)	(60)%	(50%)	(10)	$1,143,856
367 – Underground Conductors & Devices	(10%)	(25%)	(15%)	(10)	$1,904,773
369 - Services	(20%)	(100%)	(50%)	(50)	$3,542,746
Total					$8,028,935

Pous Revised PFT, p. 31.

(a) Account 362 – Station Equipment

The existing net salvage approved for this account is -30%. The Company proposed a -35% net salvage and the OCC proposed a -25% net salvage value. Pous Revised PFT, p. 32. The OCC argued that the Company provided no valid basis to

propose a more negative net salvage than the existing value. The OCC claimed that the Company's industry database better supports the OCC's proposed net salvage value of -25%. Id. The OCC further stated that transformers, which comprise 35% of the investment in this account, but only 23% of the dollar-related retirement activity should provide some positive salvage to offset cost of removal. The transformers also contain large quantities of copper, which should result in offsetting salvage. Id., pp. 32 and 33.

The Company argued that the value presented by the OCC would accrue less in depreciation expense for cost of removal than the Company incurred annually. Spanos Rebuttal Testimony, p. 26. The OCC, however, showed that its recommended level of cost of removal, when divided by the remaining life, exceeds the annual average cost of removal for the last three years by 24%. OCC Brief, p. 102. The OCC also contended that the high dollar cost transformers will have a less negative percentage level of net salvage than other types of assets when retired. Id., pp. 102 and 103.

Based on the most recent three year statistics for cost of removal, a -25% net salvage value will allow CL&P to accrue more than it incurs, while still providing room for growth. Therefore, the Authority accepts the OCC's recommendation of a -25% net salvage value for Account 362 – Distribution Station Equipment. This results in a $1,437,561 reduction in annual depreciation expense based on plant as of December 31, 2013. Pous Revised PFT, p. 34.

(b) Account 364 – Poles, Towers, and Fixtures

The existing net salvage approved under rates for this account is -50%. The Company proposed a -60% net salvage and the OCC proposed a -50% net salvage value.

The OCC contended that CL&P failed to adequately justify its increase in a negative net salvage for this account. The OCC recommended retaining the existing net salvage value of -50%. Pous Revised PFT, p. 34. It argued that major storms contributed to the higher costs of removal seen in recent years and that the Company's historical database better supports its net salvage value. The OCC maintained that recent major storms resulted in higher net salvage costs for this account, artificially increasing the negative net salvage levels. Id.

CL&P stated that most of the storm costs were removed when calculating net salvage parameters for the study since the Company "didn't want to have our going forward estimates to include that in our total salvage." Tr. 9/2/14, p. 704. The Company also stated that the STORMS software system, in use since 2006, allows for more accurately recording removal costs and factored into this net salvage value. Spanos Rebuttal Testimony, p. 28.

While the Company has shown that in general, it is incurring more salvage costs than it is accruing, there is no specific data on the record for Account 364 that supports an increase in the negative net salvage value for this account. In the Proposed Final Decision, the Authority accepted the Company's proposed -60% net salvage value for this account based on CL&P's claim that storm related costs were isolated from the

historical data. However, in its Written Exceptions, the OCC noted that the Company did not remove the impact of recent storm costs from its proposal. OCC Written Exceptions, p. 21. Specifically, the Company acknowledged in Late File Exhibit No. 14 that the incurred cost of removal amounts set forth in Table JJS-1 on page 4 of Spanos PFT did not distinguish major storm related removal costs. Further, while the Company stated that the STORMS software system more accurately records removal and salvage costs, it admitted uncertainty as to how detailed the system is with isolating specific costs related to storm work. Tr. 9/2/14, pp. 708 and 709. Finally, the Company assigned removal costs in 2006 and 2007 to Account 364 from earlier years' retirements that were delayed in being recorded. Also, the Company undertook large projects that involved retirements from both Accounts 364 and 365 and assigned large amounts to Account 364 and very little to Account 365. Response to Interrogatory OCC-214.

The Authority finds that the Company did not provide adequate justification to increase the net salvage values for Account 364. The historical data does not clearly isolate major storm costs as the Company initially claimed. Further, salvage costs assigned to Account 364 in 2006 and 2007 were not necessarily associated with those years or with that specific account. Therefore, the Authority accepts the OCC's argument to retain the existing -50% net salvage value for Account 364 – Poles, Towers and Fixtures. This results in a $1,143,856 reduction in annual depreciation expense based on plant as of December 31, 2013. Pous Revised PFT, p. 36.

(c) Account 367 – Distribution Underground Conductors and Devices

The existing net salvage approved under rates for this account is -10%. The Company proposed a -25% net salvage value and the OCC proposed a -15% net salvage value. Both net salvage values proposed are well below the negative 83% over the last 15 years and the negative 81% from the most recent 5 years.

The OCC argued that the Company did not provide sufficient evidence supporting the -25% value outlined in the study. Pous Revised, PFT, pp. 38 and 39. The OCC contended that its proposed value is superior since most underground conductors are abandoned in place and that industry trends show more cables are installed in conduit rather than direct-buried. Id., p. 39. According to the OCC, this should result in lower cost of removal since retired cable in conduit can be pulled out when not retired in place. Id.

The Company countered that most conductor in conduit has only been placed in the last 30 to 40 years and that the ASL of this account is 50 years, so the overall impact of removing retired cable from conduit will not be seen for many years. Spanos Rebuttal Testimony, p. 29. The Company further argued that the practice of abandoning direct buried conductor is a practice that has not changed and is already reflected in the cost of removal statistics. Id.

The Authority finds the Company's net salvage value for this account to more accurately reflect the historical data and the outlook for net salvage in the near future. Therefore, the Authority approves the Company's net salvage value of -25%.

(d) Account 369 – Distribution Services

The existing net salvage approved under rates for this account is -20%. The Company proposed a -100% net salvage and the OCC proposed a -50% net salvage value.

.

The OCC argued that the Company has not provided adequate justification for a five-fold increase in net salvage. OCC Brief, p. 106. The OCC also argued that the Company's claim that more services will be underground and will increase the negative net salvage is not supported by the industry database. Pous Revised PFT, p. 44. The AG opposed the increase and notes that "a negative net salvage of 100% means that for every dollar of plant invested, the Company expects to incur and additional dollar in the future to remove it." AG Brief, p.14.

The Company acknowledged that the five-fold increase does not necessarily appear gradual, but it is an appropriate change considering the historical indications that show a negative 222% net salvage over the last 15 years and a negative 450% net salvage from the most recent 5 years. Spanos Rebuttal PFT, p. 31; 2013 Study, Exhibit JJS-2, p. VIII-9. The Company also acknowledged that the negative 450% 5-year average for net salvage for this account is not appropriate. Spanos PFT, p. 30. The Company argued that the current negative 20% net salvage selected in the 2009 CL&P Rate Case was artificially low to correct the reserve imbalance. CL&P Response to Interrogatory OCC-218. The Company further argued that, recently, older than usual retirements have occurred for this account and that it therefore expects negative net salvage of 100% to 150%. CL&P Response to Interrogatory OCC-218.

The Authority finds the Company's request for an increase to negative 100% net salvage for this account is unsupported by the record. Specifically, when asked for support and justification for this increase in Interrogatory OCC-218, the Company provided only general expectations. Further, there is nothing in the 2009 CL&P Rate Case that supports the Company's claim that the current net salvage value was artificially low. The Authority therefore rejects the Company's request. The Authority accepts the OCC's recommendation of a negative 50% net salvage, which is more than double the current value. The Authority finds this value to more reasonably represent a gradual approach to full recovery for the Company. This net salvage value results in a $3,542,746 reduction in annual depreciation expense based on plant as of December 31, 2013.

iii. Software Amortization

The OCC argued that for Account 303 – Intangible Plant – Software, intergenerational inequity exists and that $44 million of investment in these systems is already amortized but is still in service. Pous Revised PFT, p. 47. This accounts for nearly 30% of the total investment. Id. The OCC recommended extending the amortization period of 6 accounts currently under a 10-year amortization period that are not fully amortized to have their amortization period extended to 15 years. Id., p. 48. The OCC also recommended the $14 million of additions to Account 303 in 2014 and 2015 be amortized over a 15-year period (Company Schedule B-2.1, line 23). Id., p. 49. The OCC further recommended that "any new plant additions subsequent to December

31, 2013 to which CL&P would assign a 10-year amortization period, also be assigned a 15-year amortization period." OCC Brief, p. 108. The OCC claimed that customers who are receiving the benefit of this software are not paying for it and that 30% of the entire software investment is fully recovered, but still used and useful. Response to Interrogatory OCC-348; Pous Revised PFT, p. 47. The OCC also argued that the base rate revenues recovered for an amortization expense become additional return on investment when the system that provides service is fully amortized. Pous Revised PFT, p. 48. The OCC claimed that CL&P ceases to record an increase to the amortization reserve when the individual system becomes fully accrued, but the Company still collects revenue dollars from customers. Id.

According to CL&P, software amortization was not covered in the 2013 Study as it was supported by the Company's accounting group. CL&P Reply Brief, p. 37. CL&P developed estimates for its software amortizations using its accounting group and Company IT professionals and the timeframes they apply are three, five and ten years. Tr. 9/2/14, pp. 709 and 710. CL&P agreed that some software systems have lasted longer than the original estimated life, but did not believe that the Company historically underestimates the useful life of its systems. Id., p. 711.

The Authority concurs that the amortization period is intended to be the period over which the investment is used and useful so that customers that receive the benefit of the asset pay for the asset. Pous Revised PFT, p. 46. The Company owns 67 software assets as of December 31, 2013. Of these, 45 have been fully amortized but are still in service. As mentioned above, this accounts for nearly 30% of the total software investment. However, all but one of the 45 systems cited above are assigned a 5-year amortization period. CL&P Response to Interrogatory OCC-348, Attachment 1. Those systems contributed the most to $44 million worth of plant still in service yet fully amortized. Therefore, the Authority finds it inappropriate to assign a 15-year amortization period for the Company's software systems that are currently assigned a 10-year amortization period since these systems have not contributed to the 30% of fully recovered investment. Further, even though 30% of the systems used by the Company are fully amortized, the OCC acknowledged that it is "reasonably" possible for some software to be taken out of service prior to the end of its amortization period. Response to Interrogatory CL&P-12. For these reasons, the Authority rejects the OCC's recommendation to impose a 15-year amortization period on the software systems that are currently assigned a 10-year amortization period. However, the Authority will adopt the OCC's recommendation that the Company perform a complete and well documented analysis of expected service periods for its existing and new software systems prior to its next rate proceeding. Pous Revised PFT, p. 49.

2. Payroll

The Company originally requested a Rate Year payroll expense of $135.881 million which includes both base and overtime payroll. Schedule C-3.26. Subsequently, the Company revised the request to $135.198 million, a decrease of $683,000 for reduced overtime due to the troubleshooters program. Late Filed Exhibit No. 3, Revised Schedule C-3.26 and Revised WPC-3.26.

a. Full Time Equivalent Positions (FTEs)

The requested Rate Year payroll expense of $135.198 million is for FTEs as of January 1, 2014. CL&P Brief, p. 27. The 4,435.8 requested Rate Year FTEs are comprised of CL&P employees and 26.2% of the cost of the employees working for the Northeast Utilities Service Company (NUSCO). NUSCO provides centralized accounting, environmental, legal, purchasing, security and other services to CL&P and the other affiliates of NU. Id. The Rate Year FTEs were calculated by beginning with the total FTEs as of January 1, 2014 (4610.8 FTEs) and subtracting the NUSCO 175 FTEs that were leaving due to the NUSCO IT reorganization. Id., p. 28. The Company claimed that between the closing of the merger in April 2012 and the end of the Test Year, the NU organization has already reduced staffing levels in other areas, with the savings reflected in the revenue requirement for this case. Joint Rebuttal Testimony of Bowes and Michelson, p. 15.

The Company further stated the positions that remain are needed to operate the distribution system and provide service to customers. Disallowing funding for 131.2 positions would have a substantial adverse impact on the Company's ability to execute its operational and business plan successfully for the Rate Year. Id. During the hearings, when asked to elaborate and explain this statement, the Company witness stated that as to a specific substantial impact he did not know. Tr. 9/12/2014, pp. 2305-2307. The witness went on to state that if the employee level was cut, the Company would have to find a way to handle that workload, which if not handled by one of its internal FTEs, would have to be handled by outsourcing, either as a temporary situation or by another contractor. Id.

The Company was also asked to provide an update on the total number of FTEs as of August 31, 2014. The total FTEs as of that date was 4,253.8. Late Filed Exhibit No. 55, Attachment 1, p. 1. The Company stated that between August 31, 2013 and August 31, 2014, 201 positions opened-up due to attrition. Id. Of the 201 open positions, CL&P is actively seeking to fill 101. Of the remaining 100 open positions, 68 are allocated to CL&P and 32 to NUSCO. In addition, the Company provided a listing of the 101 CL&P and NUSCO open/approved positions as of August 31, 2014. Id., Attachment 2, p. 1. The Company provided the status update as of September 5, 2014, for those CL&P and NUSCO May 31, 2014 Open Positions. Late Filed Exhibit No. 54, Attachment 1, p.1. The Company claimed that open positions are always filled; it does not have vacancy rate information, nor does it track that information. Tr. 9/12/2014, pp. 2295-2297.

The OCC originally proposed a reduction to the Company's requested payroll expense of $6,255,239. OCC Brief, p. 50. This reduction was based on an adjustment of 102 FTE positions for the remaining IT positions that had yet to be vacated. Id. Subsequently, the OCC revised its adjustment to correct the error associated with the actual number of IT positions remaining as of May 2014. Id. The revision, based on June 1, 2014 FTEs and a reduction of the original adjustment from 102 to 29 FTEs (due to the error in calculating the remaining IT employees), resulted in a recommended reduction to the payroll expense of $4,019,037. Id.

The OCC made a further revision to its recommended payroll expense reduction to reflect the FTE count as of August 2014 as shown in the response to Late Filed Exhibit No. 55. Id., p. 52. Using the FTE count as of August 2014, which is 80 positions less than the June 1, 2014 FTE count, the OCC recommended a reduction to payroll expense of $5,575,188. Id.

In its Reply Brief, the OCC recommended that payroll expense be reduced by $5,547,165. OCC Reply Brief, (L&A-1), Schedule 1. The OCC stated that despite the Company's claim that it plans to fill the vacant positions, the evidence clearly indicated the current level of 4,253.8 FTEs is 182 FTEs less than the 4,435.8 requested. From December 31, 2013 through August 31, 2014, the employee count declined from 4,610.8 FTEs to 4,253.8 FTEs and that with the exception of June 2014, each month showed a steady decline in FTEs. Further, the evidence clearly shows that the decline is continuing, and despite the Company's claim that positions are being filled, the net result is that further reductions have occurred. OCC Reply Brief, p. 3.

The AG stated that it supported many of the other downward adjustments to CL&P's rate request that were proposed by the OCC in this matter including a downward adjustment to full time employees. AG Brief, p.23.

The Authority finds that it is highly unlikely for the Company to not have any type of vacancy rate when it determines its payroll expense costs for ratemaking purposes. The fact that the Company stated that some positions take much longer to fill than others is evidence that there are some open positions at any point in time.

In its Written Exceptions, the Company acknowledged the Authority's legitimate concern about the need for the Company to develop a vacancy rate. The Company suggested a vacancy rate of 1.5% which equates to a reduction in the requested FTEs of 66.5. The Authority determines based on its analysis of the evidence presented in the instant proceeding that a reduction of 147 FTEs is more appropriate.

Therefore, the Authority reduces the requested FTE total, through the following adjustments, relative to the 82 active positions as of September 5, 2014 and for the 100 positions which have yet to be approved. Late Filed Exhibit No. 54; Late Filed Exhibit No. 55, Attachment 2, p. 1.

b. 82 Active Positions

Of the 82 active positions, 50 are CL&P and 32 are NUSCO. Fifteen of the 82 positions are listed as being in the reviewing/interviewing/recruiting process and 32 positions are listed as being internal transfers/positions. The Authority determines that these 47 positions are speculative hires or if they are filled from within the organization, are a shifting of payroll dollars from one cost center to another and therefore, are disallowed. The Company's reluctance to track FTE statistics and develop vacancy rates concerns the Authority as it is an appropriate measure for any company to maintain, especially when justifying recovery of an FTE level in a rate proceeding.

Of the 47 FTEs that are disallowed, 28.2 FTEs (47 x 60%) will be reflected as CL&P positions using an average expense base salary of $97,924,[11] benefits loader of 46.2% of base salary and a payroll taxes loader of 8.5% of base salary as provided by the Company in Late Filed Exhibit No. 72. Forty percent or 18.8 FTEs (47 x 40%) are NUSCO positions which are then allocated to CL&P using the Company's allocation factor of 26.2%. The allocated NUSCO FTEs being disallowed are 4.9 FTEs (18.8 FTEs x 26.2%). The disallowed 4.9 NUSCO FTEs will be reflected using NUSCO's average base salary of $87,279,[12] a benefits loader of 46.2% of base salary and a payroll taxes loader of 8.5% of base salary as provided by the Company.

Therefore, the payroll expense adjustment is $1,467,954 as shown in the table below.

Table 19

ADJUSTMENTS FOR "ACTIVE" FTES			
		Disallowed FTEs	**Total**
CL&P FTE Adjustments			
Expense Adjustment for 28.2 FTEs			
CL&P Average Base Salary	$97,924		
Base Salary Expense (46.03%)	$45,074	28.2	$1,271,099
NUSCO FTE Adjustments			
Expense Adjustment for 4.9 FTEs	$87,279		
NUSCO Average Base Salary			
Base Salary Expense (46.03%)	$40,175	4.9	$196,855
Total Disallowed Payroll Expense		33.1	**$1,467,954**

c. 100 Positions to be Approved

The Company stated it is looking to fill 100 positions, which are at various stages of review in the Company's Human Resources organization and within the businesses. Late Filed Exhibit No. 55, p. 2. Of the 100 positions, 68 are for CL&P and 32 are for NUSCO. Id., p. 1. Also, the Company is continually reviewing these additional open positions to ensure that the positions that are approved, sourced and ultimate hired are reflective of the Company's needs. Id. The Authority maintains that it is uncertain whether these 100 positions, which have yet to go through the approval process, will ever come to fruition as positions that will be filled before the Rate Year. The Authority reiterates its concern regarding the lack of a vacancy rate in determining an expected FTE level. Moreover, the Company stated that there still may be merger synergies,

[11] The average base salary of $97,924 for CL&P employees is the average of the three employee class base payrolls for the rate year as presented in responses to Interrogatories OCC-185 and OCC-186 [($103,970+$102,821+$86,981)/3].

[12] The average base salary of $87,279 for NUSCO employees is the average of the three employee class base payrolls for the rate year as presented in responses to Interrogatories OCC-185 and OCC-186 [($96,098+$92,883+$72,865)/3].

which have yet to be determined and that it is always looking for ways to improve efficiencies. Tr. 9/12/2014, p. 2308. The Authority is of the opinion that the synergies would result in a decrease to FTEs rather than creating a need for an increase in FTEs. Consequently, the Authority disallows the 100 positions, 68 for CL&P and 32 positions for NUSCO. CL&P's 26.2% allocation of the NUSCO positions results in a disallowance of 8.4 FTEs. The disallowance of payroll expense for these positions is $3,402,526 as calculated in the table below.

Table 20

ADJUSTMENT FOR 100 POSITIONS YET TO BE APPROVED			
		Disallowed FTEs	**Total**
CL&P FTE Adjustments			
Expense Adjustment for 68 FTEs			
CL&P Average Base Salary	$97,924		
Base Salary Expense (46.03%)	$45,074	68.0	$3,065,060
NUSCO FTE Adjustments			
Expense Adjustment for 8.4 FTEs			
NUSCO Average Base Salary	$87,279		
Base Salary Expense (46.03%)	$40,175	8.4	$ 337,466
Total Disallowed Payroll Expense		76.4	**$3,402,526**

d. Summary of Payroll Expense Adjustments

The total expense portion of payroll disallowed is $4,870,480. It represents a total of $1,467,954 for the active position disallowance and $3,402,526, which is the disallowance for the 100 positions yet to be approved.

e. Payroll Capitalization Adjustments

The Company capitalizes 53.97% of its payroll, which is the balance of payroll that is not expensed (100% - 46.03% expense). This capitalized portion is reflected in the Company's plant and rate base. It is necessary to adjust rate base for the portion of capitalized payroll that is being disallowed.

i. 82 Active Positions

The $1,721,170 of the disallowed capitalized portion of payroll for CL&P's 28.2 FTEs and NUSCO's 4.9 FTEs is calculated in the table below.

Table 21

CAPITALIZATION ADJUSTMENTS			
		Disallowed FTEs	**Total**
CL&P FTE Adjustments			
Capitalization Adjustment for 28.2 FTEs			
CL&P Average Base Salary	$97,924		
Base Salary Capitalization (53.97%)	$52,850	28.2	$1,490,358
NUSCO FTE Adjustments			
Capitalization Adjustment for 4.9 FTEs			
NUSCO Average Base Salary	$87,279		
Base Salary Capitalization (53.97%)	$47,104	4.9	$230,812
Total Disallowed Payroll Capitalization		33.1	**$1,721,170**

ii. 100 Positions to be Approved

The $3,989,449 of disallowed capitalized portion of payroll for the 68 CL&P FTEs and the 8.4 NUSCO FTEs is calculated in the table below.

Table 22

CAPITALIZATION ADJUSTMENTS			
		Disallowed FTEs	**Total**
CL&P FTE Adjustments			
Capitalization Adjustment for 68 FTEs			
CL&P Average Base Salary	$97,924		
Base Salary Capitalization (53.97%)	$52,850	68	$3,593,772
NUSCO FTE Adjustments			
Capitalization Adjustment for 8.4 FTEs			
NUSCO Average Base Salary	$87,279		
Base Salary Capitalization (53.97%)	$47,104	8.4	$ 395,677
Total Disallowed Payroll Capitalization		76.4	**$3,989,449**

f. Summary of Payroll Capitalization Adjustments

The total capitalized portion of payroll disallowed is $5,710,619. It represents a total of $1,721,170 for the active position disallowance and $3,989,449, which is the disallowance for the 100 positions yet to be approved.

g. Payroll Taxes

As a result of the adjustments made to the Company's payroll, the Authority makes the associated adjustments to the Company's payroll taxes. Just as the Company has payroll that is expensed and payroll that is capitalized, so does the Company have both expense and capitalized portions of its payroll taxes.

i. Payroll Tax Expense Adjustment

The disallowed portion of payroll tax expense is $413,968 ($124,775 + $289,193) as a result of the 33.1 active FTEs which are disallowed and the 76.4 disallowed FTEs for the 100 positions yet to be approved. The adjustment is calculated as shown in the tables below:

Table 23

EXPENSE ADJUSTMENTS			
		Disallowed FTEs	**Total**
CL&P Adjustments			
Expense Adjustment for 28.2 FTEs			
Base Salary Expense (46.03%)	$45,074

Payroll Tax Loader (8.5%)	$3,415	8.4	$28,685
Total Disallowed Payroll Tax Expense		76.4	**$289,193**

ii. Payroll Tax Capitalization Adjustment

The disallowed portion of capitalized payroll taxes is $485,390 ($146,300 + $339,090) for the 33.1 active FTEs which are disallowed and the disallowed 76.4 FTEs

for the 100 positions yet to be approved. The calculations are shown in the tables below:

Table 25

CAPITALIZATION ADJUSTMENTS			
		Disallowed FTEs	**Total**
CL&P Adjustments			
Capitalization Adjustment for 28.2 FTEs

Capitalization Adjustment for 8.4 FTEs			
Base Salary Capitalization (53.97%)	$47,104		
Payroll Tax Loader (8.5%)	$4,004	8.4	$ 33,634
Total Disallowed Payroll Taxes Capitalization		76.4	**$339,090**

h. Benefits

As a result of the adjustments made to the Company's payroll, the Authority makes the associated adjustments to the Company's benefits using the benefits loader of 46.2% of base salary as provided by the Company in Late Filed Exhibit No. 72. The adjustments include both the expense and capitalized portions of benefits.

i. Benefits Expense Adjustment

The disallowed portion of benefits expense is $2,250,146 ($678,190 + $1,571,956) as a result of the 33.1 active FTEs which are disallowed and the 76.4

disallowed FTEs for the 100 positions yet to be approved. The adjustment is calculated as shown in the tables below:

Table 27

EXPENSE ADJUSTMENTS			
		Disallowed FTEs	**Total**
CL&P Adjustments			
Expense Adjustment for 28.2 FTEs			
Base Salary Expense (46.03%)	$45,074		
Benefits Loader (46.2%)	$20,824	28.2	$587,242
NUSCO Adjustments			
Expense Adjustment for 4.9 FTEs			
Base Salary Expense (46.03%)	$40,175		
Benefits Loader (46.2%)	$18,561	4.9	$90,948
Total Disallowed Benefits Expense		33.1	**$678,190**

Table 28

NUSCO Adjustments			
Capitalization Adjustment for 8.4 FTEs			
Base Salary Capitalization (53.97%)	$47,104		
Benefits Loader (46.2%)	$21,762	8.4	$ 182,801
Total Disallowed Benefits Capitalization		76.4	**$1,843,157**

i. Summary of Adjustments to Payroll Items

Following is a table summarizing both the expense and capitalization disallowance adjustments made to payroll, payroll taxes and benefits.

Table 31

ADJUSTMENTS	EXPENSE	CAPITALIZED
Payroll	$4,870,480	$5,710,619
Payroll Taxes	$413,968	$485,390
Benefits	$2,250,146	$2,638,342
Totals	**$7,534,594**	**$8,834,351**

j. Capitalized Expense Related Items - Depreciation

Based on discussions in Section II.C.2.i, Summary of Adjustments to Payroll Items and Section II.C.3.e, 401(k) and K-Vantage, the Authority reduces plant-in-service by $8,834,351 for capitalized payroll related expenses and by $185,595 for capitalized 401(k) expense and as a result, reduces depreciation expense. Using the composite depreciation rate of 2.56%, the Authority reduces depreciation expense by $230,911 [($8,834,351 + $185,595) *.0256].

3. Retirement Expense

a. Background

CL&P has a defined benefit pension plan that covers the majority of its existing employees. However, in 2006, CL&P closed entry to its defined pension benefit plan to newly hired non-bargaining employees. Effective January 1, 2006, the Company introduced a new enhanced 401(k)-based benefit called the K-Vantage Program for all new non-union hires and allowed existing employees to opt out with their pension frozen into the new benefit program. All new employees participate in the K-Vantage benefit instead of the defined benefit plan. Peloquin PFT, p. 13. For certain officers, CL&P offers a Supplemental Executive Retirement Plan (SERP) and Non-SERP plans, which are unqualified plans based on IRS rules. The Company offers retiree health care benefits for all retired employees.

a. Pensions

The pension expense is calculated on the basis of the accounting rules set forth in Accounting Standards Codification 715-30 (ASC 715-30). Response to Interrogatory FI-27. The pension expense is based on the following elements, which in total equal net periodic benefit cost.

Service cost
+ Interest cost
- Expected return on assets
+ Amortization of Unrecognized
(Gain)/Loss
Prior service cost
Transition Obligation (Asset)
Net Periodic Pension Cost

Generally, service cost is the increase in projected benefit obligation due to the accrual of benefits that occurred in the current period. Interest cost reflects the growth in present value of projected accrued benefit obligations as they come one period closer to payment. These costs are offset by the expected return on assets, which equals the fair market value of plan assets times the expected long-term rate of return on plan assets. To the extent these components deviate from actual or result from plan changes, the difference accumulates in asset or liability accounts and is amortized over a number of years into (gains)/losses, prior service cost, and transition obligation (asset). To the extent that actual and expected returns on plan assets are different, this is accumulated in unrecognized net (gains) or losses. Affecting each element of net periodic benefit cost are actuarial assumptions such as the discount rate, expected return on assets, and average wage increase.

CL&P requested the following for pension expense in its Application:

Table 32

Test Year Expense 12/31/13	Rate Year Adjustments	Pro Forma Rate Year 2015
$47,213,000	($21,544,000)	$25,670,000

Application, Schedules C-3.27 and WPC-3.27d.

The above request was revised, due to a change in an actuarial assumption, to the following:

Table 33

Test Year Expense 12/31/13	Rate Year Adjustments	Pro Forma Rate Year 2015
$47,213,000	($19,477,000)	$27,736,000

Late Filed Exhibit No. 3, Revised Schedule C-3.27.

CL&P's pension expense is a product of actuarial studies that determine the Company's liability to each pension plan participant, and include assumptions on salary increases, discount rate, and expected long-term rate of return on assets. The Company's actuary calculated actual pension expense to be $47,213,000 in the Test Year ended December 31, 2013, and projected expense of $27,736,000 in the Rate

Year ended 2015. The decrease in pension expense between the Test Year and the Rate Year of $19,477,000 is due to the amortization of net investment gains from 2010 through 2013, and an increase in the discount rate as calculated by the Company's actuary for the Rate Year. CL&P Brief, p. 41.

b. Other Post Retirement Employee Benefits

The Other Post Retirement Employee Benefits (OPEB) expense is calculated on the basis of the accounting rules set forth in Accounting Standards Codification 715-60 (ASC 715-60). Response to Interrogatory FI-15. This statement focuses principally on health care benefits, where the employer promises to provide health benefits after an employee retires. These benefits are grouped together under the name OPEB and the expense is calculated with one additional assumption from pensions which is the healthcare cost trend rate. This represents the expected annual rates of change in the cost of health care benefits currently provided by the post-retirement health care benefit plan.

CL&P requested the following for OPEB expense in its rate application:

Table 34

Test Year Expense 12/31/13	Rate Year Adjustments	Pro Forma Rate Year 2015
$7,771,000	($3,829,000)	$3,942,000

Application, Schedules C-3.27 and WPC-3.27g.

The above request was revised, due to a change in an actuarial assumption, to the following:

Table 35

Test Year Expense 12/31/13	Rate Year Adjustments	Pro Forma Rate Year 2015
$7,771,000	($3,710,000)	$4,061,000

Late Filed Exhibit No. 3, Revised Schedule C-3.27.

CL&P has been pro-active in controlling the growth of retiree healthcare costs through capping the Company's health care subsidies and changing plan designs for both pre-65 retirees and post-65 Medicare eligible retirees. Specifics are that for employees that have retired after 1991, the portion of the cost for medical coverage that is paid for by CL&P is capped at $6,101 per person under age 65 and $2,166 per person over age 65. This lower cap that applies for over age 65 retirees reflects the lower cost to CL&P as a result of retiree enrollment in the federal Medicare program, which is the primary coverage to these individuals. In addition to these limits, employees retiring after 1994 are responsible for additional premium payments based on a retirement age of less than 65 or service with the Company of less than 20 years.

These plan features serve to limit future growth in the Company's retiree health care expense. The portion of post-retirement health care expense associated with capped benefits has grown to 85% as of December 31, 2013. Peloquin PFT, p. 11.

Further efforts to reduce retiree medical expenses resulted in pre-65 retirees being transitioned to the same new medical designs as offered to active employees in 2013. This produced a shift in retiree enrollment in higher cost options toward lower premium and higher deductible options. CL&P reported that this shift is a result of default enrollment in the point of plan option (PPO)-90 plan and a comprehensive communications campaign. For the Test Year, more than 75% of retirees participated in the lower cost plans. Due to this shift to variable out of pocket costs, retirees are encouraged to become more educated about lower cost options in choosing providers and treatment plans which should result in mitigating health care cost inflation. Peloquin PFT, pp. 11 and 12.

Another area CL&P has worked to lower costs is prescription drug expenses. The Company has made significant plan design changes to the prescription drug benefit for Medicare-eligible retirees. In 2013, CL&P introduced a Medicare Part D employer group waiver plan (EGWP) through its pharmacy benefits manager. Retiree participation in the EGWP provides a lower cost as a result of offsetting payments from Medicare in the form of Part D direct subsidy payments, low income subsidies, pharmacy manufacturer reimbursements, and catastrophic reinsurance payments. These payments are returned to retirees, whose subsidy from the Company is capped, through lower monthly premium costs. For grandfathered retirees that do not pay monthly premiums, these payments are an offset to CL&P's cost. In addition, in 2013 the carrier was consolidated for the Medicare supplement and in 2014, the Company updated the plan design for Medicare eligible retirees. These changes eliminate non-Medicare coverage and applies the full Medicare Part B deductible on all participants. Peloquin PFT, p. 12.

In 2007, CL&P implemented a new Post-Employment Health Reimbursement Account (HRA) program, Med-Vantage that supplements benefits offered to employees in K-Vantage. The Company deposits $1,000 annually into a tax-advantaged HRA account for each participant who is age 40 or older, which can be used for post-employment healthcare premiums or expenses. Peloquin PFT, p. 14.

The Authority notes that the Rate Year 2015 expense is $3,710,000 less than the Test Year expense. The Authority's analysis indicates that this is due to investment gains and changes in the forecasted discount rate for 2015.

c. Actuarial Assumptions

The key actuarial assumptions used in determining the Company's pension and OPEB expense are: 1) discount rate; 2) expected return on assets; 3) average wage increase; and 4) health care cost trend rate. The discount rate is used to evaluate the present value of the plan liabilities. The higher the discount rate, the lower the present value resulting in a lower pension and OPEB expense. The expected return is an assumption, not an actual return, and is a product of plan investment mix and the expected earnings on such mix. The higher the assumption, the more the plan

assumes it can earn resulting in lower pension and OPEB expense. The average wage increase is the assumed increase in annual wages for all employees in the plan. The higher the wage increase assumption, the higher the pension expense. The health care cost trend rate is comprised of an initial and ultimate cost trend rates, which is an estimate of future health care costs. The higher the health care cost trend rates, the higher the OPEB costs. The health care cost trend rate applies only to the OPEB Plan and not the pension plan

i. Discount Rate

The discount rate is the rate at which projected benefits are discounted back to a present value. It is used to evaluate the present value of the pension plan and OPEB plan liabilities. The Securities and Exchange Commission (SEC) requires the use of high quality bond yields to calculate the discount rate. In addition, the SEC has specified that discount rates should reflect the duration of a pension plan's liabilities. Response to Interrogatory FI-20.

The Company's actuary, Aon Hewitt (AH), used a yield curve methodology to calculate the discount rate for pension plan and OPEB plan liabilities. To develop its yield curves, AH uses hypothetical double A or greater yield curves represented by a series of annualized individual spot discount rates from 0.5 to 99 years. These spot rate curves are derived from a direct calculation of the implied forward rate curve based on the included bond cash flows. The forward rate curve is a continuous function and as such, this methodology allows the curves to be extended beyond the 30-year maturity period for which corporate bond data is generally available. This matches the IRS corporate bond yield curve methodology used for Employee Retirement Income Security Act (ERISA) funding calculations. Id.

AH used bond data and pricing information provided by Barclays Capital in constructing these yield curves. The bonds are screened to ensure that the resulting rates are consistent with relevant accounting standards and can be actually achieved by a pension or OPEB plan. Specific criteria used are as follows:

1. Each bond issue is required to have an average rating of double A when averaging all available ratings by Moody's Investor Services, Standard & Poor's and Fitch.
2. The universe of bonds includes only non-callable bonds so that the yield to maturity can actually be attained without intervening calls, puts or sinking funds.
3. To ensure marketability each constituent bond issue is required to have at least $250 million par outstanding.
4. Outlier bonds that have a yield to maturity that significantly deviates from the average yield within each maturity group are removed.

Id.

AH receives bond data, from Barclay's Bank, of approximately 6,000 bonds, which is effectively the data set underlying the Barclay's Aggregate Index minus U.S. Government and U.S Government related issuances. Approximately 1,000 bonds meet

the selection criteria for inclusion in the AH curves. On a monthly basis, AH produces the "AA Only Above Median" curve using this data which is calculated from a subset of bonds representing the 50% highest yielding bond issues within each defined maturity tranche of the AA only universe. Using this yield curve methodology, a discount rate of 5.03% was developed for the pension plan and a 4.78% discount rate for the OPEB plan. Id. The Authority is familiar with the yield curve approach and finds it is an acceptable methodology to calculate a discount rate for pension and OPEB expense.

CL&P stated that it will revise the discount rate on its pension and OPEB plans based on information from its actuary AH in the third quarter of 2014. Tr. 9/5/14, pp. 1496 and 1497. The Company submitted a worksheet developed by AH showing revised 2015 pension expense projections based on AA median yield curves**.** In addition, the Company submitted a worksheet developed by Towers Watson showing revised 2015 pension and OPEB expense projections. These work sheets show that interest rates have decreased by about 20 basis points from 4.45% to 4.26%. Using the most recent discount rates, calculated by AH, as of August 31, 2014, resulted in an increase to pension expense of $4.2 million and an increase to FAS 106 expense of $0.6 million. Late Filed Exhibit No. 40.

The Company revised the discount rate to a lower discount rate, at the direction of its actuary. CL&P used a discount rate of 4.26% as an input to calculate pension expense and a discount rate of 4.07% to calculate OPEB expense. Id.; Tr. 9/24/14, p. 2509.

The Authority analyzed the actuarial inputs that are used to calculate the discount rate and finds that the Company is correct in changing its discount rate. The discount rate was revised by CL&P due to changes in market conditions. Based on its analysis, the Authority approves the discount rate of 4.26% for the pension plan and 4.07% for the OPEB plan.

ii. Expected Return on Assets

CL&P developed the expected long-term rate of return assumption of 8.25%, for both the pension and OPEB plans, using input from actuaries, consultants, and economists. Data inputs come from long-term inflation and growth statistics for the economy. In addition, CL&P's expected long-term rates of return on plan assets are based on certain target asset allocation assumptions and expected long-term rates of return on those individual target asset allocations. The following shows the target asset allocation weights and the expected returns for each asset class.

Table 36

Asset Class	Target Weight	Target Returns
Equities		
US Equity	24.0%	9.0%
Non-US Equity	10.0%	9.0%
Emerging Markets	6.0%	10.0%
Fixed Income		
Fixed Income	15.0%	5.0%
High Yield Bonds	9.0%	7.50%
Emerging Market Bonds	6.0%	7.50%
Alternatives		
Hedge Funds	11.0%	7.00%
Real Assets	9.0%	7.50%
Private Equity	10.0%	13.00%

Response to Interrogatory FI-20.

Management at CL&P constructed the rates of return by asset category. These rates of return are based on management's best judgment using publicly available information regarding historical data, adjustments based on current market conditions, as well as their own experience and expectations. Based on this, CL&P management determined 8.25% should be used as the long-term rate of return on assets for the pension and OPEB plans.

A comparison of actual returns on pension plan assets to assumed rates of return on these same assets are as follows.

Table 37

Year	Actual Pension Plan Returns	Assumed Rate of Return
2013	15.0%	8.25%
2012	13.8%	8.25%
2011	2.0%	8.25%
2010	16.8%	8.75%
2009	25.0%	8.75%
2008	-31.1%	8.75%

Response to Interrogatory FI-34.

A comparison of actual returns on OPEB plan assets to assumed rates of return on these same assets are as follows:

Table 38

Year	Union Retiree Health Returns	Assumed Rate of Return
2013	16.2%	8.25%
2012	14.5%	8.25%
2011	-3.5%	8.25%
2010	15.9%	8.75%
2009	25.8%	8.75%

Response to Interrogatory FI-19.

CL&P stated that actual returns on pension plan and OPEB assets will differ from the long term rate of return assumption as a result of short-term market fluctuations. In addition, over the last five years following the 2008 financial crisis, return on plan assets have benefited from strong equity and credit markets. The strong performance of these markets explains most of the difference between the actual returns and the assumed long-term rate of return. Id.

When questioned on the validity of the 8.25% return on plan assets and whether this return should be increased for the Rate Year, the CL&P witness stated:

> Because we outperformed recently, I'd expect future returns to be less because it kind of goes back to a norm. So if anything, those higher numbers in recent years would tend to lower future expectations for rates. . . . . Not only that, my long-term rate of return is a long-term rate that is subject to review by the SEC, our auditors and our actuaries, and we do not know of any other company that is increasing their long-term rate of return and also I don't believe that our auditors would allow us to do that. We wouldn't have any support for it. Tr. 9/5/14, pp. 1498 and 1499.

The most recent return as of June 30, 2014, is reported as approximately 5%. Tr. 9/5/14, p. 1499. The Authority notes that the financial markets are subject to wide fluctuations and, therefore, recent returns may not be the norm for the future. The Authority finds that the assumed ROR of 8.25% for the pension and OPEB plans is reasonable based on the unpredictability of future returns.

iii. Average Wage Increase

The long-term average wage increase assumption is based on current salary increases, the level of promotions, and the level of increases reflected in the union contracts. A higher average wage increase would result in greater benefits earned by plan participants and thus would increase pension expense. The Company used an average wage increase assumption of 3% in its actuarial calculations. Response to Interrogatory FI-20.

A comparison of actual salary increases to assumed salary increases is as follows:

Table 39

Report Date	Year Over Year Change Average Pay	Salary Increase Assumption
2014	3.0%	3.5%
2013	3.0%	3.5%
2012	3.0%	3.5%
2011	3.0%	4.0%
2010	2.9%	4.0%

Response to Interrogatory FI-32.

Differences between the average pay increase and the salary increase assumption occur in every year. This is because the salary rate assumption is based on a long-term future pay increases rather than a one-year period of actual experience. Tr. 9/5/14, pp. 1499 and 1500. In any given year, salary can fluctuate based on overtime and commissions paid to participants in the plan. The Authority finds the 3% salary increase assumption to be reasonable.

iv. Healthcare Cost Trend Rate

The healthcare cost trend rate is an actuarial component of the retiree health care expense. There are two assumptions composing the healthcare cost trend rate, which is the initial assumption and the ultimate assumption. The initial assumption reflects expectations of health care cost increases for retirees in the near term. These increases are based on a number of factors including publically available general industry surveys, actual experience of the Company's retiree population, and experience of other large clients with post-retirement health care plans. The ultimate assumption methodology is developed from a building block methodology. Under this building block methodology, the underlying inflation assumption is established to reflect improvements in technology and additional utilization. In addition, the assumptions used in the valuation of the initial and ultimate trend rates are evaluated against those used by other general and utilities industry companies to ensure comparability. Response to Interrogatory FI-21.

The health care trend affects a decreasing number of older CL&P grandfathered retirees with an average age of 84. The portion of the NU OPEB obligation related to grandfathered retirees is less than 15% of the total plan obligation. As a result, the ultimate trend rate has very little impact given the short period of life expectancy. The remainder of the NU OPEB plan obligation relates to either retiree life insurance or health care for non-grandfathered retirees, which are subject to an employer cost cap. These obligations are not impacted by health care trend rates. In addition, post-65 retiree medical trends have been lower than active trends historically, particularly since unit cost is tied to Medicare allowable costs for the medical component. Id.

CL&P used an initial health care cost trend rate of 6.75% with an ultimate rate of 4.50%. These were developed using the following sources:

1. The 2014 Segal Health Plan Cost Trend Survey conducted in May and June of 2013 indicates that combined medical and Rx trend rates (increase in per capita claims) from 7.6 – 8.0% for PPOs and high deductible health plans (HDHP).
2. PwC's Health Research Institute (HRI) projected a 6.5% medical cost trend for 2014.
3. Sibson Consulting quoted 2014 projected medical trends ranging from 7.9% - 8.4% with Rx trend projected at a 6.3% increase.
4. CIGNA, the third-party administrator that manages the provider network, reported a combined medical and Rx trend of 9.42% for 2014.

Response to Interrogatory OCC-188.

In addition, when asked about whether there may be differences in parts of the country in medical trend rates, the CL&P witness stated that "New England typically is a very high cost area. It's because we have excellent facilities, a lot of very good employers and comprehensive health coverage." Tr. 9/5/14, p. 1507.

The Authority analyzed the above health care trend surveys and finds that they are reasonable. The Authority also finds that the initial health care cost trend rate of 6.75% with an ultimate rate of 4.50% is in the range of reasonableness and is an acceptable actuarial assumption to calculate the cost of the Company's OPEB plan.

v. Conclusion on Pension and OPEB Expenses

The Authority approves CL&P's revised requested pension cost of $27,736,000 for the Rate Year. The Authority concludes that CL&P applied the accounting rules set forth in ASC 715-30 correctly. The Authority finds the actuarial assumptions of discount rate, rate of return on plan assets, and wage increases to be reasonable. The Authority also approves CL&P's revised requested OPEB cost of $4,061,000 for the Rate Year. CL&P applied the accounting rules set forth in ASC 715-60 correctly. Further, the actuarial assumptions of discount rate, rate of return on plan assets, and health care trend rate are reasonable.

e. 401(k) and K-Vantage

A 401(k) plan is a qualified retirement plan under the Internal Revenue Code that allows employees to save a portion of their salary for retirement on a pre-tax basis. Typically, employers match a portion of each employee's contribution with the employee choosing the investment options for the contributions. The Company has two 401(k) plans which is a traditional 401(k) plan and the other an enhanced 401(k) called K-Vantage.

Participation in the K-Vantage program over the past five years has grown steadily. By the end of 2013, approximately 30% of CL&P and NUSCO employees were participating in K-Vantage compared to less than 20% in 2009. Peloquin PFT, p. 15. As of January 2006, the Company closed entry to its defined benefit pension plan to newly hired non-union employees. As an alternative these employees participate in an enhanced defined contribution benefit called K-Vantage. Under K-Vantage, in

addition to the traditional 401(k) match, the Company contributes an amount equal to a percentage of the employees covered pay into a 401(k) account. Peloquin PFT, p. 13. These contributions are based on the employee's age and amount of service which is as follows:

Table 40

Age plus Service	% of Covered Pay
Less than 40 years	2.5%
40 or more but less than 60 years	4.5%
60 or more years	6.5%

Peloquin PFT, p. 14.

The above percentages of covered pay were determined with the intent to produce the needed accrual to provide for a decent level of retirement. This is accomplished through the K-Vantage plan design such that the older an employee is, combined with increased years of service, an additional amount is added to the employee's plan. Tr. 9/5/14, p. 1525.

Non-union employees hired prior to 2006, were offered the opportunity to choose between continuing to earn benefits in the traditional defined benefit pension plan or to opt into the new K-Vantage plan. There were 2.6% of eligible CL&P employees and 7.8% of eligible NUSCO employees that elected to participate in K-Vantage. By 2009, all of the CL&P union employees had voted to participate in K-Vantage. All newly hired employees participate in the K-Vantage program. The Company reported that as is customary with defined contribution plan designs, CL&P employees bear 100% of the risk associated with their investment elections in the 401(k) and K-Vantage plans. Response to Interrogatory FI-6.

CL&P originally requested the following expense for its 401(k) plan which includes the K-Vantage expense:

Table 41

Test Year Expense 12/31/13	Pro Forma Adjustments	Test year Pro Forma	Rate Year Adjustments	Pro Forma Rate Year 2015
$4,391,000	$53,000	$4,444,000	$667,000	$5,111,000

Application, Schedules C-3.27 and WPC-3.27e.

The above request was revised due to a decrease in the NUSCO allocation to the following:

Table 42

Test Year Expense 12/31/13	Pro Forma Adjustments	Test year Pro Forma	Rate Year Adjustments	Pro Forma Rate Year 2015
$4,391,000	$53,000	$4,444,000	$543,000	$4,987,000

Late-Filed Exhibit No. 3, Revised Schedules C-3.27, WPC-3.27e.

CL&P reported that the conservation and load management employee expense was inadvertently included in allocated expenses reported for NUSCO employees. This amount was overstated by $141,000. Tr. 9/5/14, p. 1529; Response to Interrogatory OCC-190. The revised Test Year expense of $4,987,000 does not include the overstatement of $141,000.

The Authority looked for comparisons with other 401(K) programs from electric companies similar to CL&P to determine that the benefits being offered were within norms as the ratepayers fund the 401(k) plans. The Authority reviewed a detailed retirement plan benchmarking analysis prepared in April 2013 by Fidelity Investments as well as an industry benchmarking group survey that included a total of 14 like-sized utilities with revenues over $5 billion.[13] CL&P reported that the survey, last performed in 2013, shows total retirement value for new hires (which consists of 401k and K-Vantage program contributions only) ranks below median (approximately 90% of average) for the combined non-represented and union employees. Response to Interrogatory FI-5; Tr. 9/5/14, p. 1525. After analyzing both confidential studies, the Authority finds that CL&P's 401(k) and K-Vantage programs are within industry norms and reasonable.

CL&P asserted that it must attract and retain qualified employees. This is done through the benefits provided under CL&P's 401(k) Plan, which includes the K-Vantage program. Both are an important part of the total rewards program used to achieve this goal. Response to Interrogatory FI-7; Peloquin PFT, p. 3.

The OCC provided an adjustment to the 401(k) expense due to a payroll adjustment it made. The OCC stated that it employed the participation rate and average cost used by CL&P in its filing. The OCC calculated an adjustment of $132,000 on CL&P and for NUSCO, an adjustment of $129,000, for the Rate Year. The total 401 (k) adjustment, therefore, is $261,000 ($132,000 + $129,000). Schultz PFT, p. 18, Exhibit L&A-1, C-4; OCC Brief, p. 53.

CL&P took exception to the OCC's 401(k) adjustment. The Company stated that the OCC's methodology was based on a simplistic average. It does not account for the fact that CL&P's 401(k) plan costs are increasing as all new employees participate in this plan, rather than the defined benefit pension plan, which was closed to new employees as of January 2006. In addition, CL&P asserted that the OCC failed to recognize that the change in 401(k) expense is not linear based on historical data headcount or participation data. Future costs will be proportionally higher with each new employee due to the K-Vantage contribution (2.5%, 4.5% or 6.5%, based on age and years of service), which does not apply to employees who participate in the defined benefit pension plan. CL&P Reply Brief, p. 51.

[13] These studies were deemed to be proprietary and confidential.

The Authority recognizes how important qualified employees are to the overall goal of serving ratepayers for the Company. Given this, the Authority finds that the 401(k) and K-Vantage plans are useful in attracting and retaining qualified employees, which is a benefit to ratepayers. The Authority approves the Company's 401(k) and K-Vantage plans. However, for the Rate Year of 2015, the Authority finds an adjustment to the $4,987,000 401(k) expense is necessary due to the PURA's adjustment to payroll of $10,581,100 ($4,870,480 + $5,710,619) See, Section II.C.2.i Summary of Adjustments to Payroll Items, Table 31.

To adjust the 401(k) expense based on the Authority's adjusted payroll, the PURA used CL&P's methodology. Based on eligibility requirements and employee participation in the 401(k) and K-Vantage Plans, the Company reported that its contribution percentage can range anywhere from 0% to 6.5%. Therefore, an average contribution rate of 3.25% (6.50%/2) is used as a proxy. Response to Interrogatory FI-119.

The Authority calculated the adjustment to the 401(k) expense as follows:

Table 43

Description	Amount	Calculation
Change in Payroll	($10,581,100)	
Company Average Contribution to Employees 401(k) Plans	3.25%	
Change in 401 (k) Expense (pre capitalized basis)	($343,886)	($10,581,100) * 3.25%
Amount Capitalized	($185,595)	($343,886) * 53.97%
Net Change in CL&P's 401 (k) Expense	($158,291)	($343,886) – ($185,595)

Based on the above calculation, the Authority approves a 401(k) expense of $4,828,709 ($4,987,000-$158,291).

f. Supplemental Executive Retirement Plan

A SERP, which is a non-qualified plan, provides executives with a supplemental retirement benefit in addition to the benefit provided under the qualified plan. CL&P reported that it is a common company practice to provide executives with a benefit that makes them whole for the limits on pensionable earnings that the IRS imposes on qualified pension plans. The objective is for executives to receive a pension that is similar to nonexecutives' pensions relative to their pay. Response to Interrogatory FI-44. CL&P reported that there are 34 current employees eligible for SERP benefits when they retire. There are 51 retired employees and/or spouses currently collecting SERP benefits. There will be no new participants in the SERP because CL&P no longer offers a defined benefit pension plan to new employees. The SERP complies with section 409A of the IRS Code. Responses to Interrogatories FI-43, FI-45, FI-46, and FI-48.

In its Application, the Company requested the following for SERP anticipated expenditures.

Table 44

Test Year Expense 12/31/13	Rate Year Adjustments	Pro Forma Rate Year 2015
$1,680,000	$359,000	$2,039,000

Application, Schedules C-3.27 and WPC-3.27f.

CL&P stated that the Rate Year adjustment of $359,000 is due to pre-capital adjustment for NUSCO, which included allocated NSTAR costs in the rate year expense. This adjustment was partially offset by the discount rate which increased by 79 basis points from the Test Year to the Rate Year from 4.24% to 5.03%. Response to Interrogatory FI-169. The Company did not change its requested SERP expense based on a decrease in the discount rate for the rate year of 2015, which would have meant an increase in the SERP expense. Tr. 9/24/14, pp. 2509 and 2510.

The OCC opposed the Company's SERP expense in its rate case. The OCC defined SERP "as an additional retirement plan, provided to a select few employees, to increase their retirement compensation beyond what the IRS allows in a qualified plan." Schultz PFT, p. 45. The OCC's reasoning to exclude the SERP expense is based on the points cited below:

1. The SERP is available to only those employees that are already highly compensated. Therefore these highly compensated employees move even farther ahead of most of their fellow employees.
2. Employees that receive SERP benefits are already members of CL&P's regular retirement plan.
3. The SERP costs are for employees that are retired and therefore no longer providing service to ratepayers.

Id.

The OCC argued that in the 2009 CL&P Rate Case, the Authority allowed the SERP expense but with two caveats. The first was that the Authority would not authorize recovery from ratepayers of any SERP expense for employees hired after January 1, 2006. Secondly, the Authority recognized that SERP expense should not increase in the future since the SERP benefits are existing costs for the majority of those retired or inactive employees hired prior to 2006. Schultz PFT, p. 46.

The OCC's analysis shows that the SERP expense has increased significantly from the 2009 CL&P Rate Case in which CL&P included SERP costs of $1,282,000 in the first rate year and $1,277,000 in the second rate year. In the instant proceeding, the Company has $1,680,000 in the Test Year with a further increase of $359,000 in the Rate Year. The OCC argued that for an expense that should not have increased, the "jump" from $1,277,000 in the 2009 CL&P Rate Case to $2,039,000 is egregious. Schultz PFT, p. 47.

The OCC recommended a SERP adjustment to remove the entire $2,039,000 from the Rate Year. The OCC believes that this adjustment is consistent with the Authority's ruling in the Decision dated June 30, 2009 in Docket No. 08-12-06, Application of Connecticut Natural Gas Corporation for a Rate Increase. In that Decision, the Authority disallowed all costs related to both the Energy East Corporation SERP and the Excess Plan. However, if the Authority were to allow a portion of the SERP expense, the OCC recommended the removal of costs above $1,277,000, as the 2009 CL&P Rate Case stated that costs should not increase, which would be a reduction of $762,000 ($2,039,000 - $1,277,000). Id. The OCC stated that it is not recommending that the SERP be discontinued, but that CL&P's shareholders, not the ratepayers, pay for the costs. OCC Brief, p. 76.

The OCC also recommended that in conjunction with the removal of SERP costs, the offset to rate base for the SERP reserve, net of accumulated deferred income taxes, be removed, which would increase rate base by $2.128 million. The OCC made this adjustment but noted that only a portion of the net reserve be adjusted since ratepayers have funded the cost and are entitled to be credited for advancing those funds. Schultz PFT, pp. 47 and 48, Exhibit L&A-1, Schedule C-7; OCC Brief, p. 77.

The AG asserted that the Authority reject CL&P's proposal to collect any SERP expense from ratepayers, which would result in a reduction in revenue requirements of $2.0 million. The AG cited the Authority's June 30, 2009 Decision in Docket No. 08-12-06 and the Decision dated July 17, 2009 in Docket No. 08-12-07 Application of The Southern Connecticut Gas Company for a Rate Increase, where the Authority disallowed SERP expense based on the poor economy. AG Brief, pp. 17 and 18.

CL&P advocated that the SERP expense benefits ratepayers since it is necessary for the Company to offer a compensation and benefit package that correctly compensates executives with particular experience, skills and qualifications. These executives have a range of employment opportunities due to their skill levels that carry with them a certain level of compensation and benefits. As such, it becomes necessary for CL&P to offer SERP benefits to these individuals to attract them to the Company. These executives hold positions with a relatively substantial amount of responsibility and manage the work of many other employees. Hiring qualified executives is important to customers since these individuals' decisions affect a range of matters pertaining directly to the cost and quality of utility service provided to customers. Response to Interrogatory FI-49.

CL&P stated that the Authority consistently has allowed recovery of its SERP expense recognizing that the costs are "common practice among companies with qualified defined benefit pension plans." 2009 CL&P Rate Case Decision, pp. 64 and 65. In addition, CL&P cited the January 22, 2014 Decision Docket No. 13-06-08, finding that SERP expense "is an appropriate expense of doing business." CL&P Brief, pp. 49 and 50.

CL&P took exception to the OCC and AG argument to disallow SERP costs. The Company stated that the OCC and AG recommendation to disallow CL&P's costs for the SERP conflicts with established PURA precedent and the 2009 CL&P Rate Case Decision, which allowed recovery of these costs. The Company notes that while the

OCC and AG argues that the disallowance of SERP costs was supported by the June 30, 2009 Decision in Docket No. 08-12-07, CL&P asserts that they neglected to mention that the SERP ruling in that Decision was overturned by the January 2014 Decision in Docket No. 13-06-08, which allowed recovery of SERP costs. Tr. 9/5/14, pp. 2039 and 2040. In addition, the Company argued that the OCC's argument is flawed when requesting a cap on the recovery of SERP costs at $1,277,000 based on language in the 2009 CL&P Rate Case Decision. CL&P Reply Brief, pp. 50 and 51.

The Authority analyzed the SERP actuarial statements and finds them to be acceptable. Protected Response to Interrogatory FI-47. The SERP expense is driven by the actuarial discount rate. The Company testified that the change in the discount rate affected the SERP as it did pension and OPEB expense; however, the Company did not reflect the change in the discount rate as an increase in the SERP expense. The Company indicated that it does not update the SERP expense as frequently as the pension and OPEB expense. Tr. 9/24/14, p. 2509.

The Authority notes that the OCC's witness acknowledged that the Decision language on which he relied did not refer to cost changes that could occur due to active employees covered by the SERP. Tr. 9/5/14, pp. 2035 and 2036. The witness asserted that the SERP is for employees no longer providing service to the Company. However, during cross-examination, he admitted that the plan also includes active employees and that costs could change from year to year due to changes in the number of active employees. Tr. 9/5/14, pp. 2035 and 2036, 2039. The Authority determines that the 2009 CL&P Rate Case capped the SERP expense at $1,277,000 in the second rate year and the $1,282,000 in the first rate year relates only to the number of employees entering the SERP. It does not relate to the actuarial calculation of the discount rate, which is a major component of the SERP expense. The SERP expense is capped based on the fact that no new employees after January 1, 2006, are allowed in the SERP but that expense can change based on actuarial calculations. This is evident from the language in the 2009 CL&P Rate Case, which stated the following:

> The Department understands that it has been common practice among companies with qualified defined benefit pension plans to provide executives with this additional benefit, however, with the introduction of the new enhanced 401(k) plan known as the K-Advantage Program, any officers hired after January 1, 2006 will no longer be eligible to participate in SERP. The Department recognizes that the SERP expenses should not increase in the future since the SERP benefits are existing costs for the majority of those retired or inactive employees hired prior to 2006. Therefore, the Department will allow the costs associated with the existing SERP benefits as it has in past rate cases, however, the Department will not authorize the recovery by ratepayers of any SERP expenses for those hired after January 1, 2006.
>
> 2009 CL&P Rate Case Decision, pp. 63 and 64.

The Authority finds that the SERP expense should be recoverable by the Company for the same reasons as stated in its last rate case. The SERP has been a common practice among companies with qualified defined benefit pension plans to

provide executives with this additional benefit. The Authority approves the SERP expense of $2,039,000 since it is based on an actuarial calculation.

g. Non-Supplemental Executive Retirement Plan

The Non-SERP account is used to record expenses related to specially negotiated post-employment benefits, including pension enhancements not covered by the NUSCO Retirement Plan or the SERP. Such enhancements are normally provided in the hiring agreements to make up for benefits lost at previous employers by some mid-career hires or as part of a separation agreement with NU. As with SERP, Non-SERP benefits have been necessary to retain some qualified personnel and as a special retention arrangement. Tr. 9/5/14, pp. 1533 and 1534.

The Authority finds that this retention of employees benefits ratepayers since it produces a well-run company. Currently, there are 60 current or former CL&P and NUSCO employees whose expense is recorded in the Non-SERP account. Response to Interrogatory FI-122. CL&P has provided a Non-SERP benefit to one employee that was hired after January 1, 2006. This Non-SERP benefit included separation benefits as part of the individual's employment agreement and continuation of certain health benefits. CL&P recorded no expense amount included in the Rate Year for any of the Non-SERP costs associated with this individual. Response to Interrogatory FI-123.

The Non-SERP is a non-contributory plan. The benefit payments that are made to participants are first contributed from CL&P to the trust and then the funds are immediately disbursed to participants. Response to Interrogatory FI-121. There were no NUSCO employees participating in the Non-SERP hired after January 1, 2006, and therefore, the Non-SERP expense does not reflect any changes allocated to CL&P from NUSCO. Response to Interrogatory FI-124. In its Application, the Company requested the following to reimburse for Non-SERP anticipated expenditures.

Table 45

Test Year Expense 12/31/13	Rate Year Adjustments	Pro Forma Rate Year 2015
$1,203,000	($300,000)	$903,000

Application, Schedules C-3.27 and WPC-3.27g.

The Company did not change its requested Non-SERP expense in the Rate Year despite changes in the discount rate. Tr. 9/24/14, pp. 2509 and 2510.

The OCC opposed the Company including its Non-SERP expense of $903,000 in its rate case. This expense is comprised of $230,000 of CL&P expense and $673,000 of NUSCO allocated costs. Schultz PFT, p. 48. The OCC recommended the removal of the entire Non-SERP expense of $903,000. However, the OCC is not recommending that Non-SERP benefits be discontinued but that these costs be borne by shareholders. Schultz PFT, p. 50. The OCC defined Non-SERP as additional pension plans that go beyond the Company's regular retirement plan and the SERP as well. The Non-SERP expense relates to individually negotiated post-employment benefit agreements.

Schultz PFT, p. 48; OCC Brief, p. 77. The OCC argued that it is not appropriate for ratepayers to be responsible for this Non-SERP retirement package expense since it is beyond what most of CL&P's employees receive and beyond what most ratepayers receive, if they do in fact have retirement packages at all. Schultz PFT, p. 49.

The OCC noted that there is only one active employee and 60 retirees from CL&P and NUSCO receiving Non-SERP benefits, which is a reason ratepayers should not be responsible for these costs. Since the majority of the Non-SERP expense relates to former employees, it is obvious that ratepayers are not receiving current benefits from these costs. Id. The OCC also recommended that, as part of the adjustment to remove Non-SERP costs, CL&P's reserve offset to rate base, net of accumulated deferred income taxes, be removed. This would result in an increase to rate base of $406,000. The OCC made this adjustment and suggested that an argument can be made to keep the reserve as an offset to rate base because ratepayers have funded this expense and as such, should be credited for that funding. Schultz PFT, p. 50.

CL&P claimed that the Authority previously approved Non-SERP expenses since it is a benefit to employees that are a "common practice among companies with qualified defined benefit pension plans" as stated in the 2009 CL&P Rate Case Decision, pp. 64 and 65; CL&P Brief, pp. 41 and 42.

The Authority, in the 2009 CL&P Rate Case, stated the following:

> As with SERP benefit costs, Non-SERP benefits currently exist for those employees hired prior to January 1, 2006 and were part of the hiring agreements to originally retain those employees. The Department understands that this Non-SERP plan is a form of a post-employment or pension enhancement benefit, so it is only logical that the majority of these employees have since retired or become inactive. The Department does not find it fair to terminate recovery of an existing benefit that has been allowed recovery in the past.
>
> 2009 CL&P Rate Case Decision, p. 65.

The Authority also allowed the Non-SERP benefit in the Company's rate case in the Decision dated January 28, 2008, in Docket No. 07-07-01, Application of CL&P to Amend Rate Schedules.

The Authority analyzed the actuarial statements on the Non-SERP in the response to Protected Interrogatory FI-9 and finds them to be acceptable. The Non-SERP expense is driven by the actuarial discount rate. The Company testified that the change in the discount rate affected the Non-SERP as it did the pension and OPEB expense; however, the Company did not reflect the change in the discount rate as an increase in the Non-SERP expense. The Company indicated that it does not update the Non-SERP expense periodically throughout the year as is the practice for the pension and OPEB expense. Tr. 9/24/14, p. 2509. The Authority approves CL&P's Non-SERP cost of $903,000 since it is an ongoing expense and should be recoverable by the Company.

h. Allocations to CL&P from Subsidiaries on Retirement Benefits

Allocations from NUSCO are made through direct charges to the operating company that benefitted from the charge whenever possible. When costs cannot be identified as being provided to one specific company or business segment, or when direct charging is not otherwise feasible, cost allocation methodologies are used. Late Filed Exhibit No. 36. These methodologies vary with the business unit, department and cost control center. The allocation of costs for NUSCO employees is based on the NUSCO employees' total payroll, both directly charged and allocated through the use of the NUSCO charging account unit (CAU) 99 allocation rate budgeted for each year. This is referred to as the 9C allocation for the Test Year and rate C7 for the Rate Year. Responses to Interrogatories FI-152, FI-153, FI-154, FI-155, and FI-156.

The Authority approves the allocation of pension, OPEB, SERP and Non-SERP costs for NUSCO employees to CL&P based on the Authority's review of the calculations of the 9C allocation for the Test Year and rate C7 for the Rate Year. The Company's allocation methodology, for retirement benefits, is consistent with cost allocation methodologies used in prior rate cases. However, the NUSCO 401(k) cost allocated to CL&P was changed due to changes on NUSCO payroll allocated to CL&P.

Northeast Nuclear Energy Company (NNECO) is a subsidiary of NU and was the agent for Northeast Utilities system companies as well as other New England utilities in operating and maintaining the Millstone Nuclear Generation facilities. NNECO pension and OPEB expenses are allocated to CL&P based on CL&P's 81% ownership of NU's share of the Millstone units prior to their sale. This is based on the 2009 CL&P Rate Case Decision which stated that, "[t]he Department concurs with CL&P's 81% allocation of the NNECO pension costs, and finds them properly recovered in CL&P's total pension and OPEB expense." 2009 CL&P Rate Case Decision, p. 61.

The Authority approves the allocations to CL&P from NNECO for pension and OPEB expenses since this was the intention in the Authority's Decision in Docket No. 99-09-12, Application of The Connecticut Light and Power Company and The United Illuminating Company for Approval of Their Millstone Nuclear Generation Assets Divestiture Plans. In the subsequent Millstone purchase and sale agreement, the Authority required CL&P to be responsible for the NNECO pension and employee benefit costs with CL&P's share calculated at 81% of the pension and OPEB costs.

i. Capitalization

CL&P capitalized a portion of its retirement benefits expense into rate base. To the extent that employees are doing capital work, a portion of their benefits and pension costs are capitalized along with their direct labor costs. The Company indicated that the amount of pension expense that is capitalized is based on the payroll that is capitalized. The actual capitalization amounts recorded on the Company's books reflect an allocation of employee benefits, payroll taxes and insurance to expense and capital consistent with how payroll was distributed and recorded in the Test Year. Responses to Interrogatories FI-8, FI-99, FI-103, FI-110, FI-111, and FI-118. The Authority

reviewed the Company's capitalization calculations and made certain adjustments See Section II.D.3.c Capitalized Expense Related Items.

j. Consultant/Actuarial Fees

CL&P requested $310,000 for consulting/actuarial fees on Schedule C-3.27 for both the Test Year and Rate Year. This is broken down as follows:

Table 46

Vendor Name	Description	($000's)
AON/Hewitt and Associates	Actuarial Services for the Pension Plans	$149
Towers Watson/Perrin	Actuarial Services for the OPEB Plans/ Benefit Consulting Services	$602
Fiondella, Milone, & Lasaracina LLP	Consulting Services/ Benefit Audits	$230
	Total NUSCO Billing	$981
	Total Percentage Allocated to CL&P Distribution	31.55%
	Total Amount Allocated to CL&P Distribution (Schedule 3.27)	$310

Response to Interrogatory FI-51.

The history of this expense is shown by the following:

Table 47

Description	2008	2009	2010	2011	2012
Actuarial Services for the Pension Plans	$91,000	$86,000	$124,000	$66,000	$123,000
Actuarial Services for the OPEB Plans/ Benefit Consulting	$591,000	$455,000	$472,000	$320,000	$238,000
Consulting Services/ Benefit Audits	$64,000	$64,000	$63,000	$70,000	$33,000
Total CL&P Distribution Expense	$746,000	$605,000	$659,000	$456,000	$394,000

Response to Interrogatory FI-151.

The actuarial and benefit consultant expenses are for costs allocated from NUSCO based on different allocator rate codes. CL&P determined that the 31.55% should be a blended rate derived from the 99 allocator rates, and not reflect the other allocators used to allocate costs in the Test Year. CL&P provided its calculation showing how the 31.55% was derived along with a calculation by individual rate code that is more indicative of how these costs were actually allocated in the Test Year.

Response to Interrogatory FI-50. The Authority analyzed the calculation and finds it is correctly done and appropriate.

The Authority does not have an issue with this expense since it has been trending downward. Based on the Authority's experience and judgment, $310,000 seems reasonable and hereby approves CL&P's $310,000 request for actuarial/consulting expenses.

4. Rate Case Expense

The Company requested $1.5 million for rate case expenses associated with the current proceeding, which would be amortized over a seven-year period. Schedule WP C-3.34, p. 3. This cost is approximately $1.3 million more than the rate case expense of $211,000 in the Company's previous rate case. The $1.5 million includes $100,000 for an ROE witness, $350,000 for a depreciation witness, $500,000 for legal services, $300,000 for the OCC's consultants, $100,000 for other external costs and $150,000 for incremental costs. Response to Interrogatory OCC-169, p. 1.

The OCC initially recommended a reduction to rate case expense of $560,000 and an annual amortization expense of $80,000. The OCC stated that ratepayers should only be responsible for prudently incurred costs and these costs are excessive. The OCC recommended that the ROE witness costs be reduced by $60,000, the depreciation witness costs reduced by $200,000, legal fees reduced by $250,000 and the OCC fees reduced by $50,000. OCC Brief, p. 74. The OCC stated there is nothing to demonstrate that the Company produced a more thorough or informative application as a result of this dramatic increase in rate case expense. Id. The OCC also claimed that throughout this docket, the Company has repeatedly failed to meaningfully respond to relevant discovery and that CL&P failed or refused to provide its cost of service study, evidence requested regarding incentive compensation, approval of capital expenditures and system resiliency spending among other items. Id.

Subsequently, the OCC recommended that the entire rate case expense be disallowed. OCC Reply Brief, p. 9. The OCC reiterated that CL&P repeatedly denied it access to documents requested in discovery. Id. CL&P then attempted to use some of the documents that it failed to provide to impeach the very witnesses who had requested those documents and that this type of gamesmanship should not be tolerated. Id.

The AG did not address the rate case expense specifically. Rather, it stated that the Authority should make the adjustments proposed by the OCC. AG Reply Brief, p. 11. The Company did not address the issue of rate case expense in either its brief or its reply brief.

The Authority considers the requested rate case expense to be unjustified. The projected expense for the Rate Year is an increase of 611% [($1,500,000-$211,000/$211,000] over the 2009 CL&P Rate Case. The Authority disallows $510,000 of the requested $1.5 million as follows: the ROE witness costs should be reduced by $60,000; the depreciation witness costs reduced by $200,000; and the legal fees

reduced by $250,000. The allowed costs of $990,000 ($1,500,000 - $510,000) provide for a substantial increase when compared to the 2009 CL&P Rate Case.

The amortization period for the allowed costs of $990,000 will be four years rather than the seven years requested by the Company. The Authority determines that the seven-year amortization is excessive, considering the Company will be filing another rate case in 2017. Moreover, in its last rate case, the Company recovered the $211,000 rate case expense in one year. Typically, the Authority has allowed amortization periods for rate case expense from three-five years. As a result, the annual amortization expense for rate case expenses increases to $248,000 per year from the $214,000 proposed by the Company.

5. Residual O&M

Residual operation and maintenance (O&M) expense represents the portion of Test Year expenses that CL&P specifically did not analyze based on the size of the dollar amounts involved. Mahoney PFT, p. 44. The Authority typically allows utilities a residual O&M expense category since, without this adjustment, a utility would not be made whole for increases in its O&M expenses not adjusted for elsewhere.

Specific analysis of CL&P's original residual O&M request shows total Test Year O&M expenses, for the Test Year ended December 31, 2013, of $381,729,000. From these total Test Year O&M expenses, CL&P determined $2,513,000 to be Test Year residual O&M expenses. CL&P originally requested a Test Year pro forma adjustment of $1,005,000 which provides for a rate year residual O&M expense request of $3,518,000 ($2,513,000 + $1,005,000). Schedule WPC-3.31. CL&P revised its residual O&M expense request due to an accounting error that was discovered during this proceeding. The Test Year expense of $2,513,000 remained the same. A Test Year pro forma adjustment was made of $2,122,000 for a rate year pro forma expense of $4,635,000 [$2,513,000 + $2,122,000]. Response to Revised Interrogatory FI-40; Late Filed Exhibit No. 3; Revised Schedule C-3.31; Revised Schedule WPC-3.31.

The Company reported that the residual O&M expenses shown on Schedule C-3.31 generally exclude all significant fixed and contractual expenses. Almost all fixed and contractual expenses are material in nature and therefore would be captured in a specific C schedule. Response to Interrogatory FI-36. CL&P reported that Test Year total operating expenses were charged to over 500 accounts and sub-accounts. For purposes of this proceeding, CL&P employed the following steps to ascertain the most material expenses and specific adjustment to those:

1. For CL&P Distribution and NUSCO, costs allocated to CL&P Distribution Test Year expenses were broken down into cost control center (CCC) levels by direct costs.
2. CL&P then analyzed activities and sub activities to determine the different groupings of costs that would be presented on specific C Schedules for the Test Year.
3. CL&P analyzed these activities and sub activities to determine the nature of the expense, identify significant changes that affected the Test Year, and to estimate the rate year level of expense. This analysis further refined the

categorizing of common expenses for rate case schedules of various expenses such as insurance, telecommunications, depreciation, etc.
4. Expenses determined to be unrelated to the major categories of expenses or immaterial on a stand-alone basis then became a residual O&M expense.
5. CL&P continued to revisit various expense adjustments as needed to ensure that the residual amount was at a level that was considered reasonable given the amount of Test Year expenses and representative of a Rate Year level.

Response to Interrogatory FI-39.

During cross-examination the Company witness outlined the accounting process to ensure that the residual expenses are not included in other C schedules expense accounts. Tr. 9/24/14, pp. 2470 and 2471.

In its original filing, the Company made pro forma adjustments of $1,005,000 to the residual O&M expenses which are detailed in the following:

1. In March 2013, CL&P made an accounting adjustment correction of $1.442 million for storm costs that were not properly coded. This correction was made in the Company's test year in Account No. 593.
2. In April 2013, the State of Connecticut reimbursed CL&P $2.553 million for an overpayment of the State Economic Recovery Reduction Bonds. The Company removed this credit from the test year since it is a one-time credit adjustment in Account No. 930.
3. In December 2013, CL&P recorded $106,000 in payments in error. In January 2014, these payments were corrected.

Response to Interrogatory FI-40; Mahoney PFT, p. 44.

The Company, upon further review of its residual O&M expenses, stated that it found an error in its accounting. The pro forma adjustment of $1.442 million was done in error in the Test Year. Response to Revised Interrogatory FI-40. In addition, to the net credit of $1.442 million, CL&P found an offsetting debit, which resulted in no impact to the Test Year ended December 31, 2013. As such, the Company now indicated it should not have adjusted its residual O&M expenses by $1.422 million in its original filing. Revised Response to Interrogatory FI-114.

The accounting entries for the derivation of the $1.442 million, for storm expenses, are as follows:

Table 48

Month	Account No.	$ Amount	Description
March 2013	59306	1,441,500	Transfer to Reserve
March 2013	59306	(2,576,300)	True-up of Deferred Storm Balance
March 2013	59306	(2,039,000)	True-up of Deferred Storm Balance
March 2013	59306	108,300	True-up of Deferred Storm Balance
March 2013	59306	246,200	True-up of Deferred Storm Balance
March 2013	59306	2,819,300	True-up of Deferred Storm Balance
Total		$1,441,500	

Revised Response to Interrogatory FI-114, Attachment 1.

The journal entry for the $1,441,500 is as follows:

Table 49

Account No.	Account Description	Debit	Credit
59306	Overhead lines, distribution and maintenance (OH Distr Mntc A)	$1,441,500	
182SU	Contra – 182ST		$1,441,500
Total		$1,441,500	$1,441,500

Revised Response to Interrogatory FI-114, Attachment 1, p. 2.

The purpose of the above journal entry was to record the reserve for incremental deferred costs related to true-ups to the five deferred storms recorded in March 2013. Revised Response to Interrogatory FI-114, Attachment 1, p. 2; Tr. 9/5/14, p. 1461.

The derivation of the net total of the adjustment for the State Economic Recovery Reduction Bonds is as follows:

Table 50

Date	Account No.	Amount	Description
April 2013	93099	($2,553,000)	Reverse Reserve on CL&P Etc. - 04/13
December 2013	90800	$74,000	CL&P Corporate Relations Advertising Account (Corp Rel Acct)
December 2013	90800	$1,000	CL&P Corp Rel Acct
December 2013	90800	$26,000	CL&P Corp Rel Acct
December 2013	90800	$4,000	CL&P Corp Rel Acct
December 2013	90800	$1,000	CL&P Corp Rel Acct
Total		($2,447,000)	CL&P Corp Rel Acct

Revised Response to Interrogatory FI-40, Attachment 1, p. 1.

When questioned why the residual O&M expense request increased from its original application, the Company witness stated that it was due to a credit of ($2.477) million in residual O&M for the economic recovery bonds as a result of over payment by the state of these bonds. The credit came back from the State of Connecticut to CL&P

and as such the Company needed to remove that credit. CL&P took the Test Year amount and increased it by ($2.477) million. Tr. 9/24/14, pp. 2490 and 2491.

The Authority recognizes the revision of CL&P's journal entries resulted in an increase in residual O&M expense. After analyzing CL&P's revised journal entries, the Authority finds the journal entries to be correct.

CL&P's request of residual O&M expense does not reflect an inflation factor. It did not use an inflation factor to determine its residual O&M expense for the Rate Year based on the 2009 CL&P Rate Case Decision. This Decision allowed CL&P to recover Test Year expenses only. Response to Interrogatory FI-39.

In addition, since this is the first rate case filed approximately two years after its merger with NSTAR, it has not included an inflation factor on residual O&M expenses due to merger-related savings. It is the Company's expectation that merger related savings would be achieved within the first five years following the merger, which was reflected in the net benefit analysis at the time. As such, the exclusion of an inflation factor in this five–year time period is consistent with the expectations from the merger. Response to Interrogatory FI-117.

CL&P discovered several accounts that were included in residual O&M expenses that should not have been:

Table 51

FERC Account No.	Account Name	Amount
90500	Miscellaneous Customer Account Expense	$143,167
921105	Office Expense Building	$63,819
Total		$206,986

Late Filed Exhibit No. 39.

The Company also reported that $106,000 was incorrectly charged to CL&P. In the Company's analysis of the Test Year residual O&M expenses, it was discovered that these costs were for the low income special needs program payable to the Boathouse Group in December 2013. These costs should have been recorded to the Systems Benefit Charge (SBC) and CL&P corrected the accounting in January 2014. An analysis of bank records shows the breakdown of these costs as follows:

Table 52

$ Amount	Payment Reference No.
780.98	038147500000
4,269.33	138147500000
26,032.50	256747500000
929.88	338147500000
73,909.90	828147500000
$105,922.59	

Response to Interrogatory FI-147.

CL&P removed these accounts totaling $312,909 ($206,986 + $105,923) from the Test Year residual O&M expenses. The Authority agrees that these accounts should be excluded from the residual O&M.

The Authority examined the Company's residual O&M expenses for certain accounts that historically should not be included as a residual O&M expense. CL&P's witness stated that these expenses (i.e., non-industry dues and memberships, scholarships, charitable contributions and expenses for holiday parties) have been excluded from the residual O&M expenses. Tr. 9/5/14, pp. 1475 – 1478. The Authority's analysis indicates that these expenses are not included in the residual O&M.

The summary of changes the Company made to their original residual O&M expense request is as follows:

1. A decrease of $119,000 for officer's expenses included in the Company's Test Year.
2. Removal of a pro-forma adjustment for $1.442 million that was inadvertently adjusted. At the time of the Company's filing, it was unaware of an offsetting credit that was recorded in the Test Year as well.
3. A decrease of $207,000 for miscellaneous costs included in the Company's Test Year.

Late Filed Exhibit No. 3.

The Authority analyzed changes to the residual O&M expense of a Test Year pro forma adjustment amount of $2.121 million. These changes include a decrease of $119,000 in officer's expenses and a decrease of $207,000 in miscellaneous costs. The Authority approves these changes as filed in Late Filed Exhibit No. 3. The Authority examined the group of accounts totaling $4,635,000 for the pro forma rate year. The Authority's analysis focused on the contents of each individual account, whether the expenses were adjusted elsewhere in the Application, and whether these expenses would be recurring. The Authority finds that all the accounts that represent the residual O&M expenses of $4,635,000 are approved as a residual O&M expense. CL&P has excluded various accounts from the residual O&M expenses and are not in the total of the $4,635,000 residual O&M. Based on the Company's adjustments, the

Authority has no further adjustments to the revised residual O&M expense of $4,635,000.

6. Board of Directors Expense

The Company included $583,000 in its Application for the Board of Directors (BOD) expense. CL&P stated that its share of the Rate Year BOD expense is a legitimate business expense that should be recovered in rates. CL&P Reply Brief, p. 63.

The OCC recommended that the BOD expense be reduced by 75% because the role of the Board of Directors is to protect the interests of the Company's shareholders and ratepayers receive little, if any, benefit from this expense. OCC Brief, p. 78. The OCC noted that the January 22, 2014 Decision in Docket No. 13-06-08:

> …that the same 75/25 sharing of this expense between shareholders and ratepayers is appropriate and consistent with recent Board of Director's expense adjustments made in Decisions issued by this Authority.

The OCC stated that the Company provided BOD meeting minutes that were redacted to the point where the vast majority of text had been blackened out and that the BOD's activities were not transparent or open to the Company's customers and regulators. For this reason, the OCC recommended that the entire costs for the BOD be charged to shareholders as a below-the-line cost and removed from revenue requirements. Id.

The Authority finds that the main objective of the BOD is to protect the interest of the Company's investors or shareowners. Ratepayers may indirectly benefit from the activities of the BOD; however, ratepayers are not the focus of the BOD decisions. Consistent with the determinations in previous Decisions regarding BOD expense and Directors' and Officers' Liability Insurance (DOL) expense, the Authority allows only 25% of BOD costs in rates. Hence, the allowed BOD costs are $145,750 ($583,000 x 25%) and the disallowed costs are $437,250 ($583,000 - $145,750).

7. Directors' and Officers' Liability Insurance

CL&P requested $467,000 for DOL insurance expense. The Company stated that DOL is a legitimate business expense of publicly traded corporations because it protects directors and officers from lawsuits brought by shareholders, including unmeritous and frivolous lawsuits. CL&P Reply Brief, p. 61. Also, no one would serve on a board of directors of a publicly traded corporation without such insurance. Id. Furthermore, CL&P stated that the OCC failed to identify a single publicly traded corporation that does not purchase DOL insurance for its directors and officers and for that and the other stated reasons, the Authority should reject the OCC's requested reduction. Id.

The OCC agreed that DOL protects the officers of the Company from lawsuits brought against them by shareholders that arise as a result of decisions that they make while performing their duties. Therefore, the shareholders, who receive the payout, are

the primary beneficiaries of this insurance. Ratepayers receive very little of the benefit and should not be responsible for all of the costs. OCC Brief, p. 75. The OCC noted that the Company failed to recognize that many legitimate expenses (e.g., image building advertisements, lobbying expenses) are not recoverable. Id.

The OCC recommended the disallowance of the entire expense of $467,000. However, if the Authority determines that the costs should be shared, the OCC recommended a 75/25 split between shareholders and ratepayers respectively, a reduction of $350,000. Id., p. 76. The OCC also stated that this adjustment is consistent with the Decision in Docket No. 13-06-08. Id.

The AG indicated that the Authority should reject CL&P's request to have ratepayers fund 100% of the Company's DOL insurance and, consistent with the Authority precedent, allow no more than 25% of this cost be allocated to ratepayers. AG Brief, p. 16.

The Authority finds no convincing reason to deviate from its previous treatment of DOL insurance. Consistent with the determinations in previous Decisions regarding BOD expense and DOL expense, the Authority will allow only 25% of DOL costs in rates. Therefore, $116,750 of DOL expense will be funded by ratepayers ($467,000 x 25%). This results in a DOL insurance expense decrease of $350,250 ($467,000 x 75%).

8. Healthcare Expense

The Company originally requested an increase of $4.5 million related to employee healthcare benefits expense for a total requested amount of $22.3 million for the Rate Year. Schedule C-3.27. During the proceeding, the Company revised the requested increase to $4.21 million for a revised total of $22.0 million. Schedule WPC-3.27a-Revised. The reduction in the expense is a result of an increase in the capitalization portion of healthcare benefits.

The Company stated that the increase to healthcare insurance expense is necessary to recover the normal escalation in healthcare costs based on industry data, and is consistent with the trend adjustment allowed in CL&P's last rate case. CL&P Brief, p. 37. The Company claimed that the increase is less than would have occurred without the redesign and marketing effort of employee benefit programs that was undertaken following the merger of NU and NSTAR. Id. The Company further stated that the increase was determined in collaboration with Strategic Benefit Advisors (NU's health and welfare employee benefits advisor), CIGNA healthcare (NU's health plan partner) and other trend survey data. Id., p. 38. The Company uses a self-funded program design and the escalation rate experienced between 2013 and 2014, and anticipated between 2014 and 2015 reflects growth in the cost of medical care and prescriptions (healthcare inflation) and the added cost of compliance with the Affordable Care Act. Id.

The OCC asserted that CL&P simply escalated the Test Year amount in its determination of healthcare costs and that this approach is incorrect because the Company has a self-funded plan and healthcare costs are claims driven. OCC Reply

Brief, p. 5. The OCC further stated that the Company claims that 2013 measures was a one-time cost savings are disingenuous, considering the CL&P witness agreed that the increase in employee contributions that took effect in 2013 would continue and that the CL&P escalation of 13.85% ignores the savings achieved through increased employee cost sharing. Id. Additionally, the OCC claimed that the Company's reference to this escalation being supported by a collaborative effort is also disingenuous. Specifically, considering the fact that CL&P acknowledged the three industry expert studies provided in response to OCC-188 were generic and not CL&P specific, and that the CIGNA documentation was not included. Id.

The OCC expressed concern that the documents supposedly relied upon by the Company in estimating its healthcare cost in the Application are dated subsequent to when the Late Filed Exhibit was requested at the September 8, 2014 hearing. Id., p. 6. The OCC stated that this "evidence" in support of the Application, developed after the fact, should be rejected. Id. The OCC initially recommended a reduction in healthcare expense of $3.3 million based upon an average historical increase per employee and the recommended FTE count. Id. The OCC revised its recommended adjustment to a reduction of $3.014 million to the Company's requested health care cost of $22.002 million, as a result of its revision to the FTE count for payroll and the changes made by the Company in Late Filed Exhibit No. 3. Id.

The AG did not address healthcare costs specifically, but it supported many of the other adjustments requested by the OCC to CL&P's rate request. AG Brief, p. 23.

CL&P stated that the OCC's recommended disallowance of $3.3 million is based on a skewed analysis and that it rejects industry data as well as expert guidance provided to the Company by its health and welfare employee benefits advisor. CL&P Reply Brief, p. 48. Moreover, the Company asserted that the OCC's witness calculated an average annual increase of just 6.64%, which is well below the Company's actual experience and medical trend rates for 2014 and 2015. Id. Lastly, the Company indicated that its trend increases of 7.75% in 2014 and 8% in 2015 were developed based on a minimum of four sources of information to which it applied industry-accepted underwriting guidelines and its own claim experience. Id.

Based on the evidence the Company provided, the Authority accepts the Company's proposed healthcare costs increases of 7.75% for 2014 and 8% for 2015. The Authority reduces the total employee benefits expense by $2.25 million based on its reduction of 109.5 FTEs as discussed in the Payroll section of this Decision.

9. Employee Incentive

CL&P's Test Year non-executive incentive compensation expense was $7.8 million. Application, Schedule C-3.28. The total non-executive incentive compensation expense requested for the Rate Year is $10.38 million. Id. The Company excluded executive incentive compensation expense of $8.7 million from the Application and is not seeking its recovery. Judge PFT, p. 11; Application, Schedule C-3.29. The Company stated that it limited the rate year costs to the variable compensation paid to operations and staff employees up to the director levels, whose goals and performance metrics under the post-merger program promote reliability, service quality and higher

levels of customer service, among other improvements. CL&P Brief, p. 35. Also, its variable pay program is designed to drive performance improvements and operational excellence through the use of detailed metrics that may be applied across positions within the same, or across all job scopes. CL&P Brief, p. 34.

The OCC recommended disallowing the entire non-executive incentive compensation expense of $10.38 million for the Rate Year. OCC Brief, p. 60. The OCC stated that the inclusion of a portion of incentive compensation in above-the-line expenses paid for by ratepayers is appropriate only if the plan actually provides incentive to improve performance. OCC Brief, p. 56. The OCC stated that the Company's effort to emphasize how the plan focuses on customer goals as justification for the appropriateness of the cost is simply a "smoke screen." Schultz PFT, p. 22; OCC Reply Brief, p. 7. The OCC noted that the overall financial trigger to when a payout can be made is earnings per share and all incentive funding is based on an NU financial metric. The fact that the net income goal is the primary goal while customer service-related goals are of less importance, should be taken into account in determining the funding level, if any, that should be made by ratepayers. Id. In addition, the OCC stated that CL&P did not provide sufficient necessary metrics to establish that its incentive plan is indeed effective. The information that was provided strongly suggests otherwise. The OCC also claimed that the Company did not provide details of goals and results nor did it provide any evidence that goals have been raised. Id., p. 60.

The AG recommended that the Authority eliminate the entire $10.38 million from the Company's proposed revenue requirements and from rates. AG Brief, p. 17. The AG stated that CL&P's proposed incentive plans are generally designed to incent and achieve goals, such as profit levels, that benefit the Company's shareholders, not its ratepayers. Thus, ratepayers should not be forced to fund incentive plans that benefit only the Company, especially when so many Connecticut ratepayers are in difficult economic circumstances. Id. In addition, the AG stated that the Company's incentive program does not appear to be structured to provide any "incentive." Rather the Company's "incentive" plan appears to be a base compensation measure under another name therefore, ratepayers should not be forced to pay "incentive" compensation that is neither at risk nor designed to benefit the ratepayers. Id.

The Authority recognizes the importance of incentivizing employees to achieve higher standards of customer service and other goals. The Authority also acknowledges the fact that the Company did not provide compelling evidence illustrating the metrics under which incentive compensation would be achieved. The evidence the Company presented indicates that over the past 6 years, 99.7% of eligible employees received incentive compensation. Response to Interrogatory OCC-101. This suggests that the Company's incentive compensation plan is more an extension of its base compensation plan than a true incentive compensation plan.

The Company stated in its Written Exceptions that its new variable pay program is designed to drive performance improvements and operational excellence through the use of detailed metrics and therefore the Authority should allow the total requested non-executive incentive compensation of $10.38 million.

The OCC in its Written Exceptions maintains that the Company failed to provide sufficient evidence to support its claim that it has changed its incentive compensation metrics to improve performance and to focus on customer goals. Further, the OCC stated that the existing plan does not provide a true incentive for employees to achieve higher standards of customer service and other goal. OCC Written Exceptions, pp. 37 and 38.

The Authority finds that the Company's evidence in this proceeding is minimal at best. The metrics provided for incentive compensation were for one employee and one type of position. Response to Interrogatory OCC-375. The Company claimed that more emphasis is placed on customer service and customer goals. Lazor PFT, p. 23. It fails to acknowledge that its incentive compensation metrics dealing with SAIDI and CAIDI are more a function of the increase in capital expenditures on system hardening and resiliency and less a function of employees' actions.

The Authority finds that incentive compensation expenses should not be borne solely by the ratepayers. The costs should be shared by both ratepayers and shareholders. Therefore, based on an analysis of the evidence presented in the instant proceeding and consistent with its recent Decision dated September 24, 2013 in Docket No. 13-02-20, Application of Aquarion Water Company of Connecticut to Amend Its Rates and in its Decision dated January 22, 2014 in Docket No. 13-06-08, Application of Connecticut Natural Gas Corporation to Increase Its Rates and Charges the Authority disallows 50% of the total requested non-executive employee compensation for a total disallowance of $5.19 million.

10. Public Liability Expense

The Company included $4,765,000 of public liability expense for the rate year. The Test Year public liability expense was $1,955,000. The initial proposed rate year expense is an increase of $2,810,000 ($4,765,000 - $1,955,000) over the Test Year. Subsequently, in Late Filed Exhibit No. 63, the Company revised its public liability expense downward to $3,972,438 based on updated report from its actuary. Reply Brief, p. 57.

The OCC initially recommended a reduction of $2,112,400 to the public liability expense. This is the difference between the requested amount of $4,765,000 and the average of public liability expense for the years 2009-2013 of $2,652,600. OCC Brief, p. 79. The OCC later revised its recommendation based on the Company's adjustment in Late Filed Exhibit No. 63. The OCC's revised recommendation was a reduction of $752,585. This is the difference between the Company's revised requested amount of $3,972,438 and the 5-year average of $2,652,600 multiplied by the revised allocation to O&M of 57.05%. OCC Reply Brief, p. 9.

CL&P stated that its Rate Year expense is supported by an actuary that calculated the expense level based on the most recent information available about the Company's public liability losses and exposures. CL&P Reply Brief, p. 57. The Company contended that the OCC's recommendation is not supported by an actuary and that it is based on an unsupported opinion that CL&P's level of expense in the Rate

Year should merely be an average of the expense it incurred over the past six years. Id., p. 58

Based on the updated actuarial information presented by the Company in Late Filed Exhibit No. 63, the Authority determines that the requested amount of $3,972,438 is reasonable and therefore no adjustment to the public liability expense is made.

11. Facilities Rent Expense

CL&P reported $9.527 million as the rent expense for the Test Year and proposed $8.726 million for the Rate Year. The internal rent expenses are $7.18 million for the Test Year and $6.499 million for the Rate Year. The external rent expenses are $2.348 million for the Test Year and $2.226 million for the Rate Year. The $802,000 total proforma adjustment consists of reductions of $680,000 for internal and $122,000 for external rent expenses. The Company indicated that the $680,000 reduction to the internal rent expense is to remove $623,000 associated with property at 56 Prospect Street in Hartford and $57,000 associated with the closure of facilities through consolidation. Similarly, the $122,000 proforma adjustment for external rent expense is due to the closings of facilities through consolidation. Schedules C.3.19 and WP C-3.19; Mahoney PFT, p. 39.

a. NSTAR Corporate Office

As part of the total external rent expense proposed for the Rate Year, CL&P included $203,269 as its portion of the rent expense for the NSTAR Corporate office in Boston, Massachusetts. In accordance with the determination in Docket No. 09-12-05, CL&P did not include $622,939 representing its allocated amount for the 56 Prospect Street, Hartford Corporate Office. Response to Interrogatory AC-85 Attachment 1, p. 1.

Concurrent with its determination regarding the Hartford Corporate Office, the Authority opines that the NSTAR Corporate office should not negatively impact costs recoverable from CL&P's ratepayers. The Authority finds that CL&P failed to support the need for the allocated Boston corporate office space. As such, CL&P's ratepayers should not be responsible for the additional corporate office rent cost resulting from the NU//NSTAR merger. Such mergers should create cost savings from operation and management synergies and not increased operating costs for the regulated entities within the new holding company. Therefore, the Authority will reduce the Company's proposed external rent expense by $203,269.

b. NUSCO Internal Rent Expense

For facilities under the management of Rocky River Realty (RRR), the NU real estate subsidiary, internal rent expense consists of such costs as interest, depreciation, property tax and equity return expenses. CL&P indicated that the total internal RRR rents are allocated based on Test Year budgeted total payroll costs for NUSCO's employees. The Company testified that charge accounting unit (CAU) 99 allocation rates are used for direct and allocated RRR's rent expense. Response to Interrogatory AC-85, Attachment 1, pp. 1-5.

For purposes of this proceeding, the Authority focuses its analysis concerning the total internal RRR rent allocated to CL&P distribution on amounts from the Berlin Campus; 3333 Berlin Turnpike Building; and Windsor Customer Service (Windsor CS) facilities (together, RRR Facilities). For the Berlin Campus, the total rent expense for the Test Year was $8,578,534, of which $4,047,520 was allocated to CL&P. Response to Interrogatory AC-85, Attachment 1, p. 2. For the 3333 Berlin Turnpike Buildings, the total rent expense for the Test Year was $1,290,971, of which $710,109 was allocated to CL&P. Id., p. 4. For the Windsor CS facility, the total rent expense for the Test Year was $3,818,745, of which $1,651,607 was allocated to CL&P. Id., p. 5.

The internal rent expenses for the RRR Facilities are allocated in stages. The first stage involves allocation based on the total square footages occupied by the NU operating companies and by NUSCO. The second stage involves the apportionment of the total operating companies' and NUSCO's portions of the total rent amounts to the operating companies. The Company stated that the allocation factors for cost control centers (CCC) 048, 06F and 121 are used to allocate the total operating companies' portions of the total rent expenses for the RRR Facilities to the operating companies. The CCC 141 factors are used to allocate NUSCO's portion of the total rent expense to the operating companies. Response to Interrogatory AC-85, Attachment 1, pp. 1-5; Late Filed Exhibit No. 75, Attachment 3. Based on the CCC 141 allocation, 43.25% was used to allocate NUSCO's portion of total rent expense for the RRR Facilities to CL&P distribution and this percentage was shown on the work paper for CCC 1NR. Id.; Late Filed Exhibit No. 74; Response to Interrogatory AC-85, Attachment 1, pp.1-5; Schedule G-2.16 Attachment, p. 873.

Based on the following analysis, the level internal rent expense allocated to CL&P distribution as its share of the NUSCO's portion of total rent expense is overstated and the calculation of this allocation factor is flawed.

i. Equity Return

The return on equity (ROE) used to calculate the equity return costs included in the total rent expense for each of the RRR Facilities is 9.92%. Late Filed Exhibit No. 75 Attachment 1, p. 6. Ratepayers should not pay cost of capital to the Company's affiliates in an amount above the ROE allowed for CL&P in this proceeding. The equity return costs included in the total rent expense should reflect CL&P's allowed ROE in the instant proceeding. For the Berlin Campus, the Company calculated total rent expense of $8,578,534, which includes total equity cost of $3,996,782. Late Filed Exhibit No. 74, Attachment 1, p. 2. For the 3333 Berlin Turnpike Buildings, the Company calculated total rent expense of $1,290,971, which includes total equity cost of $602,726. Id., p. 4. For the Windsor facilities, the Company calculated total rent expense of $3,818,745. This amount is 99% of the total rent expense for Windsor CS because 1% was attributed to the Connecticut Valley Exchange (CONVEX). The total equity cost for Windsor CS is $1,800,458. However, only $1,782,453 ($1,800,458 x 99%) was included in the total rent expense allocable to CL&P. Id., p. 5.

Based on the allowed ROE herein, the Authority determines that the equity return costs to be included in the total rent expenses for the Berlin Campus is $3,694,606 ($3,996,782 / 9.92% x 9.17%); for the 3333 Berlin Turnpike Buildings is $557,157

($602,726 / 9.92% x 9.17%); and for the Windsor CS is $1,647,691 ($1,782,453 / 9.92% x 9.17%). Therefore, the Authority will reduce equity return costs included in the total facility rent expense by $302,176 ($3,996,782 - $3,694,606) for the Berlin Campus; $45,569 ($602,726 - $557,157) for the 3333 Berlin Turnpike Buildings; and $134,762 ($1,782,453 - $1,647,691) for the Windsor CS facilities. Consequently, the total rent expenses subject to direct and indirect allocations are $8,276,358 ($8,578,534 - $302,176) for the Berlin Campus, $1,245,402 ($1,290,971 - $45,569) for the 3333 Berlin Turnpike Buildings, and $3,683,983 ($3,818,745 - $134,762) for the Windsor CS facilities.

ii. NUSCO'S Allocation to CL&P

The Company stated that the NSTAR shared service company has been merged into NUSCO effective January 1, 2014. CL&P is now allocated costs from the former NSTAR service company and, similarly, NUSCO costs that were formerly allocated to CL&P and other NU affiliates are now allocated to NSTAR operating companies consistent with cost causation principles. Furthermore, the post-merger NUSCO reviewed its allocations to all the operating company affiliates, and that the actual cost allocation factors have changed. However, the overall allocation of service company costs has not generally caused a change to the amounts allocated to CL&P from the new NUSCO. Mahoney PFT, p. 49.

The Authority concludes that the 43.25% used to allocate NUSCO's portion of the total RRR facilities rent expense to CL&P distribution is excessive and based on an allocation factor that is without any causal effect on CL&P's use of these facilities. The Authority reviewed the 2013 Annual Report for Centralized Service Companies (Form No. 60) that NUSCO filed with the Federal Energy Regulatory Commission (FERC). Response to Interrogatory AC-20, Attachment 3. The report shows that approximately $59.874 million of the $468.84 million was billed to NSTAR Gas and Electric. The CL&P portion of the 2013 total shared cost was $252.358 million. Id., p. 307. Also, the report indicated that costs for facilities floor space should be allocated based on the projected square footage occupied. Id., Note Page 402.1. Furthermore, in the 2009 CL&P Rate Case Decision, the Company was directed to continue determining facility rent expense for CL&P based on the square footage directly charged or allocated to it, unless it could show a change in the amount of square footage needed by the distribution segment. 2009 CL&P Rate Case Decision, p. 40.

For the instant proceeding, the Company continues to use the 9C allocator that is based on NUSCO's employee labor costs and not on square footage to allocate internal rent expense to CL&P. According to the Company, the CCC 1NR allocator mirrors 9C and is based on NUSCO budgeted labor costs and does not allocate costs to NSTAR companies. Late Filed Exhibit No. 75, Attachment 4, p. 2. The Authority determines that the 9C allocator is flawed because it is based on NU legacy costs and does not take into consideration the labor costs for the NSTAR service company, which is now merged into NUSCO. More poignant to the point that the 9C allocation is faulty is the fact that the Company reported, for allocating NUSCO's costs, CCC 048 factors that are based on square footage of the Berlin Campus using the C7 allocators. Under the C7 allocation, the total CL&P distribution allocation factor is 32.94% and NSTAR's factor is

32.53%, not zero as reported under the 9C allocation, which was based on pre-merger assumptions and non-correlating labor costs. Schedule G-2.16 Attachment, p. 218.

The Company indicated that the facilities management costs for CCC 136 are allocated using the C7 Rate Code factors. These allocators are based on the new NUSCO's budgeted labor costs for both NU and NSTAR affiliates. Further, the CL&P distribution has an allocation factor of 26.95% under the C7 formula. Schedule G-2.16 Attachment, p. 608. The Company did not provide overall allocators based on the C7 Rate Code showing the total allocated rent factors for the 3333 Berlin Turnpike Buildings and Windsor CS facilities. Therefore, the Authority determines that the C7 allocation percentage of 26.95% is more appropriate than the C9 allocation percentage of 43.25% for allocating NUSCO's portion of the total rent expenses for the 3333 Berlin Turnpike Buildings and Windsor CS facilities to CL&P distribution. The C7 allocator mirrors the 9C allocator, with the exception that it is based on the new NUSCO's budgeted labor costs, not NU legacy labor costs solely based on old NUSCO costs. In its response to inquiry as to how NUSCO's 401K costs are allocated, the Company stated that the "costs are allocated based on how NUSCO employees total payroll, both directly charged and allocated through the use of CAU 99 allocation rate, is budgeted each year. This is referred to as the 9C allocation for the Test Year and rate C7 for the projected rate year." Response to Interrogatory FI-152. For the CL&P distribution allocation, the Company indicated that the 9C percentage for the Test Year is 43.25% and the C7 percentage for the Rate Year is 26.20%. Response to Interrogatory FI-152, Attachment 1, pp. 1 and 2. However, CL&P used the 9C and not the C7 allocator to determine the proposed rent expense for the Rate Year in this proceeding.

Using the C7 allocator of 26.95% for 3333 Berlin and 43.25% Windsor CS facilities for CL&P's portion of the new NUSCO's portion of the total rent expense, the Authority calculates the allowed rent expenses for the RRR Facilities as summarized in the table below:

Table 53
Calculations of the Allowed Rent Expense for RRR Facilities

	3333 Berlin Buildings	Windsor CS Facilities
Revised Total Rent Expense	$1,245,402	$3,683,983
Allocated to Operating Companies14	$ 258,047	$ 0
Portion Allocated to CL&P Distribution15	$ 258,047	$ 0
Total Rent Allocated to NUSCO16	$ 987,355	$3,683,983
Portion Allocated to CL&P Distribution17	$ 266,092	$1,593,323
Total Portions to CL&P Distribution	$ 524,139	$1,593,323

As shown in the table above, the Authority calculates allowed rent expenses of $524,139 for the 3333 Berlin Buildings and $1,593,323 for the Windsor CS facilities. Therefore, the Authority will reduce the proposed facility rent expenses by $185,970 ($710,109 - $524,139) for 3333 Berlin Buildings and $58,230 ($1,651,553 - $1,593,323 for the Windsor CS facilities.

The Company stated that the Proposed Final Decision contains a mathematical error that understates CL&P's portion of the rent expense for the Berlin Campus by $470,655. According to the Company, the $2,726,232 rental expense apportioned to CL&P in the Proposed Final Decision, calculated by multiplying $8,276,358 by 32.94%, failed to take into consideration a charge of $934,688, the CL&P portion of rental expense for the Berlin Campus directly allocated to the operating companies by RRR. The Company stated that the correct total rental expense attributable to CL&P for the Berlin Campus is $3,196,887. CL&P Written Exceptions, pp. 46-48. Thus, according to the Company, the adjustment in the draft is overstated by $470,655 ($3,196,887 - $2,726,232). Id., p. 48.

The Company is confused with the Authority's use of an overall allocation factor of 32.94% to derive the portion of the adjusted total rental expense of $8,276,358 attributable to CL&P. The C7 allocator utilized by the Authority is a combined factor that takes into consideration both the square footages directly allocable to the operating companies and the square footages allocated to NUSCO, which are indirectly allocated to all applicable operating companies. Schedule G-2.16 Attachment, p. 218. In the Proposed Final Decision, the Authority established that NUSCO should allocate cost to CL&P based on the C7 factor of 26.20% and that NUSCO's portion of total rental expense should be allocated to CL&P based on the C7 allocator of 26.95% applicable to facilities management costs. Based on the C7 allocator of 26.95%, the Authority determined that CL&P's portion of the Berlin Campus rent allocated to NUSCO is $1,850,819 ($6,867,602 x 26.95%). Thus, the total rental expense allocable to CL&P

---

14 Operating Companies directly occupy 20.72% of 3333 Berlin Turnpike Buildings' and 0% of Windsor CS's total square footages. Late Filed Exhibit No. 74 Attachment 1, pp. 4 and 5,

15 100% of total square footage occupied by Operating Companies is allocated to CL&P distribution. Late Filed Exhibit No. 74 Attachment 1, p. 4,

16 NUSCO directly occupies 79.29% of 3333 Berlin Turnpike Buildings' and 100% of Windsor CS's total square footages. Late Filed Exhibit No. 74 Attachment 1, pp. 4 and 5,

17 Based on Rate C7 allocation percentage of 26.95% for 3333 Berlin and the C9 rate of 43.25% for Windsor CS Facilities.

for the Berlin Campus is $2,785,507 ($934,688 + $1,850,819). The rental expense adjustment in the Proposed Final Decision is overstated by $59,275 ($2,785,507 - $2,726,232) as compared to the Company's claim of $470,655. Consequently, the Authority disallows rent expense $1,262,013 ($4,047,520 - $2,785,507) for the Berlin Campus.

The Company also indicated the Authority made a mathematical error in the Proposed Final Decision by changing CL&P's share of the cost of the Windsor CS facilities from 43.25% to 26.94%. The 43.25% allocation factor does not allocate any portion of the cost of the Windsor facilities to NSTAR; whereas the 26.94% allocation factor allocates a portion of the Windsor facility's cost to NSTAR. According to the Company, the Windsor CS facilities do not handle any calls for NSTAR's customers; and the Westwood, Massachusetts Customer Care Facility handles calls for NSTAR's customers and does not handle any calls for CL&P's customers. Therefore, NSTAR should not pay for a portion of the Windsor Customer Care facility rent expense. According to the Company, using the allocation factor of 26.94% instead of 43.25% understated CL&P's portion of the rent expense for the Windsor CS facilities by $600,338. CL&P's Written Exceptions, pp. 48 and 49.

Based on the record, the Authority agrees that the Windsor CS facilities currently does not handle calls for NSTAR affiliated companies. As a result, the Authority agrees and recalculated the rental expense adjustment for the Windsor CS facilities as detailed in the table above. The final reduction to the proposed rental expense for the Windsor CS facility is $58,230 ($1,651,553 - $1,593,323).

The total disallowed internal rent expense for the RRR Facilities is $1,506,213 ($1,262,013 + $185,970 + $58,230). Including the disallowed external rent expense of $203,269, the total disallowed allocated facility rent expense is $1,709,482 ($1,506,213+ $203,269).

12. NUSCO Capital Funding

The Company stated that NUSCO Capital Funding expense is the money that NUSCO requires to fund certain capital investment that support shared services. That expense is shared among all NU subsidiaries using the shared capital investments. CL&P indicated that the Rate Year adjustment is due to a change in NUSCO's actual 2013 payroll capital/expense allocation. The change caused an increase to the NUSCO capital funding expense of $402,000. CL&P reported $2.701 million as the NUSCO Capital Funding expense for the Test Year and proposed $3.103 million for the Rate Year. Schedule WP C-3.16. The NUSCO Capital Funding expenses are net of the capitalized portions of $0.805 million for the Test Year and $0.424 million for the Rate Year. Id. Thus, the total NUSCO capital funding expense, prior to the adjustment for the capitalized amount, is $3.527 million for both the Test and Rate Years. Mahoney PFT, pp. 42 and 43.

The Authority opines that there is no basis to increase NUSCO capital funding expense by simply changing the capital/expense allocation applicable to the Rate Year. No evidence was presented to support the claim that a change in the payroll capitalization ratio had any correlation to CL&P's use of the shared capital investments.

The Authority concludes that the capitalization ratio should be the same for both the Test and Rate Years. Therefore, the Authority will maintain the NUSCO capital funding expense at the Test Year level of $2.701 million and disallows $402,000.

13. Storm Reserve

Catastrophic storms are those events in which CL&P incurs incremental expense in excess of $5 million. The storm reserve is currently funded through the distribution rate at the level of $3 million per year. CL&P recognizes that funding the reserve at the level necessary to address storms of the same magnitude as Storm Irene in 2011 and the October 2011 Nor'easter and Storm Sandy in 2012 would not be reasonable. The Company proposed an amount for the annual storm reserve based on storm activity during the 2010-2013 period, excluding those storms. After excluding these events, CL&P stated that the existing collection of $3 million per year to fund the reserve is insufficient because its calculation of what would have been needed to fund the storm reserve amounts to $9.035 million annually. PFT Mahoney, pp. 30-32.

CL&P proposed to utilize the storm reserve to fund $2 million per year for pre-staging costs for storms that meet specific criteria. Pre-staging costs include: securing outside line and tree crews, food and hotel support to accommodate such crews, and travel time for crews. The Company proposed to increase the annual catastrophic storm reserve funding level from its current level of $3 million to $11 million, which is a $6 million increase for incremental costs and a $2 million increase for pre-staging costs. This increase will ensure that there are reasonably sufficient funds in the reserve to mitigate the expense of future catastrophic storms and for potential storm pre-staging costs. Id., pp. 31 and 32.

To balance the interests of the Company and customers, CL&P proposed that if the storm reserve accumulates a net balance of more than $50 million, it would pay customers carrying charges at the weighted average cost of capital on the amount of the over-funding during the period of time that the over-funding situation exists. Correspondingly, during the period of time that the balance in the storm reserve falls below a net negative of $(50) million, then customers would pay carrying charges to the Company on the under-recovery during the period of time that under-recovery exists. For example, assume that the storm reserve contained a net balance of $55 million for a three-month period and decreased to $45 million due to a catastrophic storm that occurred in month four. Then the Company must pay customers carrying charges on the $5 million over-funding that existed in the storm reserve during that three-month period where the net balance of the reserve exceeded the $50 million threshold. Additionally, the Company proposed to have the ability to elect to credit to customers a portion of the positive balance held in the storm reserve exceeding the $50 million threshold when it makes adjustments to any other rate component on January 1st or July 1st through the existing administrative rate adjustment process. Id., p. 32.

The OCC recommended that the storm reserve remain at the $3 million level. The OCC based its recommendation on the fact that the Company included a $93.805 million capital expenditure request in the filing for system resiliency. It is a glaring inconsistency to include both $93.8 million for system resiliency and an increase of $8 million for the storm reserve accrual. According to the OCC, the Company is either

ignoring the positive effects of the resiliency plan or assumes that the plan will be ineffective. Ratepayers should not be asked to pay for two contradictory expenses. The OCC also argued that three of the storms used by CL&P in its calculation of the reserve are also included in the Company filing for separate recovery. It is inappropriate and could be considered double dipping to use the costs being recovered elsewhere as the basis for increasing the reserve calculation. Finally, the Company requested $2 million for pre-staging costs and the OCC references Mr. Bowes testimony in Docket No. 12-06-09. Mr. Bowes stated that the Company would be allowed to seek recovery of pre-staging costs in future proceedings after they were incurred. The Decision in that docket stated that the costs would be subject to a "detailed review" including thorough documentation. As the Company does not have actual costs for review and recovery, its request in the Application is inappropriate, untimely and should be disallowed. OCC Brief, pp. 64-66.

Regarding the double counting of storms, the OCC stated that unusual storms that are allowed recovery by other means should be excluded from the reserve calculation. The OCC points out that the Company excluded the costs for Storm Irene, the October 2011 Noreaster and the 2012 Storm Sandy because they were unusual. However, the Company's Table KBB-JLM-7, used to calculate the estimated storm reserve of $9 million included the June 2011 and September 2012 storms that were approved for recovery in the Decision dated March 12, 2014 in Docket No. 13-03-23, Petition of The Connecticut Light and Power Company for Approval to Recover Its 2011-2012 Major Storm Costs (Storm Cost Recovery Decision). The table also included the 2013 storm costs deferred and included in the Company's request for recovery in the current filing. The OCC argued that this is inappropriate since the Company already has a means for recovery for the catastrophic storms, such as the Storm Cost Recovery Decision. In analyzing previous storm reserve activity, the OCC stated that the Company did not charge any costs to the storm reserve in 2008 and 2009. In 2010, costs of $14.783 million were charged to the reserve and as of September 2014, there were no charges to the 2014 reserve. If the deferred storm costs are removed from the calculation, the OCC calculated that the remaining amount charged to the reserve over 2008-2013 is $15 million. Amortized over six years, it equals $2.5 million annually and represents a reasonable level. Id.

The Company stated that the OCC is incorrect in its contention that system resiliency spending should limit the need to fund the storm reserve above current levels. CL&P's system resiliency initiatives are comprehensive system upgrade measures that will strengthen and modernize the system on a systematic basis over a period of time. The long-term impact of these upgrades will not be fully realized until there is critical mass in terms of the percent of the system completed. The existing PURA-approved five-year (2013-2017) System Resiliency Plan addresses 7% of CL&P circuits. The OCC claims the current accrual amount of $3 million "is considered generous because the effects of a system resiliency plan should actually reduce the reserve amount." However, it argued that "the Company has barely started implementing the $300 million resiliency plan." In the opinion of CL&P, the OCC cannot have it both ways. If the Authority grants CL&P's request to increase the storm reserve, it will have an opportunity in the 2017 rate case to re-evaluate the reserve funding level, specifically, to determine whether the proposed $9 million contribution level will continue to be

appropriate given actual experience in the intervening time period. CL&P Reply Brief, pp. 52-53.

The Authority will first address the non pre-staging portion of the reserve request, which the Company proposed to increase from $3 million annually to $9 million annually. There is no debate that the Company has seen significant storm activity in recent history, this is well documented in the Storm Cost Recovery Decision where the Company sought recovery of $414 million for costs associated with historic weather events. Since those events, the Company has embarked on a capital spending program aimed at strengthening its distribution system. This is well documented in the Resiliency Decision.

The OCC is correct that the Company has a means for recovery of catastrophic storm expense, which would be the request for the establishment of a regulatory asset to be recovered. There is also an expectation that the capital spending that the Company is performing should have a beneficial effect on storm expense items. It is also of note that the Company is planning to file for its next rate case in two and one-half years from the time of the conclusion of this docket. In an instance where the Company incurred storm costs as it had in 2011-2012, before its next rate case, the reserve as proposed would offer little relief to ratepayers. The shortened time frame between rate cases provides an opportunity for the Authority to gauge the effectiveness of the resiliency work that the Company is performing and will provide a better measure of what a storm reserve will be going forward. The Authority will maintain the Company's annual $3 million reserve and therefore, reduces the Company's request by $6 million. The Authority also denies the Company request for a storm reserve fund with carrying charges or credits.

14. Incremental Storm Costs Included in Base Rates

The Company currently recovers $9.6 million in rates annually to offset the cost of non-catastrophic storms. These are storms in which the Company's per-storm incremental expense is less than $5 million. Costs associated with this category of incremental expense include such items as overtime, intercompany expenses for labor, materials and supplies, travel expenses and outside services including services of other utilities, electrical and tree trimming contractors. The Company does not propose any increase to the current $9.6 million that is collected annually to offset the cost of non-catastrophic storms. The Company is using an historical average for Rate Year expense purposes similar to that used by the Authority in 2009 CL&P Rate Case Decision. As reflected in Table MJM-8 below, CL&P identified the incremental storm expense of $9.6 million by taking the incremental storm expense after capitalization and transferring it to the storm reserve for 2008-2013 of $57.9 million. The total net incremental cost was then reduced by removing the low and high years (2011 and 2010, respectively) to yield a net incremental storm expense. This net incremental storm expense amount was then averaged based on the remaining costs during the four years that were selected out of this six-year period, which produced an average annual amount of approximately $9.6 million. The Company reflected the adjustment for the $9.6 million in Schedule C-3.21 along with workpapers illustrating how it derived the average.

Table 54
O&M Expense for Non-Catastrophic Storms 2008-13
($000's)

Rate Year Calculation	Historical Amounts	
2008	$ 14,428	
2009	8,603	
2010	15,451	
2011	3,983	
2012	11,437	
2013	4,041	
Six Year Total	57,943	
Less: Low Year (2011)	(3,983)	
Less: High Year (2010)	(15,451)	
Adjusted Total	38,509	
4 Year Average	$ 9,627	(a)
(a) Round the rate year to	$ 9,600	

Workpaper C-3.21.

The OCC recommended that the Company's Test Year expense of $4.041 million be allowed in the Rate Year and that the increase of $5.559 million be rejected. The Company included a significant increase in major storm expense. The requested amount increases the expense for major storms despite the fact that the Company has included a large increase in expense for system resiliency. The OCC claimed that in ignoring the impact of the system resiliency plan, the Company is trying to have it both ways. For CL&P to justify the extensive costs of its resiliency system, it must acknowledge some positive impact on storm damage. OCC Brief, p. 68.

The Company stated that the OCC's proposal is inconsistent with the methodology of using a multi-year average, as the Authority in CL&P's last two rate cases, the 2009 CL&P Rate Case and Docket No. 07-07-01, Application of The Connecticut Light and Power Company to Amend Rate Schedules (2007 CL&P Rate Case). The OCC did not object to the use of this methodology in the 2009 CL&P Rate Case, and proposed using a multi-year average calculation in the 2007 CL&P Rate Case. Additionally, there are several instances in this case where the OCC proposed using multi-year averages to support its proposed reductions in this case; but the OCC avoids using a multi-year average here because in so doing, supports the current recovery level of $9.6 million. The OCC's sole justification in support of its substantial reduction to CL&P's current annual collection for non-catastrophic storms is its claim that the Company's proposal "ignores the increase requested in the system resiliency program." This assertion ignores the reality that the benefits of that system resiliency plan will take time to achieve. In 2017, when CL&P is expected to request the PURA to establish new distribution rates, the Company asserted that the Authority will have an opportunity to re-evaluate the non-catastrophic storm funding level to determine whether an adjustment is appropriate given actual experience in the intervening time period. CL&P Reply Brief, pp. 53 and 54.

The Authority finds that this item differs from the storm reserve in that the reserve is built into base rates and the expense is funded throughout the year through customer

rates. If the amount is less than the amount included in base rates in a particular year, the Company has collected rates for an expense that it did not incur. Conversely, if the amount is more than the amount included in base rates in a particular year, the Company has not collected rates for an expense that it did incur. Therefore, it is important to set the level of incremental storm expense at an appropriate level.

As mentioned, the Company calculated the level of incremental storm expense based on historical experience from 2008-2013, with adjustments that remove the high and low amounts in that time period, 2010 and 2011. The OCC's protest to this approach is that it does not take into consideration the amount of resiliency work that is being performed on the system, which the OCC claimed should reduce storm related costs. The variation of this item over the years and the Company's smoothing of the expense by removing high and low points from its request, result in the Authority find this to be an appropriate level for this expense at this time. Experience between now and the Company's next rate case will provide additional data points for the Authority and all parties to consider at that time. Again, this item differs from the reserve as this is an item built into base rates as opposed to the reserve. The Authority therefore allows an incremental storm expense of $9,600,000.

15. Pre-Staging Costs

CL&P proposed to utilize the storm reserve to fund $2 million per year for pre-staging costs, for the purpose of securing resources in advance of catastrophic storms. Pre-staging costs include, for example, securing external line and tree crews, food and hotel support to accommodate such crews, and travel time for those crews. The Company asserted that it is necessary to recover eligible pre-staging costs because the EDCs must undertake necessary preparations to be able to comply with the Authority's storm performance standards and to restore power within the timelines stakeholders demand. CL&P noted that in 2012 and 2013, it incurred $609,000 and $1,622,000, respectively, in pre-staging costs for storms that were expected but ultimately did not occur. Mahoney PFT, pp. 31 and 32; Response to Interrogatory AC-92.

The Company also stated that pre-staging costs cannot be predicted in advance of a storm event. According to CL&P, each storm is different and they are always difficult to predict. Since resources must be pre-arranged that are located one to four days' travel time from Connecticut, financially significant issues must be made in advance of storm impact. Whether the storm materializes or not, CL&P still incurs these costs. Finally, the Company opined that there is currently no ratemaking mechanism by which it can recover pre-staging costs since they are not routinely incurred. Bowes PFT, pp. 45-48.

The OCC stated that the Company does not have actual detailed pre-staging costs available for review. Therefore, the $2 million per year expense should be disallowed as inappropriate and untimely. OCC Brief, p. 64.

The Authority strongly encouraged CL&P to devote greater efforts to pre-staging resources in anticipation of a major storm. In its Decision dated August 1, 2012 in

Docket No. 11-09-09, PURA Investigation of Public Service Companies' Response to 2011 Storms (2011 Storms Decision), the Authority stated:

> In the future, CL&P should place higher priority on taking aggressive action in anticipation of such events, including pre-staging resources and making earlier attempts to acquire resources.
>
> The Authority finds that CL&P should establish a heightened state of readiness and be able to clearly document that such a state exists. In conjunction with this expectation, the Authority will order CL&P to report on actions it has taken to establish a heightened state of readiness in anticipation of a major storm including an assessment of its own lineworkers and lineworkers from sister companies and contractors. CL&P shall also state the mutual assistance organizations to which it belongs and the resources likely available from those organizations. The Authority requires that the primary emphasis of this report focus on those resources that are likely to be available during the first 48 hours of a major storm event to assist in efforts to ensure public safety. The Authority will also order the company to demonstrate its efforts to establish a heightened state of readiness.
>
> 2011 Storms Decision, p. 51.

In its investigation into the response to Storm Sandy in 2012 that was documented in the Decision dated August 21, 2013 in Docket No. 12-11-07, PURA Investigation into the Performance of Connecticut's Electric Distribution Companies and Gas Companies in Restoring Service Following Storm Sandy, the Authority noted a number of actions that CL&P took to pre-stage resources, and concluded that the Company prepared very effectively for Storm Sandy, especially through procuring and pre-positioning supplemental lineworkers prior to the storm. Decision, pp. 16-19 and 54. This investigation confirmed the valuable role that pre-staging brings to major storm response.

The Authority previously recognized the major benefits of pre-staging resources to storm restoration and public safety. The Authority also recognized that decisions on pre-staging must be made several days in advance of catastrophic storms, when the severity and timing of such storms may not be known; however, the PURA has encouraged the EDCs to make conservative decisions to ensure the state is adequately prepared for a catastrophic storm. The Authority finds that since it has strongly encouraged both EDCs to take actions that will require them to incur pre-staging costs, the PURA should provide surety that the costs are recoverable to lessen any financial disincentive to take those actions. The Authority concludes that the requested funding level of $2 million per year is reasonable given that costs were incurred in 2012 and 2013. As these are preparation costs for storms that never occur, the Authority will look for prudent decision-making in incurring these costs. Therefore, the Authority allows the Company to fund a reserve for pre-staging costs at the $2 million/year requested level. Unused amounts will not be accumulated for future years. At the end of each calendar year, unused pre-staging amounts should be transferred to the non pre-staging storm reserve. The Company shall separately account for storm reserve and pre-staging

storm reserve amounts. Detailed activity in these accounts will be subject to audit and review at the Company's next rate filing or any other period deemed necessary by the Authority.

16. Additional Storm Costs

The Company seeks recovery for storm costs that were not addressed in the Storm Cost Recovery Decision. These costs amount to $31.068 million and relate to the windstorm of January 31, 2013, the blizzard of February 8, 2013, and the remaining Hurricane Sandy costs that were not finalized at the time of the Storm Cost Recovery Decision. Amounts for these individual events are identified in Exhibits MJM-4 through MJM-6 of the Application.

The OCC stated that in calculating the additional level of storm costs, CL&P did not follow the capitalization policy applied by the Authority in the Storm Cost Recovery Decision because the Company argued that the treatment in that Decision was specialized. The capitalization classification changed with the Storm Cost Recovery Decision and should be followed on a going forward basis. The Company submitted a calculation that replicated the capitalization for the 2013 storms and Storm Sandy deferral using the procedure used in the Storm Cost Recovery Decision. The result is an additional $804,164 of capitalized items for the reclassification of costs associated with the 2013 storms and $7,010 for the residual Storm Sandy amount. This would reduce the amount subject to amortization by $811,174. The OCC recommended that the $31.068 million deferral requested by the Company should be reduced by $811,174 to $30.257 million. This would reduce rate base $446,000, net of deferred income taxes and it reduces amortization expense $116,000. OCC Brief, pp. 49 and 50; Late Filed Exhibit No. 51.

The Company stated that it has not adjusted the 2013 storm costs to reflect the adjustments made in the Storm Cost Recovery Decision because the determinations in that Decision were based on the unique factual circumstances of Storm Irene, the October 2011 Nor'easter and Storm Sandy, which were addressed in the Storm Cost Recovery Decision. CL&P asserted that the Storm Cost Recovery Decision did not change the Company's standard accounting practices for typical storms, nor did it establish new accounting practices for general application. As such, the Company recorded its costs related to the 2013 storms consistent with its standard accounting practices and with the treatment approved by the Authority in the past for typical storms. CL&P Response to Interrogatory AC-148.

The Authority agrees that the events contemplated in the Storm Cost Recovery Decision were based on the unique factual circumstances of those events. The Authority also finds that the Storm Cost Recovery Decision did not establish new accounting practices for general application. Going forward, the Authority will review events on a case by case basis to determine the appropriate accounting treatment to be afforded any particular event. The Authority sets a threshold amount of $20 million per event as the amount where CL&P must provide evidence that the Company's standard accounting practices are appropriate. In this Decision, the Authority approves the Company's request to recover $31.068 million related to the windstorm of January 31,

2013, the blizzard of February 8, 2013, and remaining Storm Sandy costs that were not finalized at the time of the Storm Cost Recovery Decision.

17. Troubleshooter Organization

a. The Prior Troubleshooter Organization

The Company has used troubleshooters for decades. The Company claimed that its prior troubleshooter organization (TSO) was not structured or sufficiently robust to cover the geographic area and time periods necessary to restore power to customers in the minimal time achievable for the types of trouble events that occur during off hours. The Company routinely compares its outage response performance with other utilities using a JD Power customer survey (Survey) to measure how customers view CL&P's performance in this area. The Survey indicated that the Company performed below the average of its peers in customer satisfaction for the restoration of power following non-storm-related outages. In 2013, CL&P reported its Customer Average Interruption Duration Index (CAIDI), the average time required to restore service, was 107.1 minutes compared to a better peer average of 102 minutes, and that its service was scored at 604 compared to a better peer average score of 655. CL&P Response to Interrogatory OCC-166. In addition, the Survey revealed that 89% of the surveyed utilities have a TSO devoted to outage restoration and trouble response. The Survey also indicated that 93% use one-person crews that pair up, as needed, to accomplish repair work. Tr. 8/27/14, p. 102; Bowes PFT, pp. 35 and 36.

Utilities that have good performance in responding to outages and trouble calls as measured by CAIDI and have positive customer experience as measured by the JD Power Score have a TSO that is directly connected with their system operation center (SOC). These utilities have troubleshooter crews that cover different geographic areas, but report through a centralized organization structure. The roving crews are able to cross town, district, and divisional boundaries to respond to outages and trouble calls. In addition, crews working during a shift are brought together if repair work during that shift requires additional support instead of calling in additional crews that work on a different shift to provide such support. Id.

The Company had two other major concerns with the prior TSO, the stability of the day time workforce and quality of life issues for line workers. The daily work center schedules were substantially affected by the number and frequency of instances in which line mechanics from the first shift were called out to perform emergency restoration work on the second and third shifts because there were an insufficient number of troubleshooters to respond to outages on these shifts. When this occurred, it reduced the availability and the ability of line mechanics to complete planned work and meet customer appointments during the first shift due to necessary rest time, which resulted in adjusted work schedules. The quality of life for a large number of mandatory on-call employees was affected due to the employees being unable to develop predictable family and non-work-related schedules and being forced to be on-call during the summer to ensure adequate coverage. Id., pp. 35 and 36.

CL&P's prior TSO had two classifications of line workers. The first classification were line mechanics that worked the day shift Monday through Friday and were

primarily responsible for routine construction projects, maintenance of distribution lines, new service installations and, occasionally, responded to outages and trouble calls as necessary. The second classification was troubleshooters who were primarily responsible for responding to outages and trouble calls. Id., p. 34. According to CL&P, all of the troubleshooters are line workers, but not all line workers are troubleshooters. Tr. 8/27/14, p. 106. Prior to the implementation of the new TSO program, there were 49 CL&P troubleshooters covering primarily the first and second shift, seven days a week in some area work centers. Typically, there was one troubleshooter per area work center on the first and second shifts and the third shift was covered by a weekly on-call rotation. Id.

b. The New TSO

The Company reorganized its TSO in spring 2014 and it was fully implemented by June 1, 2014, to improve service levels and decrease the duration of outages on the second and third shifts and on weekends. The new TSO became centralized and expanded its troubleshooter organization of 49 FTEs by adding 119 contract line workers, 10 contract foremen and 4 contract general foremen to provide expanded coverage 24 hours a day all year. Tr. 8/27/14, p. 105; Bowes PFT, pp. 34 and 35; CL&P Response to Interrogatory AC-129.

The regular first shift, Monday through Friday, are staffed with CL&P line workers and the second and third shifts and weekends are staffed with contract line workers. The expanded TSO will provide coverage to address both small-scope and large-scope emergent work, such as outages and trouble calls. Generally, the troubleshooters are geographically disbursed across the system, but can be aggregated in teams to work together if the actual restoration project requires additional support. Under the new centralized organization, troubleshooters will be organized into three geographic areas, with supervision in each area reporting directly to a troubleshooter management team consisting of CL&P managers. Additionally, the new troubleshooter organization is no longer bound by the boundaries of the Company's area work centers or divisions. The troubleshooter managers report to the Director of System Operations, who also oversees the Company's SOC. This alignment of the new troubleshooter organization with the SOC helps the Company pursue and manage a consistent response to outages and other trouble, providing a consistent platform and set of expectations across CL&P for developing customer restoration estimates. Bowes PFT, pp. 37 and 38.

The three geographic areas of the TSO do not necessarily correspond to the Company's three new divisional boundaries because the troubleshooters are deployed in a manner that: (1) assigns them to those portions of the electric system that historically, and in the future, are more likely to sustain outages and trouble calls and not routine construction or new service work; (2) incorporates travel distance and time concerns due to varied geography and development density across the CL&P service area; and (3) incorporates varied customer density patterns. Troubleshooters will perform other routine, day-to-day work when they are not responding to outages and trouble calls such as cut-out additions and replacements, installations of animal guards, lightning arrestor change-outs, pole shifts, transformer upgrades and, during nighttime hours, street lighting repairs and flood light additions. CL&P will utilize qualified line contractors who are members of the International Brotherhood of Electrical Workers

(IBEW) labor union from a Connecticut-based line contractor. CL&P will continue to work with its existing unions to attempt to implement an internal workforce for the troubleshooter organization. Id.

The Company expected that the new TSO structure will improve customer service by reducing the off-normal working hour CAIDI by 40 minutes, which will lower CL&P's overall CAIDI by up to 15 minutes. In addition, the new troubleshooter crews will work 24/7 as their normal working hours. Also, the stability of the daytime workforce will be improved because daily schedules can be maximized with a stable resource level to increase the overall efficiency of the workforce. Schedule adherence can be maximized and the area work centers will more effectively meet customer appointments and take on more construction and system resiliency projects. CL&P indicated that hiring crews that work 24/7 will reduce the number of callouts of additional personnel and thus can help improve response rates for those instances when a callout is necessary. Lastly, the Company stated that quality of life issues for employees is expected to improve by avoiding multiple forced on-calls for weekends during the summer months, and providing weekend coverage as part of regularly-scheduled work. Id., p. 39.

c. Costs

The Company projected that the cost of the new TSO to be $10.7 million and estimated that savings from the avoidance of cost for overtime work, associated rest periods, overtime meals and their meal time costs would save $5.7 million. CL&P Response to Interrogatory OCC-167. The Company is requesting that the Authority allow an adjustment to Rate Year O&M expense of $5.0 million to cover the annual net cost of the organizational change. The Company claimed cost is warranted by the direct and substantial improvement in service quality that will result from the implementation of an industry best practice. Moreover, this cost is conservatively quantified based on the cost of internal labor to fill the additional troubleshooter positions, although the Company will be using contract resources to fill the positions for the foreseeable future. Bowes PFT, p. 41. The quantification of net cost of this new initiative is conservatively based on internal labor rates.

The greater availability of the contractor resources on-system will add to the Company's resources in larger-scale, system-wide emergencies such as storm events. These critical resources will be located in Connecticut, available to the Company, and will already be familiar with the electrical distribution system and the state's geography. As a result, the expanded TSO contractor workforce will be a valuable asset in storm response. Bowes PFT, p. 40.

d. Position of the OCC

The OCC is concerned that the Company's estimate of new TSO costs of $10 million has not been offset by costs in the test year. Schultz PFT, p. 36. The $15 million for outside services and contract labor is excessive. The OCC determined that $4.552 million was spent for overhead line maintenance and it covered the labor for 49 contract workers, which equates to approximately $92,000 per contract worker. By hiring 84 more contract workers at $92,000 per year, the contract labor costs would

increase to $7.803 million. The OCC concluded that the $15 million costs for outside services and contract labor less the TSO $5 million savings in labor cost and less the $7.8 million for contract labor results in an excess estimate of TSO costs of $2.2 million and recommended that the Company's request be reduced by $2.2 million. The OCC stated that a cost benefit analysis should be performed to show that there is a benefit from the new TSO. The OCC questioned the type and level of work to be performed at night and claimed that the Company's description of work to be performed at night is not typically performed at night. Id., pp. 36 and 37.

e. Authority Conclusion on the TSO

The Authority reviewed the record and CL&P's rebuttal to the OCC's claim that the cost of the new TSO is overstated by $2.2 million. CL&P explained that the OCC incorrectly assumed that 49 troubleshooters under the former TSO were outside contractors. The 49 troubleshooters were employees of CL&P. Further, the labor cost is irrelevant with the $4.552 million spent for outside services and contractor labor that the OCC used to calculate an average contractor labor rate. WP C.310, p. 2 of 2. CL&P's estimate of contract labor in the new TSO was based on adding 90 contractors consisting of 80 line workers, 8 supervisors and 2 managers. CL&P Response to Interrogatory OCC-167. The OCC based its estimated contractor labor cost on an additional 84 contractors which understated the labor costs. Bowes Rebuttal PFT, p. 12.

The Authority accepts CL&P's explanation that associating 49 CL&P employees with the $4.55 million spent for contractor services is inaccurate. The Authority finds that the calculation of the average contactor labor cost by the OCC is not supported and rejects the OCC's claim that the new TSO cost would be $15 million. The Authority finds no justification to accept the OCC's recommended $2.2 million funding reduction for the new TSO.

Based on the reported lower restoration times experienced during the second and third shifts and for weekends at utilities using the new type TSO, the potential of increased availability of CL&P line workers having a more certain work schedule during the first shift to meet scheduled appointments and service calls, the elimination of geographic boundaries so work crews can respond to any type of outage, the opportunity to adjust the number of contract workers due to seasonal work and having additional contract work in the service territory at the start of normal and major storms. The Authority will allow CL&P's request to annually fund $5 million for the new TSO. At the time of its next annual CAIDI reliability filing in March 2015, the Company shall report the CAIDI for the second and third shifts and for weekends and the average number of contract workers staffing each work period to demonstrate the change that the new TSO had on reliability for these periods and the overall system and report the annual contractor costs of the new TSO.

In its next rate case, the Company will also be required to report the annual CAIDI and JD Power service scores for CL&P and its peer group and justify the effect that the new TSO had on these results.

18. Computer Expense

In Revised Late Filed Exhibit No. 3, the Company requested $11.187 million in computer expense for the Rate Year based on a Test Year amount of $17,250 with a pro forma adjustment reduction of $6,063 million to the Test Year amount to arrive at $11,187 million ($17,250 - $6,063 = $11,187). This is an allocated amount from NUSCO to the Company. Late Filed Exhibit 3, p. 2.

The Authority reviewed the Company's percentage changes and compared it to Schedule G-2-16 attachment to allocate NUSCO computer expense to CL&P. The Company based its request on various types of computer expenses that have various percentages of allocation to CL&P to arrive at Rate Year computer expenses of $11,187. In addition, the Authority reviewed the NUSCO allocation and accepts the Company's rate year amount of $11,187 million.

19. Facilities Maintenance

The Test Year expense for facilities maintenance was $5.990 million with a pro forma adjustment amount of ($606) for the proposed Rate Year amount of $5.384 million. Revised Late Filed Exhibit No. 3, p. 2.

The Authority reviewed the charges that comprise the facilities maintenance and finds them to be appropriate at this time. Therefore, the Authority will allow and accept the Rate Year facilities maintenance expense of amount of $5,384 million.

20. Customer Service Expense

The Company proposed $3.795 million for its Rate Year customer service expense. Late Filed Exhibit No. 3. In its Late Filed Exhibit 36, the NUSCO total amount was $1.611 million of which $1.057 million was allocated to CL&P from NUSCO. Late Filed Exhibit No. 36, p. 6. The Company subsequently reduced the Test Year amount of $3.839 million by $44 to arrive at the Rate Year amount of $3,795. ($3.839-$44)=$3795).

The Authority reviewed charges that comprise the customer service expense account and finds them to be appropriate at this time. Therefore, the Authority accepts the CL&P Rate Year amount of $3.795 million for customer service expense.

21. Conclusion on Expenses

As discussed in the preceding sections, the table below summarizes adjustments to the Company's proposed expenses:

Table 55

Summary of Expense Adjustments

Descriptions	Amounts ($)
Amortization Expense	34,000
Board of Directors' Fees	(437,000)
Depreciation Expense	(7,440,000)
Directors' & Officers' Liability Insurance	(350,000)
Employee Incentive Compensation	(5,190,000)
Gross Earnings Taxes	(139,000)
NUSCO Capital Funding	(402,000)
Other Employee Benefits	(2,250,000)
Payroll Expense	(4,870,000)
Payroll Taxes	(414,000)
401k	(158,000)
Property Taxes	(1,988,000)
Rent Expense	(1,709,000)
Storm Reserve Accrual	(6,000,000)
Total Expense Adjustments	**(31,313,000)**

D. TAXES

1. Gross Earnings Tax

Based on its current rates, CL&P reported Gross Earnings Tax (GET) expenses of $69.126 million for the Test Year and proposed $69.566 million for the Rate Year. Late Filed Exhibit No. 3, Schedule WPC-3.37, pp. 1 and 2. For the proposed additional revenue requirements, the Company proposed incremental GET expenses of $8.659 million for revenues from distribution operations; $1.792 million for system resiliency; and $5.186 million for regulatory storm costs. Late Filed Exhibit No. 3, Schedules A-1.0, p. 1; A-1.0 A, p. 1; and A-1.0 B, p. 1. Therefore, the total GET expense proposed for the Rate Year is $85.203 ($69.566 + $8.659 + $1.792 + $5.186) million.

As discussed in Section II.E. Gross Revenue Conversion Factor, the Authority calculated a GET Rate of 7.0606%. CL&P proposed total present base rate revenue of $983.676 million for the Rate Year. Late Filed Exhibit No. 3, Schedule WPC-3.37, p. 2. The total additional revenue requested for the Rate Year is approximately $221.098 million. Id., Schedule A-1.0. Thus, the total proposed revenue requirement subject to GET is $1,204.774 ($983.676 + $221.098) million, and the Authority determines that the GET expense on this amount is $85.065 ($1,204.774 x 7.0606%) million. As a result, the Authority reduces the GET expense proposed for the Rate Year by $139,000 ($85,203,000 - $85,065,000).

2. Interest Synchronization

The Authority adjusted the rate base amounts proposed by the Company and no change was made to the cost of long-term debt. Therefore, an interest synchronization adjustment is made to match the allowed rate base and with the income tax calculation. The rate base reduction adjustments reduces interest expense deductions for income for tax purposes and conversely increases income tax expenses. The tables in Section V. Rate Model, include adjustments to income taxes to reflect the impact of interest synchronization.

3. Municipal Property Taxes

CL&P reported property tax expense of $66.231 million for the Test Year and proposed $81.121 million for the Rate Year. Application, Schedules C.3.35, WPC-3.35A and WPC-3.35B. CL&P stated that property tax expense for the Rate Year is based on known assessed property values, updated for estimated depreciation, capital additions, retirements, and escalated mill rates. The property tax expense is amortized over the 12 months in a fiscal year beginning on July 1st. Mahoney PFT, p. 38. Furthermore, the Company indicated that its facility consolidation plan resulted in several reductions to the operating expenses for the Rate Year, including reductions to property tax expenses. Id. In its updated filing, CL&P increased its proposed property tax expense for the Rate Year to $81.435 million. Late Filed Exhibit No. 3, Schedule WPC-3.0, p. 1; WPC-3.35 A, p. 1. The revised request is to correct for a $75,000 calculation error in the Company's original filing and to reflect updates to estimated mill rates. Id. The Company total property tax expense proposed for the Rate Year equals the sum of 50% of the total actual property tax expense of $77,915,194, or $38,957,597, for the 2013 list year, plus 50% of the total estimated property tax expense of $84,382,289 or $42,191,145, for the 2014 list year. Id., Schedules WPC-3.35 A, p. 5 and WPC-3.35 B, p. 4. The total estimated property tax expense for the 2014 list year was determined by escalating the 2013 list year's personal and real estate property mill rates by 4%. Id. For tangible personal property, the Company reported a composite mill rate of 31.48 for the 2013 list year and 32.74 for the 2014 list year. Late Filed Exhibit No. 3, Schedules WPC-3.35 A, p. 5 and WPC-3.35 B, p. 4.

a. Escalation of Mill Rates

Concurrent with its previous rulings regarding mill rate escalations, the Authority concludes that the Company's proposal to escalate actual mill rates by 4% is not supported.[18] No evidence was provided in this proceeding that municipalities in the Company's service territories would, on average, increase their mill rates by 4%. The actual mill rate data available is for the 2013 list year. With the escalation removed, the Authority determines that the total estimated property tax expense for 2014 list year is $81,133,216 and for which 50% is $40,566,608 ($81,133,216 x 50%). As a result, the Authority disallows property tax expense of $1,624,537 ($42,191,145 - $40,566,608).

[18] See the 2009 CL&P Rate Case Decision, pp. 83 and 84; and the 2007 Rate Case Decision, pp. 74 and 75.

The Company stated that neither the OCC, the AG, nor any other participant opposed its proposal to escalate the 2013 list year mill rates by 4%, which equates to the $1,624,537 municipal property tax expense disallowed in the Proposed Final Decision. CL&P stated that its estimated mill rates escalation of 4% is conservative based on actual mill rate increases of 4.26% for list years 2010-2011; 7.14% for 2011-2012; and 4.41% for 2012-2013. However, the Company agreed to settle for a smaller mill rate escalation of 2% for the Rate Year and recommended that the Authority reduce the property tax expense reduction to $812,268.50 instead of the $1,624,537 disallowed in the Proposed Final Decision. CL&P Written Exceptions, pp. 45 and 46.

The Authority maintains its determination in the Proposed Final Decision that an arbitrary escalation of municipal property mill rates is improper as it ignores other variables that may impact actual property tax expenses.

b. Projected Plant Additions and its Depreciated Value

For the 2014 list year, CL&P reported total plant additions of $233.789 million and based on its proposed composite depreciation rate of 2.56%, it calculated a related net book value of approximately $227.804 million. Late Filed Exhibit No. 3, Schedule WPC-3.35B, p. 4. Using the 70% assessment factor, CL&P calculated total assessment value of approximately $159.463 million for the 2014 list year plant additions. Id.

The Authority takes issue with both the total plant addition and the related net book value amounts that the Company used to calculate the additional property tax requested. The Authority determines that the total plant addition for calendar year 2014, which the Company used as the proxy plant addition amount for the 2014 list year, is approximately $231.456 million. Schedule B-2.0; Tr. 09/12/14, p. 2398. CL&P stated that the difference of approximately $2.333 million is due to timing differences between the cutoffs for filing property tax and the Application. Id. Nevertheless, the Company agrees that the actual timing difference amount could go in either direction of the plant additions proposed for this proceeding. Id., p. 2399. For the 2014 list year, the personal property declaration period essentially runs from October 1, 2013 through September 30, 2014. Given the fact that only nine months in 2014 falls within the 2014 list year time frame, the Authority concludes that the 2014 list year plant addition timing difference would likely result in a declared amount less than the calendar year 2014 plant additions of $231.456 million. Therefore, the Authority recognizes the calendar year 2014 plant additions of $231.456 million as an appropriate proxy for property tax additions and disallows $2.333 million of plant additions from the calculation of property tax expense for the Rate Year.

Pursuant to Conn. Gen. Stat. §12-63(b)(6), the depreciated value of tangible personal property in their first year of declaration is 95% of acquisition costs. Thus, the Authority infers that the Company's depreciation composite rate of 2.56% is not applicable for the calculation of net book value for the proposed plant additions. Thus, the net book value for calculating the assessment value is 95% of the acquisition costs for the 2014 list year plant additions

c. Capitalized Expense Related Items

Based on discussions in Section II.C.2.i. Summary of Adjustments to Payroll Items, and Section II.C.3.e. 401(k) and K-Vantage, the Authority reduces plant-in-service by $8,834,351 for capitalized payroll related expenses and by $185,595 for capitalized 401K expense. Therefore, the Authority calculated a total plant addition amount for which additional property tax expense is applicable of $222.436 ($231.456 - $8.834- $0.186) million. Based on the foregoing, the Authority determines that the assessment value for the plant additions that should be included in the 2014 list year is $147.920 ($222.436 x 95% x 70%) million. Consequently, the Authority reduces the property tax expense associated with the proposed plant additions by $363,376 ($159.463 - $147.920) million x 0.03148).

In summary, the total reduction to the Company's proposed property tax expense is $1,987,913 ($1,624,537 + $363,376).

E. GROSS REVENUE CONVERSION FACTOR

The Company proposed a gross revenue conversion factor (GRCF) of 1.8252 for the Rate Year. Schedules A-3.0, A-3.0 (A) and A-3.0 (B). CL&P used a GET rate of 7.072% to calculate its proposed GRCF. This GET rate was determined by dividing the Test Year's GET expense of $69.126 million by the billed distribution revenue of approximately $977.414 million. Schedule WP C-3.37, p. 1.

The Authority finds that the proposed GET rate was overstated because CL&P did not incorporate unbilled revenues into the total base revenue used for the calculation. Based on CL&P's responses in this proceeding, unbilled revenues related to distribution, conservation and load management, and renewable operations are summarized below:

Table 56

Operations	Unbilled Revenues
Distribution	$1,514,144
Conservation and Load Management (C&LM)	137,787
Renewables	(30,268)
Total Unbilled for Distribution GET Expense	$1,621,663

Response to Interrogatory AC-70 Attachment 1, p. 2.

The total revenues proposed for the Rate Year encompass all revenues, billed and unbilled. Also, the proposed revenue deficiency represents the difference between the total Test Year revenues and the proposed Rate Year revenues at present rates. The Authority disagrees with CL&P's use of only billed revenue to calculate the proposed GET rate. The appropriate total base distribution revenue for calculating the GET rate is of $979.036 ($977.414 + 1.622) million. Therefore, the Authority calculated a GET rate of 7.0606% ($69.126 / $979.036). Consequently, the Authority determined that the appropriate GRCF for the Rate Year is 1.8250.

F. COST OF CAPITAL

1. Introduction

In determining the appropriate allowed cost of capital, Conn. Gen. Stat. §16-19e(a)(4) requires that:

> The level and structure of rates be sufficient, but not more than sufficient, to allow public service companies to cover their operating and capital costs, to attract needed capital and to maintain their financial integrity, and yet provide appropriate protection for the relevant public interest both existing and foreseeable.

To determine a rate of return (ROR) on rate base that is appropriate for CL&P's overall cost of capital, the Authority first identifies the components of the Company's capital structure. The cost of each capital component is then determined and weighted according to its proportion of total capitalization. These weighted costs are summed to determine the Company's overall cost of capital, which becomes the allowed ROR.

The Company retained the services of a cost of capital expert, Mr. Robert Hevert, to present evidence, to provide a recommended return on equity (ROE), and to assess the reasonableness of the Company's capital structure and cost of debt. The Authority notes that the Company is proposing to use the Test Year equity ratio, instead of the forecasted capital structure supported by CL&P's witness, Mr. Robert Hevert. The capital structure is discussed in more detail below.

2. Capital Structure

a. Capital Structure

The Company proposed rates that are based on a capital structure consisting of 50.38% common equity, 2.01% preferred stock and 47.61% long-term debt. Hevert PFT, p. 56. CL&P's long-term capital structure goal is to have an approximate 52% to 48% equity to debt ratio, and to have that capital structure used for ratemaking. CL&P Response to Interrogatory FI-52. Although CL&P plans to have an actual capital structure of approximately 52%/48% equity/debt in the Rate Year ending 2015, it has not made an adjustment to the Rate Year to reflect that expectation, and has instead reflected in this case, the equity ratio that existed at the end of the Test Year, December 31, 2013. The Company indicated that in its next rate case, it will present its actual capital structure. Mahoney PFT, p. 23. The Company's proposed capital structure and its corresponding component costs are depicted in the table below.

Table 57
Proposed 2015 Average Capitalization

Class of Capital	($000) Amount	% of Total	Cost	Weighted Cost
Long-Term Debt	2,770,150	47.61%	5.45%	2.60%
Preferred Stock	116,894	2.01%	4.80%	0.10%
Common Stock	2,931,000	50.38%	10.20%	5.14%
Total	5,818,044	100.00%		7.84%

Application, Schedule D-1.0.

As determined in the 2009 CL&P Rate Case, CL&P's currently allowed capital structure is 48.35% long-term debt, 2.45% preferred stock and 49.20% equity. CL&P Response to Interrogatory FI-53. As a measure of capital structure, Mr. Hevert calculated the average capital structures for each of his proxy companies which indicated an average common equity ratio range from 46.14% to 61% on an operating company basis. Hevert PFT, p. 58; Exhibit RBH-15, p. 2. Mr. Hevert's 15-member proxy group had an average capital structure consisting of 52.95% common equity, 0.25% preferred stock and 46.80% long-term debt. Id. Based on Mr. Hevert's capitalization analysis, CL&P's proposed and target capital structures are somewhat more leveraged than those in place at the utility operating companies held within the peer group. CL&P Response to Interrogatory FI-54. In Mr. Hevert's opinion, increasing the equity ratio to approximately 52% will serve to bring the Company in line with its peers, and would improve its ability to access the capital markets, at reasonable cost rates, under a variety of capital market conditions. Hevert PFT, pp. 59 and 60.

Mr. Hevert claimed that CL&P's capital structure has less equity than other electric utility operating companies rather than their consolidated parents, which he asserts is industry practice. Hevert PFT, p. 57. The OCC's cost of capital witness, Dr. Woolridge, contends that this assertion is incorrect because Mr. Hevert excluded short-term debt and also compared the capitalization ratios of the operating subsidiaries of the proxy group companies. Woolridge PFT, pp. 16 and 17. When evaluating financial risk, short-term debt must be included in a company's capitalization because it is a senior debt claim. As an example, Dr. Woolridge shows NU's, CL&P's parent company, common equity ratio of 49.64%, including short-term debt, which comprises 8.40% of the capitalization. Woolridge PFT, Exhibit JRW-5, Panel C. If short-term debt were to be excluded, then its average quarterly common equity ratio would only be 43.2%, a significant difference in common equity ratios. Also, comparing capitalization ratios of the proxy group's operating subsidiaries is incorrect because operating companies do not have common stock outstanding; therefore, these should not be used to estimate an equity cost rate. According to Dr. Woolridge, the proper comparison is to the actual proxy group capitalizations, including short-term debt. Id.

Dr. Woolridge provided the average quarterly capitalization ratios for all the holding companies in Mr. Hevert's proxy group which averaged 5.72% short-term debt, 45.86% long-term debt, 0.26% preferred stock, and 48.16% common equity. Woolridge PFT, p. 15; Woolridge Exhibit, JRW-5, p. 2. Given the proximity of the common equity ratio of 50.38% to those of the proxy group and NU, the OCC has accepted CL&P's

proposed capital structure. Woolridge PFT, p. 16. The OCC has adopted the Company's proposed capital structure and senior capital cost rates into its analysis. Woodridge PFT, p. 3.

In allowing a cost of capital, the Authority finds it reasonable to assume the additional equity of a 50.38% equity structure in the cost of capital calculation. The Authority determines that by slightly increasing the equity ratio from 49.20%, as determined in the Company's last rate case, to 50.38% would not dramatically increase the cost of capital, but will continue to support healthy debt ratings and expand CL&P's marketablility to attract the necessary capital. Ultimately, a strong capitalization should minimize the cost of capital through lower interest rate on financings as well as increase the availability of capital itself. While CL&P is striving to reach a 52% equity capitalization by the end of 2015, the Authority finds that the proposed 50.38% equity ratio in this rate proceeding is in line with its peers and other electric utilities with similar financing requirements and business risks. CL&P will continue to maintain its capital structure by coordinating in terms of timing and amount of common dividends paid to NU and the equity infusions that it receives from NU. As such, the Authority finds that a 50.38% equity proportion is more than fully adequate and should enable the Company greater access to the capital markets and financial flexibility.

b. Cost of Long-Term Debt

The Company's proposed average long-term embedded cost of debt for the 12 months ended December 31, 2015, was estimated at 5.45%, based on the 2013 Test Year equity ratio of 50.38%. Application, Schedule D, WP D-1.2, p. 3. The long-term debt consists of 19 series of first mortgage bonds and 9 series of pollution control revenue notes (PCRBs). CL&P Response to Interrogatory OCC-249. In order to balance the proposed capital structure, CL&P expects to issue $500 million of long-term debt in 2015. Tr. 9/10/14, pp. 1758 – 1761. The estimated embedded cost of debt also includes the unamortized cost associated with refinancing the 2005 Series A bonds and to fund the anticipated redemption of the 1996 Series A PCRBs. Unamortized costs for the PCRBs will be amortized over the term of the new first mortgage bonds. CL&P's Supplemental Response to Interrogatory OCC-249-SP01.

The Authority notes that based on CL&P's Order No. 1 compliance filing for the 12 months ended June 30, 2014, in Docket No. 76-03-07, Investigation to Consider Rate Adjustment Procedures and Mechanisms Appropriate to Charge or Reimburse the Consumer for Changes in the Cost of Fossil Fuel and/or Purchased Gas for Electric and Gas Public Service Companies, the Company lists an embedded cost of debt of 5.21%. CL&P has projected a higher embedded cost of debt of 5.45% for 2015. The OCC has accepted the proposed cost of debt into its recommendations. The Authority finds that 5.45% is a reasonable actual embedded cost of debt for CL&P as it reflects the current cost of any new planned debt issuances and refinancings.

c. Cost of Preferred Stock

The Company is expected to have $116,919 in preferred stock in its capital structure as of December 31, 2015, at a cost of 4.80%. Application, Schedule D-4.0. CL&P has 13 series of perpetual preferred stock that was issued between 1947 and

1968. Id. The Authority notes that rating agencies and investment banking firms treat preferred stock differently in that they will assign a credit to the mix of debt and equity. Based on discussions with the rating agencies, it is CL&P's understanding that equity credit for preferred stock can range from no credit to up to 50% credit. In the case of CL&P's preferred stock, Standard & Poor (S&P) considers 50% as equity and 50% as debt. CL&P Response to Interrogatory FI-57. This treatment of the Company's preferred stock has remained consistent in past rate proceedings, receiving 50% common equity credit. The 50% common equity credit assigned to CL&P's preferred stock reduces the amount of true common equity that the Company must maintain in order to achieve the same credit ratings objective. The Authority accepts the Company's proposed 4.80% costs as submitted in Schedule D-4.0.

3. Cost of Common Equity

In determining a return that is fair and reasonable while enabling the Company to operate properly and attract the necessary capital, the Authority judiciously reviewed all the testimony and evidence proffered by the witnesses in this proceeding and determines a change in CL&P's allowed return of 9.40% is warranted. The Authority finds it necessary to make various adjustments to the cost of equity data submitted in order to improve its analytical quality. These adjustments support a downward adjustment to the Company's currently allowed return. The Authority finds that the overall financial and economic indicators, business and financial risk and capital cost rates, in general, have declined since the time of CL&P's last rate proceeding. In addition, the merger of NU and NSTAR has enabled CL&P to have an even stronger financial position. The Company is obviously functioning in a relatively low interest rate environment, today, which has contributed to lower expected returns. The downward trend of approved ROEs nation-wide clearly signifies a lower cost of capital environment. Moreover, the Authority finds that the implementation of a full decoupling mechanism that helps mitigate the earnings pressure of the Company, further reduces the overall risk profile of the Company.

Therefore, in considering the arguments and analyses of the parties and intervenors, the Authority has set CL&P's ROE at 9.17**%**, and adopts such return in this proceeding. The Authority determines that such return is fair and reasonable, enabling the Company to operate properly and attract the necessary capital for capital investments. The cost of equity component, which is a measure of the investor's expected return, is discussed as follows:

a. Introduction

There are several methods commonly used to determine the appropriate cost of equity. The determination of the cost of equity in this proceeding was obtained using the discounted cash flow (DCF) method and the capital asset pricing model (CAPM) to a proxy group of companies. The DCF evaluates future cash inflows (dividends and capital gains) that investors expect to receive from a stock against the current market price investors pay for a stock. The discount rate that brings the present value of the cash flows exactly equal to the market price is the cost of equity. The Authority generally relies on the DCF analysis but also considers other methods. Accordingly, material was also presented using the risk premium CAPM by the Company's witness

and the OCC. The CAPM evaluates the cost of equity by determining first an appropriate risk free rate. To this rate it adds a beta (or the degree of co-movement of the security's rate of return with the market's rate of return) times the expected equity risk premium (the amount by which investors expect the future return on equities, in general, to exceed that on the riskless asset). The following is a summary of the positions of the parties on the subject of cost of equity:

b. Company ROE Proposal

The Company's cost of equity testimony was prepared by Mr. Hevert, a financial consultant on behalf of CL&P. Mr. Hevert advocated for an allowed ROE of 10.20% from a range of 10.20% to 10.70%. Hevert PFT, pp. 2 and 3. Mr. Hevert's testimony relied on DCF model (including the Constant Growth, Quarterly Growth, and Multi-stage forms), the CAPM (including both the traditional form of the CAPM and the Empirical CAPM), and the Bond Yield Plus Risk Premium approach to develop his cost of equity results by applying to a proxy group of electric utilities. Hevert PFT, p. 3. Although Mr. Hevert did not make an explicit adjustment to his recommended ROE of 10.20% for flotation costs, Mr. Hevert modified the DCF calculation to provide a dividend yield that would reimburse investors for issuance costs. Hevert PFT, pp. 51 and 52; Exhibit RBH-14. Reflected in his recommended ROE of 10.20%, Mr. Hevert calculated a 14-basis point adjustment to reasonably represent flotation costs for the Company. Id. In determining where the Company's ROE falls within his range of results, Mr. Hevert also took into consideration the Company's existing and proposed Earnings Sharing Mechanism, its proposed Decoupling Mechanism and the implications of certain State policy goals included in the Comprehensive Energy Strategy. Hevert PFT, p. 4.

As CL&P's stock is not publicly traded, Mr. Hevert's initial cost of equity calculations were primarily based on a proxy group of 15 publicly traded utility companies. Hevert PFT, pp. 6 – 11. However, Mr. Hevert subsequently revised the analyses for the proxy group presented in his direct testimony based on updated data through July 31, 2014. Hevert Rebuttal Testimony, dated August 22, 2014, p. 69 and Rebuttal Exhibit RBH-11. Using this updated data resulted in one company being eliminated to form a 14-member proxy group. To determine the composition of the proxy group, Mr. Hevert began with the universe of 47 companies from Value Line's Electric Utilities Industry. Mr. Hevert then applied the following screening criteria to determine his recommended proxy group: 1) consistently pay quarterly cash dividends; 2) covered by at least two utility industry equity analysts; 3) investment grade senior unsecured bond and/or corporate credit ratings from S&P; 4) regulated operating income over the three most recently reported fiscal years comprised of at least 60% of the respective totals for that company; 5) regulated electric operating income over the three most recently reported fiscal years represent at least 90% of total regulated operating income; and 6) not known to be party to a merger, or other significant transaction as of July 31, 2014.

The Authority notes that 24 of the companies were eliminated from Value Line's Universe of Electric Utilities based on Hevert's fifth criteria of a company having at least 90% of regulated electric operating income. Response to Interrogatory FI-88. The companies included in this proxy group with their ticker symbols were American Electric Power Company (AEP), Cleco Corporation (CNL), Duke Energy Corporation (DUK),

Empire District Electric Company (EDE), Great Plains Energy (GXP), Hawaiian Electric Industries (HE), IDACORP (IDA), NextEra Energy (NEE), Otter Tail Corporation (OTTR), Pinnacle West Capital Corporation (PNW), PNM Resources (POR), Southern Company (SO) and Westar Energy (WR). Prior to updating the data used for the proxy group, Mr. Hevert indicated that one of his proxy group companies, Pepco Holdings, announced the acquisition by Exelon on April 30, 2014, subsequent to the period used in the initial analyses. Hevert PFT, p. 11. Pepco Holdings was the company that was eliminated from Mr. Hevert's updated proxy group.

After selecting the 14-member proxy group, a cost of equity was calculated using a DCF method. Although Mr. Hevert recognizes the Authority places more weight on the Constant Growth DCF approach, he contests that there are a number of assumptions and constraints that may affect the reasonableness of its results. Therefore, Mr. Hevert included the Quarterly and Multi-Stage models, as well, to address those concerns. Hevert PFT, pp. 13 and 14. In theory, the standard DCF formula is based on the stock's current price reflecting the present value of all expected future cash flows. In its simplest form, the Constant Growth DCF model expresses the cost of equity as the discount rate that sets the current price equal to expected cash flows. The Constant Growth DCF model assumes: 1) a constant average annual growth rate for earnings and dividends; 2) a stable dividend payout ratio; 3) a constant price to earnings multiple; and 4) a discount rate greater than the expected growth rate. Hevert PFT, p. 14. In other words, assuming that the earnings and the dividends of a company grow at a constant rate, the DCF takes the standard form, whereas, the first term is the expected dividend yield and the second term is the expected long-term annual growth rate.

$$K = [D_0 \times (1 + g) / P] + g$$

where: K = Discount rate or Investor's required ROE

D_0 = Annualized dividend per share as of July 31, 2014

P = Current stock price (average 30, 90 and 180 day price)

g = Expected long-term annual growth rate (Zacks, First Call, Value Line, Sustainable Growth)

The first step in implementing the constant growth DCF model is to determine the expected dividend yield which is simply the annual dividend divided by a stock price. Hevert PFT, pp. 14 and 15. Mr. Hevert originally calculated the dividend yield based on the proxy companies' current annualized dividends and average closing stock prices over the 30, 90 and 180 trading day periods ended April 15, 2014. However, Mr. Hevert subsequently updated his analyses based on the data through July 31, 2014. Hevert Rebuttal Testimony, p. 69. Mr. Hevert adjusted the dividend yield to account for periodic growth in dividends by applying one-half of the long-term growth rate to the current dividend yield. While Mr. Hevert does not disagree with the Authority's use of Value Line as a sole source for projected dividends, he elected to use Bloomberg Professional Service as a source because it reflects the views of multiple analysts. Hevert PFT, p. 16. Mr. Hevert's original testimony calculated the average adjusted dividend yields using the 30-day, 90-day and 180-day average stock prices at 4.01%,

4.12% and 4.20%, respectively, for the period ending April 15, 2014. Hevert PFT, Exhibit RBH-1, pp. 1 – 3. As a result of using updated data through July 31, 2014, the average adjusted dividend yields using the 30-day, 90-day and 180-day average stock prices were reduced to 3.81%, 3.88% and 3.99%, respectively, for the 14-member proxy group. Hevert Rebuttal Exhibit RBH-1, pp. 1 – 3.

For the purpose of the DCF model, the next step is to develop a single growth rate component that reflects investors' growth rate expectations for the electric utilities. In order to reduce the long-term growth rate to a single measure, one must assume a constant payout ratio, and that earnings per share, dividends per share and book value per share all grow at the same constant rate. Hevert PFT, p. 16. According to Mr. Hevert, the fundamental measure of growth is earnings because dividends are paid from earnings and book value can only increase through retained earnings or with the issuance of new equity. His findings suggest that investors form their investment decisions based on expectations of growth in earnings, not dividends. Hevert PFT, pp. 17 and 18. Mr. Hevert used a consensus of long-term earnings growth estimates from Zacks, First Call and Value Line.

Additionally, Mr. Hevert included the sustainable growth approach to estimate a company's expected growth. The sustainable growth model is based on the theory that a firm's growth is a function of its expected earnings and the extent to which those earnings are retained and reinvested in the company. Hevert PFT, p. 18. This is calculated by the formula, g = br + sv, whereas 'b' is the expected retention ratio, 'r' is the expected return on equity, 's' is the common equity to be issued annually as new common stock and 'v' is the equity accretion rate. The 'br' portion of the formula projects growth as a function of internally generated funds. The Company stated that the 'sv' portion of the equation reflects an element of growth as the product of the growth in shares outstanding, and that portion of the market-to-book ratio that exceeds unity. As such, Mr. Hevert represents the 'sv' term as: (M/B – 1) x Common Shares Outstanding, whereas, M/B is the market-to-book ratio. Hevert PFT, p. 19; Exhibit RBH-2. As historical experience suggests that future earnings do not necessarily increase as the retention ratio increases, Mr. Hevert does not believe it is an appropriate measure of expected growth. However, recognizing that the Authority has included sustainable growth as a measure of expected growth in the DCF approach in prior proceedings, Mr. Hevert produced two sets of DCF analyses, one including sustainable growth rates and another excluding those estimates. Hevert PFT, pp. 20 and 21. Using Value Line as the source for the data, Mr. Hevert calculated an average sustainable growth rate of 4.39% for his proxy group. Rebuttal Exhibit RHB-1, pp. 1 – 3. Combining the long-term earnings growth estimates with the sustainable growth, resulted in an average growth rate of 5.28% for the 14-member proxy group. Excluding the sustainable growth rate, resulted in an average earnings growth of 5.61% for the comparable companies. Hevert Rebuttal Exhibit RHB-1, pp. 4 – 6.

For the constant growth DCF, Mr. Hevert calculated the high and low DCF results by combining the maximum and minimum EPS growth rate estimate as reported by Value Line, Zacks, First Call and sustainable growth with each company's dividend yield. Based on updated data through July 31, 2014, the constant growth DCF results, including sustainable growth, resulted in a reduced range of 7.58% to 10.95% (compared to 7.57% to 11.16% using data as of April 15, 2014). Excluding the

sustainable growth, the constant growth DCF produced a range of 8.26% to 10.87% (compared to 8.24% to 11.08% as of April 15, 2014). Hevert Rebuttal Testimony, p. 70, Tables 9a and 9b; Hevert PFT, pp. 21 and 22, Tables 3a and 3b.

According to Mr. Hevert, the constant growth DCF model is limiting because it assumes dividends are paid annually, and, consequently, likely to understate the cost of equity. Hevert PFT, pp. 22 and 23. While the adjusted yield is meant to address that assumption, it does not reflect the quarterly receipt and reinvestment of dividends. For that reason, Mr. Hevert developed the quarterly growth DCF model. This model replaces the D component of the constant growth DCF model with the following equation: $D = d_1(1 + k)^{.75} + d_2(1 + k)^{.50} + d_3(1 + k)^{.25} + d_4(1+k)^0$, whereas, d_1, d_2, d_3, d_4 is the expected quarterly dividends over the coming year, and 'k' is the required ROE. To calculate the expected dividends over the coming year, Mr. Hevert obtained the last four paid quarterly dividends for each company, and multiplied them by one plus the growth rate. Again, using the closing stock prices over the 30, 90 and 180 trading days period ending July 31, 2014, the quarterly growth DCF results ranged from 7.71% to 11.20% (compared to 7.69% to 11.40%, as of April 15, 2014) including sustainable growth, and 8.41% to 11.12% (compared to 8.38% to 11.32%, as of April 15, 2014), excluding sustainable growth. Hevert Rebuttal Testimony, p. 70, Tables 9a and 9b; Rebuttal Exhibit RBH-3; Hevert PFT, p. 24, Exhibit RBH-3.

The Company also developed a multi-stage DCF model which is an extension of the constant growth form that enables the analyst to specify growth rates over three distinct stages. Hevert PFT, p. 24. In the first two stages, cash flows are defined as projected dividends. In the third stage, cash flows equal both dividends and the expected price at which the stock will be sold at the end of the period (terminal price). In each of the three stages, the dividend is the product of the projected EPS and the expected dividend payout ratio. Mr. Hevert relied on the projected payout ratios as reported by Value Line and used a long-term growth rate of 5.70% which is based on the real GDP growth rate of 3.27% from 1929 through 2013, and an inflation rate of 2.36%. However, Mr. Hevert subsequently updated the long-term nominal growth rate to 5.74%. Mr. Hevert testified that the slight change was due to an increase in the expected inflation rate. Tr. 9/10/14, pp. 1787–1789. Mr. Hevert calculated the terminal price based on the Gordon model, which defines the price as the expected dividend divided by the difference between the cost of equity (discount rate) and the long-term expected growth rate. Hevert PFT, pp. 25 – 27. Using the Gordon model to calculate the terminal value, the multi-stage DCF analysis produced a range of results from 9.51% to 10.58% (compared to 9.46% to 10.75% in the original PFT). Hevert Rebuttal Exhibit RBH-4, pp. 1–20; Exhibit RBH-4, pp. 1-19. Of the three DCF approaches, Mr. Hevert stated that the multi-stage is better in that it provides the ability to take into account the fact that market conditions are changing, that companies may change their payout ratios over time and there may be some compression in the price-to-earnings ratio at the end of the day. Tr. 9/10/14, pp. 1776–1778.

In addition to the DCF models, Mr. Hevert employed the use of a traditional CAPM and an empirical CAPM (ECAPM), which are both risk premium-based models constructed as a forward looking estimate of market equilibrium that measures risk using the beta coefficient. The CAPM analysis estimates the cost of equity for a given security as a function of a risk-free return plus a risk premium to compensate investors

for the non-diversifiable or systematic risk of the security. Hevert PFT, p. 29. According to the theory underlying the CAPM, since unsystematic risk can be diversified away by adding securities to their investment portfolio, investors should be concerned only with systematic or non-diversifiable risk. Hevert PFT, p. 30. Systematic or non-diversifiable risk is measured by the beta coefficient. The basic CAPM is mathematically expressed as:

$$K = R_f + B(R_m - R_f)$$

where: K = required market ROE for a security

B = beta, or systematic risk, for that security

R_f = risk-free rate of return

R_m= required return on market portfolio

$(R_m - R_f)$ = market risk premium

Since electric utilities typically are long-duration investments, the 30-year Treasury yield is most suited for the purpose of calculating the cost of equity. Hevert PFT, pp. 30 and 31. Mr. Hevert used two measures of a 30-year Treasury bond yield and estimated a current rate of 3.35% and a near-term projected rate or consensus forecast of 4.03% as the risk-free rates. Hevert Rebuttal Exhibits RBH-5 and RBH-7. Mr. Hevert claimed that the current rate of 3.35% was the 30-day average as of July 31, 2014. Tr. 9/10/14, p. 1792.

After determining the risk-free rates, Mr. Hevert calculated three versions of the market risk premium. He relied on two forward-looking (ex-ante) estimates and included a third estimate that is a combination of the simple average of the ex-ante method, the Supply Side model, and the long-term historical average market risk premium. Hevert PFT, pp. 31 and 32. His first estimate required the use of Bloomberg as the data source for a DCF-derived market risk premium of 10.12%. Hevert Rebuttal Exhibit RBH-5. The 10.12% was performed by calculating for each of the S&P 500 companies for which Bloomberg provided consensus growth rates which resulted in a 13.47% required market return and then subtracted the 3.35% risk-free rate. The second market risk premium of 10.05% was derived by using the projected earnings growth rates as provided by Value Line which equated to a required return of 13.40% and again subtracting the 3.35% risk-free rate. Id. The third estimated market risk premium of 8.31% is a simple average of incorporating Ibbotson's long-term historical (ex-post) of 6.96% and Supply Side model of 6.12% together with the above ex-ante market risk premiums. Hevert Rebuttal Exhibit RBH-7. All of the expected or required market returns use analysts' EPS growth rate projections.

As for the betas, Mr. Hevert considered the beta coefficients reported by Bloomberg and Value Line for his 14-member proxy group. Hevert PFT, p. 32; Rebuttal Exhibit RBH-11. Updating the data for the 14-member proxy group, the average proxy group beta from Bloomberg was 0.783 and Value Line was 0.74. Hevert Rebuttal Exhibit RBH-6. While the betas are very similar, Mr. Hevert explained that Value Line calculates the beta coefficient over a five-year period and Bloomberg's is based on two years of data. Hevert PFT, p. 33. Based on the updated figures and the variations

discussed above, Mr. Hevert produces CAPM results in the range of 9.46% to 11.96%, a decrease from the prior range of 9.74% to 12.16%. Hevert Rebuttal Testimony, p. 72, Table 10.

Mr. Hevert also included the ECAPM analysis in estimating the cost of equity, which is another variation of the CAPM. Hevert PFT, pp. 33 and 34. Mr. Hevert believes the ECAPM addresses the tendency of the traditional CAPM to under-estimate ROEs for low beta stocks such as regulated utilities. The ECAPM calculates the product of the adjusted beta coefficient and the market risk premium, and applies a weight of 75% to that result. His model then applies a 25% weight to the market risk premium. The results of the two calculations are summed, along with the risk-free rate and takes on the following form:

$$K_e = R_f + 0.75B(R_m - R_f) + 0.25(R_m - R_f)$$

As with the CAPM, Mr. Hevert used the market DCF-derived ex-ante market risk premium estimates, the two measures of the 30-year Treasury yield as the risk-free rates and two estimates of the beta coefficient. Updating the inputs as of July 31, 2014, Mr. Hevert's ECAPM results currently range from 10.01% to 12.51%, compared to 10.21% to 12.74% as of the data provided April 15, 2014. Hevert Rebuttal Testimony, p. 72, Table 10; Hevert PFT, p. 34, and Table 9.

Besides the traditional CAPM and ECAPM, Mr. Hevert also evaluated the cost of equity for CL&P utilizing the bond yield plus risk premium method (RPM). Hevert PFT, pp. 34 – 37. The risk premium approach is similar to the CAPM in that the equity risk premium measures the additional risk required by investors for investing in equities rather than less risky assets, such as a company's debt. Typically, the RPM uses a market-based estimate to serve as a proxy for the market's return. Mr. Hevert used an alternative approach by gathering data from 1980 through July 31, 2014, of the actual authorized returns for electric utilities to serve as the proxy for estimating the equity risk premium. Id.; Hevert Rebuttal Testimony, p. 72. He defined the risk premium as the difference between the authorized ROEs and the then-prevailing level of long-term 30-year Treasury yields which resulted in the long-term average equity risk premium of 4.44%. Rebuttal Exhibit RBH-8, p. 18. However, Mr. Hevert stated that simply applying the long-term average equity risk premium of 4.44% would significantly understate the cost of equity and produce results well below any reasonable estimate. Hevert PFT, p. 37; Tr. 9/10/14, pp. 1795 – 1798. Because the data covers a number of economic cycles, Mr. Hevert used a regression analysis approach to measure the equity risk premium relative to a proportional change in the 30-year Treasury yields. To account for that variability, the risk premium is expressed as:

$$RP = a + B(\ln(T_{30}))$$

The results of the regression analysis confirms the inverse relationship between the relatively low level of the current 30-year Treasury yields and the equity risk premium. Including data through July 31, 2014, the 4.44% equity risk premium was adjusted further to 6.79%, 6.26% and 5.41% to reflect the relatively low yields of the current, projected near term and projected long-term, respectively. Rebuttal Exhibit RBH-8, p. 1. Adding the adjusted equity risk premiums to the current and projected 30-

year Treasury yields, resulted in an implied RPM range between 10.14% and 10.86% based on updated data through July 31, 2014.

In summary, Mr. Hevert's updated results determining the cost of equity using the Constant Growth DCF, Quarterly Growth DCF, Multi-stage DCF, CAPM, ECAPM and RPM methodologies to support a recommended range of 10.20% to 10.70%, with the allowed ROE of 10.20%. Mr. Hevert subsequently updated the analyses for the proxy group based on updated data through July 31, 2014. Mr. Hevert's cost of equity calculations were primarily based on a final proxy group of only 14 publicly traded utility companies. The following charts provide a summary of Mr. Hevert's ROE calculations, using updated data through July 31, 2014.

Table 58
Summary of CL&P's ROE Results

DCF Results - Including Sustainable Growth:

Constant Growth DCF	Low	Mean	High
30-Day Average	7.58%	9.10%	10.78%
90-Day Average	7.64%	9.17%	10.85%
180-Day Average	7.75%	9.27%	10.95%
Quarterly Growth DCF	**Low**	**Mean**	**High**
30-Day Average	7.71%	9.28%	11.02%
90-Day Average	7.78%	9.35%	11.09%
180-Day Average	7.89%	9.46%	11.20%
Multi-Stage DCF	**Low**	**Mean**	**High**
30-Day Average	9.51%	9.89%	10.37%
90-Day Average	9.58%	9.84%	10.45%
180-Day Average	9.70%	10.09%	10.58%

DCF Results - Excluding Sustainable Growth:

Constant Growth DCF	Low	Mean	High
30-Day Average	8.26%	9.43%	10.70%
90-Day Average	8.33%	9.50%	10.77%
180-Day Average	8.43%	9.61%	10.87%
Quarterly Growth DCF	**Low**	**Mean**	**High**
30-Day Average	8.41%	9.63%	10.93%
90-Day Average	8.48%	9.70%	11.00%
180-Day Average	8.59%	9.81%	11.12%
Multi-Stage DCF	**Low**	**Mean**	**High**
30-Day Average	9.68%	9.98%	10.35%
90-Day Average	9.75%	10.06%	10.43%
180-Day Average	9.87%	10.18%	10.56%

CAPM Results:

CAPM	Bloomberg Derived MRP	Value Line Derived MRP	Average Supply Side Ex-Ante RP
Average Bloomberg Beta - 0.783			
Current 30-Year Treasury (3.35%)	11.28%	11.22%	9.86%
Near Term Projected 30-Year Treasury (4.03%)	11.96%	11.90%	10.54%
Average Value Line Beta - 0.74			
Current 30-Year Treasury (3.35%)	10.79%	10.74%	9.46%
Near Term Projected 30-Year Treasury (4.03%)	11.48%	11.43%	10.15%

ECAPM Results:

ECAPM	Bloomberg Derived MRP	Value Line Derived MRP	Average Supply Side Ex-Ante RP
Average Bloomberg Beta - 0.783			
Current 30-Year Treasury (3.35%)	11.82%	11.76%	10.31%
Near Term Projected 30-Year Treasury (4.03%)	12.51%	12.45%	10.99%
Average Value Line Beta - 0.74			
Current 30-Year Treasury (3.35%)	11.46%	11.41%	10.01%
Near Term Projected 30-Year Treasury (4.03%)	12.14%	12.09%	10.70%

Risk Premium Results:

Bond Yield Plus Risk Premium	30-Year Treasury Yield	Risk Premium	Return on Equity
Current 30-Year Treasury (3.35%)	3.35%	6.79%	10.14%
Near Term Projected 30-Year Treasury (4.03%)	4.03%	6.26%	10.30%
Long Term Projected 30-Year Treasury (5.45%)	5.45%	5.41%	10.86%

Hevert Rebuttal Testimony, pp. 69–73.

Although an explicit adjustment for flotation costs was not added to the recommended ROE of 10.20%, Mr. Hevert calculated a 14 basis point adjustment to reasonably represent flotation costs for the Company. In addition, Mr. Hevert also took into consideration the Company's existing and proposed Earnings Sharing Mechanism, its proposed Decoupling Mechanism, financial and business risks and the capital market environment in determining where the Company's ROE falls within his range of results. These considerations are discussed in more detail in II.F.3.f, Flotation Costs.

c. OCC's Position

Dr. Woolridge advocated a 8.90% ROE in this proceeding based on the capital structure proposed by CL&P which includes a common equity ratio of 50.38%. Woolridge PFT, p. 2. Using the proposed Test Year capital structure and senior capital cost rates, the OCC recommended an overall rate of return of 7.14%. Woolridge Exhibit, JRW-1. Dr. Woolridge employed the use of the DCF and CAPM approaches to a 32-member electric proxy group. Dr. Woolridge also applied these methods to CL&P's cost of capital witness' proxy group of companies. Id.

Dr. Woolridge established a proxy group which consists of 32 publicly-held electric utility companies. Woolridge PFT, p. 13. Dr. Woolridge's proxy group includes companies that meet the following criteria: 1) at least 50% of revenues are from regulated electric operations as reported by *AUS Utilities Report*; 2) listed as an electric utility by *Value Line Investment Survey* and listed as an electric utility or combination electric and gas utility in *AUS Utilities Report*; 3) an investment grade corporate credit

and bond rating; 4) has paid a cash dividend for the past three years, with no cuts or omissions; 5) not involved in an acquisition of another utility and not the target of an acquisition in the past six months; and 6) analysts' long-term EPS growth rate forecasts available from Yahoo, Reuters and/or Zacks. The resulting proxy group is comprised of: ALLETE, Inc., Alliant Energy Corporation, Ameren Corporation, American Electric Power Co., Avista Corporation, Black Hills Corporation, Cleco Corporation, CMS Energy Corporation, Consolidated Edison, Inc., Dominion Resources, Inc., Duke Energy Corporation, Edison International, Empire District, El Paso Electric, Entergy Corporation, Great Plains Energy Incorporated, Hawaiian Electric Industries, Inc., IDACORP, Inc., MGE Energy, Inc., Nextera Energy, Northeast Utilities, Northwestern Corporation, PPL Corporation, Pinnacle West Capital Corp., PNM Resource, Inc., Portland General Electric Company, OGE Energy Corp., SCANA Corporation, Southern Company, Westar Energy, Inc. and Xcel Energy, Inc. Dr. Woolridge included CL&P's parent company, NU, into his proxy group simply because it met the selection criteria and given the size of the proxy group, including or excluding NU had no material impact on the results. OCC Response to Interrogatory FI-187. While Dr. Woolridge's proxy group provides a more comprehensive sample to estimate an equity cost rate for CL&P, he also included Mr. Hevert's proxy group in his analysis. Woolridge PFT, p. 14.

The average S&P bond ratings for the Woolridge and Hevert proxy groups are both BBB+, whereas, CL&P's bonds are rated A-. Therefore, based on bond ratings, CL&P's investment risk is below that of the two proxy groups. In assessing the riskiness of CL&P's parent company relative to the proxy groups, Dr. Woolridge compared the beta, financial strength, safety, earnings predictability and stock price stability as published by ***Value Line***. NU's risk metrics on all five measures are virtually identical to the average for both proxy groups. Therefore, Dr. Woolridge considers that both proxy groups represent a risk-comparable group for CL&P, but the Company's risk is on the low side of these groups as indicated by the bond ratings. Woolridge PFT, pp. 14 and 15.

In developing a fair rate of return for CL&P, Dr. Woolridge primarily relied on the DCF model to estimate the cost of equity and applied it to the both Mr. Hevert's proxy group and his 32-member proxy group. Woolridge PFT, pp. 24 – 29. Given the relative stability of the utility business, the maturity of the demand for public utility services, and the regulated status of public utilities since returns are set through the ratemaking process, Dr. Woolridge finds that the DCF model provides the best measure of equity cost rates for public utilities. Woolridge PFT, p. 24. The economics of the public utility business indicate that the industry is in the steady-state or constant growth stage of a DCF. Woolridge PFT, p. 28. Using the constant growth version of the DCF method, Dr. Woolridge first calculated the dividend yield by taking the current annual dividend and the 30-day, 90-day and 180-day average stock prices as of July 17, 2014. Tr. 9/10/14, p. 1845; OCC Response to Interrogatory FI-182. The mean and median dividend yields ranged from 3.6% to 3.9% for Woolridge's proxy group and ranged from 3.7% to 4.1% for Hevert's proxy group. Given these ranges, Dr. Woolridge used a dividend yield of 3.8% and 3.9% for Woolridge's and Hevert's proxy group, respectively. Woolridge PFT, p. 29. According to the traditional DCF model, the dividend yield term relates to the dividend yield over the coming period. Therefore, to reflect the growth over the coming period, Dr. Woolridge adjusted the dividend yields by one-half the expected dividend

growth resulting in an adjusted dividend yield of 3.9% for Woolridge's proxy group and 4.0% for Hevert's proxy group. Woolridge PFT, pp. 29 and 30; Exhibit JRW-10, p. 1.

According to the conventional DCF model, the expected return on a security is equal to the sum of the dividend yield and the expected long-term growth in dividends. Woolridge PFT, p. 32. Dr. Woolridge stated that the appropriate growth rate in the DCF model is the dividend growth rate, not the earnings growth rate. Nonetheless, over the very long-term, dividend and earnings will have to grow at a similar growth rate. Therefore, consideration must be given to other indicators of growth, including prospective dividend growth, internal growth, as well as projected earnings growth. Woolridge PFT, p. 34. However, in Dr. Woolridge's opinion, investors are well aware of the upward bias in analysts' EPS growth rate forecasts, and therefore, the DCF growth rate needs to be adjusted downward since the stock prices reflect this bias. Woolridge PFT, pp. 35 and 36. Dr. Woolridge testified that the upward bias is not nearly as severe for electric utilities as it is for companies in general. Tr. 9/10/14, pp. 1847 – 1849. Dr. Woolridge used a dividend yield that reflects the 180-day trading period of average stock prices which mitigates the impact because it reaches back to 2013 when utility stocks were underperforming the overall stock market, as opposed to outperforming. Tr. 9/10/14, pp. 1849 and 1850.

For the growth component of the DCF calculation, Dr. Woolridge used a combination of historic and projected growth rates for earnings per share (EPS), dividends per share (DPS), book value per share (BVPS) and prospective earnings retention rates and earned returns on common equity as provided by *Value Line*. Dr. Woolridge also utilized the average EPS growth rates of Wall Street analysts as provided by Yahoo, Reuters and Zacks. Woolridge PFT, p. 31. Dr. Woolridge employs 13 measures of growth, of which 6 measure historic growth, and 7 are *Value Line* or Wall Street analysts' projections of growth, giving primary weight to the projected EPS growth rate forecasts of analysts. OCC Response to Interrogatory FI-188. For Dr. Woolridge's and Hevert's proxy group, the average of *Value Line's* historical median growth rate measures in EPS, DPS and BVPS is 3.60% and 3.0%, respectively. Woolridge PFT, p. 36; Exhibit JRW-10, p. 3, Panels A and B. The median of *Value Line's* projected growth rates for EPS, DPS and BVPS averaged 4.5% for Dr. Woolridge's proxy group and 4.3% for Hevert's proxy group. Id; Exhibit JRW-10, p. 4. The average of *Value Line's* internal growth for the proxy groups as measured by projected retention rate and return on shareholders' equity are 4.0% and 3.6%, for Dr. Woolridge's and Hevert's proxy group, respectively. Id. The mean and median of the 3 Wall Street analysts' projected EPS growth rates for the proxy groups are 5.0% and 4.9% for Dr. Woolridge's proxy group and 5.4% and 4.8% for Hevert's proxy group, respectively. To derive the overall growth rate for the proxy groups, Dr. Woolridge gathered all the data he collected to establish a range of estimates. Giving greater weight to the projected growth rate figures, Dr. Woolridge used the midpoint of the median range for each, resulting in a DCF growth rate of 4.875% for Woolridge's proxy group and 5.0% for Hevert's proxy group. Woolridge PFT, pp. 38 and 39.

Combining all the components of the DCF model, Dr. Woolridge calculated equity costs rates of 8.80% and 9.0%, for Woolridge and Hevert's proxy group, respectively. The details underlying the DCF-derived cost for equity for each proxy group is shown below.

Table 59

	Dividend Yield	1 + 1/2 Growth Adjustment	DCF Growth Rate	Equity Cost Rate
Woolridge Proxy Group	3.80%	1.02438	4.88%	8.80%
Hevert Proxy Group	3.90%	1.02500	5.00%	9.00%

Dr. Woolridge also performed a CAPM analysis using both proxy groups. To determine an equity cost rate using the CAPM, there are three inputs: 1) the risk-free rate of interest, 2) beta (systematic risk measure), and 3) the expected equity or market risk premium. The yield on long-term Treasury bonds is viewed as the risk-free rate of interest in the CAPM and is readily observable in the markets. The yield on the 30-year Treasury bond has been in the 3.0% to 4.0% range over the 2013 to 2014 time period. Woolridge PFT, p. 41; Exhibit JRW-11. According to Dr. Woolridge, these rates are currently in the 3.35% range. Given the recent range of yields and the higher recent interest rates over the past two years, Dr. Woolridge elected to use 4.0% as the risk-free rate in the CAPM analysis. By using the top end of the range, Dr. Woolridge is building into it, a higher return. Tr. 9/10/14, p. 1853.

Dr. Woolridge stated that beta, the measure of systematic risk, is a little more difficult to measure because there are different opinions about what adjustments, if any, should be made to historic betas due to their tendency to regress to 1.0 over time. Woolridge PFT, p. 41. A stock with below average price movement, such as that of a regulated utility, is less risky than the market and has a beta of less than 1.0. Woolridge PFT, p. 42. Dr. Woolridge also found there to be several online investment information services that provide estimates of stock betas and these services can report different betas for the same stock due to the time period over which the beta is measured. As provided in the Value Line Investment Survey, the median betas for the companies in Woolridge's and Hevert proxy groups are 0.75% for both. Id.; Exhibit JRW-11.

The most contentious part of the CAPM is to measure the expected equity or market risk premium. The equity risk premium is the expected return on the stock market (such as, the expected return on the S&P 500) minus the risk-free interest rate (yield on the 30-Year Treasury). While the equity risk premium is easy to define conceptually, it is difficult to measure because it requires an estimate of the expected return on the market. Woolridge PFT, p. 43. To determine an equity risk premium, the OCC reviewed the results of over 40 equity risk premium studies and surveys performed over the past decade. These included the summary equity risk premium results of: 1) the annual study of historic risk premiums as provided by Ibbotson Associates; 2) ex ante equity risk premium studies commissioned by the Social Security Administration (as well as other similar studies labeled "Puzzle Research"); 3) equity risk premium studies of CFOs, Financial Forecasters, and academics; and 4) Building Block approaches to the equity risk premium. The overall median equity risk premium of these studies is 4.28%. Woolridge PFT, pp. 43 – 46; JRW-11, p. 5. To assess the effect of the earlier studies on the equity risk premium, Dr. Woolridge separately composed the results of the studies that were published after January 2, 2010, and

determined a median for this subset is 4.90%. Woolridge PFT, p. 47; Exhibit JRW-11, p. 6. According to Dr. Woolridge, much of the data indicated that the market risk premium is in the 4.0% to 6.0% range and the midpoint of 5% is used as the market risk premium for the OCC's CAPM analysis. Dr. Woolridge testified that he gives more credibility to the New York Fed's survey of numerous Wall Street firms that are actively involved in financial decision-making on a daily basis. Tr. 9/10/14, pp. 1854 – 1857. Based upon analysis and the inputs discussed above, Dr. Woolridge's CAPM resulted in a cost of equity of 7.80% for both proxy groups.

Table 60

	Risk-Free Rate	Beta	Equity Risk Premium	Equity Cost Rate
Woolridge Proxy Group	4.00%	0.75	5.00%	7.80%
Hevert Proxy Group	4.00%	0.75	5.00%	7.80%

In summary, Dr. Woolridge calculated equity cost rates of 8.80% DCF for Woolridge proxy group, 9.00% DCF for Hevert proxy group, and 7.80% CAPM for both proxy groups. Given these results, the OCC concludes that the appropriate equity cost rate for the proxy groups is in the 7.80% to 9.00% range. However, since Dr. Woolridge primarily relies on the DCF model, the OCC used the midpoint of the upper end of the range, concluding that 8.90% is the recommended equity cost rate for CL&P. Woolridge PFT, p. 49. Dr. Woolridge discussed several reasons why an 8.90% ROE is appropriate and fair for CL&P in this case: 1) CL&P is slightly less risky than the proxy groups as measured by its S&P bond rating of A-; 2) the electric utility industry is one of the lowest risk industries in the U.S. as measured by beta; 3) capital costs for utilities, as indicated by long-term bond yields and interest rates, are still at historically low levels; 4) while the markets have recovered significantly over the past five years, the growth in the economy is tepid and unemployment is still at 6.1%; 5) utilities have been the best performing sector of the market this past year; and 6) CL&P is a distribution-only electric utility that does not have the risks associated with the generation component of integrated utilities. While Dr. Woolridge did not consider the impact of the Company's proposed decoupling mechanism nor the earnings sharing mechanism on the OCC recommended ROE, he concurred that the mechanisms are reflected in the lower risk of Company. Tr. 9/10/14, pp. 1869 – 1871. Furthermore, Dr. Woolridge provided the authorized ROEs in 18 rate cases in 2013 and 2014 involving distribution-only electric utilities. There are no authorized ROEs of 10% or higher, and the average for the distribution-only electrics is 9.48%. Woolridge PFT, pp. 51 and 52.

Dr. Woolridge critiqued the most significant areas of disagreement in measuring CL&P's cost of capital which are: 1) the DCF equity cost rate estimates; 2) the market or equity risk premium in the CAPM and RP approaches; and 3) whether an equity cost rate adjustment is needed to account for flotation costs. In the DCF approach, the OCC finds there to be three major areas of contention with CL&P's DCF estimates, and in particular, Mr. Hevert's (a) decision to ignore 1/3 of his low-end DCF results, (b)

excessive reliance on the long-term EPS growth rates of Wall Street analysts and *Value Line* in developing a DCF growth rate, and (c) employment of an unrealistic projected GDP growth rate in his multi-stage DCF model. Woolridge PFT, p. 53. With respect to the asymmetric elimination of low-end DCF results, Dr. Woolridge stated that Mr. Hevert biases his DCF study and reports a higher equity cost rate than the data indicate. Dr. Woolridge continues that it appears that Mr. Hevert simply ignored the mean low DCF results for his constant and quarterly-growth DCF model application. In comparison, Dr. Woolridge stated that he used the median as a measure of central tendency so as to not give outlier results too much weight while not ignoring the impact of low and/or high results in determining an estimate for DCF. Woolridge PFT, p. 55.

Another area of concern for Dr. Woolridge with Mr. Hevert's DCF is the excessive reliance on the projected EPS growth rate forecasts of investment analysts as compiled by Zacks, First Call and *Value Line* in estimating an equity cost rate. Mr. Hevert's DCF growth rate in all three models employ the overly optimistic and upwardly-biased EPS growth rate estimates of Wall Street analysts. The OCC considered it to be a well-known fact that analysts' EPS forecasts are consistently too high. Woolridge PFT, p. 56 and Appendix B. In comparison, Dr. Woolridge reviews 13 different measures of growth to develop a DCF growth rate, including prospective dividend growth, internal growth, as well as projected earnings growth. Id.

Dr. Woolridge also highlights two critical errors in Mr. Hevert's multi-stage DCF approach which grossly inflates the projection of GDP as a growth rate. Woolridge PFT, p. 59. Dr. Woolridge claims that Mr. Hevert has not provided any theoretical or empirical support that long-term GDP growth is a reasonable proxy for the expected growth rate of the companies in his proxy group. Dr. Woolridge illustrated the historic measures of growth for earnings and dividends for both his and Hevert's proxy group which suggest growth that is 200 basis points below Mr. Hevert's 5.70% GDP growth rate. More importantly, Dr. Woolridge demonstrates that the projected GDP growth rate of 5.70% is not reflective of economic growth in the U.S., and is well in excess of projections of GDP growth. As such, Dr. Woolridge provided evidence that shows nominal GDP as well as its components, real GDP and inflation, have declined significantly in recent decades. Id; Exhibit JRW-14. With respect to GDP forecasts, there are several forecasts available from economists and government agencies of annual GDP growth that show a long-term growth range of 4.5% to 4.8%. Woolridge PFT, p. 61.

The OCC deems there to be two primary errors in Mr. Hevert's CAPM analysis which is the use of the ECAPM and the market premiums. Dr. Woolridge considers the ECAPM as nothing more than an ad hoc version of the CAPM and there is no empirical validation for the use of the weighting factors to boost the equity risk premium measure. Woolridge PFT, pp. 63 and 64. The major area of contention with respect to the CAPM and RP approaches is the measurement and magnitude of the market or equity risk premium. Dr. Woolridge demonstrates how Mr. Hevert's CAPM includes an expected return on the stock market that is not reflective of current market fundamentals, expected earnings, and GDP growth. Mr. Hevert's use of expected EPS growth rates from Wall Street analysts of 11.8% and 10.31% to produce estimated market returns of 13.91% from Bloomberg and 12.31% from Value Line, respectively, are not consistent

with historic or projected economic and earnings growth in the U.S. Woolridge PFT, pp. 65 and 66.

The national growth in nominal GDP, S&P 500 stock price appreciation, and S&P 500 EPS and DPS growth since 1960 has averaged 6.50%, which demonstrates that Mr. Hevert's long-term growth rate projections are vastly overstated. OCC Brief, p. 25. Also, as discussed above, projected long-term GDP growth rate forecasts are in the 4.5% to 4.8% range. Woolridge PFT, p. 67. Moreover, the risk premium in Mr. Hevert's RP approach, which is based on the difference between authorized ROEs for electric utility companies and Treasury yields, is overstated because the approach uses historic authorized ROEs and Treasury yields, and the resulting risk premium is applied to projected Treasury yields. Woolridge PFT, p. 72. In comparison, Dr. Woolridge uses a market risk premium which uses alternative approaches to estimating a market premium, and employs the results of over 30 studies and surveys of the market risk premium. Dr. Woolridge stated that his market risk premium is consistent with the market risk premiums: 1) discovered in recent academic studies by leading finance scholars; 2) employed by leading investment banks and management consulting firms; and 3) that result from surveys of companies, analysts, financial forecasters and corporate CFOs.

Mr. Hevert supported his DCF, CAPM and RP results with claims that the current market environment, flotation costs, and other factors suggest a higher equity cost rate is justified. Dr. Woolridge demonstrates that these factors should not be considered in setting the appropriate equity cost rate for CL&P.

d. Intervenors' Positions

i. Wal-Mart Stores

Pre-filed testimony of Steve W. Chriss, on behalf of Wal-Mart Stores East, LP and Sam's East, Inc. (collectively, Wal-Mart) was submitted with a recommendation concerning the ROE. Mr. Chriss demonstrates that the Company's proposed ROE of 10.2% is higher than ROEs approved by the Authority since CL&P's last rate proceeding and higher than those approved by other utility regulatory commissions. Chriss PFT, p. 17. As Mr. Chriss points out, there is a declining trend in authorized ROEs, particularly for distribution-only utilities. According to data from Regulatory Research Associates,[19] the average of 101 reported electric utility rate case ROEs authorized by commissions in 2012, 2013 and so far in 2014, is 9.91%, with a reported range of 8.72% to 10.95%. Chriss PFT, p, 18. The reported ROEs authorized by commissions were also recognized in Mr. Hevert's rebuttal testimony. Hevert Rebuttal Exhibit, RBH-20. However, the average reported ROE for distribution-only utilities was 9.57%, which is 63 basis points lower than CL&P's proposed ROE. Chriss PFT, p. 18. Mr. Chriss also revealed that in 16 recent utility rate cases in which Mr. Hevert provided expert testimony, the approved ROE decided in each case was lower than Mr. Hevert's recommended ROE in all cases. Chriss Late Filed Exhibit No. 35. In fact, each of the

[19] Regulatory Research Associates is part of SNL Financial, a financial news and reporting company.

16 recent cases in which Mr. Hevert provided expert testimony, all of the final approved ROEs were below Mr. Hevert's recommended ROE ranges. Id.

Mr. Chriss recommended that the Authority continue its practice of using recent Decisions to establish benchmark parameters and to indicate in which direction the allowed ROE should trend. Chriss PFT, p. 19. In addition, Mr. Chriss suggests that if the Authority approves a decoupling mechanism and earnings sharing mechanism for CL&P, it should consider the extent to which the implementation of these mechanisms reduces the business risk and be reflected in the Company's approved ROE. Chriss PFT, p. 4.

ii. AG's Position

The AG stated that the Authority should reject CL&P's proposed ROE of 10.2% since it is not consistent with recent PURA Decisions or analysis and is based on flawed and unreliable cost of capital analyses. AG Brief, p. 3. The AG generally supported the OCC's cost of capital testimony and its recommended ROE of 8.9%. However, the AG argued that the Authority should impose additional reductions to CL&P's authorized ROE to reflect the reduced business and operations risk from the revenue and sales decoupling mechanism. Id.

The AG contended that the Company's ROE is far out of line with recent Authority Decisions and would be the highest authorized return for any major regulated public service company in Connecticut. In the last 18 months, the Authority has not authorized a ROE over 9.2% and cites to the recently awarded returns of Connecticut Natural Gas Corporation, The United Illuminating Company and Aquarion Water Company of Connecticut. AG Brief, pp. 4 and 5. The AG also argued that CL&P's testimony in support of its proposed ROE of 10.2% contains errors that have distorted the Company's DCF, RP and CAPM analyses and unreasonably inflated its proposed ROE as demonstrated by the testimony and exhibits of the OCC's witness. As a result, the Company's recommended ROE is substantially higher than other similarly situated utility companies and substantially higher than the levels that the PURA recently approved for Connecticut's other public service companies. Id.

e. Authority Analysis – Cost of Equity

The Authority assessed the testimonies and recommendations of Mr. Hevert and Dr. Woolridge and is confident that the best solution to CL&P's cost of equity capital requirements still exists within the framework of the DCF model while considering the results of the CAPM. To test the results of the Company and the OCC witnesses, the Authority conducted its own cost of equity analysis of regulated utilities in an effort to take into account the differing approaches to estimating the cost of equity. The Authority's cost of equity analysis is based on the consensus positions and evidence gathered in Docket No. 09-10-06, Investigative Inquiry into the Desirability, Need and Feasibility of Establishing a Uniform Methodology for Determining Return on Equity (2009 Generic ROE Proceeding) in order to maintain consistency among rate proceedings. The Authority also takes notice that the testimony, arguments, calculations and methodologies by the OCC's consultant, have been uniform in the last several rate proceedings and have proved to be unfailing.

i. Analysis of the DCF Proposals

Since CL&P's stock is not publicly traded, a proxy group of companies comparable to CL&P must be developed in order to estimate the cost of equity. With regard to the choice of a proxy group, the Authority considered the Company and the OCC witnesses' proxy groups. The OCC chose to use the same 14-member proxy group derived by CL&P, as well as Dr. Woolridge's selection of a 32-member proxy group and performed analyses for both groups. Both the Company and the OCC used similar criteria in the selection of their proxy groups, such as those followed by Value Line, paid consistent quarterly dividends, covered by at least two utility industry equity analysts, an investment grade corporate credit and bond rating, and not involved in a merger, acquisition or other significant transaction. The Authority finds these to be reasonable factors to consider in the selection of the proxy companies.

The Authority takes issue with the percentage of regulated business criteria and it is the major difference between the Company and the OCC in that selection criteria. For example, the OCC recommended that proxy group companies have at least 50% of revenues from regulated electric business as reported by AUS Utility Reports. Alternatively, the Company cited that the basis for selecting its proxy electric companies was that it should represent at least 60% of total regulated operating income and 90% or greater of income from regulated electric operating income as conveyed in each companies' respective SEC 10-k filings and reported by SNL Financial. The difference of regulated operating revenues versus income and the source used to derive the data is not much of a concern as is the disproportion in the percentage of regulated business considered. The Company's selection criteria of having at least 90% of its regulated business from electric utility operations resulted in the elimination of 25 companies from Value Line's universe of 47 electric utility companies. This factor alone caused the greatest disparity between the Company and the OCC proxy group of companies. The Authority finds the Company's elimination of companies with less than 90% regulated income to be too restricting, while the OCC's criteria of at least 50% regulated revenues, too broad.

With respect to the proxy group selection criteria, the Authority reviewed prior rate proceeding decisions and closely followed the discussions by the parties in the 2009 Generic ROE Proceeding. According to the consensus, the Authority finds that the percentage of regulated business criteria to be 70% of regulated electric revenues as followed by *AUS Utility Reports*. The Authority finds the 70% valuation for an electric utility as appropriate and allows the PURA to create a pure play electric proxy group. Although it is not as restricting as the Company's 90% criteria, the Authority finds the 70% threshold still results in a large, robust proxy group. Including this modification to this selection criteria, the Authority's approved electric peer group (Authority Peer Group) represents the following selection criteria: 1) followed by Value Line; 2) has consistently paid dividends; 3) covered by at least two utility industry equity analysts; 4) has investment grade corporate credit and bond ratings; 5) not involved in a merger or takeover activity; and 6) 70% or more of revenues should be from regulated electric operations. Thus, the proxy group employed by the Authority to determine the cost of equity for CL&P lead to an Authority Peer Group of 25 comparable companies which includes: (ALLETE, Alliant Energy Corporation, Ameren Corporation, American Electric

Power, Consolidated Edison, Duke Energy, Edison International, Empire District, El Paso Electric, Entergy Corporation, Great Plains Energy, Hawaiian Electric, IDACORP, NextEra Energy, Northeast Utilities, NorthWestern Corporation, PG&E Corporation, Pinnacle West Capital Corporation, PNM Resources, Portland General Electric, OGE Energy, Southern Company, TECO Energy, Westar Energy, Xcel Energy). The table below provides a comparison of the proxy companies proposed by the Company, the OCC and also indicated those that passed the Authority's criteria.

Table 61

Hevert: Company Proxy Group	Woolridge: OCC Proxy Group	Authority Peer Group
	ALLETE, Inc.	ALLETE, Inc.
	Alliant Energy Corporation	Alliant Energy Corporation
	Ameren Corporation	Ameren Corporation
American Electric Power Co.	American Electric Power Co.	American Electric Power Co.
	Avista Corporation	
	Black Hills Corporation	
Cleco Corporation	Cleco Corporation	
	CMS Energy Corporation	
	Consolidated Edison, Inc.	Consolidated Edison, Inc.
	Dominion Resources, Inc.	
Duke Energy Corporation	Duke Energy Corporation	Duke Energy Corporation
	Edison International	Edison International
Empire District	Empire District	Empire District
	El Paso Electric	El Paso Electric
	Entergy Corporation	Entergy Corporation
Great Plains Energy Inc.	Great Plains Energy Inc.	Great Plains Energy Inc.
Hawaiian Electric Industries, Inc.	Hawaiian Electric Industries, Inc.	Hawaiian Electric Industries, Inc.
IDACORP, Inc.	IDACORP, Inc.	IDACORP, Inc.
	MGE Energy, Inc.	
Nextera Energy	Nextera Energy	Nextera Energy
	Northeast Utilities	Northeast Utilities
	NorthWestern Corporation	NorthWestern Corporation
	PPL Corporation	
	PG&E Corporation	PG&E Corporation
Pinnacle West Capital Corp.	Pinnacle West Capital Corp.	Pinnacle West Capital Corp.
PNM Resources, Inc.	PNM Resources, Inc.	PNM Resources, Inc.
Portland General Electric Co.	Portland General Electric Co.	Portland General Electric Co.
	OGE Energy Corp.	OGE Energy
Otter Tail Corporation		
	SCANA Corporation	
Southern Company	Southern Company	Southern Company
Westar Energy, Inc.	Westar Energy, Inc.	Westar Energy, Inc.
	Xcel Energy Inc.	Xcel Energy Inc.

In reviewing the DCF approaches, the Authority finds it necessary to address several differences between the Company and the OCC witnesses' applications of the model. Both the CL&P and the OCC witnesses incorporated the standard version of the DCF model to their proxy groups where the current dividend payment and stock price are directly observable. Although Mr. Hevert provided additional versions for estimating the DCF, such as the Quarterly and Multi-stage forms, the Authority finds the constant growth DCF model to be applicable due to the regulated stability and nature of public utilities, as well as the fact that returns on investment are effectively set through the

ratemaking process. The basic fundamentals of a regulated utility, such as CL&P, indicated that the industry is in a mature or steady-state stage of the three-stage DCF.

The DCF valuation approach for companies in this industry is the constant growth DCF. The constant growth DCF model is widely-accepted in the utility industry and is the most common method to calculate the ROE in regulatory proceedings. Consistent with past practice and industry standards, the Authority's preferred method is the constant growth form of the DCF that assumes dividends grow at a constant rate which simplifies to $K = D_1/P_0 + g$. Although the DCF seems straightforward, its components can vary widely depending on the type of growth measured and the time period selected. The Authority also considers the extent to which economic anomalies may affect the DCF analyses and prudently selects the individual components based on the current conditions within the constraints of the model and closely following the consensus of the 2009 Generic ROE Proceeding. The Authority is cognizant of the current market conditions and their relevant impact on growth rate recommendations, and reserves the right to use its judgment to form a reasonable estimate for the expected growth rate portion of the DCF model. As with each rate proceeding, a major point of contention is the computation of the growth component in the DCF, which is discussed further below.

After selecting the Authority Peer Group, the first step in the DCF is to calculate the average dividend yield. Both the Company and the OCC compute the dividend yield in a similar manner by using the proxy companies' current annualized dividends and average closing stock prices over the 30, 90 and 180 trading day periods and then adjusts the dividend yields by applying one-half of the long-term growth rate to the current dividend yield. Mr. Hevert's updated computation for the period ending July 31, 2014, resulted in adjusted dividend yields of 3.81%, 3.88% and 3.99%. Using both Mr. Hevert's proxy group and the OCC's 32-member proxy group, Dr. Woolridge employed the same approach for an adjusted dividend yield, but used the average stock prices as of July 17, 2014, to arrive at an adjusted dividend yield of 4.0% for Mr. Hevert's proxy group and 3.9% for OCC's proxy group.

Although the Company and the OCC employed comparable approaches to forecast the dividend yield in this proceeding, there is usually great deliberation over how much growth is to be applied (full year or half year) to forecast the dividend portion. To be consistent with prior proceedings, the Authority will incorporate *Value Line's* estimate of dividends to be paid over the next 12 months from *Value Line: Summary & Index*, column (f) as the D_1 input to the DCF model. This is based in part on evidence in the 2009 Generic ROE Proceeding and the fact that it is simply easier to utilize a number reported in *Value Line* than debate how much growth to be applied to inflate the current dividend. This debate can be lengthy in proceedings and the impact is *de minimis*. In fact, Mr. Hevert did not disagree with the Authority's use of *Value Line* as a sole source for projected dividends. Even though Mr. Hevert elected to use Bloomberg Professional Service as a source because it reflects the views of multiple analysts, he noted that the difference in results between the two sources is not significant. The Authority's analysis used *Value Line: Summary & Index* dated August 29, 2014, to obtain estimates of dividends to be paid over the next 12 months (D_1).

Regarding the time period that the data is collected, the Authority finds a 30-day average stock price long enough to capture changes in stock price movements and relatively simple to obtain from public sources online. Both the Company and the OCC used the average closing stock prices over three various time periods (30, 90 and 180 trading days) as its low, mean and high range for the dividend yield. The Authority incorporates a timeframe of 30 business days, or approximately 6 weeks, as reasonable for estimating the stock price portion for the dividend yield component of the DCF model. The Authority's time period covered six weeks ended August 29, 2014. Based on the Authority's Peer Group, resultant forecasted dividend yields used in the Authority's DCF model range from a minimum of 2.54% to a maximum of 5.17%. The mean (average) is 3.87%, while the median is virtually identical at 3.95%.

Next step is the calculation of long-term growth rates which is the most complex and debated issue of all the DCF components. There was agreement from the Company and the OCC that professional stock analysts' five-year forecasts for EPS growth and *Value Line's* projections for EPS should be included in the estimation of the overall growth component to apply in the DCF model. Mr. Hevert used a consensus of long-term earnings growth estimates from Zacks, First Call and *Value Line* which reports the lowest, average and highest projected growth rates. Dr. Woolridge elected to use *Value Line's* projected growth rate estimates and the EPS growth rate forecasts as provided by Yahoo, Zacks and Reuters. The Authority finds little debate with regards to the incorporation of which professional analysts' EPS estimates to include and integrates EPS growth projections from *Value Line*, Yahoo Finance/I/B/E/S and Zacks.[20] The Authority chose not to include Thompson Reuters as a source of EPS forecasts since it would be redundant to Yahoo Finance which lists Thompson Reuters as the source of its summary EPS forecasts. For the Authority Peer Group, examination of the EPS growth rate data reveals a range of 1.0% minimum to a maximum of 11.0%, while the mean-average of the three estimates taken together was 4.94% and their median was 4.79%.

One area of contention between the Company and the OCC is over the inclusion of *Value Line's* projections for DPS and BVPS. Mr. Hevert chose only to focus on earnings growth in his analysis because earnings are the fundamental measure of growth, whereas, earnings growth enables both dividend and book value growth. Conversely, Dr. Woolridge included *Value Line's* projected growth rate estimates for DPS and BVPS as well as, the historic growth rates for EPS, DPS and BVPS. There is general agreement that the DCF concept presumes that earnings, book value, market price and dividends all grow at the same rate. The Authority finds that under the DCF theory and financial literature in general, all earnings will eventually accrue to investors through dividends and eventual sale of the stock. Even so, the cash stream an investor receives is a dividend and not the company's earnings. In reality, the investor only shares in those company earnings to the degree and timing the company wants the investor to participate in the company's performance (i.e., the dividend). A similar

[20] Value Line projected EPS, DPS and BVPS growth rates were obtained from the August 22, 2014 East edition; the August 1, 2014 West edition, and the June 20, 2014 Central edition. The 5-year EPS growth rates for Yahoo Finance (www.finance.yahoo.com) and Zacks (www.zacks.com) were obtained from their Internet domains on September 5, 2014 and September 8, 2014, respectively.

argument can be made for the inclusion of the BVPS growth rate into the DCF model since BVPS represents the underlying investment which generates earnings and therefore, dividends. Lastly, from a more practical view point, the Authority finds that it is unlikely that an investor would examine the *Value Line* sheet for a company and look only for the EPS projections while those forecasts for DPS and BVPS are also there. Based upon its review, the Authority finds DPS and BVPS to be relevant growth rates and incorporates *Value Line's* projections for DPS and BVPS in its analysis. For the Authority Peer Group, examination of the forecasted DPS and BVPS growth rate data reveals a range of 1.0% minimum to a maximum of 12.0%, while the mean-average of both estimates taken together was 4.44% and their median was 4.0%. Evidence shows the DPS and BVPS projections are slightly lower than those projections for EPS growth rates.

Another disparity between the Company and the OCC was the inclusion of *Value Line's* historic growth rates for EPS, DPS and BVPS in the estimation of the growth rate to be used in the DCF model. The OCC suggests that historic rates should be considered to provide a baseline of growth since investors have access to historic information, which provides the basis for investors' investment decisions. However, it appears Dr. Woolridge did not include the historic growth rate figures (3.6% and 3.0%) when establishing the appropriate growth rate range of 4.75% to 5.0%. The OCC explained that the projected rates are given more weight compared with the historic rates. While investors may not prefer or rely on historical growth estimates, the Authority does not believe investors completely ignore past history. However, the Authority finds that the *Value Line* historic growth rates for EPS, DPS and BVPS should not be a separate input included in a composite growth rate for the DCF model in this proceeding. Although historic growth estimates are excluded from the expected growth component of the DCF model, this does not suggest these historic growth figures have no place in the DCF analysis as they indicate the reasonableness of analyst forecasts. Therefore, the Authority considered the *Value Line's* 5-year and 10-year historical growth rate estimates for EPS, DPS and BVPS only as a base line measurement means for evaluation of the forecasts.

In addition to the growth rates discussed above, the Company and the OCC have included a sustainable or retention growth rate (retention rate = br + sv) as a measure of expected growth in the DCF analyses. According to financial theory, the sustainable growth formula (g = ROE x retention rate) is the best measure to estimate long-term growth rate expectations and the growth rate component of the DCF. As in past practices, the Authority focuses on the 'br' portion (internal growth) that is known as the earnings retention rate times the projected ROE. The primary debate with the sustainable growth rate is regarding the 'sv' portion (external growth) of the retention growth formula. There is agreement that *Value Line's* projections of BVPS take into account external growth. Likewise, the 'sv' portion is only applicable when a company is in the process of issuing stock to achieve external growth.

The Authority realizes that it is difficult to determine 'sv' as one needs to know when a utility will undertake a stock offering and even more difficult to determine the market-to-book ratio of that stock offering at the time of its issuance. Under this circumstance, the 'sv' portion should be widely disseminated to the investment public and should be known and measurable. This is unlikely to happen as companies do not

normally publicly report their plans to issue equity well in advance of the issue. It is clear that the greater portion of the sustainable growth rate does come from the 'br' portion. Examining the Company's assumption for estimating the 'sv', Mr. Hevert used the projected market-to-book ratio and the growth rate in common shares outstanding for the 's' portion while the 'v' portion was computed as 1 minus the projected market-to-book. In this case, the Company used *Value Line* projections for the increase in number of shares outstanding for each member of the proxy group. In other words, an assumption is being made that all the proxy group companies will be issuing shares and at an increase in value or at a price greater than book value.

The Authority finds this to be an unlikely assumption. Consequently, the Authority includes the sustainable growth formula, but places no weight on the 'sv' portion of the equation. The Authority's 'br' computation is obtained from the final projection's column (years 17-19) from *Value Line* company sheets. For the Authority Peer Group, examining the computed sustainable growth rate data shows that it ranges from a minimum of 2.47% to a maximum of 5.90%, with a mean-average of 3.90% and median of 3.72%.

To fully develop an understanding of what the composite or overall long-term growth will be for a company, various growth rates including dividend, earnings and book value growth must be taken into consideration. It is apparent that growth rates vary widely depending on the type of growth measured and the time period selected. The Authority was vigilant in analyzing different subsets of time periods within each type of growth rate because averaging different years or months of data can produce widely different results due to short-term fluctuation and oscillations in security prices. Also, the Authority finds sustainable growth is a significant and primary driver of long-run earnings growth. In its analyses, the Authority incorporated measures of growth for EPS, DPS, BVPS, as well as, sustainable growth rates. Prior to the close of the record in this proceeding, the Authority applied the latest editions and most recent measures of data found in the record or publicly available online in its analyses.[21] Use of the most recent issue of the Mergent Bond Record, Value Line editions, EPS estimates and updated stock prices revealed a decrease in interest rates, stock prices and growth rates since the Company and the OCC submitted their analyses.

In applying the DCF model, the Authority reviewed the annual constant growth form and incorporated a screening mechanism, based upon the rationale that the cost of equity should be greater than the cost of debt due to equity's greater risk. The Authority used the data in the record employing different measures of growth, including *Value Line's* 5-year projected growth rates for EPS, DPS and BVPS, as well as growth rates computed using the sustainable earnings/retention growth formula. The Wall Street analysts' forecasts of EPS obtained from Yahoo Finance and Zacks were also

[21] Value Line projected EPS, DPS and BVPS growth rates were obtained from the August 22, 2014 East edition; the August 1, 2014 West edition; and the June 20, 2014 Central edition. The 5-year EPS growth rates for Yahoo Finance (www.finance.yahoo.com) and Zacks (www.zacks.com) were obtained from their Internet domains on September 5, 2014 and September 8, 2014, respectively. The stock prices were derived from the historical prices from Yahoo Finance for a 30-day trading period ending August 29, 2014. The cost of debt recent issue was the August 2014 Mergent Bond Record.

incorporated into the DCF analysis. Overall, the Authority computed several scenarios using different estimates of growth. No one growth estimate was favored in place of another.

In the case of the electric industry, the Authority implements more stringent screening criteria as there is a large universe of publicly traded electric utilities. In addition to the initial proxy group screening criteria discussed above, the Authority set an acceptance criterion relative to the individual DCF results. With the changing market conditions, the Authority finds the screening mechanism for implausibly high and low DCF results to be beneficial. Regarding the low side threshold, the Authority finds as reasonable, the concept that equity is more risky than debt. Traditionally, the Authority's method has been to add 100 basis points to the average Mergent Public Utility Bond yield as its low end to screen individual DCF estimates. The cost of debt benchmark consists of the most current effective cost of long-term debt rate for each Authority Peer Group company using the latest Mergent Bond Guide as the source for the corporate bond yield averages. With the continuous decline in interest rates combined with the decrease in stock prices and growth rates, the Authority observed the individual DCF estimates also have fallen.

The latest Mergent Bond Record, August 2014 edition indicates that over the time period this rate proceeding commenced, the average Aa Public Utility Bond yield ranged from 4.23% to 4.07%. Applying the concept that equity is more risky than debt, the Authority finds it reasonable to increase the minimum basis point threshold above the cost of debt from 100 basis points to 375 basis points. Raising the minimum threshold to 375 basis points had the effect of eliminating 10 companies that had DCF estimates ranging from 6.49% to 8.22%. Those companies excluded were: American Electric, Consolidated Edison, Duke Energy, Edison International, El Paso Electric, Empire District, Entergy, IDACORP, PG&E Corporation and Pinnacle West.

Regarding the high side threshold, the Authority did not find it necessary to change the maximum benchmark set at 750 basis points and there were no companies eliminated. In this case, a definitive high end screen was not necessary given the DCF indicated results are low and below 10%. After establishing the minimum and maximum thresholds for the Authority Peer Group, the DCF estimate shows that it ranges from 8.02% to 10.69% with a mean-average of 9.03% and a median of 8.79%. The Authority finds the average of 9.03**%** to be a reasonable estimate of the indicated DCF cost of capital methodology. The Authority also finds this result is very conservative given the elevated threshold for screening the lower DCF estimates. Furthermore, the Authority highlights the fact that the Company's own constant growth DCF analysis using the 30-day average stock price, including its version of sustainable growth, produced DCF results of 7.58%, 9.10% and 10.78% for the low, mean-average and high, respectively.

ii. Analysis of the Capital Asset Pricing Models

The Authority evaluated the CAPM approaches employed by the Company and the OCC witnesses. There are several debates surrounding the application of the CAPM methodology, such as the actual use of other non-traditional forms of the CAPM and the equity risk premium estimates. The major controversy contiguous to the CAPM is always the calculation of the equity or market risk premiums. The Authority applied

the traditional CAPM to its proxy group using the standard formula of $K = R_f + B (R_m – R_f)$. The Authority applied an equity risk premium based on data of equity risk premiums in the record.

Reviewing the evidence regarding the selection of the risk-free rate of interest (R_f), does not show much controversy. The Company used two measures of a 30-year Treasury bond yield and estimated a current rate of 3.35% and a near-term consensus forecast of 4.03%. The OCC also recommended the recent 30-year Treasury bond yield of 4.0% to be conservative based on its observation that the 30-year Treasury bond yields have ranged between 3.0% to 4.0% over the 2013 to 2014 time period. The Authority reviewed recent trends in 30-year Treasury bond yields and finds that these have bounced up and down since 2013; however, since the beginning of 2014 interest rates have slowly decreased again. In fact, on the last day of hearings, before the record closed, the 30-year Treasury bond yield was 3.22%.[22] To be conservative, the Authority finds it reasonable to use the average of the Company (3.69%= [3.35%+4.03%]/2) and the OCC proposals of 3.845% (i.e., [3.69%+4%]/2) as an acceptable proxy for the return on long-term risk-free rate of interest, and incorporates this into its CAPM analysis.

The measure of beta represents the volatility of a proxy group of companies to the aggregate market. The OCC recommended use of *Value Line* adjusted betas, while Mr. Hevert considered the beta coefficients reported by both *Value Line* and Bloomberg. The Authority is aware that there are several online sources that provide estimates of stock betas and these services can report different betas for the same stock due to the time period over which the beta is measured. The Authority has relied on *Value Line* adjusted betas in the past, and therefore, incorporates *Value Line* betas into its analysis. The average beta of the Authority Peer Group is 0.75.

The primary concern with the CAPM is the estimation of the expected equity or market risk premium ($R_m – R_f$). The Company used three market risk premium measures of 10.21% (an ex-ante DCF-derived market risk premium from Bloomberg), 10.05% (an ex-ante market risk premium utilizing data from *Value Line*) and 8.31% (a simple average of the ex-ante Ibbotson model, Supply Side model, and ex-post or long-term historical average). With respect to Mr. Hevert's ex-ante measures using data provided by Bloomberg and *Value Line*, the Authority reviewed the Company's approach of using a DCF analysis on companies in the S&P 500 and back into a market risk premium and finds it to be an interesting approach to take. On the surface, the approach seemed reasonable but the Authority took issue with the execution of the method, especially with the expected EPS growth rates from Wall Street analysts used as inputs.

The Authority concurs with the OCC that these growth rates of 11.8% from Bloomberg and 10.31% from Value Line are inflated and not consistent with either historic or projected economic and earnings growth in the U.S. Of course, estimating the inputs to the DCF approach to generate an estimated return on the market requires

[22] The Company agreed to take administrative notice of recent and historical US Treasury Rates from www.treasury.gov in its Response to Interrogatory FI-67.

using analyst estimates of growth. Although it is difficult to evaluate the level of optimism in Wall Street analysts projected growth rates, it is a factor that needs to be considered in the evaluation of cost of capital especially when expected growth rates are involved. Regarding the Company's third approach to estimating a market risk premium, the Authority finds this to be a simple blending of the ex-ante and ex-post approaches that temper the impact of any one result of a particular method. The Authority included all three of the Company's market risk premium measures in its overall computation of a reasonable estimate for the equity risk premium, but gave these measures only one-third weight.

Regarding the OCC's equity risk premium, the Authority finds Dr. Woolridge's approach to be the most comprehensive in that it incorporates over 40 equity risk premium studies and surveys performed over the past decade. The OCC's recommended average market risk premium of 5.0% also incorporates the Ibbotson historical approach, as well as, both the arithmetic mean and the geometric mean approach. The OCC's approach is the most inclusive and has been included as an approach in numerous previous Decisions. Therefore, the OCC's proposed 5% is included in the Authority's methodology and is also given one-third weight in estimating the overall equity risk premium.

The Authority's review of equity risk premium determines that an investor should not expect a return much different than that produced by companies in the economy. In reviewing the methodologies presented, the Authority is drawn to the Ibbotson Supply Side Model. The Ibbotson Supply Side Model suggests that equity returns consist of inflation, the growth in real EPS, and income returns. The Authority notes that both the Company and the OCC presented the supply side within their estimate of the equity risk premium. One difference between the supply side model and the historical model calculations of Ibbotson is that the supply side excludes the growth in the price earnings ratio. Both calculations use the arithmetic mean and the difference is modest. For example, over the time period 1926-2013, the historical approach yields an equity risk premium of 6.20% while the supply side approach yields 6.12%. The Authority finds that the Ibbotson supply side approach is responsive to problems and biases contained in the historical data and is the best approach. Thus, the Authority incorporates the Supply Side equity risk premium of 6.12% and will apply to it a one-third weight in developing its equity risk premium.

In addition to the traditional CAPM, the Company proposed another variation known as the ECAPM which is basically a size or leverage adjustment of beta that increases the expected returns for low beta stocks and decreases returns for high beta stocks. As discussed previously, both the OCC and the Company used the Value Line betas which have been adjusted to address the empirical issues with the CAPM. The Authority has reviewed Mr. Hevert's ECAPM and finds that the only difference between the CAPM and ECAPM is the use of the weights or Alpha factor which is an arbitrary figure and has not been validated in referred journals. The Authority finds that the Alpha factor incorporates another level of conjecture that is unnecessary given that the simple CAPM formula is widely accepted in the cost of equity literature. Furthermore, the Authority has previously rejected the use of the ECAPM in numerous rate

proceedings.[23] As a result, the Authority rejects the notion of adding more layers of speculation or another variation to the CAPM, therefore, the Authority discards the ECAPM estimates from its analyses.

As with past practice, the Authority implemented a traditional CAPM cost of equity using the standard formula. First, the Authority incorporates the 6.12% from the Ibbotson Supply Side approach, the OCC's survey recommendation of 5% and the combination of the Company's 10.21%, 10.05% and 8.31%, to estimate the equity risk premium. These values are weighted equally for an Authority estimate of 6.88% representing the ($R_m - R_f$) calculation. Applying the Authority's assumptions using the simple CAPM formula (3.845% R_f + 0.75 B [6.88% $R_m - R_f$]), resulted in CAPM equity cost rate of 9.03**%** for the Authority Peer Group.

iii. Analysis of the Risk Premium Model

The Authority also reviewed the risk premium method employed by the Company. Mr. Hevert's risk premium method shows that the proxy for the utilities' cost of equity were the returns authorized by state commissions for the years from 1980 through 2014 and the respective Treasury yields for those periods. The resulting risk premium is applied to three different projected Treasury yields. The Authority notes that the OCC did not perform a utility risk premium and this method was not used in the cost of equity estimation process. The Authority concurs with the OCC that using the allowed authorized returns as a proxy for the return on the stock market reflected utility commission behavior. Jurisdictionally-allowed returns should not be relied upon as a proxy from a cost of capital approach, this should be market based and reflect investor behavior. The Authority finds that to allow utility state commissions' authorized ROEs to serve as a proxy for the stock return portion of a risk premium approach is to allow a non-market based estimate to serve as a proxy for the market's return. Cost of capital methods need to be market based. Therefore, the Authority rejects the Company's proposed risk premium method in total.

f. Flotation Costs

According to the Company, an adjustment to the ROE to include flotation costs is appropriate to not only reflect current or future financing costs, but also to compensate investors for costs incurred for all past issuances comprising the total equity portion of the Company's capitalization and are part of capital costs. Flotation costs are the costs associated with the sale of new issues of common stock and are part of capital costs. These costs include out-of-pocket expenditures for preparation, filing, underwriting, and other costs of issuance. Since flotation costs are incurred over time, the majority of flotation costs are incurred prior to the Test Year, but remain part of the cost structure during the Test Year and beyond. Mr. Hevert stated that recovery of flotation costs is appropriate even if no new issuances are planned in the near future because failure to allow such cost recovery may deny the Company the opportunity to earn its required

[23] *See* Decision dated August 14, 2013 in Docket No. 13-01-09, p. 137; and 2009 CL&P Rate Case Decision, p. 109.

rate of return in the future, thereby diminishing its ability to attract adequate capital on reasonable terms. Hevert PFT, pp. 49–52.

To calculate a flotation adjustment, Mr. Hevert modified the DCF calculation to provide a dividend yield that would reimburse investors for issuance costs. Mr. Hevert gathered the two most recent open market common stock issuances for each member of the proxy group to determine the amount of flotation cost incurred for each issuance and then divided those costs by each proxy company's expected dividend yield. As shown in Hevert Exhibit RBH-14, Mr. Hevert arrived at an adjustment of 0.14% or 14 basis points as a reasonable representation of flotation costs for CL&P. Although Mr. Hevert claimed that a flotation cost adjustment of 14 basis points is appropriate, he is not proposing an upward adjustment to his recommended ROE of 10.20%. Instead, Mr. Hevert considered the effect of flotation costs, in addition to the Company's other business risks, in determining where CL&P's ROE falls within his range of results. Hevert PFT, pp. 51 and 52, Exhibit RBH-14.

The OCC argued that an upward adjustment to CL&P's equity cost rate for flotation costs is not warranted. The OCC contends that this adjustment factor is erroneous for several reasons. To start, the Company had not identified any test year flotation costs for CL&P. Foremost, it is commonly argued that a flotation cost adjustment is necessary to prevent the dilution of the existing shareholders. In this case, the Company justifies an adjustment by referring to the manner in which issuance costs are recovered by including the amortization of bond costs in annual financing costs. Dr. Woolridge points out that the Company's justification for recovery of flotation costs is incorrect for several reasons. First, market-to-book ratios for the electric industry trade above 1.5x, which suggests a flotation cost reduction. Second, a flotation adjustment would be needed only in the event the market price of the stock was at/or below its book value. Third, flotation costs are primarily underwriting spreads or fees and not out-of-pocket expenses. It is the offering price, not the price the Company receives which matters to the market; therefore, the Company should not get an adjustment to the allowed return. Fourth, flotation costs would be best viewed as a transaction expense to access the capital markets. Although, CL&P wanted to be compensated for these transaction costs, the Company had not accounted for other transaction costs in determining the cost of equity, such as brokerage fees investors pay. If the Company considered brokerage fees in the DCF analysis, the stock prices would be higher and the dividend yield would be lower. This would lower the effective cost of equity. Woolridge PFT, pp. 74–76.

Mr. Hevert disagreed with Dr. Woolridge's observation that underwriter fees are not out-of-pocket expenses and that flotation costs could represent a reduction in cost of equity. Mr. Hevert disputed that the distinction is not meaningful whether fees are paid directly or through an underwriting discount, the cost results in net proceeds that are less than gross proceeds. Also, Mr. Hevert maintained that flotation costs are true and necessary costs to the issuer, and to the extent flotation costs are not recovered, the issuing company is denied a portion of the opportunity to earn its required return. Hevert Rebuttal Testimony, pp. 59 and 60.

The Authority concludes that the allowance for flotation costs is reviewed on a case by case basis. Mr. Hevert calculated a 14-basis point adjustment to reasonably

represent flotation costs for CL&P, and the Authority will incorporate the 14 basis point adjustment for flotation cost in this Decision.

g. Financial Condition and Other Economic Factors

The Authority analyzed a considerable breadth of information presented in this proceeding in order to determine the appropriate return on equity to allow CL&P. Examining the testimonies, record evidence, various approaches and methodologies, as well as the financial and economic factors, the Authority is unable to substantiate maintaining the Company's currently allowed ROE of 9.40%, much less increase the ROE as proposed by CL&P. This is attributable to both the technical analysis and a variety of changes in key factors surrounding the financial setting of such a ROE. The Authority's review of the record evidence also focused on the economic and financial changes since the 2009 CL&P Rate Case, the 2012 merger of NU with NSTAR, recently awarded ROEs in Connecticut, the application of the cost of capital methods proffered by the Company and the OCC witnesses, and the Authority's assessment of each witness' recommendations and its own application of the cost of capital models as applied to the financial data in the record.

The Authority reviewed the changes to several financial and economic indicators to take account of the economic trends that have occurred since the Company's last rate case approximately four years ago. There have been several noteworthy changes in this span of time. The first is the economic recession that began in the third quarter of 2008 which resulted in steep declines to the stock market, real estate market, and dramatic increases in the number of unemployed and underemployed workers. In response to the recession, the Federal government intervened to support the banking and auto sectors in the form of bailouts, as well as to provide injections of money to state government to assist in stimulating the economic recovery. Since the time of CL&P's last rate proceeding, the Federal Reserve's asset purchases under its Quantitative Easing Policy (Federal Monetary Policy) began putting more liquidity in the market and yields fell again resulting in a higher valuation of utility stocks. The quantitative easing Part 3 of the Federal Monetary Policy began in September 2012, and is thought to have a high correlation on utility price earnings ratios. Tr. 9/10/14, pp. 1810 – 1815. The accommodative, cheap money policies and resultant low interest rate environment of the Federal Reserve Bank continue to preside, though there is discussion that these policies will likely taper off and gradually reverse should the national unemployment rate reach 6.5%.

The Company provided the following financial and economic statistics related to Gross Domestic Product (GDP), Consumer Price Index (CPI), unemployment, U.S. Treasury rates and other relevant information covering the changes in these from the time of its last rate case through the most recent quarter. This information is contained in the table below:

Table 62

Financial/Economic Indicator	2009	2013	2014 (latest day, month or quarter)*	Change 2009 to 2013	Change 2009 to Present
Gross Domestic Product (Trillions)	14,417.9	16,799.7	17,101.3	16.52%	18.61%
Consumer Price Index (CPI)	214.54	232.96	232.07	8.59%	8.17%
Unemployment Rate (National)	9.28%	7.35%	6.30%	(1.93%)	(2.98%)
Unemployment Rate (Connecticut)	8.21%	7.76%	6.90%	(0.45%)	(1.31%)
U.S. Treasury Bills (90-day)	0.15%	0.06%	0.03%	(0.09%)	(0.12%)
U.S. Treasury Bills (180-day)	0.28%	0.09%	0.06%	(0.19%)	(0.22%)
U.S. Treasury Bonds (10-year)	3.26%	2.35%	2.63%	(0.91%)	(0.63%)
U.S. Treasury Bonds (20-year)	4.11%	3.12%	3.18%	(0.99%)	(0.93%)
U.S. Treasury Bonds (30-year)	4.08%	3.45%	3.45%	(0.63%)	(0.63%)
State Allowed ROE's for utilities	10.48%	10.02%	10.23%	(0.46%)	(0.25%)
Market-to-book ratios for Industry	1.56	1.79	1.98	14.98%	27.08%
Market-to-book ratios for Peer Group	1.37	1.63	1.77	18.25%	28.73%
Dividend Yield NU	4.13%	3.47%	3.39%	(0.66%)	(0.74%)
Dividend Yield-Industry Average	4.69%	3.83%	3.42%	(0.86%)	(1.27%)

CL&P Response to Interrogatory FI-66.

Since CL&P's last rate case, it appears that the U.S. economic growth has out-paced the increase of inflation as indicated by the increase in the GDP of 18.61% while inflation as measured by the CPI only increased by 8.17%. However, the interest rates and long-term utility bond yields remain at historical low levels and are below the levels existing at the time of the Company's last rate case. Even with the strong growth seen in the GDP, interest rates remain at historically low levels. Overall, the sluggish economy and relative uncertainty still remains and is also expressed in the continued downward trend of the state authorized ROE's for utilities. Typically, the Authority would incorporate the downward trend in the 30-year long-term U.S. Treasury yields of 63 basis points to the Company's last allowed ROE of 9.40% to calculate an updated ROE of 8.77%. Although there are some signs of improvement in the economy, such as unemployment easing off its highs during the height of the recession, unemployment still remains high at 6.60% nationally and 6.90% in Connecticut. Achieving a 6.5% national rate of unemployment, which could trigger the Federal Reserve to slow its pace or reverse its accommodative monetary policy, would be highly desired but still remains ambiguous that it will occur in the near future.

The economic outlook, now for several years, has promised economic recovery and the rise of interest rates which have not occurred. It can be assumed that as the U.S. economy strengthens with the GDP growing at a rapid pace and interest rates steadily rising, cost of capital should moderately increase. However, it is not clear when, or even if, improvement in economic activity will occur. Even with the Federal Reserve market intervention known as the Quantitative Easing Policy Part 3 expected to taper off in a few months, the Open Market Committee reserves the right to change the pace of its tapering so it is uncertain exactly when or if it will finish. It is reasonable to assume that any impact of the Federal Monetary Policy on the utility stock prices and

the relative valuations will persist over time. Therefore, it is probable that the current economic condition that some suggest is a market anomaly, is the "new normal," and interest rates and capital costs will remain low over the next few years. Until there are dramatic improvements in the economy, it is reasonable to assume that these lower estimated returns will persist as long as the low equity cost environment exists.

The average ROEs for the electric and gas industries continue to trend downward as seen by the quarterly publications released by Regulatory Research Associates (RRA), Major Rate Case Decisions. At the time CL&P's last ROE was set at 9.40%, the annual average allowed ROE for the electric industry was 10.48% for 2009. For the calendar year 2013, the national average electric equity return authorized by state commission was 9.8%. This figure has further declined to 9.72% for the first six months of 2014. The Authority notes that the national average electric equity returns would still include those vertically integrated utilities that would hold a higher general risk profile than CL&P which would drive the average ROE higher. As indicated in the exhibit submitted by the OCC witness, in 2013 to 2014, there have been no authorized ROEs of 10% or higher, and the average for the distribution-only electrics is 9.48%. Woolridge PFT, p. 74 and Exhibit JRW-12. This further implies that a decrease in the ROE is warranted in this proceeding. As stated previously, commission-awarded ROEs are not purely market driven outcomes and while instructive, are not solely relied upon from a cost of capital approach.

In addition to the continued decline in authorized ROEs for electric utilities in other states' commissions, the Authority also conducted a review of Connecticut rate case Decisions since the 2009 CL&P Rate Case which allowed 9.40%. The Authority notes that these lower allowed returns transcend to other utilities as well. For example, in the Decision dated August 14, 2013, in Docket No. 13-01-19, the Authority allowed a 9.15% ROE. In Decision dated January 22, 2014, in Docket No. 13-06-08, the Authority allowed a 9.18% ROE. In the Decision dated September 24, 2013, in Docket No. 13-02-20, the resulting ROE was 9.13% excluding a water utility specific 50 basis point bonus. By the Decision dated June 29, 2011, in Docket No. 10-12-02, Application of Yankee Gas Services Company for Amended Rate Schedules, a 8.83% ROE was granted. In the Decision dated July 14, 2010, in Docket No. 09-12-11, Application of Connecticut Water for Amended Rates, a 9.75% was granted. Likewise, in the Decision dated July 17, 2009, in Docket No. 08-12-07, Application of The Southern Connecticut Gas Company for a Rate Increase, a 9.26% ROE was granted. Given these awarded ROEs in Connecticut since 2009, the range of reasonableness is 8.83% to 9.75%, with those awarded recently in 2013 and 2014 averaging 9.15%.

The Authority also contrasts the Company's recommended ROE of 10.20% to the current economic trends and recently awarded ROEs. In reviewing the full list of all utility rate cases, in which, the Company's witness provided expert cost of capital testimony, Mr. Hevert's recommended ROE has been much higher than the actually allowed ROE awarded in every case. CL&P Response to Interrogatory FI-65. Mr. Hevert testified that it is fairly unusual for a commission to adopt any one witness' ROE. Tr. 9/10/14, pp. 1766 – 1769. Upon closer inspection of 16 of the most recent cases where Mr. Hevert provided expert testimony, all of the final authorized ROEs were below Mr. Hevert's recommended ROE ranges. Late Filed Exhibit No. 35. In fact, in this proceeding, the Authority finds that Mr. Hevert's recommended ROE range of

10.20% to 10.70% is well outside even his own results. Out of the 81 total estimates computed by the Company, only 11 of those estimates fell within Mr. Hevert's recommended ROE range for CL&P. Tr. 9/10/14, pp. 1804 – 1808.

According to Conn. Gen. Stat. §16-19tt (Decoupling Statute) and later amended with the passage of P.A. 13-298, An Act Concerning the Implementation of Connecticut's Comprehensive Energy Strategy (the Act), the Authority may consider the impact of decoupling and make any necessary adjustments to the ROE to account for a full decoupling of electric revenues from customer usage. The Authority concurs with the AG that the implementation of a decoupling mechanism further mitigates the earnings pressure of the Company having the impact of reducing the overall risk profile of CL&P. However, the record evidence does not support or quantify a specific adjustment to the ROE to account for decoupling. In fact, neither the Company nor the OCC witnesses suggested an adjustment to their recommended ROEs to quantify an impact for decoupling. These revenue stabilization mechanisms have become common in the industry and among the peer group companies selected in this proceeding. The Authority finds that revenue stabilization and cost recovery mechanisms, such as decoupling, are already reflected in current market valuations of the proxy companies. Although the Authority did not explicitly make a downward adjustment to the ROE to account for a decoupling mechanism, it confirms that a lower ROE is appropriate in this proceeding.

i. Credit Rating and Financial Metrics

From a financial viability perspective, CL&P's credit ratings and financial metrics have improved since the 2009 CL&P Rate Case. Even more significantly, the successful integration of the merger of NU and NSTAR in April 2012, momentously impacted CL&P's business and financial risk profiles and overall positive outlook by the financial community. Both S&P and Fitch upgraded CL&P's ratings due to the merger between NU and NSTAR. Since the 2009 CL&P Rate Case, the Company has increased its S&P bond rating from BBB to the present A-, two notches. As of June 24, 2014, the Company has credit ratings of A- (outlook: Positive), Baa1 (outlook: Stable), and BBB+ (outlook: Stable) from S&P, Moody's and Fitch, respectively. CL&P Response to Interrogatory FI-74. CL&P also testified that the Company is at least one notch above the average for the rest of the proxy companies. Tr. 9/10/14, pp. 1829-1832.

The Company expects to maintain its creditworthiness. The rating agencies consider a variety of factors including the regulatory environment, credit metrics such as strength of capital structure, allowed returns, earnings and cash flows in assigning ratings to any given company. The Company's S&P ratings have steadily improved in recent years as a result of NU's improved consolidated financial risk profile along with its excellent consolidated business risk profile, continued focus on controlling costs and customer service. On April 25, 2014, S&P affirmed the corporate credit ratings and revised outlooks to positive from stable of NU, CL&P, NSTAR Electric, PSNH, WMECO, Yankee Gas and NSTAR Gas. CL&P Interrogatory Response to FI-53. For Moody's, evaluation of key financial metrics such as debt measurements and liquidity in earnings measurements approximates 40% of its ratings factors, while the recovery of costs and earning allowed returns account for approximately 25% of its ratings factors. The

remaining 35% are qualitative factors, such as regulatory framework and diversification. CL&P Response to Interrogatory FI-75.

According to S&P's Research Report dated April 30, 2014, S&P's positive outlook for the Company reflects the view of NU's successful merger integration. Because CL&P is a core subsidiary of NU, the positive outlook on CL&P mirrors that of NU and reflects NU's successful merger integration and effective management of regulatory risk. CL&P Response to Interrogatory FI-75. The Company has improved its financial measures due in part to the successful merger integration. From a credit perspective, recovery of the bulk of storm costs through the PURA's Storm Cost Recovery Decision is favorable as it eliminates a considerable degree of uncertainty. Overall, CL&P's business risk is viewed as excellent due in part to its low-risk regulated electric distribution and transmission operations, predictable revenue stream and efficient operations. Id.

The Company supplied key financial metrics on a consolidated basis valued at year end, December 31st, which are compiled in the table below. The forecasted figures for year-end 2014 through 2018 were filed as confidential.

Table 63

Ratio	2009	2010	2011	2012	2013
Total Asset Turnover	40.9%	36.3%	29.0%	26.3%	27.2%
Current Ratio	122.9%	106.2%	69.2%	70.9%	63.5%
Cash Flow from Operations	120.7%	99.9%	52.5%	23.0%	45.4%
Total Debt to Total Capitalization	50.9%	50.7%	51.4%	52.7%	51.8%
Times Interest Earned	3.15x	3.73x	3.56x	3.28x	4.15x
Fixed Coverage Ratio	3.05x	3.59x	3.42x	3.17x	4.01x
Cash Flow Coverage Ratio	4.3x	5.1x	3.9x	1.6x	3.7x
Operating Margin	N/A	N/A	N/A	N/A	N/A
Profit Margin	6.3%	8.1%	9.8%	8.7%	11.4%
Contribution Margin	N/A	N/A	N/A	N/A	N/A
Return on Total Assets	5.87%	6.23%	5.38%	4.78%	6.18%
Return on Total Capital	2.02%	0.52%	0.13%	1.94%	2.18%

CL&P Response to Interrogatory FI-70.

CL&P has been able to improve many key financial measures from the period ending 2009 through 2013 as indicated in the table above. Since 2009, the Company shows a stronger times interest earned ratio, fixed coverage ratio, profit margin, return on total assets and return on total capital. Although the Company's cash flow coverage, total asset turnover and cash flow from operations ratio declined since 2009, these financial ratios rebounded and significantly improved from 2012. The Company will continue to maintain its financial strength as CL&P forecasts robust financial metrics through 2018.

In general, public utilities are exposed to a lesser degree of business risk than other, non-regulated businesses, due to the essential nature of their services as well as their regulated status. Although the overall outlook for the economy as a whole has a

great deal of uncertainty and recovery has been sluggish, CL&P has been successful in navigating the credit markets due to its healthy and stable financial condition. Investment risk of public utilities is still relatively low compared to the market as a whole (1.0 beta) as evidenced by the drop in NU's beta from .80 in 2009 to .75 currently. CL&P continues to maintain a strong financial position, limited risk profile, visible forward earnings stream, a stable dividend yield, strong balance sheet and strong cash position. Despite the decline in interest rates, utilities continue to outperform most sectors of the bond market. As such, the cost of equity for the electric industry is among the lowest of all industries in the U.S. All these indicators discussed above, including the technical analysis and current market conditions, suggest a decline in the overall equity cost rate while allowing CL&P to retain its financial viability.

h. Response to Written Exceptions on Cost of Equity

In its Written Exceptions, CL&P claims that the decision to authorize an ROE of 9.17 percent is improper because it was determined using: 1) a separate "cost of equity analysis" prepared by the Authority and not subjected to review in the hearing phase of this proceeding; 2) non-record evidence, 3) factually incorrect evidence; as well as 4) "positions and evidence" gathered in an unresolved PURA docket that was closed without a Final Decision being issued. CL&P Written Exceptions, pp. 6 and 7. For these reasons, CL&P requests that the Authority reject its cost of equity analysis and set the authorized ROE at the national average of 9.48%. CL&P Written Exceptions, p. 18.

Essentially, CL&P claims that the Authority committed legal errors in setting the ROE of 9.17%by using the same method the PURA used to determine the ROE level in the UI, CNG and Aquarion rate cases and by not formally taking judicial notice of 11 publicly available data sources and 1 data source available by subscription which were data identified in Interrogatory FI-67 directed to CL&P. The Authority has routinely reviewed these data sources in past rate case proceedings, including the UI, CNG and Aquarion rates cases, and has relied on this data in past Decisions for determining ROE levels.[24]

Specifically, CL&P claims that the Authority erred by relying on certain evidence that was not administratively noticed and applying an ROE calculation methodology other than the one offered by its or the OCC's experts. CL&P claims the Authority deprived CL&P of its statutory right under Conn. Gen. Stats §§4-177c(a) and 4-178(5) to conduct cross-examination and submit rebuttal testimony to all of the evidence the PURA relied upon, including the right to cross-examine and rebut (through the use of its own witnesses) the data the Authority relied upon in its decision-making process. CL&P claims that the Authority deprived the Company of its right to cross-examine and rebut evidence because the PURA failed to properly take administrative notice of facts it

[24] Docket No. 13 06-08, Application of Connecticut Natural Gas Corporation to Increase Its Rates and Charges, Decision dated January 22, 2014, Section II.F., pp. 65-109; Docket No. 13-02-20, Application of Aquarion Water Company of Connecticut for Amended Water its Rates, Decision dated September 24, 2013, Section II.K., pp. 74-116; Docket No. 13-01-19, The United Illuminating Company's Application to Increase Rates and Charges, Decision dated August 14, 2013, Section II.G., pp. 87-139.

relied on in its ROE analysis. Conn. Gen. Stat. §4-178 and the Regulations of Connecticut State Agencies §16-1-38(d) and (e).

As discussed in detail below, all of the data sources relied on by the Authority were contained in the evidentiary record of this proceeding. Additionally, analyses of record evidence produced by this decision-making process after the initial evidence gathering step are not themselves evidence and do not entitle a party to cross-examine their authors and rebut their accuracy. Connecticut Natural Gas Corp. v. Public Utilities Control Authority, 183 Conn. 128, 136-143 (1981). Authority staff may also advise the Commissioners regarding the appropriate methods of ROE analysis to use in its consideration of the Application. The Authority is not required to base its Decision on expert testimony offered by the applicant or other parties' experts if the Authority determines, based on its knowledge and expertise, that another method is reasonable and more appropriate. Moreover, the Authority, as an expert regulatory agency, may treat the testimony of expert witnesses as to which conclusions they would draw from facts of record as mere argument, which, if reasonable, may help the agency arrive at its Decision, and the Authority may disregard the expert testimony if it is contrary to its knowledge or experience. Thus, CL&P's expert opinion testimony regarding the appropriate evidence and analysis to rely for calculating the Company's ROE does not bind the Authority. Id.

With respect to which method to employ to review and set CL&P's ROE, the Authority has broad discretion. The PURA's enabling statute evinces a legislative intent to rely on the Authority to regulate and supervise public utilities, and to establish rates that are not unreasonable. The legislature, however, has not imposed upon the Authority any specific formula or policy to use in setting rates. In view of the remedial purpose of the statute, the lack of an express statutory formula and the evident legislative intent to rely on the Authority's expertise, the Connecticut Supreme Court concluded that the language of the enabling statute is sufficiently flexible to permit the Authority to create necessary policies to guide its rate-making decisions. Greenwich v. Department of Public Utility Control, 219 Conn. 121, 124-127 (1991); Office of Consumer Counsel v. Dep't of Pub. Util. Control, 2005 Conn. Super. LEXIS 1174, Superior Court of Connecticut, Judicial District of New Britain at New Britain, Docket No. CV040528294S, Memorandum of Decision dated April 26, 2005, Robert F. McWeeny, J., pp. 6-10. The Connecticut Supreme Court also found that "Rate-making bodies (are not bound) to the service of any single formula or combination of formulas. The agency to which the legislative power has been delegated is free, within the ambit of their statutory authority, to make the pragmatic adjustments which may be called for by particular circumstances." Greenwich at footnote 4 citing Power Commission v. Pipeline, Co., 315 U.S. 575, 586 62 S. Ct. 736, 86 L. Ed. 1037.

CL&P had notice of the ROE methodology that the Authority applied in this proceeding to determine the Company's ROE. The Authority finds that the methodology it applied to determine CL&P's ROE of 9.17 percent is supported by past precedent in the CNG, Aquarion and UI rate cases[25] where the Authority applied the same

[25] Docket No. 13 06-08, Decision dated January 22, 2014, Section II.F., pp. 65-109; Docket No. 13-02-20, Decision dated September 24, 2013, Section II.K., pp. 74-116; Docket No. 13-01-19, Decision dated August 14, 2013, Section II.G., pp. 87-139.

methodology in setting the ROEs for those companies. The Authority developed its current ROE methodology based on comments and evidence submitted in Docket No. 09-10-06, Investigative Inquiry into the Desirability, Need and Feasibility of Establishing a Uniform Methodology for Determining Return on Equity (2009 Generic ROE Proceeding), which the Authority cites to provide guidance and clarity to parties regarding the PURA's approach to its cost of equity analysis. The purpose of referencing the 2009 Generic ROE Proceeding is to show consistency and transparency among the Authority's analysis in each rate proceeding in which the methodology has been applied.

The Authority also finds that its use of the data from particular data sources is also supported by the record and by precedent of the PURA using that data in past rate Decisions, including CL&P's last rate case.

The record supports the Authority's use of the 12 sources of financial data it relied on to determine the ROE. The Authority asked in Interrogatory FI-67, if CL&P objected to the Authority considering the following data sources, commonly relied on by finance experts, as part of the record:

a) Recent and historical US Treasury Rates (90 day, 180 day, 10 year, 20 year and 30 year) as reported in the Wall Street Journal and online at:
   1. www.bankrate.com/brm/ratewatch/leading-rates.asp
   2. www.ustreas.gov/offices/domestic-finance/debt-management/interest-rate
   3. www.finance.yahoo.com
b) Latest Mergent Bond Guide.
c) Latest Value Line: Electric Industry Group, East, Central & West editions.
d) Latest Value Line: Summary and Index.
e) Latest Blue Chip Economic Indicators edition through end of proceeding.
f) Latest Blue Chip Economic Forecast edition through end of proceeding.
g) Latest AUS Monthly Utility Reports.
h) Ibbotson Associates, Stocks, Bonds, Bills and Inflation (SBBI) 2014 Yearbook, Morningstar Inc., 2014 edition. Including Basic Series exhibit and Determination of the Discount Rate exhibit.
i) Stock prices from www.finance.yahoo.com for companies included in proposed company peer group.

k) EPS growth estimates from www.finance.yahoo.com for companies included in proposed company peer group.
l) EPS growth estimates form www.zacks.com for companies included in proposed company peer group.

With the exception of the Mergent Bond Record, all sources of financial data have been provided on the record and/or were publicly accessible through their Internet domains.[26] The Authority notes that the Mergent Bond Record was only relied on to

[26] *See* CL&P responses to Interrogatories FI-86, FI-87, FI-88, FI-90, FI-94,FI-95 (Bulk Filing), OCC-243, OCC-244, OCC-245 and OCC-246. Hevert PFT, Exhibits RBH-1 through RBH-15. Hevert Rebuttal

elevate the threshold to screen out those low DCF results. By removing this data source from the record, therefore eliminating the DCF screening, has the effect of decreasing the DCF ROE estimate from 9.03% to 8.47%. As explained previously in more detail, the Mergent Bond Record was used to obtain the average bond yield for each company in the proxy group. The Authority increased the minimum threshold which eliminated numerous companies that had very low DCF results, thereby increasing the average DCF ROE result.

Through Interrogatory FI-67, the Authority provided CL&P with actual notice of the data sources the Authority intended to rely on in analyzing the ROE and gave CL&P an explicit opportunity to object. In response to Interrogatory FI-67, CL&P stated that it had no objection to any of the sources listed, except the AUS Monthly Utility Reports. CL&P objected to AUS Monthly Utility Reports because "[t]he information they compile is available reliably from other listed sources, and therefore CL&P would object on this basis to PURA taking administrative notice of these reports." Response to Interrogatory FI-67. If CL&P had objected on the basis that the AUS Monthly Utility Report data was inaccurate, in some manner unreliable, or not accepted as a reliable source in the finance expert community, the Authority may have examined this objection further by cross examining CL&P's expert witness during the hearing. CL&P has not objected to the AUS Month Utility Reports on any of such basis. To the contrary, CL&P agrees that these sources of financial data are broadly published and generally used for industry purposes. These sources of financial data have been used reliably by cost of capital experts and the Authority in rate proceedings. CL&P Written Exceptions, p. 9.

The Authority finds that CL&P waived the right to object to any of the other sources cited to in FI-67.[27] The Authority also finds that CL&P is not harmed if the Company is merely claiming that the AUS Monthly Utility Report may provide repetitive or redundant data already contained in the other sources. Based on the foregoing, the Authority overrules CL&P's objection to use of the AUS Monthly Utility Reports.

Additionally, use of the data CL&P now objects to in its Written Exceptions is supported by Authority precedent in past rate Decisions. CL&P cannot now claim ignorance or surprise regarding the Authority's reliance on those data sources to determine ROE levels. For example, the Mergent Bond Guide which CL&P objects to the Authority using in its analysis was relied on by CL&P's witness and examined by the Authority in CL&P's 2010 Rate Case Decision[28] and was used by the Authority in the CNG and UI rate cases.[29] Moreover, by virtue of the Authority's Interrogatory FI-67,

See also, Transcript of Oral Arguments held on December 12, 2014, for numerous references to the record made by the OCC and AG during their oral arguments.

[27] In its Written Exceptions, CL&P objects to the Mergent Bond Guide for the first time on the basis that is a subscription service that is not publicly available. The Mergent Bond Guide was relied on by CL&P's witness and examined by the Authority in CL&P's 2010 rate case. Docket No. Docket No. 09-12-05 Decision, p. 97.

[28] Id.

[29] Decision dated January 22, 2014 in Docket No. 13-06-08, ; Docket No. 13-02-20, Decision dated September 24, 2013; Decision dated August 14, 2013 in Docket No. 13-01-19pp. 109, 117 and 130.

CL&P had actual notice that the Authority was going to examine and use recent data from these sources. The AUS Monthly Utility Report that CL&P objects to was also used by the Authority in the UI, CNG and Aquarion rate cases.[30]

The Authority finds that there is no merit to CL&P's claim that a "lack of a proper introduction of evidence into the record affects the computation of the ROE adopted by the Authority in the Draft because the product of the "Authority's Analysis" are the low-side values skewing the ROE to 9.17 percent." The ROE of 9.17 percent was not affected by how data sources were introduced in the record. Rather, the ROE of 9.17 percent was the correct result produced by analysis which properly took into account a full set of appropriate data sources.

Finally, CL&P did not in response to Interrogatory FI-67 or now in its Written Exceptions object on a substantive basis to the Authority's use of any data, (i.e. that data is inaccurate, the data is not reliable, the data is not the correct type of data, etc.) CL&P now sees the specific data points relied on by the Authority and has provided no substantive reason for why any of the data points should not be considered by the Authority in setting the ROE. CL&P's objection is purely procedural. CL&P, through its Written Exceptions, has been provided an opportunity to impeach, discredit or otherwise explain why the data or data sources relied on by the Authority in its ROE analysis should not be used because it is somehow flawed, inaccurate, not accepted within the financial community, etc. CL&P offered no such claims in response to Interrogatory FI-67 or in its Written Exceptions, but rather seeks to preclude the Authority from using otherwise appropriate, relevant, material and probative data based on claims of procedural harm. There is no evidence of actual procedural harm to CL&P since it had actual and constructive knowledge that the Authority would rely on recent versions of these data sources. Based on Interrogatory FI-67 as well as the Authority's recent rate case decisions for CNG, UI and Aquarion, CL&P had actual and constructive notice that the Authority would review and probably rely on these data sources to set the ROE. The Authority further finds that CL&P suffered no actual prejudice due the fact that all but one of the sources is publicly available.

In its Written Exceptions, CL&P claims that there are three components that are legally and factually deficient and cannot be relied upon. CL&P Written Exceptions, pp. 11 and 12. First, CL&P claims that the value of 8.77% as an update to the last rate case is nowhere in the record and has not been presented for review or cross examination. As indicated previously in the Decision, the 8.77% simply reflects the decline in the 30-year long-term U.S. Treasury yields of 63 basis points to CL&P's last allowed ROE of 9.40% (9.40% - 0.63% = 8.77%). The Authority typically makes this simple calculation to use as another benchmark or parameter to indicate in which direction the current allowed rate should trend. Although the drop in the interest rates is much more pronounced than the decline of the state authorized ROEs, the overall downward trend in returns is evident. This benchmark was also used by the Authority in the recent UI and CNG rate case Decisions.

[30] Decision dated January 22, 2014 in Docket No. 13-06-08, p[p. 68 and 70; Decision dated September 24, 2013 in Docket No. 13-02-20, pp. 82, 91, 99 and 115.

Second, the Company claims that the statements made in the draft that a 6.5% national rate of unemployment and a change in Federal Reserve policy to reverse its monetary policy would be highly desired but still remains ambiguous that it will occur in the near future, are factually incorrect. CL&P Written Exceptions, pp. 12 and 13. The Authority finds that these statements are correct and refers the Company to review the lengthy discussions cited in the transcript.[31] At the time the Authority drafted this Decision and the record was closed, it was still unknown if or when the Federal Reserve would reverse its accommodative monetary policy. The Authority agrees that the steady decline in the national unemployment and the reversal of the Federal Monetary Policy is highly desirable and supports an improvement in the economy. However, as the Authority stated in that section of the Proposed Final Decision, there are also other indicators such as continued decline in interest rates, low long-term bond yields, downward trend of the state authorized ROEs for utilities, and the relative uncertainty still remains.

Lastly, the Company contends that the DCF and CAPM analysis computed by the Authority used financial data not on the record for the proceeding and the entire computational analysis not made available to the Company or other parties in this proceeding. CL&P Written Exceptions, p. 13. As discussed above, the Authority finds that its use of the sources of financial data is clearly supported by the record, as well as precedent of the Authority using that data in past rate Decisions. Without a specific reference by CL&P to the computational analysis, the Authority finds that the record is clear regarding the PURA's computations based on the narrative description regarding the process, methods, computation and sources of financial data used in the Authority's analysis.

The Company's request that the Authority reject the proposal in the Decision and set the authorized ROE at the national average of 9.48% is unreasonable. Since the ROE is a market-based concept, jurisdictionally allowed returns should not be relied upon as a proxy from a cost of capital approach. To simply ignore all the relevant financial data and current market analysis compiled by all the cost of capital witnesses in this proceeding, is not keeping with the fundamental standards that returns should be commensurate with the returns expected of enterprises having comparable risks. The Authority's analysis is reflective of the record and corresponds as closely as possible to the current market conditions and expected returns.

i. Conclusion on Cost of Equity

In determining the cost of equity, the Authority considered all of the witnesses' cost of equity analyses by integrating some of the methods in its own evaluation. Consistent with past practice, the Authority relies on the results of the constant growth DCF and simplified CAPM methods in its analysis. Typically, the Authority weighs the DCF model more heavily in its analysis. However, in this case the weighting of the methodologies had no influence on the final result since the DCF and CAPM estimates were identical. The Authority also used its analysis that updated the last Company rate case and the survey of recent Decisions merely to establish benchmark parameters and

[31] See Tr. 9/10/14, pp. 1810 - 1815.

to indicate in which direction the current allowed rate should trend. The Authority has not incorporated an explicit downward adjustment to ROE for the implementation of a full decoupling mechanism, given that the majority of its peer companies have some form of a revenue stabilization cost structure embedded into their cost of equity valuations. The Authority recognizes that these mechanisms reduce the risk of the Company and contribute to lower expected returns. Consequently, in regulating CL&P to allow a return commensurate with the current economic conditions, the Authority has determined that investors expect less of a return today than in 2010, when the return was established at 9.40%. The Authority finds that the Company has strengthened its financial capability and has less risk, both financially and operationally, which provides further support that CL&P is performing well in an environment that expects lower returns.

The table below represents a summary of the Authority's analyses and findings with respect to the ROE.

Table 64

Method	Authority Result
Update Last Rate Case (decline interest rates)	8.77%
RRA Average Allowed ROE as of June 2014	9.72%
2014 Average Distribution-Only ROE	9.48%
Survey Connecticut Allowed ROEs: Average Awarded in 2013 and 2014	9.15%
DCF	9.03%
CAPM	9.03%
Utility Risk Premium	Not Used
Indicated ROE	9.03%
Adjustment for Flotation Cost	.14%
Allowed ROE	**9.17%**

Based upon the implementation of several of the principles detailed from the 2009 Generic ROE Proceeding, the Authority notes that the methodologies have become more transparent and less "black box." Likewise, the application of the process with the present data has narrowed the range of reasonableness. An ROE of 9.17% is indicated by the analysis and the cost of capital measures employed by the Authority is incorporated into its weighted cost of capital assessed below.

j. Authority's Allowed Weighted Cost of Capital

Consistent with the legal guidelines defined in Conn. Gen. Stat. §16-19e(a)(4), the Authority identified a rate of return on the rate base that is deemed appropriate for the Company's overall capital structure. The Authority has recognized the key components of the Company's capital structure, estimated the cost of each component of capital, and then calculated its overall cost of capital by weighting each component cost by its proportionate share of the overall capital structure.

After study and deliberation of all cost of capital issues presented in this proceeding, the Authority finds that 7.31**%** is a fair rate of return, reflecting a return on equity of 9.17**%**. The table below summarizes the approved capital structure components, capital costs and calculates the weighted cost of capital, including the 9.17**%** assigned ROE, determined by the Authority based upon the 50.38% common equity, 2.01% preferred stock and 47.61% long-term debt capitalization.

Table 65
Allowed Weighted Cost of Capital

Class of Capital	Ratemaking Percentage	Embedded Cost	Ratemaking Weighted Cost
Long-term Debt	47.61%	5.45%	2.59%
Preferred Stock	2.01%	4.80%	0.10%
Common Equity	50.38%	9.17%	4.62%
Total Capitalization	100.00%		7.31%

The Authority finds that these rates, when applied to the rate base found reasonable for the Company, should produce operating income sufficient for the Company to operate successfully and serve its ratepayers, maintain its financial integrity, and compensate its investors for the risk assumed.

4. ROE Penalty

In late August, 2011, Connecticut was struck by Tropical Storm Irene (Storm Irene). In late October, 2011, Connecticut was struck by an early snowstorm (October Snowstorm). Storm Irene and the October Snowstorm (the 2011 Storms) resulted in extensive interruptions to electric service. The Authority opened Docket No. 11-09-09, PURA Investigation of Public Service Companies' Response to 2011 Storms, to investigate the Company's (and other utilities') response to the 2011 Storms.[32] The Decision dated August 1, 2012, in the above captioned proceeding states as follows:

> . . . [t]he Connecticut Light and Power Company's performance in the aftermath of the 2011 storms was deficient and inadequate in the areas of outage and service restoration preparation of personnel, support of its municipal liaison program, development and communication of restoration times to customers, and overall communication to customers, other service providers and municipalities, as to warrant regulatory sanction. In this Decision, the Public Utilities Regulatory Authority also concludes that because of The Connecticut Light and Power Company's failure to obtain adequate assistance in advance of the October 29, 2011 storm, its response to that storm was deficient. Because of The Connecticut Light

[32] Docket No. 11-09-09 was initially opened in September, 2011 to investigate response to Tropical Storm Irene. After the October Snowstorm, the scope was expanded to include that event.

> and Power Company's failure to adequately fulfill its duties imposed by law and to adequately and suitably provide for the overall public interest with regard to these particular areas of performance, the Public Utilities Regulatory Authority establishes in this Decision, a rebuttable presumption that The Connecticut Light and Power Company should have imposed on it, an appropriate reduction to its allowed return on equity in its next ratemaking proceeding as a penalty for poor management performance and to provide incentives for improvement. . . In considering the appropriate reduction to allowed returns on equity in forthcoming ratemaking proceedings and in exercising its jurisdictional approval for recovery of appropriate 2011 storm costs, the Authority will consider and weigh the extent to which CL&P has recognized its shortcomings and taken concrete and measurable steps to embrace the need for aggressive, extensive restructuring of both its attitude toward storm management and establishment of new practices for execution of future storm response.
>
> Decision, p. 1.

The Authority took administrative notice of the record evidence presented in Docket No. 11-09-09 and the following consultant reports prepared in connection with the review of CL&P's storm response as well as the Report of the Two Storm Panel: Witt Associates Report; Report of the Two Storm Panel; Liberty Consulting Group; and the Davies Report. Notice of Taking Administrative Notice dated September 3, 2014.

CL&P stated that there is no basis for sanctioning it for its performance in the 2011 Storms. The Company asserted that it has met every applicable requirement relating to storm performance. The Company also asserts that the Authority's investigations and rulings to date support the fact that CL&P's response to these storms was reasonable under the circumstances. CL&P stated that the reasonableness of its actions can be confirmed in two ways. First, the Authority's Decision dated March 12, 2014 in Docket No. 13-03-23 (March 12, 2014 Decision), did not find CL&P to be imprudent, nor did that Decision disallow any costs related to any of those areas. Second, the evidence described in Bowes PFT, Exhibit KBB-3 demonstrates that CL&P's conduct in these areas was reasonable under the circumstances. Finally, CL&P stated that it has made concrete and measurable improvements in relation to its emergency preparedness and response function, as described in Bowes PFT, Exhibit KBB-4. Bowes PFT, pp. 43-45.

The OCC believes that the Authority should impose a 35 basis point penalty on CL&P for its imprudence in responding to the 2011 Storms. Although the OCC recognizes that CL&P has taken a variety of steps to increase the resilience of its distribution system and otherwise improve its storm response, the OCC argues that an ROE penalty is still appropriate because the Company did not adequately prepare and respond to the 2011 Storms. Furthermore, according to the OCC, the prudence standard requires that a utility's actions must be evaluated within the context of information that was known at the time the actions were taken, not after the utility has had an opportunity to remedy any harm that occurred at ratepayer expense. Finally, the OCC cites evidence submitted in Docket No. 13-04-07, PURA Investigation into Allegations that The Connecticut Light and Power Company Impaired and Impeded

PURA's Investigation of CL&P's Response to the October 2011 Nor'easter, as demonstrating that CL&P deliberately withheld accurate power restoration time estimates from the public. OCC Brief, pp. 33-38.

The AG also believes that the Authority should impose an ROE penalty on CL&P for its performance in the 2011 Storms. The AG notes that the Authority established a rebuttable presumption in its Decision in Docket No. 11-09-09 that CL&P should have imposed upon it an appropriate reduction to its ROE in this rate case. The AG cited to findings in the Liberty Report on the 2011 Storms performance that was submitted by the Authority's consultant in Docket No. 11-09-09, and other extensive record evidence in that docket as confirming the Company's inadequate performance in preparing for and responding to the 2011 Storms. Similar to the OCC, the AG asserted that the Authority should impose an ROE penalty of 35 basis points on the Company for its 2011 Storms response regardless of the subsequent demonstrated improvements, since the penalty was intended to be imposed on that basis. The AG next noted that the Authority has previously imposed financial penalties on other utilities that have exhibited poor management performance, and provides cites to those dockets. Finally, the AG stated that, absent the Company's subsequent improvements, it would have advocated for stronger penalty. AG Brief, pp. 23-30.

In the Decision in Docket No. 11-09-09 and restated in the March 12, 2014 Decision, the Authority indicated that it intended to review, in this rate proceeding, the issue of whether or not CL&P's ROE should be reduced to reflect deficiencies in response to the 2011 Storms. Such a review is appropriate in this rate proceeding as the Authority is charged with setting just and reasonable rates after specifically examining and determining the appropriate level and structure of rates charged customers that shall reflect, along with other considerations: 1) prudent and efficient management of the franchise operation, and 2) that public service companies shall perform all of their respective public responsibilities with economy, efficiency and care for public safety and energy security. Conn. Gen. Stat. §16-19e(a)(3) and (5).[33] The

[33] Conn. Gen. Stat. §16-19e, which governs the Authority's regulation of internal utility management and rate structures, states: 16-19e(a) In the exercise of its powers under the provisions of this title, the Public Utilities Regulatory Authority shall examine and regulate the transfer of existing assets and franchises, the expansion of the plant and equipment of existing public service companies, the operations and internal workings of public service companies and the establishment of the level and structure of rates in accordance with the following principles: (1) That there is a clear public need for the service being proposed or provided; (2) that the public service company shall be fully competent to provide efficient and adequate service to the public in that such company is technically, financially and managerially expert and efficient; ***(3) that the authority and all public service companies shall perform all of their respective public responsibilities with economy, efficiency and care for public safety and energy security,*** and so as to promote economic development within the state with consideration for energy and water conservation, energy efficiency and the development and utilization of renewable sources of energy and for the prudent management of the natural environment; (4) that the level and structure of rates be sufficient, but no more than sufficient, to allow public service companies to cover their operating costs including, but not limited to, appropriate staffing levels, and capital costs, to attract needed capital and to maintain their financial integrity, and yet provide appropriate protection to the relevant public interests, both existing and foreseeable which shall include, but not be limited to, reasonable costs of security of assets, facilities and equipment that are incurred solely for the purpose of responding to security needs associated with the terrorist attacks of September 11, 2001, and the continuing war on terrorism; ***(5) that the level and structure of rates***

Authority has reserved for this proceeding consideration of an ROE reduction related to poor performance in 2011.

In this proceeding, CL&P has the burden of proving both its rate proposal is just and reasonable and that its management of storm-related actions in 2011 and going forward were and are appropriate. Conn. Gen. Stat. §16-22; Decision in Docket No. 11-09-09 and March 12, 2014 Decision. CL&P's customers have a right to expect that CL&P performed in 2011, and will perform in the future, its public service duties in a prudent, efficient, safe and adequate manner. See generally, Conn. Gen. Stat. §§16-11, 16-19e, and 16-20. Part of CL&P's burden of proof in a rate case was to show that it has and will properly fulfill its duties.

Based on its findings in Docket No. 11-09-09, the Consultant Reports and other evidence contained in the record in this proceeding and taking into account CL&P's position that it acted prudently in both storms, the Authority finds that CL&P fell short of reasonably fulfilling its duties with respect to the 2011 Storms. The Authority further finds that CL&P's management needs to work toward eliminating past deficiencies and gross inefficiencies and to demonstrate more "prudent and efficient management" with actual improved future storm preparation response performance at a level at or above good utility practice. Further, the Authority finds that CL&P must not repeat its past deficient level of performance and improve the performance of "public [storm response] responsibilities with respect to economy, efficiency and care for public safety and energy security" at or above the level of acceptable utility practice standards.

Contrary to CL&P's assertions, the Authority concludes that it is not required by Conn. Gen. Stat. §16-19e(a)(3) and (5) to make any explicit findings of past imprudence in order to set the going forward ROE for CL&P. If the Authority were going to disallow cost recovery, the Authority would be required to make a finding of imprudence to support the disallowance. In the Decision in Docket No. 11-09-09 dated August 1, 2014, the Authority specifically tied its discussion of prudency to the issue of CL&P's future recovery of storm-related costs. Decision, Section III.A.3, p. 18. The Authority did not state that the prudency issue or prudency determination had any relevant relationship to the Authority's future determination regarding an appropriate ROE level for CL&P. Decision, Section III.A.4, 18-19.

With respect to setting an appropriate ROE in this proceeding, the Decision in Docket No. 11-09-09 stated that the Authority would examine whether to impose an "appropriate basis point reduction to CL&P's allowed return on equity (ROE) for such poor management performance and to provide incentives for improvement." As CL&P recognizes, the Authority is not ordering the disallowance of storm-response-related cost recovery in this proceeding. Therefore, prudence is not at issue. Instead, the Authority is 1) reviewing the history of CL&P's 2011 storm response performance and CL&P's subsequent actions in that regard; 2) making determinations based on the

---

charged customers shall reflect prudent and efficient management of the franchise operation; and (6) that the rates, charges, conditions of service and categories of service of the companies not discriminate against customers which utilize renewable energy sources or cogeneration technology to meet a portion of their energy requirements. [Emphasis added].

factors listed in Conn. Gen. Stat. §16-19e(a)(3) and (5); and, 3) reflecting those determinations in establishing a just and reasonable future ROE level for CL&P.[34]

With respect to Conn, Gen. Stat. §16-19e(a)(3) and (5), the Authority finds that the record evidence from Docket No. 11-09-09 and this docket fully, as described herein, supports the Authority's determination that CL&P's storm response was inadequate and deficient sufficient to warrant implementation of a rate making ROE reduction incentive to signal the need for improved management performance with respect to past and future storm responses. The Authority's consultant, The Liberty Consulting Group (Liberty) found that "CL&P's storm performance was below average." Liberty Report, 1. Liberty cited to failures in CL&P's tree trimming program, its restoration estimates, its management command system, its ability to acquire outside resources and its coordination with towns as all deficient. Liberty Report, 1 and 2. CL&P did not seek meaningful outside resources until after the storm hit and caused numerous service outages. Liberty Report, p. 78; Davies Report, p. 21.

In addition, CL&P's Emergency Response Plan (ERP) did not adequately stress training and drills. Liberty Report, pp. 13 and 18. CL&P employees questioned the plan and its application during the 2011 Storms and suggested that it was written for regulators, was not applied during the 2011 Storms, lacked adequate specificity and that while it may have worked on paper, it was not the subject of adequate training. Liberty Report, pp. 18-19. There is no evidence that CL&P drilled or exercised its ERP for at least five years prior to the 2011 Storms. Witt Report, p. 17.

The Authority finds that there was also substantial evidence in the record of Docket No. 11-09-09 that CL&P's municipal liaisons were poorly prepared, poorly

---

[34] Notwithstanding this determination, the Authority finds that CL&P's 2011 Storm preparations and responses were imprudent. The Authority applies a three-part test is as follows: "First, there must be a clearly understood definition of the standard of care by which a utility's performance can be measured. Second, the actions of the utility must be examined to determine if there has been a failure on its part to conform to the standard required. Finally, there must be a reasonably close casual connection between the imprudent conduct, if any, and actual loss or damage. Applying this test, the Authority finds that CL&P was imprudent for failing to act as a reasonably prudent utility in the following ways: 1. CL&P inadequately prepared for major storms, and failed to exercise or drill its emergency response plans and evaluate the results for at least five years prior to the storms; 2. CL&P failed to request the assistance of outside crews in a timely manner and failed to reasonably manage the crews that arrived; 3. CL&P engaged in an unreasonable damage assessment process, including failure to transmit assessment information from the field to operations headquarters efficiently; 4. CL&P failed to train and support municipal liaisons and defer to local restoration priorities; 5. CL&P failed to reasonably develop estimated restoration times; and 6. CL&P failed to reasonably manage communications with the public and public officials concerning restoration times. As a result of the aforementioned imprudent conduct, CL&P's customers suffered tangible great economic losses, including but not limited to lost food, medicine, and income and added expenses for hotels and other items purchased to survive the storm and cold weather conditions during outages. CL&P's customers likewise suffered substantial intangible harms, including but not limited to great levels of inconvenience, uncertainty, and discomfort. The Authority finds that the various storm reports contained in the record and the Briefs and Reply Briefs of the AG and OCC filed in this proceeding appropriately describe CL&P's imprudent conducts and the resulting harm to customers. The Authority declines to articulate further on this imprudence finding given that "imprudence" is not a necessary statutory finding for the Authority to make in reducing the ROE pursuant to Conn. Gen. Stat. §16-19e(a)(3) and (5).

supported and often ineffective. The results of CL&P's unpreparedness and mismanagement were disastrous for the affected towns and their citizens. Docket No. 11-09-09, Werbner Pre-Filed Testimony, p. 3. Elected representatives from the towns of Simsbury, South Windsor, Tolland, Redding, Newtown, and Ridgefield appeared before the Authority and testified concerning CL&P's failures and the impacts on their towns. Decision in Docket No. 11-09-09, pp. 5-9. For example, CL&P could not tell Tolland leaders where Company crews were working, where the outages in town were, or provide real-time progress reports on restoration. Werbner PFT, p. 4. CL&P's inability to provide accurate restoration projections "had a material adverse impact on the town's ability to protect the health and safety of town residents." Glassman PFT, p. 5. Simsbury had no accurate information on which to schedule its shelter operations and care for its elderly and disabled. Id.

The Authority received more than one thousand written complaints and an additional one thousand telephone calls from customers concerning CL&P's deficient and inadequate response to the 2011 Storms. PURA stated that:

> [t]he majority of the customers who were affected by the 2011 Storms were concerned with the length of time it took the companies to restore service and the difficulty receiving information from the companies. Several customers stated that the companies were unprepared, mismanaged, and had underestimated the magnitude of the storm by not having sufficient repair crews available. Consumers believed that the lack of information provided by the companies left them unable to prepare for a longer than normal outage.
>
> Customer comment varied, but frustration regarding the amount of time the utility companies required to repair and restore service was a common theme. Several customers mentioned that Connecticut has the highest electric rates in the country and therefore, warrants better customer service. Customers suggested ways to help avoid future outages such as trimming trees and burying power lines. Others felt that customers with wells or septic systems should have their restoration of service prioritized because of the public health issues.
>
> Decision in Docket No. 11-09-09, p. 5.

CL&P's unreasonable level of preparedness and its failure to respond to the 2011 Storms in a reasonable manner caused the service restoration process to take longer than it otherwise would have. The failure of the municipal liaison program, as well as the delay in restoration for many customers, caused the towns to incur significant additional costs. Docket No. 11-09-09, Tr. 5/20/12, pp. 409-14. CL&P's management deficiencies with respect to the October Snowstorm, turned extended power outages into crisis situations, caused significant public anxiety and severely impacted residents' and towns' abilities to deal effectively with the outages.

Based on the foregoing, the Authority concludes that CL&P's performance in response to the 2011 Storms was deficient and inadequate and that the rates approved in this proceeding must encourage better storm response performance by CL&P

management. Therefore, the Authority will employ its authority under Conn. Gen. Stat. §16-19e(a)(3) and (5) to reduce the Company's ROE of 9.17% by 15 basis points for a period of one year to incent CL&P's management to show actual improvements in future storm responses. The ROE penalty of 15 basis points imposed on the Company for the Rate Year will reduce the revenue requirement by $4.394 million. Because the penalty will be in effect for the Rate Year only, the Authority will not require that Rate Year rates be designed to reflect the penalty. Instead, the adjustment will be made to the allowed revenue requirement target in the Company's first decoupling mechanism reconciliation. In following years, the Company may true-up to its full allowed revenue requirements. The Authority directs the Company to include the adjustment for the ROE penalty in its Rate Year decoupling mechanism reconciliation filing.

If CL&P fails to improve based on major storm preparedness and response and is found not to be in compliance with the outage restoration standards established by the Authority's November 1, 2014 Decision in Docket No. 12-06-09, PURA Establishment of Performance Standards for Electric and Gas Companies, the Authority may impose penalties as defined in that Decision and reduce CL&P's going forward ROE to create an incentive for CL&P to improve its performance.

The Authority recognizes that, subsequent to the 2011 Storms, CL&P has been required by statute and PURA decisions to implement certain proactive measures aimed toward improving CL&P's storm response performance. The Authority, as described below, has accounted for these improvements in determining an appropriate ROE reduction. The Authority also recognizes, however, that the real test of whether CL&P's storm performance will meet and exceed acceptable standards is by reviewing CL&P's actual future performance. Therefore, pursuant to its authority under Conn. Gen. Stat. §16-19e(a)(3) and (5), the Authority finds that it is just and reasonable in setting the structure and level of CL&P's rates to take into account evidence from recent past poor, deficient, imprudent and inefficient management performance with respect to storm response and create an incentive for CL&P to ensure that it attempts to improve its future management performance regarding future storm response. ROE adjustments such as the one implemented by the Authority in this Decision ensure that rates reflect prudent and efficient management. Conn. Gen. Stat. §16-19e(a)(5). Similar adjustments that have been upheld on appeal have been made by the Authority[35] and state public utility commissions in other jurisdictions.[36]

Control, CV094021664S, Superior Court of Connecticut, Judicial District of New Britain at New Britain, Memorandum of Decision dated January 6, 2010); Southern Conn. Gas Co. v. Conn. Dep't of Pub. Util. Control, 2010 Conn. Super. LEXIS 788, 19 (Southern Conn. Gas Co. v. Conn. Dep't of Pub. Util. Control, CV094021665S, Superior Court of Connecticut, Judicial District of New Britain at New Britain, Memorandum of Decision dated April 1, 2010).

[36] In re Citizens Utilities Company, 171 Vt. 447, 769 A.2d 19 (2000); US West Communications, Inc. v. Utilities & Transportation Commission, 134 Wn.2d 74, 949 P.2d 1337, 1358-1362 (1997); Mountain Fuel Supply Company v. Public Service Commission of Utah, 861 P.2d 414 (1993); Gulf Power Co. v. Wilson, 597 So. 2d 270, 270-274 (1992); Wisconsin Public Service Corp. v. Public Service Commission of Wisconsin, 156 Wis. 2d 611, 457 N.W.2d 502 (1990).

Specifically, the Authority finds that reducing the base ROE of 9.17% by 15 basis points to an ROE of 9.02% for the period 2015 is just and reasonable. For purposes of tracking ESM sharing and overearnings under Conn. Gen. Stat. §16-19(g), the Authority will base these calculations on an ROE of 9.02%. The primary purpose of the ROE reduction is to provide an incentive for CL&P to improve its storm response performance. If CL&P improves its future storm response performance, CL&P's ROE will not be subject to such reductions in the future.

If during the Rate Year, CL&P's storm response performance triggers the Authority to reopen this proceeding and find deficiencies in CL&P management's performance regarding storm response meriting extension of the ROE reduction, as determined by any proceedings opened to determine CL&P's compliance with the Docket No. 12-06-09 standards, the Company's ROE will remain at 9.02%.

In determining the allowed base ROE of 9.17% using the Authority's approved methodology, the Authority examined the testimonies, record evidence, various approaches and methodologies proffered by the Company and OCC witnesses, as well as the financial and economic factors in this proceeding. The Company had provided numerous ROE estimates that resulted in an expansive range from a low of 7.58% to an astronomical 12.51%. The OCC witness calculated a narrower ROE range of 7.80% to 9.0%. To test the results of the Company and OCC witnesses, the Authority conducted its own cost of equity analysis consistent with the methodologies exercised in past practice resulting in an allowed ROE of 9.17%. According to data from Regulatory Research Associates, the average of 101 reported electric utility rate case ROEs authorized by commissions in 2012, 2013 and so far in 2014, is 9.91%, with a reported range of 8.72% to 10.95%. Again, an ROE of 9.02% generated by the ROE penalty of 15 basis points, is supported within the general trend of interest rates and nationally authorized ROEs. The Authority notes that the reduced ROE of 9.02%, including the ROE penalty, falls within a range of ROEs determined by others to be reasonable for other utilities as well as the Company's and the OCC's limited range of ROE estimates. Setting the authorized return, inclusive of the reduction, should allow the Company to maintain its credit and financial integrity and will enable it to acquire sufficient new capital at reasonable terms to meet its service requirements.

The Authority finds that the 15 basis points ROE reduction is reasonable compared to previous reductions it has ordered in past proceedings. For example, in Docket No. 10-09-08, Application of United Water Connecticut, Inc. to Amend Rate Schedules, dated April 27, 2011, the Authority imposed a fifty basis points ROE reduction for imprudent management. In that case, the Authority found that the United Water Company's accounting, record keeping and billing methods were lacking and imposed the fifty basis point downward reduction to its ROE "as a penalty and strong warning to improve its business management practices." Id., 83.

Similarly, in the Decision dated June 30, 2009 in Docket No. 08-12-06, the Authority found that CNG did not properly include certain charges in its bills, found that the company's management that oversaw billing and rates was imprudent, and imposed a 10 basis point reduction to its return on equity as an imprudence penalty. The Authority noted in that case that such ROE adjustments are designed to ensure that

rates reflect prudent and efficient management as required by Conn. Gen. Stat. §16-19e(a)(5).

In other cases, the Authority has repeatedly imposed substantial cost recovery disallowances where it has found CL&P acted imprudently. See Decision dated July 30, 1997 in Docket No. 96-10-06, DPUC Investigation Into Whether The Connecticut Light and Power Company Fulfilled its Public Service Responsibilities with Respect to its Nuclear Operations (imprudence disallowance of $600 million in replacement power costs due to shutdown of Millstone reactors / disallowance of additional $360 million in other incremental costs); Decision dated February 13, 1992 in Docket No. 90-02-03, Connecticut Yankee Nuclear Plant Shutdown (imprudence disallowance of $31,269,000 in replacement power costs for shutdown of Millstone reactor); Decision dated December 30, 1992 in Docket No. 91-10-02, DPUC Investigation into the Millstone 1 Shutdown on October 4, 1990 (imprudence disallowance of $2,865,000 in replacement power costs for shutdown of Millstone reactor).

The Authority finds that CL&P's mismanagement of its major storm response in 2011 merits a more severe ROE reduction than the 10 basis points reduction imposed on CNG and possibly the 50 basis points reduction imposed on United Water because more CL&P customers were negatively impacted and to a much greater degree by the extended outages following the 2011 Storms than customers were by the billing errors in the 2009 CNG matter or the accounting errors in the 2011 United Water matter. The OCC and AG each requested a 35 basis points reduction. The 15 basis points reduction falls within the range of these two past similar management-performance-based ROE reductions and is on the lower end of the 10 to 50 basis points range to reflect the steps CL&P has already taken since the 2011 Storms to be better prepared to respond to future storms.

The Authority may have assessed a greater reduction to CL&P's ROE, if the Authority did not find that the Company has demonstrated a strong commitment to improving storm performance as demonstrated by its improvements in storm response protocols (such as pre-staging practices), emergency planning, and storm resiliency measures, all widely documented in this and a number of other PURA proceedings. Furthermore, improvements in emergency preparedness and response practices were confirmed in the Authority's Decision dated August 21, 2013 in Docket No. 12-11-07. No parties or intervenors have argued that the CL&P storm response practices have not improved since the 2011 Storms.

While the Authority finds that the extent of CL&P's improvements in storm resiliency measures weigh strongly against a larger ROE reduction, the Authority finds there remains a need to penalize CL&P and incentivize it to improve its future storm performance to avoid a repeat of the mismanaged and deficient performances that occurred in response to the 2011 Storms. The Authority notes that, but for the major improvement in CL&P's storm preparedness and response subsequent to the 2011 Storms, the ROE reduction would have been substantially higher.

G. MERGER SAVINGS

In the Merger Decision, the Authority approved the merger agreement between Northeast Utilities and NSTAR, stating that it was in the public interest. Merger Decision, p. 48.

A condition of the merger settlement agreement provided that any future recovery of transaction costs is subject to Authority review and approval in a future rate proceeding. Merger Decision, Attachment A, Article 5.3. The instant docket is the first rate case since the merger was approved; therefore, the Authority will review the costs and merger savings associated with the merger.

The Authority found in the Merger Decision that total net benefits of approximately $783.8 million were expected on an overall, enterprise-wide basis with an estimated 38.5 percent of that amount, or approximately $301.8 million, allocable to CL&P's transmission and distribution operations based on 2011 financial data. The companies provided the analysis of savings through a Merger Integration Report (MIR). The Net Benefits Analysis was developed by analyzing the current cost structures of NU and NSTAR, with total actual labor costs disaggregated into nine principal functional areas for analysis. The savings quantified in the Net Benefits Analysis were estimated on the basis of potential reductions in labor and non-labor costs within corporate and administrative functional areas. For non-labor cost savings, the companies examined actual costs in 17 potential areas of savings, including 13 categories of corporate and administrative costs (e.g., insurance, facilities, benefits and fleet costs) and 3 categories of purchasing costs (procurement, inventory and contract services). The same methodology was used to quantify merger-related savings in this case. Mahoney PFT, pp. 6 and 7. The Company submitted an updated MIR summarizing the areas of savings, updated through June 1, 2014. Mahoney PFT, Exhibit MJM-2A. The updated MIR forecasts an increase, from the amount presented in Docket No. 12-01-07, in merger savings on an enterprise-wide basis of $92.8 million for a total of $876.6 million. Id., p. 4.

The Company stated that over the 10-year post-merger period, that the MIR covers, the generated savings will far outweigh the costs incurred to complete the merger. The merger integration report indicates total estimated merger-related costs of $119.4 million. Mahoney PFT, Exhibit MJM-2A, p. 4. The Company proposes to share costs associated with the merger based on the same percentage that savings are allocated. The Company proposes to amortize this amount over 10 years, without a return. The CL&P portion of the $119.4 million is calculated at $25.204 million in total or $2.520 million annually for ten years. Application, WP C-3.34, p. 3. In justification, the Company stated that the projected cumulative net merger-related savings of $876.6 million are significantly higher than the costs incurred to complete the merger. PFT Mahoney, pp. 7 and 8.

Article 5.3 of the settlement agreement in the Merger Decision states the following:

> Merger related payments made to officers leaving the employ of NSTAR, NU, any of the temporary or surviving entities engaged in the proposed merger transactions, the operating companies, or their successors (together, the "post-merger organization") in the

> category of “change of control” payments, or to executives remaining with the post-merger organization in the category of “retention payments,” shall be recorded at the parent company level upon the merger close and shall not be eligible for recovery as a merger related cost or otherwise from customers.

The Authority reviewed the expense items that the Company is claiming as merger-related costs and finds that CL&P has appropriately removed the above stated payments from costs associated with the merger in accordance with the settlement agreement. The Company has also verified exclusion of these payments through responses to interrogatories and testimony, including the response to Interrogatory AC-45.

With regard to the remaining expense items that compose the $119.4 million, the Authority has reviewed these items and notes that they include amounts for: legal fees, bankers’ fees and non-executive separation costs. Response to Interrogatory AC-114. These items are customary and can be expected to be incurred in this type of transaction. The Authority therefore approves of the items to be included for cost recovery.

No party addressed this issue in its brief or reply brief.

The Authority agrees that the merger has provided benefits to customers which exceed the costs to achieve those reductions. The Authority therefore approves the Company’s request to amortize the CL&P portion of merger costs of $2.520 million annually for 10 years.

In terms of going forward merger costs and savings that the Authority can expect to see in future CL&P filings, the Company stated:

> I guess what we would see moving away from this rate case is our ability to retain those merger savings that we have already achieved at this point. I believe after this rate case, while we'll have merger savings by holding onto the savings that we've achieved over time, I wouldn't go as far as to say that the attrition going forward through 2017 will be related to the merger. At some point, and I believe at this point with the rate case, we will start to look at things as business as usual and that just acquiring more efficiencies. To the extent, as Mr. Chung explained earlier, that these efficiencies would have occurred only but for the merger, then we will recognize them as merger related.
>
> Tr. 9/5/2014, pp. 1445 and 1446

At the conclusion of this rate case and going forward, the Company should move from identifying items that could be considered merger related towards a business as usual approach. In the Company’s next filing, the Authority expects to see little to no claim for merger-related initiatives or cost recovery. Future efficiencies should be

attributed to management initiatives under a business structure that will have been in place for over five years at the time of the Company's next rate filing in 2017.

H. DECOUPLING

The Authority approves the same decoupling mechanism for CL&P as it approved for UI. This decoupling mechanism provides for customers to pay the Company for any under-collection of revenues and that CL&P credit back any over-collection of revenues. CL&P may not retain any revenues. See, Decision dated February 4, 2009 in Docket No. 08-07-04, Application of The United Illuminating Company to Increase its Rates and Charges, pp. 126 and 127; Decision dated September 1, 2010 in Docket No. 08-07-04RE02, Application of The United Illuminating Company to Increase its Rates and Charges - Review of Decoupling Pilot, Pension Tracker, ROE Sharing Mechanism, and GET Adjustment, p. 9; Decision dated August 14, 2013 in Docket No. 13-01-19, pp. 126, 146 and 147. In reaching this determination, the Authority reviewed the language of the decoupling statute, the Company's proposal, the positions of the parties and past Authority Decisions addressing decoupling. The Authority finds that the decoupling rate will be a single, company-wide rate per kWh. The Authority also finds that the Company's proposal to include all sources of revenue in the decoupling calculation is appropriate. The Authority does not approve CL&P's proposal to assign carrying charges to either an over- or under-recovery or to any deferral. The Authority further directs that the present CIAC practices remain the same without any of CL&P's alterations. Additionally, as detailed in Section II.F.4 above, the 15 basis points reduction to the Company's for the Rate Year will reduce the revenue requirement and be reflected in an adjustment to the allowed revenue requirement target in the Company's first decoupling mechanism reconciliation. In following years, the Company may true-up to its full allowed revenue requirements. The Authority directs the Company to include the adjustment for the ROE penalty in its Rate Year decoupling mechanism reconciliation filing.

The OCC, AG and BETP expressed in their Written Exceptions their concern with including the adjustment for the ROE penalty in the decoupling reconciliation, and recommended that Rate Year rates be reduced immediately to reflect the penalty. OCC Written Exceptions, pp. 15-17, AG Written Exceptions, p. 4-6, BETP Written Exceptions, p. 2. They indicated this rate treatment means that customers may not see the full benefit of this reduction for two and a half years or more. This was not the Authority's intent. As discussed in the June 27, 2014 letter issued by the Authority and the Prehearing Conference held on June 19, 2014, it was agreed upon by the parties that the effective date of new rates will occur after the effective date of the Rate Year, which begins December 1, 2014. Similar to its directive for the ROE penalty, the Authority is not requiring the Company to design rates that reflect the delayed implementation of rates. Therefore, the Authority anticipates a shortfall in Rate Year revenue due to the delayed implementation of rates. In other words, customers are realizing the benefit of the penalty immediately by a delay in the implementation of rates rather than over the course of the Rate Year.

The decoupling statute, Conn. Gen. Stat. §16-19tt, provides in relevant part:

> (b) In any rate case initiated on or after July 8, 2013, or in a pending rate case for which a final decision has not been issued prior to July 8, 2013, the Public Utilities Regulatory Authority shall order the state's gas and electric distribution companies to decouple distribution revenues from the volume of natural gas and electricity sales. For electric distribution companies, the decoupling mechanism shall be the adjustment of actual distribution revenues to allowed distribution revenues . . . . In making its determination on this matter, the authority shall consider the impact of decoupling on the gas or electric distribution company's return on equity and make any necessary adjustments thereto.

With respect to the electric decoupling, the legislature expressed its intent to specifically require one type of mechanism with language clearly stating that the "decoupling mechanism shall be the adjustment of actual distribution revenues to allowed distribution revenues."

In the Application, the Company originally proposed a decoupling methodology that would reconcile actual revenues to PURA-approved revenues. At the end of each Rate Year, the Company would calculate the annual difference in revenues and establish a single kWh rate applicable to all customers over the following year. In addition, carrying charges[37] and a prior-year decoupling true-up will apply. The Company proposed to retain the revenue collected from post-rate year customers requiring a service set[38] (new service customers). The Company claimed that this money is needed to compensate them for the cost of installing new equipment. Absent retention of new service customer revenues, the Company suggested that new service customers be charged a 100% CIAC grossed up for income taxes. The annual process will continue until the Company's next rate application where PURA-approved revenues will be reset. Goodwin PFT, pp. 9-11.

During the hearing, the Company revised its decoupling proposal. Under the revised proposal the Company would add revenues received from post-rate year new service customers to the allowed revenues established in the instant case. The original proposal subtracted new service customer revenues from actual revenues. The decoupling amount is identical in either case. According to the Company, the new approach satisfies the language of the statute[39] because the Authority has great latitude in determining allowed revenues. Further, the Company argued that:

> In addition, there are other statutory provisions that relate to CL&P's statutory right to recover revenues lost due to various Connecticut policy initiatives regarding renewable energy and collectively ensure that the

---

37 The carrying charge as proposed will equal the Company's overall cost of capital.

38 Service set customers are new customers lacking any electrical service at their location. The Company will need to install a meter, service and possibly extend the distribution system as well to service these customers.

39 Conn. Gen. Stat. §16-19tt(b) defines decoupling for electric companies as follows: "For electric distribution companies, the decoupling mechanism shall be the adjustment of actual distribution revenues to allowed distribution revenues."

> Company can recover the revenues due to it as a result of PURA rate rulings (provided below). Collectively, these provisions establish that the Company has a right to recover revenues that are lost due to initiatives such as energy efficiency and the waiver of back-up charges for DG[40] customers, which is recovery obtained through the NBFMCC[41] rate. Other programs resulting in lost revenue (going forward after rates are set in this case), such as virtual net metering will be recovered in future NBFMCC rate filings.
>
> Late Filed Exhibit No. 15.

The Company reiterated the PURA's right to establish allowed revenues in its preliminary brief and also argued that the decoupling statute must be read in concert with the Authority's responsibility to establish just and reasonable rates.

> In regard to §16-19tt, the legislative directive to implement a revenue decoupling mechanism for CL&P cannot be read in isolation, but rather it must be read within the context of, and consistent with, PURA's full rate-making authority as set forth in §§16-19, 16-19e(a) and related sections. PURA cannot implement decoupling in a manner that would cause CL&P's rates to be less than just and reasonable, or insufficient to cover its operating costs. Conn. Gen. Stat. §16-19e(a)(4). Therefore, the Authority has broad discretion to establish "allowed revenue" for purposes of the decoupling tariff to equal the revenues associated with the revenue requirement approved in this case for the rate year, plus the distribution revenues collected from new customer connections after the rate year. Absent the inclusion of the new customer revenue as part of allowed revenue, the decoupling mechanism would result in the Company incurring incremental capital investment and cost of service associated with the new customers, with no means of recovering or offsetting these costs short of filing a new rate case.
>
> CL&P Preliminary Brief, pp. 7 and 8.

Other parties to the docket presented their positions regarding CL&P's decoupling proposal. The CIEC wants all large C&I and DG customers to be exempt from the proposed company-wide decoupling rate. Absent full exemption, the CIEC recommended a decoupling rate that is equally applicable to all rate classes on a company-wide rate per kWh basis. CIEC Brief, pp. 22-24. The AG requests that the Authority reject the Company's proposed decoupling methodology because it lacks the fundamental symmetry contemplated by the decoupling statute and the Company's proposal to retain revenues from new service customers is not permitted by decoupling statute. AG Brief, pp. 21, 22 and 23.

The Bureau of Energy and Technology Policy (BETP) supported the Company's proposal. The Company should be allowed to retain new service customer revenues because it is only a minor adjustment that may help delay the need for a new rate case.

---

[40] Distributed generation (DG).

[41] Non-bypassable Federally Mandated Congestion Charge

BETP also considered decoupling to be an effective cost-recovery alternative to increasing fixed charges as proposed by the Company. BETP Brief p. 13; Reply Brief, p. 1.

Environment Northeast (ENE) favors granting the Company full revenue decoupling because it will not hamper state energy policy and can be used to replace the need for fixed charges. ENE defines decoupling as actual revenue coming in less than allowed revenues. ENE Brief, p. 8.

Wal-Mart[42] argued that since demand-metered customers are already paying substantially excessive rates, no decoupling charge should apply. Additionally, a company-wide kWh decoupling charge as proposed by the Company only introduces further inter-class subsidization. For rate classes that have no volumetric kWh rates, a kWh decoupling charge also shifts cost responsibility from lower load factor customers to higher load factor customers. Wal-Mart Brief, pp. 4-6.

The OCC disagreed with the Company's position in three respects. First, it recommended that decoupling be applied at either the individual rate class level or at a broader residential, commercial and industrial level. Use of broader levels would prevent potentially severe impacts in customer classes with relatively few customers. Second, whereas the Company proposed to include carrying charges equal to its weighted average cost of capital, the OCC argued that CL&P's short-term cost of debt is more appropriate. Finally, the Company's proposal to adjust either allowed or billed revenues to remove revenues from new service customers is outside the scope of the legislation and should be denied by the Authority. OCC Brief, pp. 138-142. In response to the CIEC's argument that larger rate classes should be exempt from decoupling because they are already decoupled through rate design, the OCC stated that a reduction in their demand levels, for example, would be trued-up by other rate classes. Further, the OCC disagreed with the BETP's claim that the Company should be allowed to retain new service customer revenues. The OCC pointed out that retained revenues include all customer, energy and demand charges that exceed the cost of newly installed facilities. OCC Reply Brief, pp. 22-25.

The Authority finds that CL&P's proposed decoupling mechanism is not permissible, based on the plain and express language of the decoupling statute. The decoupling statute requires the adjustment or reconciliation be made on the basis of a true up between allowed distribution revenues and "actual distribution revenues." The statute makes no provision for the exclusion of any revenue, such as new customer revenue, from the revenue reconciliation. The Authority, therefore, declines to interpret that statute, as CL&P urges, to conclude that certain actual new customer revenues should be excluded from the decoupling true up adjustment or treated as an upward adjustment to allowed distribution revenue.

Besides not being permitted by the plain and express statutory language, the Authority also finds that CL&P's proposal is contrary to the legislative intent of the decoupling statute to establish a balance and symmetry between the electric or gas

[42] Wal-Mart Stores East, LP and Sam's East are intervenors collectively referred to as Wal-Mart.

distribution companies and their customers.[43] In its Decision dated January 22, 2014 in Docket No. 13-06-08, the Authority described the legislative intent for:

> . . . decoupling to be a simple true-up mechanism established to decouple revenue from fluctuations in sales. If utility rates reflected only fixed monthly charges, then fluctuations in revenue would parallel customer count. As expressed to the PURA by Connecticut utilities many times in numerous dockets, decoupling only permits the utility to recover its revenue requirement calculated by the Authority as the amount just adequate to provide safe, reliable service, no more, no less. Decoupling is symmetrical in theory in that it requires ratepayers to contribute missing revenues to utilities and in turn, for utilities to refund additional revenues to ratepayers. In practice, however, decoupling can favor ratepayers or utilities over extended periods. For example, in a warming world of expanding customer conservation coupled with poor economic activity, utilities will collect more from ratepayers than they refund. Alternatively, in a situation of unprecedented customer growth, ratepayers would be expected to share in the financial benefits.
>
> Docket No. 13-06-18 Decision, p. 122.

The Company's legal argument submitted in support of its latest proposal to adjust allowed revenues, centers on the Authority's need to read the decoupling statute in concert with its responsibility to approve nothing less than just and reasonable rates. The Authority is aware of those requirements. Decoupling is not a rate developed to recover underlying, prudently incurred costs. It is a true-up mechanism for revenues previously designed fully in accordance with the Authority's just and reasonableness responsibility. Adding future unknown costs to today's allowed revenues to incorporate a single item of cost, even if it is described by some as minor, it is another version of single-issue rate-making that violates the symmetrical balance of decoupling. Therefore, the Authority rejects the Company's decoupling proposal. The Company will be directed to revise its proposed Decoupling Rates Rider to reflect the formula approved for UI. That formula is consistent with the enabling legislation and was implemented for all other utilities granted decoupling to date. If at any time in the future, CL&P determines that decoupling and other approved rate mechanisms are insufficient for the Company to collect enough revenue to provide adequate and reliable electric service at just and reasonable rates, recover its costs, and give CL&P a reasonable opportunity to earn a reasonable return, the Company may file a rate case application seeking an increase to its allowed distribution revenues and other rate relief.

The Authority has determined that present CIAC practices will not to be altered. While it is true that new service customer revenues will be returned to ratepayers, a new customer has no control over the situation and should not provide the Company with a contribution newly calculated outside of existing practices. Since new service

---

[43] In this proceeding, the Company's witness also acknowledged that the decoupling relationship is intended to be symmetrical, with risks and potential benefits for both the Company's shareholders and its ratepayers as stated below. Tr. 9/3/14, pp. 955 and 956.

subscribers tend to be customers for many years, valuing their contribution to costs must be normalized over the life of the analysis. Imputing zero revenues for a few years of a 50-year revenue contribution stream is inappropriate. The potential loss of revenue from new service customers is more than balanced from the protection ratepayers stand ready to provide should sales decrease for any reason.

The Authority finds that the decoupling rate will be a single, company-wide rate per kWh. Customers serviced by rate classes lacking volumetric distribution rates should be charged the same rate based on their monthly kWh usage. The Authority understands the OCC's concern that a single, company-wide decoupling rate inevitably involves inter-class subsidizations that are always inappropriate when viewed from the perspective of any single class. Nonetheless, decoupling is only a true-up mechanism that involves minimal dollars in comparison to total distribution revenues. Individual customers are involved in this true-up; but only to the extent of their relative level of annual consumption. Small consumption customers are charged or benefitted less than large consumption customers. Decoupling at either the rate class or broader group level introduces the possibility of simultaneous debit and credit charges within the same true-up year. Ultimately, decoupling is a blunt regulatory or administrative tool utilized until the rate formula can be rebalanced in a future rate case. Decoupling will supersede the existing conservation adjustment mechanism (CAM) and lost revenue true-ups within the FMCC reconciliation process. The Company will be directed to propose a phase-out formula at its next scheduled CAM and Federally Mandated Congestion Charge reconciliation filings.

The Authority finds that the Company's proposal to include all sources of revenue in the decoupling calculation is appropriate. A regulatory asset (debit or credit) will be created following Authority approval of the Company's annual decoupling calculation. The asset will be written off monthly using actual billings. The last month's write-off will use actual billed revenues and estimated net unbilled revenues for the year. Since allowed revenues will not change during the year, all accounting and financial reporting documents prepared for public consumption will reflect a forecast of normalized allowed revenues for the period in question. Customer bills will present the decoupling charge on a separate line item entitled Revenue Adjustment Mechanism per kWh. Annual requests to the Authority for approval of a new decoupling rate may follow the format recently employed by UI. Annual decoupling filings should be made expeditiously following the availability of complete data. The actual rate calculation will use forecasted sales for the upcoming collection year. The decoupling rate will not be grossed-up for gross receipt tax or uncollectible expense. Periodic decoupling audits will be conducted by the Authority.

I. EARNINGS SHARING MECHANISM

An earnings sharing mechanism (ESM) is a ratemaking mechanism that shares a company's earnings in excess of its allowed ROE. The purpose of an ESM is to provide for the equitable distribution of a company's earnings above its allowed ROE between the company's customers and shareholders. Typically, the Authority has established the sharing threshold at the Company's allowed ROE with the sharing distributed equally with 50% to shareholders and 50% for the customers. Since 1999, the

Company has operated under an ESM whereby earnings in excess of the allowed ROE are shared with ratepayers.

Connecticut's over-earnings statute, Conn. Gen. Stat. §16-19(g), allows the Authority to review a company's earnings if an earned ROE exceeds a company's authorized ROE by 1% point for a period of six consecutive months, equivalently two fiscal quarters. The Authority has a long tradition of using an ESM and has approved these for companies as an incentive to shareholders. Its implementation allows shareholders to capture a portion of potential overearnings and also avoiding an overearnings financial review that would be otherwise initiated by the Authority. The ESMs have been implemented in the past for electric, gas and water utilities.

In this proceeding, CL&P is proposing a change to the existing ESM by suggesting a 100-basis point deadband above its authorized ROE, within which, there would be no sharing. Between 100 and 150 basis points above the allowed ROE, earnings would be shifted with 75% shareholders and 25% shared to ratepayers. For earnings above 150 basis points, CL&P offers to share earnings equally. According to the Company, the proposed ESM may help mitigate CL&P's exposure to the downside risk of earnings deficiencies. CL&P claims that if it could retain a higher margin of earnings, it would provide a strong incentive for the Company to undertake broad-scale efficiency measures that would consume management focus, institutional resources and, in some cases, costs to achieve, but would reduce the cost of service for customers in the next rate case. Hevert PFT, pp. 42–47.

A recommendation to reject CL&P's proposed changes to the ESM was also provided by Wal-Mart. Per traditional regulatory practice, the Company has the opportunity, but not the guarantee to earn its authorized return. Chriss PFT, p. 14. According to Mr. Chriss, over-earnings indicate that rates are set too high and should be reduced. Implementation of the proposed deadband above the allowed ROE results in the potential for the Company to significantly over-earn with no offset to customers of the rates that have been set too high. Chriss PFT, p. 15. Mr. Chriss stated that the current ESM already provides an incentive for the Company to maximize the efficiency of its operations, as achieved cost reductions that increase earnings over the authorized return are awarded with 50% of the over-earnings going to the Company. Id. Mr. Chriss also claims that the Company has not provided sufficient justification to deviate from the precedent established by PURA with respect to ESMs. Wal-Mart Brief, p. 8.

Additionally, the CIEC stated that the Company's proposal would significantly reduce the ability of ratepayers to share in over-earnings without providing any additional corresponding benefit. CIEC Brief, p. 29. The CIEC concurs with Mr. Chriss that CL&P is not entitled to nor guaranteed to over-earn its rate of return. Id. Contrary to the Company's assertions, the record in this proceeding demonstrates that the current ESM already provides sufficient incentive to maximize the efficiency of its operations. CIEC Brief, p. 30. The AG also recommends that CL&P's proposed ESM be rejected as unfair to ratepayers. AG Brief, p. 11. Since the Company can expect to see increasing earnings and savings resulting from efficiencies created by the merger between NU and NSTAR, the AG claimed that CL&P's proposed ESM would funnel the vast bulk of those savings back to its shareholders. Id.

The Authority finds that CL&P's current ESM provides sufficient incentive to maximize the efficiency of its operations as the Company is rewarded for its efforts with 50% of any earnings above its authorized ROE. Under the existing ESM, the Company has achieved efficiencies associated with the merger with savings in operating expenses and by optimization of its facilities. The Authority expects the Company to continue to strive for efficiencies in its operations. The current ESM is also consistent with other recent ESMs that were approved by the Authority for electric, gas and water utilities. The Company should maintain an equal share of the benefits and savings and continue to pursue efficiency in all areas of its operations. The Authority directs CL&P to continue its existing ESM. The earnings sharing mechanism shall remain in effect until the Company's next rate case where it will again be reviewed. Accordingly, the Company's excess earnings over its allowed ROE of 9.02%, or 9.17% in 2016 and beyond, calculated using the cost of capital method will be shared 50/50 ratepayers/Company. The ratepayers' share of any such excess earnings will be returned through a line item credit on their bills.

J. RATES, REVENUE AND TARIFFS

1. Sales Forecast

CL&P stated that historically, electric rates have generally followed the economy, and the relationship is critical to understanding and forecasting electric use. The level of economic activity is a driver in determining customers' purchase and operation of electric equipment and appliances that subsequently determine electric demand. Residential customers are determined by the number of households, and residential electric sales are correlated with household income. Commercial sales are driven by growth in the non-manufacturing sector, which also provides jobs that produce additional residential sales growth. Industrial sales are driven by manufacturing employment and productivity. For this reason, a sales forecast is generally a reflection of the underlying economic forecast. The economic forecast used by CL&P in this case was developed by Moody's Economy.com in July 2013. Plecs PFT, pp. 1 and 2.

While the recession had a dramatic impact on sales, CL&P indicated a recovery seems to be underway and its economic forecast predicts that this modest recovery is expected to continue throughout the forecast period. In 2011 and 2012, total retail sales declined by 0.5% and 0.2%, respectively, on a weather-normalized basis. However, 2013 proved to be a turning point, with sales up 0.7% over 2012. Residential sales growth has been flat to positive, accelerating during the most recent years of the economic recovery. Commercial sales only recently turned positive in 2013, and industrial sales growth has been volatile, growing in 2012 before a sharp decline in 2013. While the economic recovery has been volatile for several years, it now appears to be gaining some momentum in some sectors, with some degree of stability in non-manufacturing employment and household incomes. The Company nevertheless expects that the industrial sector will continue to be volatile and difficult to predict. Id.

CL&P forecasts retail sales to remain relatively flat through 2016. Forecasted CL&P retail sales are shown in the chart below:

Table 66

Exhibit CAP-7 CONNECTICUT LIGHT AND POWER COMPANY- TOTAL FRANCHISE SALES CALENDAR ELECTRIC SALES GIGAWATT HOURS											
	RES.		COM.		IND.		ST. LIGHT.		RAIL-ROAD		TOTAL RETAIL

FORECAST											
2014	10,295	1.1%	9,525	0.9%	2,290	-1.0%	96	-1.3%	194	2.3%	22,401
2015	10,307	0.1%	9,514	-0.1%	2,285	-0.2%	95	-1.0%	196	0.9%	22,397
2016	10,387	0.8%	9,528	0.2%	2,267	-0.8%	94	-1.0%	198	0.9%	22,474

Application, Exhibit CAP-7.

The resulting flat sales forecast reflects both an anticipated modest improvement in economic conditions in certain sectors, and it includes the effect of expanded Company-sponsored energy efficiency programs, which are expected to add approximately 300 gigawatt hours (GWh), or nearly 1.5% of annual sales, of new energy efficiency measures per year. The forecast is structured to consider previously installed measures, which still provide an energy savings benefit, and the estimated impacts of future programs, without double-counting those savings with the savings implied by the regression model's historical relationships.

Historically, the Company's sales have very closely mirrored economic activity. In the last 10 years, that relationship held subject to adjustments for energy price spikes and DG activity. The Company stated it expects that this sales-economy relationship to hold through the forecast period, subject to additional adjustments for growth in DG and energy efficiency programs. However, CL&P cautioned that a number of factors may affect the sales outlook such as weather, economic activity, energy prices, energy efficiency, and DG activity. Plec PFT, pp. 3-8.

a. Forecasting Methodology

i. Trend Forecast

CL&P traditionally used statistically adjusted end-use models to forecast sales by customer class, which were useful in identifying the end-use factors that are driving energy use. For the purposes of the instant case, CL&P changed its sales forecasting methodology to a traditional econometric, or trend, model to forecast customer and sales for the Rate Year. The Company found that both approaches produce similarly reliable results. It decided to use the econometric modeling approach because it produces reliable results with less complexity at lower cost. CL&P Response to Interrogatory OCC-204. The Company forecasted sales on the customer class level, (e.g., Residential, Commercial, Industrial, Street Lighting and Railroad). Late Filed Exhibit No. 16, Attachment 1; Tr. 9/3/14, pp. 825-827. The Company indicated it performed a weather normalization study in developing the rate year sales forecast and associated revenues. CL&P Response to Interrogatory OCC-123.

The Company also provided its lost sales associated with the major recent weather events. CL&P lost approximately 159 GWh in 2011, or 2.2% of its sales for the affected period, due to Hurricane Irene and the October 2011 snowstorm. In 2012, CL&P lost approximately 86 GWh, or 2.6% of its sales for the affected period, due to Hurricane Sandy. Late Filed Exhibit No. 16, Attachment 2. The Company adjusted the forecast models' dataset historical for the impact of these storms by using a separate set of weather-specific sales models to capture the sales impacts of both statistically significant weather events and the typical variations caused by heating and cooling degree days. In some cases where a storm is substantial, it used a binary variable to account for some unusual relationships between the economic driver and the actual sales experience to make sure that that relationship was not something that the model would interpret as a normal response. Late Filed Exhibit No. 16; Tr. 9/3/14, pp. 828 and 829.

ii. Out of Model Adjustments

The Company made a series of “out of model” adjustments to the trend forecast to adjust sales where new demand side programs are in place and/or it finds the trend forecast is not accurately capturing a particular sales trend. For instance, the Company increased its C&LM spending, and expects to lose additional sales that are not reflected in historical sales trend which only include the base conservation savings. Other items that the Company adjusted for are distributed generation, the residential solar program, electric vehicle program, the low- and zero-emission renewable energy credit (LREC/ZREC) program and large customer changes. The Company provided a summary of the out of model adjustment:

Table 67

Late Filed Exhibit No. 8.

iii. Rate Class Sales Allocation

Once the sales forecast was developed at the customer class level, the Company looked at the test year billing data from its records, specifically the relationships based on the customer class versus rate class sales levels. In developing the rate class level forecasts, CL&P then used those relationships to extrapolate the customer, demand, and sales billing determinants. CL&P utilized the relationships of customer class to rate class sales in the test year to develop the rate year comparable billing units by rate class. Tr. 9/3/14, p. 832.

b. Sales Forecast Results

The table below summarizes CL&P's proposed Rate Year rate revenue at present rates and the forecasted changes in customer, sales and revenues from the Test Year, allocated among each of the rate classes:

Table 68

		Test Year revenues at current rates				Rate Year revenues at current rates				% Change

Exhibit EAD-14, pp. 1 and 2.

c. Position of the Parties

None of the Parties commented on CL&P's proposed sales forecasting methodology or the forecast results in their respective testimony or Briefs.

d. Authority Analysis

The Company is forecasting customer growth of approximately 1.2% for the residential, 1.4% for the commercial and 0.4% for the street lighting customer classes over test year levels, and a decrease in customer growth in the industrial class of 1.2%. CL&P Responses to Interrogatories OCC-304 and OCC-305. The Authority reviewed CL&P's forecasting methodology and forecasting results and finds the methodology reasonable and the results acceptable for setting rates. The sales numbers for 2015 reflect a modest level of growth in sales, consistent with observed and forecasted economic trends, known customer changes, and offset by expected sales reductions due to various demand-side program initiatives. The customer forecast is also reasonable given historic trends and expected changes, as discussed in the case.

2. Operating Revenue

CL&P filed the following summary of earned operating revenues for the Test Year, forecasted Revenue at present rates using the sales forecast discussed in Section II.J.1, Sales Forecast, proposed Rate Year revenues based on the rate request, and the associated revenue increase.

Table 69

DISTRIBUTION COSTS

OPERATING INCOME SUMMARY - RATE YEAR ENDING 2015

Description	Rate Year Ending 2015 at Current Rates	Required Increase		GET & Uncollectible Adjustment	Required Increase including GET & Uncollectible	Rate Year Ending 2015 at Proposed Rates
Operating revenues (distibution only)	$ 905,882	$ 108,101	(a)	$ 8,607	$ 116,708	$ 1,022,590
Operating revenues (storm cost)	$ -	$ 82,928	(a)	$ 6,603	$ 89,531	$ 89,531
Operating revenues	$ -	$ 23,474	(a)	$ 1,869	$ 25,343	$ 25,343
	905,882	$ 214,503		$ 17,079	$ 231,582	$ 1,137,464

Application, Schedule C-1.0.

CL&P's proposed Rate Year revenue at present rates of $905.882 million consists of $883.661 million of rate revenue based on applying CL&P's current distribution rates to forecasted sales volumes and $22.221 million in "other" revenues. Application, Schedule C-3.1.

a. Rate Revenue at Present Rates

Based on the sales forecast discussed in Section II.J.1, Sales Forecast, CL&P calculated Rate Year distribution revenue at present rates of $883.667 million.[44] Since the Authority accepted the Company's sales forecast, no change to the rate revenue at present rates is needed.

b. Other Revenues

CL&P forecasted an increase in "other" operating revenues from $22.038 million in the Test Year to $22.221 million in the Rate Year, a total increase of approximately $183,000. The Company showed that this is primarily due to an expected increase in revenue related to increasing the pole attachment rental rates. Schedule WPC-3.1. The following table illustrates the breakdown of Rate Year other revenues.

[44] There is a slight discrepancy of $6,000 in CL&P's distribution revenue at present rates shown in the C-Schedules vs. the E-Schedules.

Table 70

OTHER REVENUES - RATE YEAR ENDING 2015		
Amounts in $000's		
Account	**Description**	**Amount**
450.01	Late Payment Charge	$ 6,994
450.04	Other Late Payment Charge	2,371
	Forfeited Discounts	$ 9,365
451.01	Reconnect Fees	$ 734
451.02	Return Check Charges	328
	Misc. Service Revenues	$ 1,062
454.01	Intercompany Rent/Lease	$ 104
454.99	Rent from Elec Property (Other)	10,912
456.51	Other Facilities Charge Revenue	41
456.99	Other Electric Revenue	737
	Rent From Electric Property	$ 11,794
	Total Rate Year	$ 22,221

Response to Interrogatory RA-11, Attachment 1.

i. Late Payment Charge / Reconnection Fee Revenue

Late payment charge revenue is generated by the Company by charging 1% on a customer's delinquent balance. Revenue from reconnect fees consists of two charges: a reconnect at meter charge of $35 and a reconnect at pole charge of $60. These service charges are listed in Appendix A of the Terms and Conditions for Delivery Service, and have been in effect throughout the period 2008-2013.

Table 71

The Connecticut Light and Power Company Annual Company Revenue for Late Payment Charges and Reconnection Fees (Amounts in Dollars)						
	2008	**2009**	**2010**	**2011**	**2012**	**2013**
1.) Late Payment Charges (a/c 450)	7,713,350	8,908,561	9,590,315	6,097,963	8,269,604	9,365,076
2.) Reconnect Fees (a/c 451)	334,530	763,935	1,757,841	1,033,975	1,081,085	734,182
Total	8,047,880	9,672,496	11,348,156	7,131,938	9,350,689	10,099,258

Response to Interrogatory RA-10.

The Authority finds the proposed revenues associated with late payment charges to be reasonable. However, the rate year revenues for reconnect fees for 2013 are low compared to prior years, and should not be used as the basis for forecasting Rate Year revenue. The five-year average of reconnection revenue shown in the table above based on current charges is $1,074,204. As noted in Section II.J.8, Tariff Changes, the Authority is requiring that CL&P increase the charge for reconnection at the meter from

$35 to $42, a 20% increase, instead of the Company's proposal to lower the charge to $31. The Company is also proposing to increase the charges substantially for reconnections at the pole, by more than 100%. The Authority will adjust the Company's proposed revenue for reconnection fees to $1,350,000, which reflects the 5-year average through 2013 and approximately 25% in additional revenue expected from the increase in the reconnection charges. Therefore, other revenues will be increased by $615,818 as a result of the adjustment to reconnect fees.

ii. Pole Attachment Revenue

The OCC recommended that the Authority impute $275,260 of revenue to CL&P's Rate Year related to amount of annual pole attachment revenue it contends CL&P should receive from Verizon in the portion of Greenwich where CL&P and Verizon are joint pole owners. The OCC's recommendation is based on the following:

- CL&P has an agreement with Verizon that gives all recurring attachment revenues for jointly owned poles to Verizon.

- With ratepayer funding, CL&P pays for its share of the capital costs for all poles it jointly owns with Verizon. CL&P is also the custodian of more than 60% of the poles that it jointly owns with Verizon, and CL&P pays for O&M associated with its designated custodial poles.

- CL&P receives none of the revenue collected from attachers in the communications gain on the poles it owns jointly with Verizon.

Consequently, the OCC argued that because ratepayers share capital and custodial costs, they should share in the revenue associated with their jointly owned poles. Response to Interrogatory OCC-360; OCC Brief, pp. 109-111.

CL&P indicated that the 1956 contract between CL&P and Verizon's predecessor (the New York Telephone Company), which pre-dates the existence of cable television and fiber pole attachments, does not allow CL&P to retain any of the revenues from such attachments in the communications gain space on jointly owned poles. Responses to Interrogatories OCC-209 and OCC-360. Therefore, CL&P currently has no legal entitlement or mechanism through which to recover it from Verizon. CL&P Reply Brief, pp. 61 and 62.

The OCC also recommended that the Authority impute $1.946 million into Rate Year revenue, which reflects the amount of make-ready expense CL&P incurred in the test year that it did not recover from pole attachers. The OCC's recommendation for cost recovery is based on the following:

1. The communications gain on the pole is used by telecom/cable attachers for their service provision.

2. Code compliance work in the communications gain is necessitated by having the attachers' equipment in the communications gain. The attachers are the beneficiaries and the cost causers of the code compliance work.

3. While Telecom/cable companies should be allowed to attach to utility poles, the OCC is unaware of any statutory or regulatory requirement that electric ratepayers must subsidize their attachment.

4. CL&P should be made whole for make-ready costs by the attachers, who are the cost causers, not by the CL&P ratepayers.

For the future, the OCC recommended that the Authority direct the Company to develop a recurring or non-recurring rate for the attachers that provides the revenues necessary to reimburse CL&P fully for the cost of make-ready work in the communications gain. OCC Brief, pp. 111 and 112.

CL&P indicated that it does not have explicit permission from the Authority to recover these specific make-ready costs from pole attachers. CL&P agreed with the OCC's statements that "the OCC is unaware of any statutory or regulatory requirement that electric ratepayers must subsidize their attachment" and "CL&P should be made whole for make-ready costs by the attachers." However, the OCC's proposed increase to CL&P's rate year revenues cannot be made unless CL&P receives permission from the Authority in this case to recover this specific type of make-ready expense from pole attachers. Reply Brief, pp. 62.

The Authority will not impute revenue associated with the poles that it jointly owns with Verizon. Although CL&P is responsible for some O&M on these joint poles without full compensation, it is limited in nature to inspection and fixing damage arising from outside sources. It is unclear what the costs associated with the O&M activities are and what the real revenue deficiency is. In any event, it appears in either case that CL&P has no legal means at this time to collect revenue from Verizon under the Agreement. Imputing a revenue estimate into rates would serve to penalize the Company. The Authority finds CL&P's actions here do not warrant the penalty proposed by the OCC. The Authority will require CL&P to address this issue in the pole attachment working group meetings ordered pursuant to the October 8, 2014 Decision in Docket No. 11-03-07, DPUC Investigation into the Appointment of a Third Party Statewide Utility Telephone Pole Administrator for the State of Connecticut. The Company will be directed to report back to the Authority with a proposal that addresses the OCC's concerns.

The Authority also finds that the Company is billing properly for make-ready work under existing Authority guidelines and, therefore, will not impute revenue associated with make-ready revenue shortfalls proposed by the OCC. Not all make-ready costs are the responsibility of the attacher, such as when a new attachment is requested and the electric distribution company finds in its survey that there is a national electric safety code violation and takes corrective action.

As discussed in Section II.J.6, Pole Attachment Rates, the Authority lowered CL&Ps proposed CATV Rate from $16.56 to $13.19 and the proposed Telecom Rates were lowered from $16.56 to $13.82 and $13.89 for urban and rural attachments, respectively. The Authority could not calculate the resultant adjustment to Rent from Electric Property, Account No. 45499, as the billing determinants for pole attachments is not available. Since the adjustment will decrease Other Revenues, the Company shall include the adjustment in distribution revenue when designing rates.

c. Summary of Changes

Based on the adjustments made to other revenue herein, the initial change to Rate Year revenue will be an increase of $615,818. This increase will be offset by the reduction in in pole attachment revenue discussed in Section II.J.2.b, Pole Attachment Revenue.

3. Cost of Service Study

In general, a cost of service study (COSS) is a mathematical business model that systematically assigns cost responsibility among customer classes for company assets and expenses incurred by an EDC to serve customers. Since the COSS culminates in summarizing customer, demand and total costs by customer class, it is an invaluable tool for documenting equity and establishing revenue requirements and tariff charges by customer class. In developing its COSS, the Company followed the detailed methodology consistently approved by the Authority in recent rate case Decisions. As has been the case historically, residential class ROR have fallen well below the overall system average ROR while commercial and industrial class RORs have exceeded system average significantly. The Company relied on its COSS results when designing rates. Effectively, the Company's proposed rates move all rate classes closer to the system average ROR. Davis, PFT, p. 8.

Wal-Mart took no position on the Company's filed COSS, other than to endorse its use for establishing rates. Wal-Mart stated that COSS-derived rates reflect cost causation, send proper price signals and minimize price distortions. Chriss PFT, p. 19.

The OCC found fault with many of the COSS allocation methodologies employed by the Company. According to the OCC:

1. The minimum distribution system study should be rejected, while distribution costs incurred for poles, lines and transformers should be classified as demand-related.

2. A quarter of transformer costs should be allocated on the basis of usage.

3. Uncollectible expense and operating expenses for customer service and information should be allocated on the basis of class revenues.

Since the OCC considered the COSS to be too impaired to be used to assign revenue responsibility among rate classes, the OCC recommended that bundled, equal percentage revenues increases be applied to all but the smallest rate classes. Should

the Authority rely on the COSS, the OCC recommended that the rate of movement to rate class equality be tempered. Johnson PFT, p. 4.

The OCC also argued that poles and conductors should be classified as 100% demand-related based in large part on a population density argument. In densely populated areas found in Connecticut, utilities tend to oversize conductors when they are installed initially. As such, the incremental cost of adding new customers is minimal because neither new poles nor new conductors are required. Consequently, the cost characteristics of poles and conductors are not consistent with the partial customer classification utilized by the Company. Johnson PFT, p. 17.

The OCC also stated that since minimum system studies contain a certain load-carrying capability, they incorrectly allocate a segment of conductors on the basis of customers. As such, a zero-intercept approach to determining minimum system costs is superior. Finally, the OCC supported classifying transformers as 76% demand and 24% energy. While the typical classification is between demand and customer, the OCC argued that a new operating standard established by the FERC designed to save energy losses in transformers warrants substituting an energy classification for the customer classification. Johnson PFT, pp. 19-21.

The CIEC argued against the OCC's COSS recommendations. The CIEC stated that the COSS methodology adopted by the Company is consistent with the National Association of Regulatory Utility Commissioners Electric Utility Cost Allocation Manual (NARUC Manual) and historical treatment approved by the Authority. CIEC Brief, p. 3. The CIEC pointed out that the NARUC Manual requires plant installed to service customers and meet their peak demand, must be segmented into customer and demand related costs. Concerning Accounts 364 through 368, the NARUC Manual at page 90 states that:

> [these accounts] involve *demand and customer costs*. The customer component of distribution facilities is that portion of costs which varies with the number of customers. Thus, the number of poles, conductors, transformers, services, and meters are directly related to the number of customers on the utility's system … each primary plant account can be separately classified into a demand and customer component. Two methods are used to determine the demand and customer components of distribution facilities. They are, the minimum-size-of-facilities method, and the minimum-intercept cost (zero-intercept or positive-intercept cost, as applicable) of facilities.
>
> CIEC Brief, p. 5.

The NARUC Manual recommended that either the minimum intercept method or other methods like the minimum distribution system method be undertaken to discern customer and demand cost components. CIEC Brief, pp. 4 and 5. Continuing, the CIEC quoted earlier Authority Decisions that supported the use of a customer classification.

> The Authority further held in Docket No. 90-12-03, *Application of the Connecticut Light and Power Company to Amend Rate Schedules Phase*

> *II,* in order to achieve an appropriate allocation of distribution plant, "the simplicity of the minimum-size methodology together with its producing results similar to the much more complex minimum-intercept methodology, warrants its continued use by CL&P in future COSSs."[45] The Authority determined that "a genuine, but minimal, distribution system is necessary for a utility to stand ready at no load or to serve nominal loads."

CIEC Brief, p. 9.

The CIEC also provided supportive Authority language used in other electric rate cases stating that:

> The Authority has continued to reaffirm its position. In Docket No. 05-06-04, *Application of the United Illuminating Company to Increase its Rates and Charges*, the Authority rejected the OCC's recommendations that no costs be allocated based on the number of customers.[46] Similarly, in Docket No. 08-07-04, *Application of the United Illuminating Company to Increase its Rates and Charges*, the Authority held that the "OCC has provided no compelling reason to deviate from these established standards"[47] and rejected its request for allocation on the basis of demand only.[48] The OCC's repetition of these repeatedly rejected arguments in this Docket is without support and should be rejected.

CIEC Brief, p. 10

The Authority finds that the population density argument for allocating poles and lines fully on demand is tortured at best. Poles and lines are installed to expand circuits to reach new off-circuit customers. Poles and lines are also required to provide service to new customers situating along existing circuits; albeit not new poles and lines. Regardless of whether pole and lines are new or existing, circuits require both to reach customers. Additionally, it is hard to visualize a demand component to a pole. Demand components exist for poles through the formalistic design of minimum system theory much more than in the practical world of circuit design. Lines or cables have both a customer and demand component. While some minimum size cable is necessary to simply reach all customers, kVA levels differ dramatically between residential neighborhoods and industrial parks.

---

45 Docket No. 90-12-03, Application of The Connecticut Light and Power Company to Amend Rate Schedules Phase II, Final Decision (August 1, 1991) Lexis Version at 36.

46 Docket No. 05-06-04, Application of The United Illuminating Company to Increase its Rates and Charges, Decision (issued January 27, 2006) at 114.

47 Docket No. 08-07-04, Application of The United Illuminating Company to Increase its Rates and Charges, Final Decision (February 4, 2009) at 107-108.

48 The Authority has also rejected the application of a demand only to gas plant. Specifically, in its Decision dated June 29, 2011 in Docket No. 10-12-02, Application of Yankee Gas Services Company for Amended Rate Schedules, the Authority held that "[t]he OCC's conclusion that trenching costs, 2/3 of current installation costs, should be allocated on peak day demand because of some statistical result defies common sense." Decision, p. 156.

Transformers also have a customer and demand component since transformers are needed to expand circuits to reach customers and sized to reflect differing kVA demands. While the OCC argued that the new efficiency performance standards reduce energy losses, transformers are still sized to satisfy diversified neighborhood peak kVA. The newer transformers will simply provide this service with less energy lost as heat. Additionally, the 24% portion that the OCC proposed to allocate on energy represents the increased cost of a transformer. It does not represent the minor reduction in heat loss actually achieved by the new standard. Johnson PFT, p. 26.

The Company proposed to allocate uncollectible expenses of $5.2 million on the basis of the actual net write-off per rate class. This methodology assigns approximately 82% of the cost to residential rates. Late Filed Exhibit No. 7. The OCC recommended an allocation of uncollectible expense on the basis of class revenues as it is a social cost, and should be spread broadly across the customer base. The magnitude of the uncollectible expense in a given period is affected not only by the number of customers on the system, but also by the amount of revenue billing attributable to each particular type of customer. In addition, the potential for significant impact from individual large accounts should be considered. Direct assignment of the cost does not allocate the expense to cost causers, because the non-payers, by definition, are not paying customers. Therefore, the expense is a social cost which should be spread on a general allocator like revenues. Johnson PFT, pp. 29 and 30.

At the hearing on August 28, 2014, the Authority introduced the concept of allocating uncollectible expense on a socialized, or 100% customer basis. Effectively, every customer would pay the same monthly fee. Tr. 8/28/14, p. 351. In response to cross examination, the Company filed Late Filed Exhibit No. 7, which indicated that under this approach, residential rates would be assigned 90% of the total cost. The Authority accepts the Company's method of allocating uncollectible expense, which utilizes the same methodology approved in recent rate cases. While socialization is a valuable approach, it can wait until a future rate application to be implemented. The Authority may undertake a full COSS and rate design generic review to establish a standardized methodology.

The Authority accepts the COSS submitted by the Company and will rely on it to address rate design issues. The Company's methodology has been consistently applied and approved in multiple rate increase applications and the arguments presented mainly by the OCC have been examined before. Nonetheless, the Company will be directed to submit a zero-intercept study for determining the customer and demand components of various plant accounts in its next rate increase application.

4. Revenue Allocation

a. Company Proposal

The Company allocated revenue increases and determined distribution revenue targets for each rate class based on an evaluation of the excess or deficiency identified in the COSS of each rate class. In general, to reduce the amount of excess or deficiency, and accordingly move the class ROR closer to the equalized ROR, classes with a deficiency (e.g., Rates 1 and 7, defined below) received an increase to their

current distribution revenue increase that was greater than the Company-average of 26.2%. Classes with a revenue excess (e.g., Rates 27, 30, 35, 37, 55-58, defined below) received an increase that was less than the average. Unmetered classes (particularly the street lighting classes for which significant structural redesign and specific other rate design constraints apply) received an increase at or near the Company average. Davis PFT, p. 10.

Based on its proposed rate request, the Company proposed the following Rate class rate increases:

Table 72

		2015						% Change
		Forecasted	Current		Proposed			Proposed
Rate	Schedule/Description	Sales (mWh)	Revenue	$kwh	Revenue	$kwh		vs. Current
1	Residential - Regular	8,461,362	$ 1,556,750	0.1840	$ 1,704,998	0.2015		9.52%

	Total	22,396,911	$ 3,663,662	0.1636	$ 3,895,206	$ 0.1739		6.32%

Exhibit EAD-15, p. 3.

To determine a fair and equitable revenue allocation, the Company considers each rate class' ROR relative to the system average ROR to measure where the excesses/deficiencies exist. The following table illustrates each rate class' existing contribution to overall system ROR.

Table 73

Rate	Class ROR		Rate	Class ROR
1 & 7	1.10%		41	17.12%
5	2.87%		55	11.97%
18	-0.38%		56	13.17%
29	6.17%		57	12.39%
27 & 30	10.47%		58	12.44%

b. OCC Proposal

The OCC indicated that while the COSS provides useful information for developing the class revenue increases, it should not be the sole consideration. Non-cost considerations are appropriate in mitigating pure COSS results. Further, COSS are imprecise instruments. COSS allocate costs to a multiple decimal point level, which could provide a false sense of security about the accuracy of the studies. This conclusion is based on two general reservations regarding embedded COSS. First, some of the costs are classified and allocated on a weak causal basis, and subjective judgment enters into the selection and development of allocation methods. Second, COSS are a static snapshot of the dynamic relationship between supply and demand. Both costs and class usage characteristics will change over various long-run time periods. For these reasons, some degree of judgment may be appropriate in applying the COSS to class revenue increases. "Cost based rates" are best viewed as representing a reasonable band around the COSS results, rather than exact price points. Furthermore, COSS which do not recognize the differences in risk associated with customer classes should be utilized cautiously. Johnson PFT, pp. 40-47

The OCC also disagreed that all classes should be targeted to produce equalized RORs. The Company's required ROR is dependent upon the perceived financial and business risk of the public utility. If the composition of sales by customer class has the effect of producing differing business risks to the utility, then the rationale for equalized relative ROR is not sound. In that situation, it is no more reasonable to expect equal

relative contributions to return than it would be to expect all stocks in a portfolio to make equal contributions to the overall ROR of the portfolio. Id.

The OCC noted that industrial customers are generally riskier to serve due to the larger capital investment required to serve each customer, and the revenue impact from customer losses. Industrial customers' load is more dependent upon domestic or international market conditions. Distributed generation installed by large businesses, as well as manufacturing shutdowns or declining production, reduce the revenue generating capability of distribution plant and ultimately shifts costs onto the more stable residential class. Therefore, the residential class should be expected to produce a lower relative ROR and industrial customers a higher one. Since the revenue targets produced by a COSS presume uniform class RORs, this is an inherent weakness in the practice of strictly moving toward the class RORs in the COSS. Id.

The OCC suggested that several non-cost considerations counterbalance the COSS. First, the COSS does not take into account the risk differences among the classes. Second, the customer class cost relationships are more complicated than the COSS implies. Third, CL&P's current residential rates are very high, and implementing an above system average percent increase on the residential class will exacerbate the situation. According to the Energy Information Administration, Connecticut has the second highest residential electric rate in the United States (behind only Hawaii). Id.

The OCC pointed out that there are a number of bill items that impact distribution, but are recovered in other billing categories, such as non-bypassable federally mandated congestion charges (NBFMCC). In the OCC's view, these bill items feature: (a) cross subsidization among the rate classes; (b) charges for programs that impact distribution rates; and (c) costs that should properly be charged to distribution. Examples of this include the following.

- The DG program: This program includes payment of gas distribution charges and waiver of backup charges for the large user participants. Most of the ratepayers who pay the cost of this subsidy do not qualify for participation in the program. In addition, DG program participants greatly reduce their usage of electricity, leaving the remaining ratepayers to shoulder the share of distribution costs previously supported by the DG participants.
- Storm resiliency: In this case, CL&P includes an additional $44 million for resiliency that it would charge to NBFMCC until the next rate case after this one. CL&P has also charged resiliency costs to NBFMCC in a pending proceeding (Docket No. 14-02-01, PURA Semi-Annual Reconciliation of the Federally Mandated Congestion Cost and Generation Service Charges of The Connecticut Light and Power Company and The United Illuminating Company). Residential customers pay a disproportionate amount of NBFMCC costs, and distribution costs previously recovered from residential users through the NBFMCC appear to reflect equalized rates of return. Because the charges were outside the COSS, residential customers do not receive credit in the COSS results for the returns paid through the NBFMCC.

Id.

Additionally, the OCC stated that CL&P's proposed distribution percentage revenue changes are much higher for residential customers than commercial and industrial (C&I) customers. The OCC recommended setting the increase 120% higher than the system average percent increase for the following Rates: 18, 25, 39, 116, 117, and 119. The OCC further recommended distributing the remaining portion of the revenue increase on an equal percentage basis to the remaining classes (6.2% based on the Company's filed request). Capital investments for resiliency, upgrading distribution facilities, and replacement of outdated distribution infrastructure are among the drivers of the increased rates. All customer classes should contribute to the rate increases supporting these upgrades on an equivalent basis. The OCC stated that, even assuming that the proposed rate increases rely on the COSS targets, CL&P's proposed class revenue increases represent movement that is too rapid and produces excessive rate impacts on residential customers. The alternative COSS proposed by the OCC reduced the residential revenue deficiency by almost 40%. Given the reduction in the residential target, the severity of the proposed movement to cost of service for below-cost classes can be relaxed. Id.

As an alternative to its proposal, the OCC recommended the following revenue increase allocation parameters: set the residential total bill revenue increase no higher than 118% of the system average percentage (approximately a 7.5% percent increase based on the Company's filed request); limit all below-cost class increases to 120% of system average; and set a floor of 75% of system average percent for all above-cost classes. This would produce a 28% increase in distribution revenues for the residential class or approximately 110% of the system average distribution increase, which would represent reasonable movement toward the COSS results, particularly taking into account the adjustments recommended for the COSS methodology. Id.

c. Position of the Parties

In addition to the positions/alternative proposal offered by the OCC above, the CIEC and the BETP provided comments specific to revenue allocation.

i. Connecticut Industrial Energy Consumers

The CIEC indicated that the RORs of the residential classes are significantly below the system average. In contrast, rates imposed upon C&I rate classes provide above-average ROR. As a result, the C&I classes are subsidizing the residential classes and providing, in most instances, RORs, at current rates of approximately three times the system average. The total subsidy paid by C&I classes under current rates exceeds $20 million annually. Undoubtedly, over the past decade, large C&I customers have paid tens of millions of dollars in excess of their actual cost of service. In order to continue to promote rate unity and properly allocate distribution costs among rate classes, the Company's allocation should be approved. CIEC Brief, pp. 15 and 16.

ii. Bureau of Energy & Technology Policy

The BETP is concerned with the proposed allocation of the overall rate increase among CL&P's customers and recommended narrowing the difference between the

average increase for different rate classes, especially for residential and street lighting customers. CL&P's COSS should be regarded as a guide to ratemaking, but not the only factor considered. Other important factors that must be considered are rate impacts, equity, continuity, efficiency, and understandability. The BETP disagrees with CL&P that the ROR for each rate class should be equal. Electricity use for residential customers is more predictable than C&I customers, whose usage is much more affected by economic trends. The BETP recommended lowering the overall increase to Residential Rate 1 and Street Lighting Rate 116 customers to no more than 125% of the average rate increase for all customers to reduce the burden on residential customers and municipalities. BETP Brief, pp. 10-13.

d. Authority Analysis

The Company's COSS will be relied upon by the Authority for designing rates. The Authority finds that to reduce interclass subsidies, all classes should be moved closer to their cost to serve, or closer to the system average ROR, while applying the principles of rate gradualism. While gradualism is certainly a debatable concept, the Authority considers the impacts on each rate class relative to the system revenue increase approved herein. The approved revenue requirement increase of $130.172 million will increase the current total revenues of $3,663 million by approximately 3.5%. See, Table 74. Since the Authority is allowing a total system-wide rate increase of approximately 3.5%, it would suggest that the rate classes that are contributing a lower relative return will be allocated a revenue requirement increase in excess of that amount, and vice versa for higher contributing classes. The farther the class is from the system average, the larger the percentage increase/decrease necessary to align the class revenues to the average.

The Company demonstrated, through the results of its COSS, the need to assign a higher proportion of the distribution rate increase to Rates 1, 7, 5, 18, 115, 116 and 117 and a lower portion of the rate increase to rates 27, 30, 35, 37, 41, 55, 56, 57 and 58. This determination was made through analysis of each rate class' current contribution to the Company's revenue requirements. As shown, Rates 1, 7, 5, 18, 115, 116 and 117 are contributing a ROR that is at least 200% lower than the system ROR. Rates 27, 30, 35, 37, 41, 55, 56, 57 and 58 have a class ROR that is at least 200% higher than the system ROR. To reduce inequities between classes, it is necessary to align the rate classes as close to the system ROR as possible.

The Authority accepts the Company's proposed allocation methodology of its rate request among the customer classes. CL&P has provided a reasonable proposal which is generally fair to all rate classes while moving the RORs closer to the Company's average. The Company allocated a higher than average (6.35%) increase to Rates 1, 5, 7, 18, 29, 115, 116, 117 and 119, which are the rate classes showing the lower than system RORs in the COSS. Conversely, the Company allocated a lower than average increase to Rates 27, 30, 35, 37, 39, 40, 41, 55, 56, 57 and 58. The proposed allocation appropriately shifts more revenue responsibility to the residential customer class while keeping the rate increase to approximately 50% greater than the average, which the Authority does not view as excessive, given the current ROR of 1.1%. The highest increases of 14.07% and 13.25% are proposed for the low volume Street &

Security Lighting and Special Contract classes, again, not excessive relative to the overall increase and their current ROR of 0.50%.

The allowed increase (not including the ROE penalty) is approximately $96 million less than the Company's original proposal of $231.6 million, on which they based their rate design proposal. Therefore, the revenue allocation to the individual rate classes will change as a result of the Authority's reduction to CL&Ps proposal. To maintain the equity balance previously discussed, the Authority will apply the adjustment to the proposed revenue increase to the rate classes by holding intact each rate class' overall percentage increase relative to the average percentage increase for all customers from CL&P's original proposal. For example, for Rate 1, CL&P proposed an overall percentage increase of 9.52%, which is 51% higher than the overall proposed rate increase of 6.32%. By holding the relationship of the increase to Rate 1 relative to the overall allowed increase of 3.51%, the adjusted increase for Rate 1 is 5.51%. The following table details this methodology applied to all of CL&P's rate classes[49]:

Table 74

Rate Year Revenue and Rate Class Allocation

									I = (B+M)/A-1		
		(J)	Company Request (Application)		$ 231,545						
		(K)	Allowed Rate Increase		$ 134,565						
		(L)	Increase in Other Revenue		$ 600						
		(M)	Adjustment to Rate Revenue		**$ (97,580)**	= (J-K)+L					

The Authority notes that the transfer of $15.3 million of system resiliency expenses will reduce the overall increase once it is implemented. Because the system resiliency charges will not be removed from the NBFMCC charge until it is reset in January, the Company shall return to customers the system resiliency-related revenues it collects through the NBFMCC in December 2014.

[49] The Authority made further adjustments to the approved revenue requirement for 2016 previously established in the Proposed Final Decision of approximately $489,000. In Section II.J.5., Rate Design, the Authority directs the Company to allocate the net decrease to Rate 116.

5. Rate Design

a. Company Proposal

The Company proposed rate changes that are designed to recover its Rate Year distribution operating deficiency and previously approved storm costs and system resiliency costs commencing on December 1, 2014. The Company developed the proposed distribution rates by allocating the revenue increases and designing rates for each rate class in a manner that achieves a balance among a number of interrelated objectives, based on an evaluation of the cost of service, current rates and impacts of changes to rates in each class. In particular, the Company sought to move rates in each rate class closer to their actual cost of service, both at a total class level and with respect to the prices for distribution service within each rate class. By applying the principles of equity and cost causation in allocating cost responsibility among rate classes, as well as the principle of gradualism in setting total class revenues, the Company reduced the revenue excess or deficiency and moved the ROR for each rate class closer to the Company average. Those rate classes with below system average RORs (as computed within the COSS based on current rates) have been allocated a greater than average percentage distribution increase, while those classes with above system average RORs have been allocated a lower than average percentage increase. Davis PFT, pp. 1-3.

CL&P indicated that its rate design also moves current rates closer to cost-of-service levels within rate classes by generally decreasing or eliminating per kWh charges, and moving customer and demand charge rates closer to their cost-of-service levels. The Company redesigned residential and small general service customer rates based on the COSS. Specifically, these rates were redesigned to increase the amount of distribution costs collected through customer charges and, where applicable, demand charges, and thereby reduce the recovery of fixed distribution costs through volumetric charges. In redesigning specific rates within each class, application of these principles more equitably align the recovery of fixed distribution costs with an appropriate, corresponding rate mechanism. Id.

Overall, the proposed rates were designed to collect a total distribution revenue increase of $231.6 million, and when combined with a corresponding reduction of $15.3 million to the NBFMCC, will represent an overall average increase to total bills of 5.9%. Id. CL&P proposed to move the ROR of each rate class closer to the Company's average ROR, and reduce the amount of fixed distribution costs recovered through volumetric charges. The Company gave additional consideration to the allocation of costs and redesign of rates within the street lighting class due to its proposed structural changes. CL&P asserted that its proposal achieves a balance between assigning an appropriate level of cost responsibility to each rate class, maintaining reasonable bounds around rate changes and customer impacts, and addressing fixed cost recovery through rates as appropriate. Davis PFT, p. 8.

CL&P proposed the following rate design changes for the residential classes:

Table 75

Comparison of Current Rates vs Proposed Rates				
	Current	Proposed	Proposed vs. Current	
	Rate	Rate	Difference	% Chg
Rate 1 - Residential Electric Service				
Customer Charge	$16.00	$25.50	$9.50	59.38%
Energy Charge All kWh	$0.16165	$0.16591	$0.00426	2.64%
Rate 5 - Residential Electric-Heat				
Customer Charge	$20.25	$30.00	$9.75	48.15%
Energy Charge All kWh	$0.15768	$0.16176	$0.00408	2.59%
Rate 6 - Residential Electric Heat TOD				
Customer Charge	$20.25	$30.00	$9.75	48.15%
Energy Charge On-Peak kWh	$0.15768	$0.18496	$0.02728	17.30%
Energy Charge Off-Peak kWh	$0.15768	$0.14996	($0.00772)	-4.90%
Rate 7 - Residential TOD				
Customer Charge	$16.00	$25.50	$9.50	59.38%
Energy Charge On-Peak kWh	$0.18485	$0.18911	$0.00426	2.30%
Energy Charge Off-Peak kWh	$0.14985	$0.15411	$0.00426	2.84%

Application, Exhibit EAD-3.

For Rate 1, CL&P set a distribution rate revenue target of $570.4 million, an increase of $148.2 million or 35.11% over its current distribution revenue of $422.5 million. Application, Exhibit EAD-2. CL&P also proposed to collect the increase through a 59% increase to the Rate 1 Customer Charge and a 2.64% increase to the per-kWh Charge.

b. Office of Consumer Counsel Proposal

The OCC disagreed that the Company's proposed customer charge is cost-based. This relates to the OCC's assertion that the Company's COSS is faulty, particularly with respect to the classification of distribution infrastructure as customer-related. If the COSS classified distribution facilities on a full demand basis, without classifying the plant costs as customer-related, the study would support a customer charge no higher than $11.68. Therefore, both the current and proposed customer charges are above cost. Even among those utilities that utilize a minimum system study for the COSS, it is rare that the customer charge is fixed at a level which recovers the cost of secondary and primary voltage conductors, poles, and transformers. Further, the fact that the law now requires a revenue decoupling mechanism should lead to the conclusion that the motivation for continued increases in fixed charges no longer exists. Johnson PFT, pp. 33-40.

The OCC proposed that the customer charge should only recover costs which directly vary with the number of customers such as: O&M expense for meters, services, meter reading, and customer accounting, and return and depreciation on meter and service investment, minus credits for customer deposits and related deferred federal income taxes. General overhead, such as administrative and general expense, should be excluded from the customer charge computation, because these costs do not vary

directly with number of customers. The OCC proposed a maximum $11.68 customer charge. Id.

The OCC stated that with the exception of its access rationing role, the customer charge provides no price signal relevant to resource allocation. Because the electric utility cost structure is dominated by costs which vary with changes in demand and annual electric load, the usage-sensitive rate is the primary source of meaningful price signals. A lower customer charge ensures that a greater proportion of costs are recovered through a usage-sensitive price. A lower customer charge is more consistent with energy conservation goals and provides pricing policies appropriate for consumption of finite natural resources. In addition, a policy that minimizes the customer charge is more equitable to low usage residential customers. Many such customers often reside in older multi-family structures served by largely depreciated meters and service drops. Id.

The OCC pointed out that low-use customers in Rate 1 will face the largest percentage bill increases from the proposed customer charge increase (for instance, a 16% increase in the total bill for 300 kWh customers. According to the OCC, imposing a larger increase on customers who impose a minimal demand on the system, and may be the least capable of affording the rate increase, is inequitable. The concept of fixed vs. variable costs is not a very meaningful distinction for purposes of utility cost analysis. Inasmuch as the majority of customer usage within the residential class falls within a reasonable range of load factors, a kWh usage charge is likely to accomplish approximately the same purpose as a demand charge. Id.

The OCC recommended that the Customer Charge for Rate 1 be set no higher than $11.50, which is in line with the COSS service results. If the Authority is reluctant to reduce the customer charge, at the least, the current customer charge should not be increased. A high customer charge tends to inhibit energy conservation. Minimizing the customer charge provides the ratepayer with a greater ability to control his/her bill on the basis of usage. For that reason, an excessive customer charge can promote wasteful energy consumption. Connecticut has numerous statutory programs which provide incentives for increased energy efficiency, evincing a staunch policy in favor of reduced energy consumption. The increase in customer charge runs counter to that state policy. The OCC calculated that there is a 10% reduction in the life cycle present value savings under the Company's pricing vs. the OCC's proposed charge of $11.50. At a practical level, the lower potential savings under the Company's increased customer charge represents an extra incentive amount, which may have to be paid by state programs to achieve the expected demand reductions. Id.

c. Position of the Parties

The OCC, BETP, ENE and AG all strongly objected to the 59% increase in the customer charge. The Authority also received an unprecedented number of comments from customers, public officials and consumer advocates on the proposed rate increase. An overwhelming majority of customers who submitted public comment or testified at the public hearings or filed written comments strongly opposed the proposed rate increase, especially the 59% increase in the residential Customer Charge.

i. Office of the Attorney General

The AG commented that CL&P's proposal to increase the customer charge by 60% is unduly burdensome for residential ratepayers and is poor public policy. Further, due to the implementation of full sales decoupling in the instant proceeding, increasing the customer charge is completely unnecessary to further the intent of decoupling. AG Brief, p. 20.

ii. Office of Consumer Counsel

The OCC indicated that CL&P's rate design proposal is contrary to the state's energy policy and adversely impacts small electricity users, low-income and fixed income and elderly customers. CL&P's efforts to radically increase the customer charge is also "anti-conservation," as it attempts to shift costs currently recovered through commodity rates to fixed monthly charges that do not vary by usage levels. OCC Brief, p. 4. Further, the OCC pointed out that CL&P's Rate 1 Customer Charge is much higher than in the other New England states. The OCC urged the Authority to consider the actual impacts of this dramatic increase in CL&P's customer charge and whether those impacts are consistent with state policy, rather than adhering to an ideological path that is clearly inconsistent with state policy. OCC Brief, 115 and 116.

iii. Environment Northeast

ENE stated that the Company's proposed increases in the fixed charges do not align with Connecticut's energy efficiency and clean energy policies and, therefore, are not in the best interest of CL&P's customers. ENE supported CL&P's request for full revenue decoupling because it will help remove any Company sales-related disincentive to promote energy efficiency and distributed generation. Decoupling is also an effective cost-recovery alternative to CL&P's proposal to increase the fixed charge. ENE argued that the proposed high fixed charge increases do not align with state energy policy for several reasons: (1) they reduce customer control over electricity costs, (2) they are unfair to energy efficient (or low-use) customers (3) they reduce the value of existing efficiency or on-site generation investments, (4) they reduce the economic signal to customers to invest in energy efficiency and (5) they may harm the cost-effectiveness of the state's energy efficiency programs. ENE Brief, pp. 4-6.

ENE recommended that the Authority design rates by: (1) lowering the fixed customer charge in the residential classes to at least $11.50, as recommended by the OCC; (2) rejecting the excessive fixed charge increases in the small business and church and school customer classes; (3) applying any approved rate increase solely to the variable charges, which is the portion of the distribution bill that the customer can control; and (4) requiring CL&P to implement revenue decoupling with a full reconciliation mechanism between allowed and actual revenue. ENE Brief, p. 7.

iv. Bureau of Energy & Technology Policy

The BETP recommended that the Authority: (1) reduce CL&P's proposed fixed monthly service charge increase for all residential and small commercial customers; (2) reduce the burden on residential customers and municipalities by narrowing the

difference in the average rate increase among rate classes; (3) approve CL&P's decoupling proposal; and (4) increase the rate differential for on- and off- peak charges in residential time-of-use Rate 7. The BETP indicated that the priorities outlined in the 2013 Comprehensive Energy Strategy (CES) form the basis for their recommendations, namely energy efficiency, increasing system reliability with DG and advancing the development of in-state renewable energy resources. BETP Brief, pp. 2-4.

The BETP opposed CL&P's proposed fixed monthly service charge for three main reasons. First, increasing the fixed monthly service charge unfairly penalizes certain classes of customers, specifically those customers who use the least electricity, such as small businesses, churches and schools, and people on low or fixed incomes. Second, increasing the fixed monthly service charge undermines a customer's ability to obtain the full benefits of key energy-saving programs encouraged in the 2013 CES, such as energy efficiency. Third, CL&P's proposal to increase the fixed monthly service charge works against the state's efforts to increase the deployment of in-state, local clean energy resources like solar, fuel cells, combined heat and power, and other similar technologies, as detailed in the 2013 CES. Id.

d. Authority Analysis

i. Residential

The Authority finds that applying this rate class increase in an across-the-board manner to the residential rate classes is a reasonable approach to increasing the distribution charges in a more moderate manner than the Company's proposal. The Authority fully agrees with the Company that the general objective of rate design is "to continue to move distribution rates among and within classes to better reflect the cost responsibilities identified in the Company's cost of service study." While the Authority generally prefers an approach that moves rates towards increased fixed cost recovery, it must consider the customer impact of how the rate increase is applied. The Company made a significant leap in the 2008-2009 timeframe by implementing a 60% increase in the residential Customer Charge, from $10 per month to the current charge of $16. Response to ENE-6. Further, the Authority is no longer mandated to implement decoupling through increased fixed charges, but instead required to implement full revenue decoupling. See, Section II.H, Decoupling. Given the level of customer opposition to the fixed charge design, the current Customer Charge levels and the implementation of a decoupling mechanism in the instant case, a more gradual approach is warranted. Therefore, the Authority will approve customer charge increases for Rates 1, 5 and 7 that reflect the application of the average distribution rate class increase across-the-board.

The Authority illustrates this approach in the case of Rate 1 (and TOD companion Rate 7). As shown in Table 74, the Authority lowered CL&P's proposed distribution revenue increase for Rates 1 and 7 by approximately $62.5 million, which lowers CL&P's distribution revenue target from $570.8 million to $508.3 million. The proposed distribution rate increase for Rate 1 and 7 will therefore be decreased from 35.1% to 20.3% ($508.3 million / $422.5 million in current revenue). Applying this increase in an across-the-board manner in the residential rate classes, or 20.3% in the case of Rate 1 and 7, produces a customer charge of approximately $19.25. See,

Table 75 and Application, Exhibit EAD-2, line 21. Applying the Rate 5 adjusted distribution increase of approximately 17.2% [($103.3 million - $10 million) / $79.6 million in current revenue] across-the-board will raise the customer charge from $20.25 to approximately $23.73. See, Table 75 and Application, Exhibit EAD-2, line 22. The Authority will further adjust the Rate 5 Customer Charge by rounding it to $23.75.

Several parties argued that decoupling reduces the need for large increases in fixed charges, as the Company will be assured the revenue recovery through the decoupling mechanism. Now that the Company is shielded from the effects of revenue variability due to decoupling, it is tempting to dismiss the need to continue the move towards fixed costs recovery. While that is true to some extent, the Authority cautions on the unintended consequences of over-relying on a decoupling mechanism and, consequentially, eroding cost-based ratemaking principles. In a decoupling environment, lower customer charges and higher variable charges increases ratepayers' exposure to large swings in sales related to conservation, distributed generation, weather and the economy. For example, in the event of a much warmer than normal summer, a portion of the revenue recovered from residential customers may be returned to commercial and industrial (C&I) customers.

As such, the Authority is against lowering the customer charges from current levels, or eliminating the customer charges altogether. While the Authority supports the state's energy policy goals, they do not justify abandoning well-established cost of service principles that promote customer equity and cost causation. Intentionally increasing fixed cost recovery on a volumetric basis does not reflect cost causation and misallocates demand cost responsibility, thereby increasing inequities within a class. Distribution costs do not vary in proportion to the energy delivered, but are only a function of the number of customers and their peak demands. If rates are designed in large part to maximize customers' ability to control their bill, then those costs are shifted to other customers or perhaps re-charged to the customer the following year through the decoupling mechanism. Regarding some of the Parties assertions that increasing fixed charges unfairly burdens low-use customers, the Authority notes that not increasing fixed charges has the effect of shifting that cost responsibility to the remaining customers in that rate class. In approving the overall rate design, the Authority must balance the competing interests of all customers.

Lastly, more investigation is needed regarding how customers perceive price signals, both at the overall bill level and on the billing component level. It is not clear what the magnitude of price signals will need to be to effectuate change in customer usage behavior. The Authority can use anecdotal evidence based on customer migration levels from Rate 1 to 7 that the potential for a 10% savings has not induced a large customer migration to TOD pricing.

The approved revenue requirements, revenue allocation and rate design changes discussed above will result in an increase of approximately $7.12 per month[50]

[50] Bill impact estimate is based on a current customer bill of $129.16 for 700 Kwh of usage and an average increase of 5.51%, totaling approximately $136.28 under new rates. See, Exhibit EAD-6, p. 1.

for the average residential customer's bill. Under the approved rate design, ample opportunity remains for customers to conserve and save as the vast majority of customers charges are priced on a volumetric basis. A $19.25 Customer Charge, the only fixed component, relative to a total customer bill of $136.28 is approximately 14 percent. Therefore, approximately 86 percent of the bill remains subject to immediate savings if kWh consumption is reduced.

ii. Commercial and industrial

Many of the arguments raised by the Parties on increasing the fixed charge in the residential rate classes also apply to the smaller commercial rate classes. The following table illustrates the impact of the customer charge proposal for the smaller commercial rates:

Table 76

Comparison of Current Rates vs Proposed Rates				
	Current	Proposed	Proposed vs. Current	
	Rate	Rate	Difference	% Chg
Rate 27 - Small TOD General Service				
Customer Charge	$38.50	$55.00	$16.50	42.86%
Demand Charge Greater Than 2 KW	$9.34	$15.35	$6.01	64.35%
Energy Charge On-Peak kWh	$0.19899	$0.16296	($0.03603)	-18.11%
Energy Charge Off-Peak kWh	$0.11493	$0.09941	($0.01552)	-13.50%
Rate 30 - Small General Service				
Customer Charge	$38.50	$55.00	$16.50	42.86%
Demand Charge Greater Than 2 KW	$12.51	$18.52	$6.01	48.04%
Energy Charge First 300 Hours Use	$0.12616	$0.10836	($0.01780)	-14.11%
Energy Charge Over 300 Hours Use	$0.12616	$0.10836	($0.01780)	-14.11%
Rate 40 - Church and School				
Customer Charge	$47.50	$70.00	$22.50	47.37%
Energy Charge All kWh	$0.16473	$0.16980	$0.00507	3.08%

Application, Exhibit EAD-3.

The Authority finds that, similar to the proposed increase to the residential fixed charges, the percentage increase proposed for customer charges for these rates are high, in excess of 40%. As such, the Authority will direct the Company to apply an increase to the fixed charge component for Rates 27, 30 and 40 in one of the following manners: (a) at the individual rate classes distribution percentage increase; or (b) at the overall distribution increase percentage, if higher than (a).

Except as modified above, the Authority finds the Company's rate design proposal acceptable, as it continues the move towards more equitable, cost-based rates while mitigating the impact that such increases have on customers. CL&P appropriately reallocated the revenue responsibility of the rate classes closer to the system average without excessive impacts. The customer and demand charges are fully cost-based,

---

Actual bill impact is subject to slight change upon review of the final Rate Plan submitted by the Company.

where possible, and the customer and/or demand charges for the remaining classes move closer to the cost-based rates without excessive impact on customers on either spectrum of usage. The Company will be directed to submit a final rate plan (Rate Plan) that incorporates the following modifications:

1. The Company will file a final-rates COSS reflecting rate year billing determinants, the financial profile approved in this Decision and the then current rates developed in accordance with the Rate Plan approved herein.

2. The Company will include adjustments to Other Revenue for reconnection fee revenue and pole attachment revenue discussed in Section II.J.2. Operating Revenue, when designing rates.

3. The TOD rate structure proposed by the Company as Rate 5 is denied; Rate 7 will continue to be available to either Rate 1 or 5 customers.

4. The approved customer charge for Rates 1 (and associated Rate 7) and 5 are $19.25 and $23.75, respectively.

5. The Company will apply an increase to the fixed charge component for Rates 27, 30 and 40 in one of the following manners: (a) at the individual rate classes distribution percentage increase; or (b) at the overall distribution increase percentage, if higher than (a).

6. The allocation of pro forma revenues to the rate classes will be set in accordance with the directives in Section II.J.4, Revenue Allocation.

7. The Company will apply the increase associated with the adjustment in pole attachment revenue to distribution revenues before designing rates.

8. The Company will apply the net decrease of approximately $489,000 to the 2016 revenue requirement level to offset the revenue allocation to Rate 116 when designing rates, since this rate class received the largest percentage rate increase.

9. The compliance filing for the Rate Plan will consist of the following:

    a. Testimony
    b. Schedule E-1, Scored and Unscored Proposed Tariffs
    c. Schedule E-2.0 Revenue Summary
    d. Schedule E-2.1 Detailed Revenue Summary
    e. Schedule E-2.2 Revenue Calculation
    f. Schedule E-2.3 Typical Bill Comparisons
    g. Schedule E-6.0 COSS
    h. Schedule E-6.0 COSS – Unity
    i. Standard Revenue Proof Exhibits

The distribution rate increase will become effective December 1, 2014; however, new rates will not be implemented until after final approval of the Rate Plan. Since the

Company will be submitting full year rates to be recovered over less than a full year period, it may encounter a shortfall in collecting the approved distribution rate increase. Any such shortfall may be reconciled in the decoupling mechanism approved herein. The Authority notes that the customer bill impact of a portion of the distribution rate increase will be mitigated by a subsequent decrease of the storm related costs which will be removed from the NBFMCC effective January 1, 2015. The Company shall consider the net impacts of the revenue recovery transfer between the NBFMCC and the distribution rates in their revised rate filing and provide this information to the Authority.

6. Pole Attachment Rates

a. Company Proposal

Pursuant to Order No. 1 in the Decision dated September 12, 2013 in Docket No. 11-11-02, Petition of Fiber Technologies Networks, L.L.C. for Authority Investigation of Rental Rates Charged to Telecommunications Providers by Pole Owners (Fibertech Decision), the Company proposed to change its methodology for calculating pole attachment fees under its Community Antenna Television (CATV) pole attachment tariff (CATV Rate), Telecommunications pole attachment tariff (Telecom Rate) and Municipal pole attachment tariff (Municipal Rate). The current pole attachment tariffs provide recurring and non-recurring charges for pole attachments. Recurring charges are typically fees for rental of pole space, and non-recurring fees typically include items such as make-ready costs. Municipal Rate customers are allowed an exemption from pole attachment fees for their first attachment on any pole; therefore, the recurring fees apply predominantly to CATV and Telecom attachers. Pole attachments under all three tariffs are subject to non-recurring fees for make-ready work and other charges for services, as outlined in the tariffs.

To implement Order No. 1 in the Fibertech Decision, the Company proposed adjustments to the formula rate for Telecom attachers consistent with the methodology in the Federal Communications Commission's Report and Order on Reconsideration, In the Matter of Implementation of Section 224 of the Act (WC Docket No. 07-245), and A National Broadband Plan for Our Future (GN Docket No. 09-51), adopted and released April 7, 2011 (Pole Attachment Order). To achieve parity between the Telecom Rate and the CATV Rate, the Company applied factors to the pole attachment Telecom Rate methodology calculations to be consistent with the factors applied in the CATV Rate calculations. Davis PFT, pp. 20-24. The following tables detail CL&P's calculation of the Cable Rate and the Telecom Rate:

Table 77

CATV Formula						
Maximum Rate	=	Space Factor	x	Net Cost of a Bare Pole	x	Carrying Charge Rate
	=	8.11%	x	$643.57	x	31.73%
		Fully Owned		Jointly Owned*		
	=	**$16.56**		**$8.28**		
* Fully Owned Rate / 2						

Table 78

Telecom Formula								
Maximum Rate	=	Space Factor	x	Net Cost of a Bare Pole	x	Carrying Charge Rate	x	Conversion Factor
Maximum Rate (Urban)	=	11.723%	x	$643.57	x	31.73%	x	69.18%
		Fully Owned		Jointly Owned*				
		$16.56		**$8.28**				
Maximum Rate (Non-Urban)	=	17.872%	x	$643.57	x	31.73%	x	45.38%
		Fully Owned		Jointly Owned*				
		$16.56		**$8.28**				
* Fully Owned Rate / 2								

As shown above, CL&P calculated pole attachment rates for the CATV Rate and Telecom Rate of $16.56 for a fully owned pole and $8.28 for a jointly owned pole, respectively. For the CATV Rate, CL&P calculated a space factor of 8.11%, based on the space occupied by one attachment (typically a foot) as a percentage of the total usable space (estimated by CL&P to be 12.33' across its system). CL&P calculated a net cost of a bare pole of $643.57 using a combination of 90% of the embedded cost of a pole of $609.62, and 10% of the marginal (replacement) cost of a pole of $949.14. The Carrying Charge Rate of 31.73% grosses the rate up for elements such as administrative expense, maintenance, depreciation, taxes and rate of return on investment. Application, Exhibit EAD-10.

For the Telecom Rate, CL&P calculated a space factor of 11.723% for poles situated in urban areas and 17.872% for poles situated in non-urban areas, based on the following formula:

$$\text{Space Factor (Urban/Non-Urban)} = \frac{\text{Space Occupied} + \left[\frac{2/3 \times \text{Unusable Space}}{\text{No. of Attaching Entities}}\right]}{\text{Pole Height}}$$

CL&P used 27.67' as the unusable space assumption, a pole height assumption of 40' and 3 attaching entities for the urban space factor and 5 attaching entities for the non-urban space factor. CL&P also applied an urban conversion factor of 69.18% and a non-urban conversion factor of 45.38%. Application, Exhibit EAD-10. CL&P stated that applying the new methodology to calculate the Telecom Rate shows that it becomes essentially the same as the CATV Rate, regardless of whether the telecom attachment is classified as "urban" or "non-urban." Davis PFT, pp. 20-24. CL&P's proposed reduction in the Telecom Rate would reduce the amount of pole attachment fee rental revenue received from pole attachments by approximately $164,000 annually. The Company imputed an expected change to the Telecom Rate into its proposed rates.

The Company's proposal converts the stated rate to a formula-based rate, such that the rate and revenue received from pole attachment will vary annually as costs, numbers of attachments and other factors change. The Company also proposed to flow any revenue variation from pole attachment fees that may occur through changes to the rate, as well as changes in numbers of attachers through the Company's decoupling mechanism. The pole attachment rates are billed on a semi-annual basis. Given the proposed December 1, 2014 effective date for implementation of the proposed pole attachment rate methodology, the Company plans to notify customers of the change in rate, and provide prorated bill adjustments for December 2014. On an ongoing basis, rate changes based on the proposed methodology would be calculated, and notice of rate changes would be provided annually for rates in effect on January 1 of each year. Id.

b. NECTA Proposal

The New England Cable and Telecommunications Association, Inc. (NECTA) opposed CL&P's calculation of the CATV Rate and Telecom Rate, indicating that the Company did not follow the Fibertech Decision or the Pole Attachment Order. According to NECTA, CL&P significantly raised the CATV Rate, created its own formula, and lowered the Telecom Rate only enough to meet the inflated CATV Rate. Glist PFT, pp. 5-12. NECTA also stated that CL&P blended parts of a 20-year old rate formula used in a case involving The Southern New England Telephone Company (SNET) with selected elements of the Pole Attachment Order's revised upper bound Telecom formula resulting in an inflated annual pole rental rate. As such, CL&P's pole rate methodology deviates from the Pole Attachment Order by not using the FCC's lower bound Telecom Formula, which excludes capital costs from the cost of providing space, since those costs are recovered through make-ready. The lower bound formula is intended to ensure that pole owners are fully compensated for actual costs associated with pole attachments. Id.

NECTA also argued that CL&P deviated from the Pole Attachment Order methodology as follows:

1. The Pole Attachment Order methodology uses historic (embedded) costs while CL&P uses a combination of historic and reproduction (marginal) costs, which the FCC has expressly rejected;

2. The Pole Attachment Order methodology applies cost allocators of 66% in urban areas and 44% in rural areas while CL&P applies higher cost allocators of 69.18% in urban areas and 45.38% in rural areas; and

3. The Pole Attachment Order methodology allocates pole costs using a presumption of 13.5' of usable space on the pole to derive a space allocation factor while CL&P uses 12.33' without providing credible evidence to rebut the 13.5 feet usable space presumption.

NECTA did not dispute the basic formula used by CL&P used in its calculation, but rather, the assumptions. NECTA outlined the Pole Attachment Order formulas is as follows:

- FCC Pole Attachment Order formula (for Cable) = Net Pole Cost x Carrying Charge Factor x Space Allocation Factor

- FCC Pole Attachment Order formula (for Telecom) = Net Pole Cost x Carrying Charge Factor x Space Allocation Factor x Conversion Factor

Id.

NECTA contended that the average pole height and average amount of usable space on the pole (pole height above ground clearance) has increased. NECTA members, including Cablevision, Charter, Comcast, Cox, and MetroCast, conducted a survey of current pole plant under the direction of NECTA and a statistician, Dr. Charles Cowan, with Analytic Focus (Pole Survey). The Pole Survey used a sample population of approximately 500 poles. The data collected included the pole height and the height of the lowest strand on the pole attached with a through bolt for each sampled pole. The data was then extrapolated back into the total universe of CL&P poles to obtain the average pole height and the average amount of usable space on the pole. According to the study, the average CL&P pole height is 38.57'. Removing 18' clearance and 6' setting depth, the remaining space usable for pole attachments is 14.57', greater than the 13.5' presumption in the Pole Attachment Order and the 12.33' assumption used by CL&P. Id., pp. 5-12; Cowan PFT, pp. 1-5.

In summary, NECTA argued that CL&P calculated a sizable CATV Rate increase and a Telecom Rate that does not meet the Pole Attachment Order methodology. NECTA stated that proper application of the FCC Pole Attachment Order formulas produce solely-owned CATV Rates of $14.33 for cable, and solely-owned Telecom Rates of $14.30 in urban areas, and $14.38 in rural areas. Exhibit PG-2. If any presumptions are changed they should reflect the data collected by NECTA member operators supporting an average pole height of 38.57' and a usable space factor of 14.57'.

c. Position of the Parties

The OCC agreed with NECTA, stating that CL&P has failed to calculate its rates in conformance with the Pole Attachment Order as ordered in the Fibertech Decision. The Company's methodology incorrectly incorporates a rate-setting methodology

derived from a PURA order from the 1993 SNET Rate Case. The Fibertech Decision followed the methodology detailed in the Pole Attachment Order, and directed calculations that superseded the SNET 1993 Rate Case Decision. OCC Brief, pp. 133 and 134.

d. Authority Analysis

The Authority agrees that CL&P's proposed pole attachment rates do not conform with the Pole Attachment Order or the Authority's prior directives. In calculating either rate, marginal costs should not be used in calculating the net pole cost. The use of 100% embedded costs is both consistent with the directives of the Pole Attachment Order and other FCC decisions as well as the methodology contemplated by the Authority in the Fibertech Decision. Therefore, the Authority approves the use of the fully embedded net cost of $609.62 in the pole attachment rate calculation. Further, the Authority finds NECTA's proposed average pole height of 37.57', usable space factor of 14.57' and unusable space factor of 24' from the Pole Survey are acceptable for use in calculating rates in this case. The Company will be directed to conduct a usable space survey prior to filing its next rate case. The Authority will use CL&P's proposed conversion factor, adjusted from 31.73% down to 31.54%, to reflect the allowed ROE of 9.02%. Lastly the conversion factors used by CL&P in calculating the Telecom Rate do not conform to the conversion factors outlined in the Pole Attachment Order (66% of the fully allocated costs for urban and 44% for rural) and will be adjusted by the Authority.

Based on the above, the Authority recalculates the CATV and Telecom Rates as shown:

Table 79

CATV Formula						
Maximum Rate	=	Space Factor	x	Net Cost of a Bare Pole	x	Carrying Charge Rate
	=	6.86%	x	$609.62	x	31.54%
		Fully Owned		Jointly Owned*		
	=	**$13.19**		**$6.60**		
* Fully Owned Rate / 2						

Table 80

Telecom Formula								
Maximum Rate	=	Space Factor	x	Net Cost of a Bare Pole	x	Carrying Charge Rate	x	Conversion Factor
Maximum Rate (Urban)	=	10.889%	x	$609.62	x	31.54%	x	66.00%
		Fully Owned		Jointly Owned*				
		$13.82		**$6.91**				
Maximum Rate (Non-Urban)	=	16.420%	x	$609.62	x	31.54%	x	44.00%
		Fully Owned		Jointly Owned*				
		$13.89		**$6.94**				
* Fully Owned Rate / 2								

The Authority approves the Company's proposal to flow variations in pole attachment revenue through the decoupling mechanism, and to provide prorated bill adjustments for December 2014.

7. Unbundling of Street Lighting Rates

a. Existing Street Lighting Rate Design

In the 2009 CL&P Rate Case Decision the Authority approved the unbundling of street lighting rates into their functional components (e.g., Distribution, Transmission and Generation Service). Based on that ruling, the Company proposed an unbundled rate design of street lighting service and set pricing for: (a) the component of service associated with the use of the distribution system that would apply to all street lighting customers, regardless of street light facilities ownership (i.e., the "system" component of rates); and (b) the component of service associated with Company-owned street lighting facilities applicable only to CL&P's full service street lighting customers [e.g., the equipment and operations and maintenance (O&M) components of rates]. The Company stated that a rate structure based on this unbundling is critical to its ability to introduce a Company-owned light-emitting diode (LED) street lighting option that has a cost basis consistent with other traditional street lighting technology options.

CL&P stated that its proposal shows the actual cost of providing these services. It used that data along with other factors to develop a street lighting rate design that better reflects the Company's cost of service. Davis PFT, pp. 14 and 15. The following Table shows the distribution breakout by component:

Table 81

STREET LIGHTING DISTRIBUTION RATE DESIGN				
Distribution Breakout by Component				
Rate Year Ending 2015	Rate 117		Rate 116	
Fixtures	A	46,289	E	141,898
Connected Demand KW	B	5,659	F	22,540
Annual kWh	C	23,425,448	G	92,563,009
Proposed Distribution Revenue	D	$839,496	H	$16,894,406
Distribution by Category				
1) D - System Demand				
Revenue $	I = D * 75%	$629,622	K = J* F* 12* 1000	$2,507,700
Charge Per Watt	J = I / B	**0.00927**	L = K / F	**0.00927**
2) D - System Customer				
Revenue $	M = D * 25%	$209,874	O = N* E* 12* 1000	$643,365
Charge Per Fixture	N = M / A	**$0.38**	P = O / E	**$0.38**
3) D - Operations & Maintenance				
Revenue $			Q = RY COSS O&M	$2,574,000
Charge Per Fixture			R = Q / E	**$1.51**
4) D - Equipment				
Revenue $			S = H- K- O- Q	$11,169,342
Total D		**$839,496**		**$16,894,406**

Exhibit EAD-8, p. 1.

The Company proposed a two-part charge for Partial Street Lighting Service (Rate 117) consisting of customer and demand components that applies to applicable fixtures connected to the CL&P's distribution system. The customer component is a uniform rate per fixture that applies monthly to each fixture connected to the Company's system. The demand component is a uniform rate per watt that applies to the rated wattage of each fixture under either rate schedule. These two charges are combined to form the total charge per fixture each month for the system component of distribution service. The revenue targets for customer and demand were derived by applying a 75% / 25% proportion of demand and customer costs, respectively, to the proposed distribution revenue (D). Accordingly, for each fixture the monthly distribution charge under Rate 117 would be $0.38 plus the product of $.00927/watt and the wattage of that fixture. These would be the only distribution charges for service under Rate 117, and also become the system-related distribution charges for Street and Security Lighting (Rate 116). CL&P contended that the proposed rate design appropriately charges all street lighting fixtures the same formula distribution rate for the use of the system, regardless of wattage and regardless of equipment ownership.

For Rate 116, additional equipment and O&M charges apply. The street lighting O&M rate is an average monthly rate that applies uniformly to all Rate 116 fixtures. This rate, which equals $1.51 per fixture, has been derived directly from street lighting O&M expenses of the COSS shown on page 2 of Exhibit EAD-8. The monthly equipment charge was developed for each specific type of equipment utilized by customers taking service under Rate 116. CL&P developed these charges by calculating the total installed cost of each type of equipment and developing a monthly

rate by multiplying a street lighting carrying charge by the installed cost of each type of street lighting equipment. The Company proportionally adjusted the calculated equipment charges by a factor of 1.054 (the ratio of the $11.2 million equipment revenue requirement to the $10.6 million calculated equipment revenue) to derive proposed equipment prices. Davis PFT, pp. 13-19; Exhibit EAD-8, p. 3.

b. New Street Lighting Options

The Company proposed to introduce several new street and highway lighting options that utilize LED technology. The unbundling and development of rates for the system, equipment and O&M components of street lighting service discussed above provide a structure upon which the Company has been able to develop LED rates. The same methodologies for determining the system, equipment and O&M rates for other street lighting service offerings has been applied in developing proposed LED street lighting distribution rates. Davis PFT, pp. 13-19; Exhibit EAD-8.

The Authority accepts CL&P's proposed unbundled rate design methodology for Rates 116 and 117. The proposed rate design effectively carves out the equipment costs from the general distribution system costs and allocates the equipment costs to customers in a manner that is more cost-based than the previously bundled rates. The Company will be directed to adjust the proposed rates to reflect the new revenue targets shown in Section II.J.4, Revenue Allocation.

8. Tariff Changes

a. Company Proposals

The Company proposed to update certain provisions in its rate schedules and terms and conditions (T&Cs) for service and to update charges for a number of services provided under the T&Cs. The Company also proposed to withdraw its surge protection tariff as previously approved by the Authority; proposed tariff language to implement the unbundling of street lighting offerings, as discussed in Section II.J.7, Unbundling of Street Lighting Rates; and proposed a new TOD rate for residential heating customers on Rate 5.

i. Terms and Conditions for Electric Suppliers

The Company's proposed amendments to the T&Cs for Electric Suppliers included several proposed new definitions and clarifying provisions associated with changes in market-related services, obligations and practices (e.g., supplier switching rules), and elimination and proposed changes to fee structures for data and information services. Davis PFT, pp. 24 and 25, Exhibit EAD-11.

ii. Terms and Conditions for Delivery Service

The Company's proposed amendments to the T&C's for Delivery Service included clarifying changes to definitional terms and labeling, and several new provisions including unauthorized use and meter diversion. These T&C amendments included a proposed new meter diversion fee, proposed changes to the reconnection

fee structure and rates, and proposed, restructured extended metering options. The proposed rates for these services have been developed based on the cost of providing service under these options. Davis PFT, pp. 24 and 25, Exhibit EAD-11.

iii. Withdrawal of Surge Protection Tariff

The Company requested approval to withdraw its surge protection tariff, pursuant to a previous letter order ruling by the Authority approving the CL&P's request to discontinue this program.[51] Also, a new Metering Communications Equipment provision is proposed to replace the Telemetering provision (or to be added where such provision is not currently stated) for any schedule that has meter communications requirements associated with electric service meters. The Company also proposed clarifying language regarding the availability and applicability provisions associated with small commercial rates (Rates 27, 30, 35 and 37), and with regard to the billing of certain charges under the Company's net metering tariffs. Davis PFT, pp. 24 and 25, Exhibit EAD-11.

iv. Residential Heating Time-of-day Rate

Currently, CL&P offers a TOD rate option, Rate 7, for residential non-heating customers. Rate 7 was designed based on the service characteristics of the non-heating residential class, Rate 1, and on methodologies and guidelines developed and approved by the Authority that resulted in time-differentiated generation service rates and an overall rate design conducive to the migration of Rate 1 customers to Rate 7 TOD service. Because residential heating customers do not have a comparable TOD option, the Company developed a new TOD rate, Rate 6, based on the specific service characteristics of Rate 5 and application of the same methodologies and guidelines used in developing Rate 7. Davis PFT, pp. 19 and 20.

The general availability, applicability and other provisions of Rate 6 are identical to those of Rate 5, with the exception that Rate 6 is open to new customers. As in the Rate 7 rate design, the non-TOD rate components of Rate 6, including the customer charge and per kWh charges, are the same as those for Rate 5. The generation service charge however, has been developed on a TOD basis using the same differential between peak and off-peak rates as used in designing Rate 7 pricing. This differential has been applied on a revenue neutral basis to develop the TOD equivalent of the Rate 5 generation service charge and thereby provide a TOD rate option specifically for Rate 5 customers. Id., Exhibits EAD-11 and EAD-12.

b. Position of the Parties

The BETP generally supported time-of-use rates; however, it suggests that CL&P educate customers on the benefits of time-of-use rates and improve the structure of its existing time-of-use rates rather than add another new residential rate. The BETP also suggested that CL&P redesign its Residential Time-of-Use Rate 7 and focus on

[51] See, March 20, 2014 letter order ruling on Motion No. 54 in Docket No. 09-12-05.

educating customers on the value of time-of-use rates rather than create a new and unnecessary time-of-use rate. It is unclear why CL&P is proposing a new time-of-use rate option other than to have a rate that directly corresponds to Rate 5 residential heating. The rate design and resulting bills for Rate 6 are very similar to those on Rate 7, which is already available to Rate 5 customers. Rate 7 however, has not been successful in attracting customers from Rate 1 or Rate 5. Less than 500 customers receive service on Rate 7 compared to over 1.1 million customers on Rate 1 and Rate 5. The BETP commented that CL&P has done little to educate customers and promote time-of-use rates in the past and does not have a plan to do so in the future. BETP Brief, pp. 14 and 15.

c. Authority Analysis

The Authority denies the Company's proposed implementation of the proposed Rate 6 as a TOD companion tariff to Rate 5. Rate 5 is a legacy tariff and new customers are no longer allowed to take service under that rate. It seems counterintuitive to allow new customers to take service under a companion tariff to Rate 5. However, the existing TOD Rate 7 should continue to be made available to Rate 5 as well as Rate 1 customers. Since both the customer and the volumetric delivery charges under Rate 7 will be lower than Rate 5, customers will still realize a benefit on the distribution portion of their bill as well as the differential between peak and off-peak rates in the generation services charge. It remains uncertain as to how much of an incentive will be necessary to drive significant migrations to TOD rates for any type residential customer. This is evident by the lack of participation in Rate 7, and the anticipated low migration rates the Company expects for Rate 6. CL&P Response to Interrogatory RA-22. Further, it is unclear whether a similar pricing mechanism would be the right fit for a heating customer's service characteristics. The Authority welcomes more discussion on this matter and how the current residential TOD tariffs could be redesigned to stimulate more customer participation.

The Authority finds it appropriate, given the increase to distribution rates herein, to require that CL&P increase the charge for reconnection at the meter from $35 to $42, instead of the Company's proposal to lower that charge to $31. This rate has not changed in many years, despite increases to general rates.

The Authority accepts the Company's remaining proposed tariff changes subject to rate amendments pending Authority approval of final rates as directed in Section II.J.5, Rate Design. Regarding the availability sections of Rates 27, 30, 35 and 37, the Authority approves the Company's proposed minimum demand requirement of 200 KW under which customers are not eligible to return to Rate 30 or Rate 35.[52] The Authority approves the proposed revisions to Rates 116 and 117 with the associated charges subject to change pending the reallocation and rate design of the approved revenue requirements herein.

---

[52] The Authority previously ordered that it be lowered to 100 kW in a three-phase implementation process in the Decision dated December 21, 2006 in Docket No. 05-10-03, Application of The Connecticut Light and Power Company to Implement Time-of-Use, Interruptible or Load Response, and Seasonal Rates. By Decision dated May 10, 2010 in that Docket, the Authority delayed the implementation of the final phase of Order No. 7.

K. NEW BUSINESS POLICIES

CL&P's New Business Policies (NBP) establish standardized costs and methodologies for developing work estimates and for billing customers those costs that are customer-specific which are not recovered in rates. CL&P submitted revisions to its NBP in this proceeding. Bowes PFT, Exhibit KBB-5.

CL&P's NBP revisions primarily reflect organizational changes that have taken place since the Company's last revisions in 2011. The revisions also update certain prices to current costs, and update metering technology and requirements to current standards, which have evolved over time, particularly with regard to distributed generation interconnections and communication technology. No party or intervenor opposed the Company's NBP revisions.

The Authority finds that the NBP revisions are reasonable and appropriate. The Authority therefore approves the revisions to the NBPs.

L. CUSTOMER SERVICE ISSUES

1. Customer Notifications and Collections

CL&P's standard bill form, termination notice and customer rights notice were reviewed and found to be in compliance with applicable regulations. Application, Schedule H-2.0, Exhibits A and B; Response to Interrogatory CA-7. CL&P's Terms and Conditions for Delivery Service were also reviewed and found to be in compliance with applicable regulations. Application, Schedule H-2.0, Exhibit E, Schedule E-1.0 and E-1.1; Response to Interrogatory CA-19.

The Company implemented a strategy in 2010, to more effectively manage and pursue collections on inactive customer accounts, and modified the plan for efficiency in the following three years. CL&P then summarized the results of its changes in workflow timing for collections efforts in relation to final bills, and indicated a noticeable increase in its collection of outstanding revenues. Response to Interrogatory CA-5. The Company measures its "net back," which is the total collections made on its behalf, minus the commissions that CL&P pays to the collections agency. The Company's Net Recovery percentage increased from 0% to 7.1% between 2010 and June 2014. Id.; Tr. 8/27/14, pp. 61 and 62. The total number of accounts in arrears increased 12% from 114,808 in June 2011 to 128,595 in June 2014. However, the total amount of arrearages increased only 1.3%, from $76.5 million to $77.5 million, during the same period. Response to Interrogatory CA-21.

2. Policy and Procedures for Estimated Billing

CL&P provided its policy and procedures for generating an estimated bill. CL&P's billing system produces an estimated bill based upon historical usage in the comparable month in the prior year. The Company continues to follow the automated notification process to inform customers of options to avoid an estimated bill as outlined

in Order No. 20 in the 2009 CL&P Rate Case Decision. Response to Interrogatory CA-1.

CL&P issues estimated bills infrequently. The table below shows the percentage of estimated bills issued over time periods ranging from one month to 12 or more months:

Table 82

Year	1 Month	2-3 Months	4-6 Months	7-11 Months	12+ Months
2014 Y-T-D	1.487%	0.263%	0.073%	0.003%	0.000%
2013	2.760%	0.518%	0.127%	0.041%	0.001%
2012	1.275%	0.542%	0.138%	0.012%	0.000%
2011	3.298%	0.703%	0.201%	0.017%	0.000%

Response to Interrogatory CA-13.

The Authority finds the extremely low percentage of estimated bills issued by the Company supports CL&P's current estimated billing policy and procedures. The Company's estimated billing procedures have been reviewed and found to be in compliance with applicable regulations. CL&P's bill form and associated customer notices were also reviewed and found compliant. Application, Exhibit H-2.0, Exhibit D.

3. Customer Security Deposits

The Authority has reviewed CL&P's current customer security deposits policies and procedures and found them to be in compliance with Conn. Agencies Regs. §16-11-105 and §16-262-1. Application, Schedule H-2.0 Exhibit F, Customer Service Policies, No. C150.1 and No. C350.1; Response to Interrogatory CA-18. The Company provides policy and procedures in writing to those customers that are required to pay a security deposit, and stated that there are other means by which customers are informed of security deposit requirements. For example, termination notices inform the customer that a security deposit may be required before service can be restored, and CL&P's Customer Service Representatives remind customers that a deposit is required when reinstating service. Finally, new commercial accounts receive information in the mail regarding security deposit requirements and how they are calculated. Response to Interrogatory CA-18.

4. Energy Audit Service Appointments

In October 2012, CL&P informed the Authority of its intent to discontinue the practice of on-site energy audit service appointments at a customer's location by Energy Service Representatives. Docket No. 09-12-05, Order No. 19 compliance filing dated October 3, 2012. The new customer service practice is to guide customers to more comprehensive energy savings programs such as the Connecticut Energy Efficiency Fund's Home Energy Solutions. The Company maintains that these programs are a cost-effective way to provide customers with maximum energy and dollar savings. Id. After completing its own review of the Company's policy change as described above, the Authority approved the change in November 2012. PURA Response to Docket No. 09-12-05, Order No. 19 compliance filing dated November 2, 2012.

5. NUStart Program

CL&P changed its NUStart program in 2013, shortening it from a three-year program to a one-year program, because customers were routinely failing to maintain required budget payments over a 36-month period, and thus placed back in the service disconnection stream. By converting NUStart to a one-year program, an increased amount of forgiveness dollars is applied to NUStart balances, which helps reduce arrearages at a quicker pace. From 2010 to 2012, only 1,543 customers completed the NUStart program. After the program change was made in 2013, approximately 6,000 customers successfully completed the program. In the first six months of 2014, 2,347 customers successfully completed the NUStart program. NUStart program changes have dramatically increased participants' success. Response to Interrogatory CA-15.

6. Customer Call Center

CL&P maintains a Customer Service Center to address customer complaints and inquiries. Statistics below, submitted by CL&P for calendar years 2012 through 2014, depict the call center's monthly performance:

Table 83

2012	ASA[53]	ACR[54]	2013	ASA	ACR	2014	ASA	ACR
January	31.5	2.6%	January	15.9	1.3%	January	60.2	5.3%
February	35.3	2.8%	February	20.7	1.8%	February	38.7	3.4%
March	29.9	2.7%	March	14.4	1.1%	March	20.4	1.9%
April	51.4	3.9%	April	23.0	1.2%	April	6.1	1.1%
May	25.5	2.2%	May	24.7	1.9%	May	12.9	1.5%
June	10.8	1.3%	June	25.2	2.5%	June	9.6	1.4%
July	12.8	1.8%	July	27.5	2.4%	July[55]	12.0	1.8%
August	10.7	1.4%	August	26.0	2.2%	-------	------	-------
September	18.8	1.8%	September	27.3	2.7%	-------	------	-------
October	13.9	1.4%	October	7.4	1.1%	-------	------	-------
November	14.2	1.5%	November	15.7	1.9%	-------	------	-------
December	17.3	1.8%	December	8.7	1.4%	-------	------	-------

Response to Interrogatory CA-2.

Currently, there are no specific standards or benchmarks for electric distribution company call center metrics set forth in Connecticut's state statutes or regulations. The Authority finds CL&P's call center performance statistics to be acceptable as filed, based upon its experience in reviewing other regulated utilities call center statistics. Response to Interrogatory CA-2.

CL&P participates in monthly meetings with the Authority's Consumer Affairs Unit as a means to improve upon the level of service provided to customers. These monthly meetings were established in the 2009 CL&P Rate Case Decision, Order No. 30. All parties agree that these meetings have been helpful in handling customer service matters and the parties mutually agree it will be beneficial to continue meeting each month.

7. Conclusion

Overall, the Authority finds CL&P's customer service policies and procedures to be in compliance with applicable statutes and regulations.

III. FINDINGS OF FACT

1. The ADIT for the Test Year ending December 31, 2013 is $655.417 million.

2. The plant related non-FAS 109 ADITs were $461.429 million, $553.453 million, $567.297 million, $674.02 million, and $658.815 million for calendar years ending December 31 in 2009, 2010, 2011, 2012 and 2013, respectively.

---

53 Average Speed of Answer, in seconds.

54 Abandoned Call Rate.

55 Through July 13, 2014.

3. The deferred tax liability created by the permanent RTD regulations will reverse over the same time period as the related assets capitalized in accounting books are depreciated.

4. RTD treatment is the same as that of other normalized deductions for tax and regulatory purposes.

5. CL&P included normalized ADITs of $40.85 million in 2014 and in 2015 for RTD.

6. The 2014 and 2015 levels of ADITs are based on RTD allowances of $100 million in each year.

7. CL&P did not adopt the RTD temporary regulations.

8. CL&P will adopt the final RTD regulations and include benefit associated with RTD deductions for 2012 and 2013 in its 2014 tax returns.

9. There are additional look-back periods for which costs incurred for repair and maintenance of tangible property can be deducted in the 2014 tax return with the adoption of the final RTD regulations.

10. CL&P failed to incorporate additional deferred tax benefits for the RTD look-back periods, which included 2012 and 2013, in its estimated deferred taxes for 2014.

11. CL&P will be included in that cumulative adjustment in its 2014 tax return, amounts which would have been deducted in 2012 and 2013.

12. The Company will record additional normalization deferred tax liabilities for the 2012 and 2013 RTD allowances in its books.

13. The Company only included the deferred taxes associated with RTD allowances in 2014 and 2015 in this proceeding.

14. The Company reduced the ADITs balance Account 28200 by $124,742,248 in August 2013.

15. The $124,742,248 reduction represents a subsequent true-up of estimates made during 2012 based on adjustment in its 2012 tax return.

16. A shorter retirement schedule increases the deduction for depreciation expense for a particular period.

17. Businesses may automatically change from one permissible method of computing depreciation expense for tax purposes to another permissible method by filing Form 3115.

18. Recent tax law changes allow corporations special tax deductions, above the normal MACRS amounts.

19. Account 282 is debited and Account 411 is credited with an amount by which income tax is greater due to tax/book differences from prior years.

20. The net changes to the balances in Account 28200 are $95.888 million in 2011, $100.262 million in 2012 and ($42.293) million in 2013.

21. The annual accretions to the ADITs balances in Account 28200, exclusive of true-up adjustments, are $95.888 million in 2011, $101.330 million in 2012 and $82.449 in 2013.

22. The total federal depreciation deductions are $541,275,640 in 2011 and $586,677,407 in 2012.

23. The distribution portions of total federal tax depreciation deductions are $359,956,682 in 2011 and $384,142,472 in 2012.

24. No adjustments were made to the balance in Account 28200 in August 2011 and a reduction of $1.1 million in August 2012.

25. On August 1, 2013, the Company submitted to the Authority a compliance filing that included a Form 3115 filed with the IRS.

26. In the Form 3115 filed on July 10, 2013, CL&P requested an automatic change of its method for accounting for certain retirement costs.

27. The amount changed from NOL was $19.939 million in 2011 to $118.004 million in 2012.

28. The total system resiliency plant addition in 2013 was $25.554 million.

29. The book depreciation related to total system resiliency plant addition in 2013 was $198,000.

30. The ADIT associated with the total 2013 system resiliency plant addition was $252,000.

31. CL&P used a stratified random sample of its retail accounts and calculated that it took an average of 40.95 days for CL&P to receive its revenues once service has been rendered based on data through December 31, 2013.

32. Included in this average revenue lag of 40.95 days is a service lag (time between service being provided and the reading of the meter) of roughly 15 to 16 days, a billing lag (time between the reading of the meter and sending out the bill) of two to three days and a payment lag (time between the bill being sent out and the payment being received by the Company) of approximately 23 days (41 days minus 15 days minus 3 days).

33. The Company calculated a cash working capital requirement of $17,230,000 based on a net lag of approximately 3.20 days for the Rate Year.

34. The OCC argued that non-cash expenses should not be part of the lead/lag study because they do not involve an outlay of cash and are excluded by some regulatory jurisdictions in the determination of a working capital allowance.

35. If there is a lag between a reduction in rate base resulting from an expense and the receipt of revenues recovering the expense, a carrying cost is incurred by the Company for the time of the lag.

36. The lead/lag study proposed by the Company assumes and/or calculates that depreciation expense (and expense related to amortization and deferred taxes) results in a reduction to rate base after 15 days on average and that funds for this expense are received 25.95 days later.

37. A service lag is appropriate for revenues associated with most expense categories, but not appropriate for revenues associated with costs recovered through adjustment clauses that use billed revenues.

38. Based on billing cycles of 27 to 33 days and 12 months in a year, a reasonable estimate of the service lag would be 15.21 days.

39. The Company identified three of its adjustment clauses as using billed revenues to recover costs; the CTA, the SBC and the NBFMCC. These clauses recover $30,860,000, $41,418,000 and $189,702,000 in Rate Year costs, respectively.

40. The expense and income levels used to calculate the working capital needs of the Company reflect the expense and income adjustments made by this Decision.

41. The Traditional Capital Program consists of expenditures for programs that address routine infrastructure issues such as those necessary to supply new customer loads, meet peak loads, meet basic business requirements, meet regulatory commitments, and reliability related projects.

42. The Pre-Approved Resiliency Plan consists of system resiliency expenditures for programs that were approved in the Resiliency Decision.

43. The New System Resiliency Programs are for system resiliency measures that were not approved in the Resiliency Decision.

44. CL&P proposed to spend $257 million on its Traditional Capital Program in the Rate Year.

45. The Authority previously examined the issue of plant in service forecasting in its Decision in Docket No. 05-07-04.

46. Total CL&P capital spending over the years 2010-2012 was $958.8 million, which was within 0.2% of its forecast.

47. CL&P planned to spend $44 million on its New Resiliency Programs in 2015.

48. In the 2013 Study, CL&P used a depreciation system composed of the straight line method, ASL procedure, and remaining life technique.

49. CL&P last filed a Depreciation Study based on plant as of December 31, 2008.

50. The Company originally requested a Rate Year payroll expense of $135.881 million.

51. The Company revised the requested Rate Year payroll expense to $135.198 million.

52. The Company's requested level of FTE positions is 4,435.8 for the Rate Year.

53. Since the merger in April 2012, staffing levels have been reduced.

54. As of August 31, 2014, the Company had 4,235.8 FTEs.

55. From December 31, 2013 through August 31, 2014, 201 positions became vacant due to attrition.

56. Of the 201 open positions, CL&P is actively seeking to fill 101..

57. Of the remaining 100 positions, 68 are for CL&P and 32 are for NUSCO.

58. As of September 5, 2014, the Company had 82 of the 101 positions still active and open.

59. The remaining 100 positions are at various stages of review in the Company's Human Resources organization and within the businesses.

60. The Company used a benefits loader of 46.2% and a payroll taxes loader of 8.5%.

61. CL&P has a defined benefit pension plan that covers the majority of its existing employees.

62. In 2006, CL&P closed entry to its defined pension benefit plan to newly hired non-bargaining employees.

63. On January 1, 2006, the Company introduced a new enhanced 401(k) based benefit called the K-Vantage Program for all new non-union hires and allowed existing employees to opt out with their pension frozen into the new benefit program.

64. All new employees participate in the K-Vantage benefit instead of a defined benefit plan.

65. The Company offers retiree health care benefits for all retired employees.

66. The pension expense was calculated on the basis of the accounting rules set forth in ASC 715-30.

67. Pension service cost is the increase in projected benefit obligation due to the accrual of benefits that occurred in the current period.

68. Pension interest cost reflects the growth in present value of projected accrued benefit obligations as they come one period closer to payment.

69. CL&P's pension Test Year expense was $47,213,000.

70. For pension expense, CL&P requested $27,736,000 in the pro forma rate year of 2015.

71. The OPEB expense is calculated on the basis of the accounting rules set forth in ASC 715-60.

72. The health care cost trend rate represents the expected annual rates of change in the cost of health care benefits currently provided by the post-retirement health care benefit plan.

73. CL&P's OPEB Test Year expense was $7,771,000.

74. For OPEB expense, CL&P requested $4,061,000 in the Rate Year.

75. CL&P capped health care subsidies and changed plan designs for both pre-65 retirees and post-65 Medicare eligible retirees.

76. The portion of post-retirement health care expense associated with capped benefits has grown to 85% as of December 31, 2013.

77. CL&P transitioned pre-65 retirees to the same medical designs offered to active employees in 2013.

78. In 2013, CL&P introduced a Medicare Part D employer group waiver plan through its pharmacy benefits manager.

79. CL&P retiree participation in the employer group waiver plan provides lower cost as a result of offsetting payments from Medicare in the form of Part D direct subsidy payments, low income subsidies, pharmacy manufacturer reimbursements, and catastrophic reinsurance payments.

80. In 2014, the Company updated the plan design for Medicare eligible retirees which eliminated non-Medicare coverage and applies the full Medicare Part B deductible on all participants.

81. In 2007, CL&P implemented a Med-Vantage that supplements benefits offered to employees in K-Vantage.

82. The key actuarial assumptions used in determining the Company's pension and OPEB expense are: 1) discount rate, 2) expected return on assets, 3) average wage increase, and 4) health care cost trend rate.

83. The discount rate is used to evaluate the present value of the plan liabilities.

84. The higher the discount rate, the lower the present value resulting in lower pension and OPEB expense.

85. Expected return on plan assets is an assumption, not an actual return, and is a product of plan investment mix and the expected earnings on such mix.

86. The higher the return on plan asset assumption, the more the plan assumes it can earn resulting in lower pension and OPEB expense.

87. The average wage increase is the assumed increase in annual wages for all employees in the plan.

88. The higher the average wage increase assumption, the higher the pension expense.

89. The health care cost trend rate is comprised of an initial and ultimate cost trend rates which is an estimate of future health care costs.

90. The higher the health care cost trend rates, the higher the OPEB costs.

91. The health care cost trend rate applies only to the OPEB Plan.

92. The SEC requires the use of high quality bond yields to calculate the discount rate.

93. CL&P used a discount rate of 4.26% as an input to calculate pension expense and a discount rate of 4.07% to calculate OPEB expense.

94. CL&P used input from actuaries, consultants, and economists to develop the expected long-term rate of return assumption of 8.25%, for both the pension and OPEB plans.

95. Data inputs for the expected long-term rate of return assumption are derived from long-term inflation and growth statistics for the economy.

96. The Company used an average wage increase assumption of 3.50% in its actuarial calculations.

97. There are two assumptions composing the healthcare cost trend rate: the initial assumption and the ultimate assumption.

98. The initial healthcare cost trend rate assumption reflects expectations of health care cost increases for retirees in the near term. It is based on a number of factors including publically available general industry surveys, actual experience of the Company's retiree population, and experience of other large clients with post-retirement health care plans.

99. The ultimate healthcare cost trend rate assumption is developed from a building block methodology. It is established to reflect improvement in technology and additional utilization.

100. The assumptions used in the valuation of the initial and ultimate health care trend rates are evaluated against those used by other general and utilities industry companies to ensure comparability.

101. CL&P used an initial health care cost trend rate of 6.75% with an ultimate rate of 4.50% for the calculation of the OPEB expense.

102. A 401(k) plan is a qualified retirement plan under the Internal Revenue Code that allows employees to save a portion of their salary for retirement on a pre-tax basis.

103. In a 401(k) employers match a portion of each employee's contribution with the employee choosing the investment options for the contributions.

104. By the end of the Test Year of 2013, approximately 30% of CL&P and NUSCO employees were participating in K-Vantage as compared to less than 20% in 2009.

105. A SERP is a non-qualified plan that provides executives with a supplemental retirement benefit in addition to the benefit provided under the qualified plan.

106. There are 34 current employees eligible for SERP benefits when they retire.

107. There are 51 retired employees and/or spouses currently collecting SERP benefits.

108. There will be no new participants in the SERP because CL&P no longer offers a defined benefit pension plan to new employees.

109. CL&P's SERP complies with section 409A of the IRS Code.

110. CL&P's Test Year SERP expense ending December 31, 2013, was $1,680,000.

111. For SERP expense, CL&P requested $2,039,000 million in the pro forma rate year of 2015.

112. The Non-SERP account is used to record expenses related to specially negotiated post-employment benefits, including pension enhancements not covered by the NUSCO Retirement Plan or the SERP.

113. Non-SERP enhancements are normally provided in the hiring agreements to make up for benefits lost at previous employers by some mid-career hires or as part of a separation agreement with NU.

114. CL&P provided a Non-SERP benefit to one employee that was hired after January 1, 2006, but excluded that expense in the rate year.

115. The Authority allowed the Non-SERP benefit in the 2007 Rate Case.

116. Allocations from NUSCO are made through direct charges to the operating company that benefitted from the charge whenever possible.

117. NNECO was the agent for Northeast Utilities system companies and other New England utilities in operating and maintaining the Millstone Nuclear Generation facilities.

118. In the 2009 CL&P Rate Case, CL&P was allowed recovery of 81% of NNECO pension costs in rates.

119. CL&P's pension expense projections included costs being allocated to CL&P distribution operations from NNECO.

120. CL&P capitalized a portion of its pensions and OPEB expenses into rate base.

121. When employees are doing capital work, a portion of their benefits and pension costs are capitalized with their direct labor costs.

122. The amount of pension expense that is capitalized is based on the payroll that is capitalized.

123. The actual capitalization amounts recorded on the Company's books reflect an allocation of employee benefits, payroll taxes and insurance to expense and capital consistent with how payroll was distributed and recorded in the Test Year.

124. CL&P requested $310,000 for consulting/actuarial fees on Schedule C-3.27 for both the Test Year and the Rate Year.

125. CL&P consultant and actuarial fees have been trending downward since 2010.

126. The Company requested $1.5 million for rate case expense associated with this proceeding.

127. The Company proposed the rate case expense be amortized over seven years.

128. The proposed $1.5 million rate case expense includes $100,000 for an ROE witness; $350,000 for a depreciation witness; $500,000 for legal expenses; $300,000 for OCC consultants; $100,000 for other external costs and $150,000 for incremental costs.

129. The projected Rate Year rate case expense is 611% higher than the previous rate case.

130. The Company recovered the 2009 CL&P Rate Case expense in one year.

131. The Authority typically allows amortization periods of three to five years.

132. Residual O&M expense represents the portion of Test Year expenses that CL&P specifically did not analyze based on the size of the dollar amounts involved.

133. CL&P revised its residual O&M expense request due to an accounting error.

134. For the Test Year ended December 31, 2013, CL&P subtracted total expenses excluding residual of $379,216,000 from total Test Year O&M expense of $381,729,000 for a Test Year residual O&M Expense of $2,513,000.

135. A Test Year pro forma adjustment of $2,122,000 and a Rate Year pro forma expense of $4,635,000 were made.

136. Test Year total operating expenses were charged to over 500 accounts and sub-accounts.

137. For CL&P Distribution and NUSCO, costs allocated to CL&P Distribution Test Year expenses were broken down into CCC levels by direct costs.

138. In April 2013, The State of Connecticut reimbursed CL&P in the amount of $2,553,000 for an overpayment of the State Economic Recovery Reduction Bonds.

139. CL&P made an accounting adjustment correction of $1,442,000 for storm costs.

140. In December 2013, CL&P Distribution Company recorded $106,000 in payments in error as a residual O&M expense which was corrected in January 2014.

141. The $4,635,000 million rate year request of residual O&M expense does not reflect an inflation factor.

142. CL&P removed Account No. 90500, Miscellaneous Customer Account Expense, of $143,167 from residual O&M expenses.

143. CL&P removed Account No. 921105, Office Expense Building, of $63,819 from residual O&M expenses.

144. The Company reported that $106,000 was incorrectly charged to CL&P for the low income special needs program payable to the Boathouse Group in December 2013.

145. CL&P reflected an $119,000 decrease in officer's expense from its residual O&M request.

146. CL&P reflected a $207,000 decrease in miscellaneous costs from its residual O&M request.

147. The Company included $583,000 in its Application for BOD expense.

148. The main objective of the BOD is to protect the interest of the Company's shareholders.

149. Ratepayers may indirectly benefit from the activities of the BOD.

150. In the past, the Authority has allowed 25% of BOD expense be funded by ratepayers.

151. CL&P requested $467,000 DOL insurance.

152. Shareholders are the primary beneficiaries of DOL insurance.

153. In the past, the Authority has allowed 25% of DOL insurance expense be funded by ratepayers.

154. The Company originally requested an increase of $4.50 million for healthcare benefits expense but revised that amount to $4.21 million.

155. The total requested for healthcare benefits expense was $22.0 million.

156. The increase in the healthcare benefits expense is necessary to recover the normal escalation of healthcare costs.

157. The Company stated that the increase was determined in collaboration with Strategic Benefit Advisors, CIGNA healthcare and other trend survey data.

158. The Company used a self-funded program design.

159. CL&P's Test Year non-executive incentive compensation was $7.8 million.

160. The total non-executive incentive compensation requested for the Rate Year is $10.38 million.

161. The Company excluded executive incentive compensation expense of $8.7 million from the Application.

162. CL&P's variable pay program is designed to drive performance improvements and operational excellence.

163. The importance of incentivizing employees is to achieve higher standards of customer service and other goals.

164. Incentive compensation expenses should not be borne solely by the ratepayers.

165. The Authority has allowed some level of employee incentive compensation in previous decisions.

166. The Company included $4,765,000 of public liability expense for the Rate Year.

167. The Test Year liability expense was $1,955,000.

168. The initial proposed expense is an increase of $2,810,000 over the Test Year.

169. CL&P revised its public liability expense downward to $3,972,438 based on an updated actuarial report.

170. The total rent expense for the Test Year was $9.527 million.

171. The total proforma rent expense adjustment of $802,000 consisted of reductions of $680,000 to internal and $122,000 for external rent expenses.

172. The $680,000 reduction to the internal rent expense removes $623,000 associated with 56 Prospect Street in Hartford and $57,000 associated with the closure of facilities through consolidation.

173. CL&P included $203,269 for the NSTAR Corporate office in Boston, Massachusetts in the total external rent expense proposed for the Rate Year.

174. RRR manages NU's facilities and its internal rent expense that consists of interest, depreciation, property tax and equity return expenses.

175. The total internal rent expenses are allocated based on Test Year budgeted total payroll costs for NUSCO's employees.

176. CAU 99 allocation rates are used for directly and allocated RRR's rent expense.

177. CL&P allocated $4,047,520 out of the total rent expense of $8,578,534 for the Berlin Campus.

178. CL&P allocated $710,109 out of the total rent expense of $1,290,971 for the 3333 Berlin Turnpike Buildings.

179. CL&P allocated $1,651,607 out of the total rent expense of $3,818,745 for the Windsor CS facilities.

180. The first stage in the allocation internal rent expenses is based on the total square footages occupied by the NU operating companies and by NUSCO. The second stage involves the apportionment of the total operating companies' and NUSCO portions of the total rent amounts to the operating companies.

181. The allocation factors for CCC 048, 06F and 121 are used to allocate the total operating companies' portions of the total rent expenses for the RRR facilities to the operating companies.

182. The CCC 141 of 43.25% was used to allocate NUSCO's portion of total rent expense for the RRR facilities to CL&P distribution.

183. The ROE used to calculate the equity return costs included in the total rent expense for each of the RRR facilities is 9.92%.

184. The total rent expense for the Berlin Campus of $8,578,534 included total equity cost of $3,996,782.

185. The total rent expense for the 3333 Berlin Turnpike Buildings of $1,290,971 included total equity cost of $602,726.

186. The total rent expense for the Windsor CS of $3,818,745 included total equity costs of $1,800,458.

187. NSTAR shared service company merged into NUSCO effective January 1, 2014.

188. Approximately $59.874 million was billed to NSTAR Gas and Electric and $252.358 million was billed to CL&P by NUSCO.

189. Costs for facilities floor space should be allocated based on the projected square footage occupied.

190. In the 2009 CL&P Rate Case Decision, the Company was directed to be charged rent expense by NUSCO based on the square footage directly charged or allocated to CL&P.

191. The 9C allocator is based on NUSCO's employee labor costs and is used to allocate internal rent expense to CL&P.

192. The CCC 1NR allocator mirrors 9C, is based on NUSCO budgeted labor costs and does not allocate costs to the NSTAR companies.

193. For allocating NUSCO's costs to operating affiliates, the CCC 048 factors are based on square footage of the Berlin Campus using the C7 allocators.

194. Under the C7 allocation, the total CL&P distribution allocation factor is 32.94% and the NSTAR factor is 32.53%.

195. The facilities management costs for CCC 136 are allocated using the C7 Rate Code factors.

196. The C7 allocators are based on the new NUSCO's budgeted labor costs for both NU and NSTAR affiliates.

197. CL&P distribution has an allocation factor of 26.95% under the C7 formula.

198. The C7 allocator mirrors the 9C allocator, except that it is based on the new NUSCO's budgeted labor costs, not solely on the old NUSCO costs.

199. The 9C allocators are for the Test Year and rate C7 factors are for Rate Year.

200. The NUSCO Capital Funding expense funds certain capital investment that support shared services and the expense is shared among all NU subsidiaries using the shared capital investments.

201. The NUSCO Capital Funding expense for the Test Year was $2.701 million and $3.103 million was proposed for the Rate Year.

202. The NUSCO Capital Funding expenses are net of the capitalized portions of $0.805 million for the Test Year and $0.424 million for the Rate Year.

203. The total NUSCO Capital Funding expense, prior adjustment for the capitalized amount is $3.527 million for both the Test and Rate Years.

204. The $0.424 million represents 12.03% capitalization ratio for NUSCO's payroll costs in 2013.

205. The Company currently recovers in rates, $9.6 million annually to offset the cost of non-catastrophic storms when the Company's per-storm incremental expense is less than $5 million.

206. CL&P identified the Incremental Storm Expense of $9.6 million.

207. Incremental Storm Costs differ from the storm reserve in that they are included in base rates and the expense is funded throughout the year through customer rates.

208. Catastrophic storms are those events in which CL&P incurs incremental expense in excess of $5 million.

209. The storm reserve is currently funded through the distribution rate at the level of $3 million per year.

210. The Company proposed an amount for the annual storm reserve based on storm activity during the 2010-2013 period, excluding Storm Irene, the October 2011 Nor'easter and Storm Sandy.

211. The Company proposed to utilize the storm reserve to fund $2 million per year for pre-staging costs for storms that meet specific criteria.

212. If the storm reserve accumulates a net balance of more than $50 million, then the Company will pay customers carrying charges at the weighted average cost of capital on the amount of the over-funding during the period of time that the over-funding situation exists. Conversely, the balance in the storm reserve falls below a net negative of $(50) million, then customers will pay carrying charges to the Company on the under-recovery during the period of time that under-recovery exists.

213. The Company has a means for recovery of catastrophic storm expense, which would be the request for the establishment of a regulatory asset to be recovered.

214. The Company sought recovery for storm costs that were not addressed in the Storm Cost Recovery Decision. These costs amount to $31.068 million and relate to the Windstorm of January 31, 2013, the blizzard of February 8, 2013, and remaining Hurricane Sandy costs that were not finalized at the time of the Storm Cost Recovery Decision.

215. The Company has not adjusted the 2013 storm costs to reflect the adjustments made in the Storm Cost Recovery Decision

216. CL&P proposed to utilize the storm reserve to fund $2 million per year for pre-staging costs.

217. The Company has used troubleshooters for decades.

218. The 2013 CAIDI was 107.1 minutes compared to a peer average of 102 minutes and CL&P's service scored at 604 compared to a peer average score of 655.

219. The cost of the new TSO is expected to be $10.7 million and that savings from the avoidance of cost for overtime work, associated rest periods, overtime meals and their meal time costs would save $5.7 million.

220. The total GET expense for the Test Year was $69.126 million.

221. The total GET expense proposed for the Rate Year is $85.203 million.

222. The total property tax expense for the Test Year was $66.231 million.

223. CL&P escalated known property tax mill rates to calculate the estimated property tax expense for the Rate Year.

224. The total estimated property tax expense for the 2014 list year was determined by escalating the 2013 list year's personal and real estate property mill rates by 4%.

225. The tangible personal property composite mill rate of 31.48 for the 2013 list year was escalated to 32.74 for the 2014 list year.

226. In the 2007 and 2009 CL&P Rate Case Decisions, the Authority directed CL&P not to escalate known mill rates.

227. For the 2014 list year, CL&P reported total plant additions of $233.789 million.

228. The total plant addition for calendar year 2014 is approximately $231.456 million.

229. The personal property declaration period for the 2014 list year runs from October 1, 2013 through September 30, 2014.

230. Nine months in 2014 falls within the 2014 list year declaration period.

231. Pursuant to Conn. Gen. Stat. §12-63(b)(6), the depreciated value of tangible personal property in the first year of declaration is 95% of acquisition costs.

232. The GRCF of 1.8252 was proposed for the Rate Year.

233. The GET rate of 7.072% was used calculate the proposed GRCF.

234. The total billed distribution revenue of approximately $977.414 million was used to calculate GET rate.

235. The total unbilled distribution revenue for the Test Year was approximately $1.622 million. The Company proposed rates that are based on a capital structure consisting of 50.38% common equity, 2.01% preferred stock and 47.61% long-term debt.

236. CL&P maintained its capital structure by coordinating in terms of timing and amount of common dividends paid to NU and the equity infusions that it receives from NU.

237. For the 12 months ended June 30, 2014, the Company's embedded cost of debt was 5.21%.

238. The long-term debt consists of 19 series of first mortgage bonds and nine series of pollution control revenue notes.

239. CL&P's proposed long-term embedded cost of debt is 5.45%, based on the 2013 Test Year equity ratio of 50.38%.

240. The Company proposed $116,919 in preferred stock in its capital structure as of December 31, 2015, at a cost of 4.80%.

241. CL&P has 13 series of perpetual preferred stock that was issued between 1947 and 1968. The determination of the cost of equity in this proceeding was

obtained using the DCF model and CAPM method to a proxy group of companies.

242. The Company's cost of equity testimony was prepared by Robert Hevert, a financial consultant on behalf of CL&P.

243. The Company advocated an allowed ROE of 10.20% from a range of 10.20% to 10.70%.

244. Mr. Hevert relied on a DCF model (including the Constant Growth, Quarterly Growth, and Multi-stage forms), the CAPM (including both the traditional form of the CAPM and the Empirical CAPM), and the Bond Yield Plus Risk Premium approach to develop his cost of equity results by applying to a proxy group of electric utilities.

245. Mr. Hevert did not make an explicit adjustment to his recommended ROE of 10.20% for flotation costs, but computed a 14-basis point adjustment to reasonably represent flotation costs for the Company.

246. Mr. Hevert's cost of equity calculations were primarily based on a proxy group of only 14 publicly traded utility companies.

247. To determine the composition of the proxy group, Mr. Hevert began with the universe of 47 companies from Value Line's Electric Utilities Industry.

248. Mr. Hevert applied the following screening criteria to determine his recommended proxy group: 1) consistently pay quarterly cash dividends; 2) covered by at least two utility industry equity analysts; 3) investment grade senior unsecured bond and/or corporate credit ratings from S&P; 4) regulated operating income over the three most recently reported fiscal years comprised of at least 60% of the respective totals for that company; 5) regulated electric operating income over the three most recently reported fiscal years represent at least 90% of total regulated operating income; and 6) not known to be party to a merger, or other significant transaction as of July 31, 2014.

249. Mr. Hevert calculated the dividend yield based on the proxy companies' current annualized dividends and average closing stock prices over the 30, 90 and 180 trading day periods ended July 31, 2014.

250. Mr. Hevert used a consensus of long-term earnings growth estimates from Zacks, First Call and Value Line.

251. Mr. Hevert included the sustainable growth approach to estimating a company's expected growth.

252. The Company's constant growth DCF results, including sustainable growth, produced a range of 7.58% to 10.95%.

253. Mr. Hevert used two measures of a 30-year Treasury bond yield and estimated a current rate of 3.35% and a near-term projected rate of 4.03% as the risk-free rates in the CAPM.

254. Mr. Hevert calculated three versions of the market risk premium. He relied on two forward-looking estimates and included a third estimate that is a simple average of the ex-ante method, Supply Side model, and the long-term historical average market risk premium.

255. Mr. Hevert produced CAPM results in the range of 9.46% to 11.96%, a decrease from the prior range of 9.74% to 12.16%.

256. Mr. Hevert included the ECAPM analysis in estimating the cost of equity, which is another variation of the CAPM.

257. Besides the traditional CAPM and ECAPM, Mr. Hevert evaluated the cost of equity utilizing the bond yield plus risk premium method.

258. The OCC's cost of capital witness, Dr. Woolridge, advocated a 8.90% ROE in this proceeding based on the capital structure proposed by CL&P which includes a common equity ratio of 50.38%.

259. Using the proposed Test Year capital structure and senior capital cost rates, OCC recommended an overall rate of return of 7.14%.

260. Dr. Woolridge employed the use of the DCF and CAPM approaches to a 32-member electric proxy group, as well as, Mr. Hevert's proxy group of companies.

261. The average S&P bond ratings for the Woolridge and Hevert proxy groups are both BBB+, while CL&P's bonds are rated A-.

262. In developing a fair rate of return for CL&P, Dr. Woolridge primarily relied on the DCF model to estimate the cost of equity and applied it to the both Mr. Hevert's proxy group and his 32-member proxy group.

263. Using the constant growth version of the DCF method, Dr. Woolridge first calculated the dividend yield by taking the current annual dividend and the 30-day, 90-day and 180-day average stock prices as of July 17, 2014. To reflect the growth over the coming period, Dr. Woolridge adjusted the dividend yields by one-half the expected dividend growth resulting in an adjusted dividend yield of 3.9% for Woolridge's proxy group and 4.0% for Hevert's proxy group.

264. For the growth component of the DCF calculation, Dr. Woolridge employed 13 measures of growth, of which 6 measure historic growth, and 7 are *Value Line* or Wall Street analysts' projections of growth, giving primary weight to the projected EPS growth rate forecasts of analysts.

265. To derive the overall growth rate for the proxy groups, Dr. Woolridge used the midpoint of the median range for each resulting in a DCF growth rate of 4.875%

for Woolridge's proxy group and 5.0% for Hevert's proxy group, giving greater weight to the projected growth rate figures.

266. Dr. Woolridge calculated equity costs rates of 8.80% and 9.0%, for Woolridge and Hevert's proxy group, respectively.

267. Dr. Woolridge performed a CAPM analysis using both proxy groups.

268. Dr. Woolridge elected to use 4.0% as the risk-free rate in the CAPM analysis.

269. The median betas for the companies in Woolridge's and Hevert proxy groups are 0.75% for both.

270. To determine an equity risk premium, the OCC reviewed the results of over 40 equity risk premium studies and surveys performed over the past decade.

271. Dr. Woolridge claimed that much of the data indicates that the market risk premium is in the 4.0% to 6.0% range and the midpoint of 5% is used as the market risk premium for OCC's CAPM analysis.

272. Dr. Woolridge's CAPM resulted in a cost of equity of 7.80% for both proxy groups.

273. The OCC concluded that the appropriate equity cost rate for the proxy groups is in the 7.80% to 9.00% range.

274. Dr. Woolridge did not take into consideration the impact of the Company's proposed decoupling mechanism nor the earnings sharing mechanism on the OCC recommended ROE. He concurred that the mechanisms are reflected in the lower risk of the company.

275. Dr. Woolridge provided the authorized ROEs in 18 rate cases in 2013 and 2014 involving distribution-only electric utilities. There are no authorized ROEs of 10% or higher, and the average for the distribution-only electrics is 9.48%.

276. There is a declining trend in authorized ROEs, particularly for distribution-only utilities. According to data from Regulatory Research Associates, the average of 101 reported electric utility rate case ROEs authorized by commissions in 2012, 2013 and so far in 2014, is 9.91%, with a reported range of 8.72% to 10.95%.

277. The average reported ROE for distribution-only utilities was 9.57%, which is 63 basis points lower than CL&P's proposed ROE.

278. In 16 recent utility rate cases in which Mr. Hevert provided expert testimony, the approved ROE decided in each case was lower than Mr. Hevert's recommended ROE in all 16 cases.

279. The AG generally supported the OCC's cost of capital testimony and its recommended ROE of 8.9%.

280. To calculate a flotation adjustment, Mr. Hevert modified the DCF calculation to provide a dividend yield that would reimburse investors for issuance costs.

281. The Company did not identify any test-year flotation costs.

282. CL&P has incurred the issuance expenses associated with NU's dividend reinvestment plan, which is only at the parent company level.

283. The record also indicates that NU has not executed any common stock offerings since the filing of CL&P 2009 Rate Case.

284. Interest rates and long-term utility bond yields remain at historical low levels and are below the levels existing at the time of the 200r CL&P Rate Case.

285. The economic outlook now for several years has promised economic recovery and the rise of interest rates which have not occurred.

286. The average ROEs for the electric and gas industries continue to trend downward.

287. At the time CL&P's last ROE was set at 9.40%, the annual average allowed ROE for the electric industry was 10.48% for 2009.

288. In 2013 to 2014, there have been no authorized ROEs of 10% or higher and the average for the distribution-only electrics is 9.48%.

289. The Company and OCC did not suggest an adjustment to their recommended ROEs to quantify an impact for decoupling.

290. Revenue stabilization and cost recovery mechanisms, such as decoupling, are already reflected in current market valuations of the proxy companies.

291. Both S&P and Fitch upgraded CL&P's ratings due to the merger between NU and NSTAR.

292. 2009 CL&P Rate Case, the Company has increased its S&P bond rating from BBB to the present A-, two notches.

293. As of June 24, 2014, the Company has credit ratings of A- (outlook: Positive), Baa1 (outlook: Stable), and BBB+ (outlook: Stable) from S&P, Moody's and Fitch, respectively.

294. Since 2009, the Company has a stronger times interest earned ratio, fixed coverage ratio, profit margin, return on total assets and return on total capital.

295. The investment risk of public utilities is still relatively low compared to the market as a whole (1.0 beta) as evidenced by the drop in NU's beta from .80 in 2009 to .75 currently.

296. CL&P continues to maintain a strong financial position, limited risk profile, visible forward earnings stream, a stable dividend yield, strong balance sheet and strong cash position.

297. Despite the decline in interest rates, utilities continue to outperform most sectors of the bond market.

298. The cost of equity for the electric industry is among the lowest of all industries in the U.S.

299. The Authority has established the sharing threshold at the Company's allowed ROE with the sharing distributed equally with 50% to shareholders and 50% for the customers.

300. Since 1999, the Company has operated under an ESM whereby earnings in excess of the allowed ROE are shared with ratepayers.

301. Conn. Gen. Stat. §16-19(g) allows the Authority to review a company's earnings if an earned ROE exceeds a company's authorized ROE by 1% point for a period of six consecutive months, equivalently two fiscal quarters.

302. The Authority has a long tradition of using an ESM and has approved these for companies as an incentive to shareholders.

303. Implementation of an ESM allows shareholders to capture a portion of potential overearnings and avoid an overearnings financial review that would be otherwise initiated by the Authority.

304. ESMs have been implemented in the past for electric, gas and water utilities.

305. The current ESM is also consistent with other recent ESMs that were approved by the Authority.

306. In its 2011 Storm Decision, the Authority stated that it was establishing a rebuttable presumption that CL&P should have imposed on it an appropriate reduction to its allowed return on equity in its next ratemaking proceeding as a penalty for poor management performance and to provide incentives for improvement.

307. In the Merger Decision, the Authority approved the merger agreement between Northeast Utilities and NSTAR.

308. A condition of the merger settlement agreement provided that any future recovery of transaction costs are subject to Authority review and approval in a future rate proceeding.

309. This docket is the first rate case since the merger was approved.

310. The Authority found in the Merger Docket that total net benefits of approximately $783.8 million were expected on an overall, enterprise-wide basis with an estimated $301.8 million allocable to CL&P's transmission and distribution operations.

311. The Company submitted an updated merger integration report integration forecasting an increase, in merger savings on an enterprise-wide basis of $92.8 million for a total of $876.6 million.

312. The decoupling statute requires the adjustment or reconciliation be made on the basis of "actual distribution revenues."

313. No other utility in Connecticut has sought and the Authority has not approved any such exception for revenues to be retained in excess of those allowed to meet revenue requirements.

314. Decoupling is not a rate developed to recover underlying, prudently incurred costs; it is a true-up mechanism for revenues previously designed fully in accordance with the Authority's just and reasonableness responsibility.

315. The potential loss of revenue from new service customers is more than balanced from the protection ratepayers stand ready to provide should sales decrease for any reason.

316. Decoupling is only a true-up mechanism that involves minimal dollars in comparison to total distribution revenues.

317. Decoupling is not an appropriate alternative to increasing fixed charges.

318. CL&P traditionally used statistically adjusted end-use models to forecast sales by customer class.

319. The Company performed a weather normalization study in developing the rate year sales forecast and associated revenues.

320. In 2011, CL&P lost approximately 159 GWh, or 2.2% of its sales for the affected period, due to Hurricane Irene and the October 2011 snowstorm.

321. In 2012, CL&P lost approximately 86 GWh, or 2.6% of its sales for the affected period, due to Hurricane Sandy.

322. The Company recently increased its C&LM spending, and will lose additional sales which are not reflected in historical sale trends, that only include the base conservation savings.

323. Rate Year revenues for reconnect fees for 2013 are low compared to prior years.

324. The Rent from Electric Property, could not be calculated as the billing determinants for pole attachments is not available.

325. CL&P has an agreement with Verizon from 1956 that gives all recurring attachment revenues for the communications gain on jointly owned poles to Verizon, and pre-dates the existence of cable television and fiber pole attachments.

326. CL&P did not recover all of its pole attachment make-ready expense in the Test Year.

327. CL&P does not have explicit authority to collect all make-ready expenses from pole attachers.

328. A COSS is a mathematical business model that systematically assigns cost responsibility among customer classes for company assets and expenses incurred by an EDC to serve customers.

329. A COSS is an invaluable tool for documenting equity and establishing revenue requirements and tariff charges by customer class.

330. The Company followed the detailed methodology consistently approved by the Authority in past rate case Decisions.

331. The Company relied on its COSS results when designing rates.

332. FERC established a new operating standard designed to save energy losses in transformers.

333. The NARUC Manual requires plant installed to service customers and meet their peak demand, must be segmented into customer and demand related costs.

334. The NARUC Manual states that the customer component of distribution facilities is that portion of costs which varies with the number of customers.

335. The NARUC Manual recommends that either the minimum intercept method or other methods like the minimum distribution system method be undertaken to discern customer and demand cost components.

336. The Authority held in Docket No. 90-12-03 that the simplicity of the minimum-size methodology warrants its continued use by CL&P in future COSS.

337. A genuine, but minimal, distribution system is necessary for a utility to stand ready at no load or to serve nominal loads.

338. In Docket No. 05-06-04, the Authority rejected the OCC’s recommendations that no costs be allocated based on the number of customers.

339. In Docket No. 08-07-04, the Authority rejected the OCC’s request for allocation on the basis of demand only.

340. Poles and lines are installed to expand circuits to reach new off-circuit customers.

341. Some minimum size cable is necessary to simply reach all customers.

342. kVA levels differ dramatically between residential neighborhoods and industrial parks.

343. Transformers are needed to expand circuits to reach customers and are sized to reflect differing kVA demands.

344. Newer transformer designs will operate with less energy lost as heat.

345. The COSS methodology submitted by the Company can be relied upon for designing rates.

346. To reduce interclass subsidies, all classes should be moved closer to their cost to serve, or closer to the system average ROR, while applying the principles of rate gradualism.

347. The farther the class is from the system average, the larger the percentage increase/decrease necessary to align the class revenues to the average.

348. To reduce inequities between classes, it is necessary to align the rate classes as close to the system ROR as possible.

349. The Company's rate design moved rates in each rate class closer to their actual cost of service, both at a total class level and with respect to the prices for distribution service within each rate class.

350. The Company's rate design moved the ROR for each rate class closer to the average ROR by allocating a greater/lesser than average percentage distribution increase, depending on their current ROR.

351. CL&P's rate design decreased or eliminated per kWh charges, and moved customer and demand charge rates closer to their cost-of-service levels.

352. CL&P's rate design proposal was designed to collect a total distribution revenue increase of $231.6 million.

353. For Rate 1, CL&P set a distribution rate revenue target of $570.4 million, an increase of $148.2 million or 35.11% over its current distribution revenue of $422.5 million.

354. CL&P's rate design for Rate 1 included a 59% increase to the Customer Charge and a 2.64% increase to the per-kWh Charge.

355. If the COSS classified distribution facilities on a full demand basis, without classifying the plant costs as customer-related, the study would support a customer charge no higher than $11.68.

356. The low-use customers in Rate 1 will face the largest percentage bill increases from the proposed customer charge increase.

357. The OCC, BETP, ENE and AG objected to the 59% increase in the customer charge.

358. The Authority received an unprecedented number of comments from customers, public officials and consumer advocates on the proposed rate increase, especially the 50% increase in the Rate 1 Customer Charge.

359. Decoupling removes any Company sales-related disincentive to promote energy efficiency and distributed generation, and assures cost-recovery for the Company.

360. A potential 10% savings in distribution charges has not induced a large customer migration to TOD pricing.

361. CL&Ps rate design for Rates 27, 30 and 40 include increases to the Customer Charge in excess of 40%.

362. New rates will not be implemented until after final approval of the Rate Plan.

363. The customer bill impact of the distribution rate increase will be mitigated by a subsequent decrease of the storm related costs which will be removed from the NBFMCC effective January 1, 2015.

364. Recurring charges for pole attachments are typically fees for rental of pole space, and non-recurring fees typically include items such as make-ready costs.

365. Municipal Rate customers are allowed an exemption from pole attachment fees for their first attachment on any pole.

366. The pole attachment rates are billed on a semi-annual basis.

367. The Pole Attachment Order methodology uses historic (embedded) costs while CL&P uses a combination of historic and reproduction (marginal) costs, which the FCC has expressly rejected.

368. The Pole Attachment Order methodology applies cost allocators of 66% in urban areas and 44% in rural areas while CL&P applies higher cost allocators of 69.18% in urban areas and 45.38% in rural areas.

369. The Pole Attachment Order methodology allocated pole costs using a presumption of 13.5’ of usable space on the pole to derive a space allocation factor while CL&P uses 12.33’ without providing a pole survey.

370. NECTA conducted a Pole Survey and calculated a usable space factor for pole attachments of 14.57'.

371. In Docket No. 09-12-05, the Authority approved the unbundling of street lighting rates into their functional components.

372. The Company's unbundled rate design of Rate 116 set pricing for the system component of rates and the equipment and O&M components of rates.

373. The Company designed a two-part charge for Rate 117 consisting of customer and demand components that applies to applicable fixtures connected to the CL&P's distribution system.

374. The revenue targets for customer and demand were derived by applying a 75% / 25% proportion of demand and customer costs, respectively.

375. For Rate 116, additional equipment and O&M charges apply.

376. The same methodologies for determining the system, equipment and O&M rates for other Rate 117 offerings have been applied in developing proposed new LED street lighting distribution rates.

377. The proposed rates in the T&C for Delivery Service were developed based on the cost of providing service.

378. In the past, the Authority approved CL&P's request to discontinue the surge protection program.

379. CL&P offers a TOD rate option, Rate 7, for residential non-heating customers, of which Rate 5 customers may elect to receive service.

380. Rate 7 was designed based on the service characteristics of the non-heating residential class Rate 1, and on methodologies and guidelines developed and approved by the Authority.

381. Less than 500 customers receive service on Rate 7 compared to over 1.1 million customers on Rate 1 and Rate 5.

382. Rate 5 is a legacy tariff and new customers are no longer allowed to take service under that rate.

383. The Reconnection at the Meter Charge has not changed in many years, despite increases to general rates.

384. CL&P's standard bill form, termination notice and customer rights notice comply with applicable regulations.

385. For calendar year 2014, less than 1.5% of bills issued were estimated.

386. CL&P's estimated bill form complies with applicable regulations.

387. CL&P's policies and procedures for the administration of customer security deposits comply with applicable regulations.

388. In November 2012, CL&P discontinued the practice of on-site energy audit service appointments at a customer's location.

389. NUStart became a one-year program in calendar year 2013.

390. CL&P's Call Center performance statistics were acceptable as filed.

IV. CONCLUSION AND ORDERS

A. CONCLUSION

Based on the evidence presented in this proceeding, the Authority finds allowed revenues of $1.033 billion to be appropriate for CL&P in the Rate Year as detailed in Appendix A. This is a reduction of $93 million from the Company's adjusted cumulative request of $1.127 billion and a $134.076 million increase or 13.9% to present revenues. The Authority allows the Company an allowed rate base of $3.233 billion. The Authority approves an allowed ROE of 9.02% for 2015, inclusive of a one year penalty of 15 basis points for 2011 Storms response. The allowed capital structure consists of 50.38% common equity, 2.01% preferred stock, and 47.61% long-term debt components. The revenue requirement adjustments as authorized herein will be sufficient to enable the Company to operate successfully, maintain its financial integrity, attract capital, compensate its investors for the use of their money and the risks assumed, and maintain high quality service. New rates will become effective for usage on and after December 1, 2014. The Authority will reopen this proceeding for the purpose of further reviewing and ruling on issues identified herein related to the repair tax deductions and accumulated deferred income taxes.

B. ORDERS

For the following Orders, submit one original of the required documentation to the Executive Secretary, 10 Franklin Square, New Britain, Connecticut 06051 and file an electronic version through the PURA's website at www.ct.gov/pura. Submissions filed in compliance with the PURA's Orders must be identified by all three of the following: Docket Number, Title and Order Number.

1. Beginning on December 17, 2014, the Company, for each restoration event that it incurs in excess of $20 million, shall submit to the Authority its proposed cost recovery utilizing its standard accounting practices as well as a proposed recovery using the accounting treatment that was utilized in the Decision in Docket No. 13-03-23. This filing shall be made with the Authority within 30 days of full restoration of the event.

2. No later than December 31, 2014, the Company shall submit a final Rate Plan for Authority approval that incorporates the directives herein as outlined in Section II.J.5. Rate Design, Section II.J.8. Tariff Changes, and also include the following:

   a. the CATV Rate and Telecom Rate as discussed in Section II.J.6. Pole Attachment Rates and the Company shall prorate the December charge in accordance with its proposal; and
   b. a new Decoupling Tariff Rider as discussed in Section II.H. Decoupling.

3. No later than January 30, 2015, CL&P shall file a copy of its 2013 income tax return with the IRS with the Authority. The filing shall include all applicable schedules and forms supporting tax elections made or requested. Additionally, the filing shall include a worksheet showing portions of the tax depreciation deductions reported on Form 4562 that are applicable to distribution plant-in-service.

4. No later than January 30, 2015, CL&P shall acknowledge in writing that it will submit for the Authority's approval, any changes to its customer service practices, procedures or policies in writing at least 20 business days prior to the effective date of such changes.

5. No later than February 16, 2015, the Company shall file a final-rates COSS reflecting rate year billing determinants, the financial profile approved in this Decision and the then current rates developed in accordance with the Rate Plan approved herein.

6. No later than March 31, 2015 and each year thereafter until its next rate case, the Company shall report the CAIDI for the second and third shifts and for weekends and the average number of contract workers staffing each work period to demonstrate the change that the new TSO had on reliability for these periods and the overall system and report the annual contractor costs of the new TSO.

7. No later than March 31, 2015, 2016 and 2017, the Company shall provide the Authority with a report of actual construction program capital spending by Initiative or category for the preceding year. If actual spending varies from budgeted spending by more than 10% in any initiative or category from that budgeted, or if the total aggregate capital spending varies by more than 10%, the Company shall provide an explanation of the reason for such variance.

8. No later than April 1, 2015, the Company shall report on the status of introducing a phase-out formula concerning revenue true-ups in their next scheduled CAM and FMCC reconciliation filings.

9. No later than April 1, 2015, CL&P shall provide a proposal that addresses the OCC's concerns regarding its joint pole agreement with Verizon.

10. No later than September 30, 2015, CL&P shall file a copy of its 2014 Federal income tax return with the Authority. The filing shall include all applicable schedules and Form 3115 filed requesting accounting changes regarding the RTD election pursuant Revenue Procedure 2012-20. Additionally, the filing shall

include a worksheet showing portions of the tax depreciation deductions reported on Form 4562 that are applicable to distribution plant-in-service and a summary of the RTD amounts for the appropriate calendar years.

11. No later than November 30, 2015 and 2016, the Company shall provide the Authority with the budget of construction program capital spending by initiative or category for the following year.

12. No later than February 15, 2016 and annually thereafter, the Company shall file its proposed decoupling rate for the upcoming 12-month period.

13. Beginning January 31, 2016, and annually thereafter for the term of this rate plan, the Company shall report to the Authority unused amounts of pre-staging costs that are transferred to the storm reserve.

14. In its first Decoupling Mechanism reconciliation filing, the Company shall adjust its allowed revenue requirement target to reflect the ROE penalty imposed in Section II.F.4 ROE Penalty.

15. In its next rate case, the Company shall submit a:

    a. Depreciation Study.
    b. Complete and well documented analysis of expected service periods for its existing and new software systems and provide such analysis to the Authority prior to its next rate proceeding.
    c. Report on the annual CAIDI and JD Power service scores for CL&P since 2013 and its peer group and justify the effect that the new TSO had on these results. COSS that is methodologically consistent with the study performed in the instant application.
    e. Second COSS that utilizes a zero-intercept methodology for segmenting plant included in the current minimum-size-of-facilities method into customer and demand categories.
    f. Rate design that utilizes a rate year COSS that reflects the methodology approved in the instant case.

DOCKET NO. 14-05-06 APPLICATION OF THE CONNECTICUT LIGHT AND POWER COMPANY TO AMEND RATE SCHEDULES

This Decision is adopted by the following Commissioners:

Arthur H. House

Michael A. Caron

This Decision is adopted, in part, and dissented to, in part, by the following Commissioner:

John W. Betkoski, III

CERTIFICATE OF SERVICE

The foregoing is a true and correct copy of the Decision issued by the Public Utilities Regulatory Authority, State of Connecticut, and was forwarded by Certified Mail to all parties of record in this proceeding on the date indicated.

Nicholas E. Neeley
Acting Executive Secretary
Public Utilities Regulatory Authority

12/17/14
Date

DOCKET 14-05-06
APPLICATION OF THE CONNECTICUT LIGHT AND POWER COMPANY FOR A RATE INCREASE

DISSENTING OPINION, IN PART, OF VICE CHAIRMAN JOHN W. BETKOSKI, III

Every Commissioner at the Connecticut Public Utilities Regulatory Authority (PURA or Authority) has the right to a dissenting opinion. I'm exercising this right at this time. My dissenting opinion in the instant proceeding was not an easy decision. However, my experience in utility rate making is the basis for my decision. My dissenting opinion is on the allowed return on equity (ROE) authorized by this Authority.

The determination of the cost of capital was a large part of this CL&P rate case proceeding. The cost of capital includes both the cost of equity and the cost of debt. The basis for the determination of an overall cost of capital is articulated in Federal Power Commission v. Hope Natural Gas Company, 320 US 591 (1944), in which the Court established criteria to determine cost of capital allowances. In its Decision, the Court determined that companies need to be allowed to earn a level of revenues sufficient to enable them to operate successfully, maintain their financial integrity and to attract capital and compensate their investors for their risk. By Connecticut law, utilities are entitled to a level of revenues that will allow them ". . . to cover their operating and capital costs, to attract needed capital and to maintain their financial integrity, and yet provide appropriate protection for the relevant public interest both existing and foreseeable." Connecticut General Statutes (Conn. Gen. Stat.) §16-19e(a)(item 4).

To determine a rate of return (ROR) on rate base that is appropriate for a utility's overall cost of capital, the Authority first identifies the components of a utility's capital structure. A capital structure is defined as the permanent long-term financing of a company which consists of long-term debt, preferred stock, and equity. The cost of each capital component is then determined and weighted according to its proportion of total capitalization. These weighted costs are summed to determine the utility's overall cost of capital, which becomes the allowed rate of return on rate base. The most difficult and controversial cost of capital component to determine is the ROE. My dissension centers on the determination of this ROE.

In order to determine an allowed ROE the risks that investors face must be considered as well as what a rational investor's expectations are. An investment of any kind results in an opportunity cost to the investor. This opportunity cost is best thought of as the cost of using capital for a certain investment as measured by the benefit of revenues given up (opportunity loss) by not using the capital in the next best alternative investment. An equity investor forgoes the use of their money in exchange for a set of expectations being a series of cash dividend payments, recovery of their initial investment, and also some growth in their initial investment. The key wordin this is expectations because the concept of risk relates to expected not realized returns on an investment.

I find that the Authority has properly calculated the discounted cash flow (DCF), capital asset pricing model (CAPM), and risk premium methodologies in coming to a conclusion of a 9.17% ROE. Market data was used as close to the date of this decision as possible to make for a timely allowed market based ROE. The simple fact is I believe this Authority should consider the use of data of average ROE's as published by Regulatory Research Associates (RRA). This is a well-respected publication used by state commissions as well as utilities. ROE data from other state commissions should also be used. From my seventeen years as a commissioner at this Authority, I have found that RRA has been consistently used as a benchmark for ROE determination. The ROE awarded by a commission should be commensurate with other utilities in the same industry. If a utility consistently has a lower ROE than peer utilities, this will put that utility at a disadvantage in attracting investor capital.

CL&P is currently at an allowed ROE of 9.40% and requested an allowed ROE of 10.20% in this proceeding. The record indicates that RRA, calculated the average of 101 reported electric utility rate case ROEs authorized by commissions in 2012, 2013 and so far in 2014, is 9.91%, with a reported range of 8.72% to 10.95%. Chriss PFT, p, 18. These electric utilities are both distribution and integrated.

The record also indicates that distribution only electric utilities allowed ROEs for 2013 and 2014 are the following:

Date	State	Utility	Docket/Case Number	Authorized ROE
1/16/2013	Texas	Cross Texas	Docket No. 40604	9.60%
1/16/2013	Texas	Wind Energy Transmission Texas	Docket No. 40606	9.60%
2/22/2013	Maryland	Baltimore Gas and Electric Co.	Case No. 9299	9.75%
3/14/2013	New York	Niagara Mohawk Power Corp.	Docket No. 12-E-0201	9.30%
5/1/2013	Ohio	Duke Energy Ohio Inc.	Case No. 12-1682-EL-AIR	9.84%
6/21/2013	New Jersey	Atlantic City Electric Co.	Docket No. ER-12121071	9.75%
7/12/2013	Maryland	Potomac Electric Power Co.	Case No. 9311	9.36%
8/14/2013	Connecticut	United Illuminating Co.	Docket No. 13-01-19	9.15%
10/3/2013	Texas	Southwestern Electric Power Co	Docket No. 40443	9.65%
12/9/2013	Illinois	Ameren Illinois	Docket No. 13-0301	8.72%
12/13/2013	Maryland	Baltimore Gas and Electric Co.	Case No. 9326	9.75%
12/18/2013	Illinois	Commonwealth Edison Co.	Docket No. 13-0318	8.72%
2/20/2014	New York	Consolidated Edison Co. of NY	Case No. 13-E-0030	9.20%
3/17/2014	New Hampshire	Liberty Utilities Granite St	Docket No. DE-13-063	9.55%

3/26/2014	District of Columbia	Potomac Electric Power Co.	Formal Case No. 1103-2013-EL	9.40%
4/2/2014	Delaware	Delmarva Power & Light Co.	Docket No. 13-115	9.70%
5/16/2014	Texas	Entergy Texas Inc.	Docket No. 41791	9.80%
5/30/2014	Massachusetts	Fitchburg Gas & Electric Light	DPU 13-90	9.70%
7/2/2014	Maryland	Potomac Electric Power Co.	Case No. 9336	9.62%
			Average	9.48%

Woolridge PFT, Exhibit JRW-12, p. 3.

Using the allowed ROE data from RRA and other sources is much like the comparable earnings (CE) methodology in determining an allowed ROE. The CE methodology in its simplest form compares other utilities with the same risk characteristics with the utility in question and averaging the returns found to be applicable. I believe the risk characteristics of the electric companies found in RRA are comparable to Connecticut Light and Power Company (CL&P). More importantly' I believe investors consider the whole electric utility industry and look to the opportunity of electric companies to earn a fair rate of return as embodied in the allowed ROE authorized by their various state utility commissions. With this said, my experience tells me that critics will say that the drawback of using this methodology is stale data from allowed returns that were set some time ago so as to preclude current market data. I counter this argument with the fact that these allowed ROEs, whenever set, are currently in effect and that the electric utility has the opportunity to earn revenues based on those allowed ROEs. Investors have a choice as to where to put their investment capital and in my opinion one of the paramount factors in investor decision making is how high the allowed return is for a specific electric utility. Other ROE proxies that can be used, for a determination of an allowed ROE for CL&P, are an allowed ROE for Western Massachusetts Electric Company (WMECO) currently at 9.60% and Public Service of New Hampshire (PSNH) at an allowed ROE of 9.67% which are both electric utility operating companies of CL&P's parent company Northeast Utilities (NU).

The determination of an allowed ROE is a balance between revenue requirements paid by ratepayers and the financial integrity of CL&P. The higher the allowed ROE the greater the revenue requirement paid by ratepayers. However, the higher the ROE, the greater is the financial integrity of CL&P. This is shown in the credit rating of CL&P which is currently at an A- credit rating. This credit rating is a primary factor in the cost of borrowing which is an expense passed on to ratepayers. An allowed ROE needs to strike a balance between increased cost to ratepayers and a decrease in the cost of debt for CL&P.

The Parties offer a range of reasonableness for an allowed ROE, as determined by the expert witness for CL&P of 10.20% and the expert witness for the Office of Consumer Counsel (OCC) of 8.90%. In addition I am aware that CL&P is a distribution only electric utility and as such does not have the risks associated with the generation component of integrated utilities. Since CL&P is a distribution only electric utility it is most closely risk comparable to other distribution only electric companies. Therefore I believe a 9.48% allowed ROE is reasonable which falls within the range of reasonableness of 8.90% and 10.20% established by the expert witnesses in this proceeding.

I believe this 9.48% allowed ROE will lower CL&P's cost of debt by maintaining the A- credit rating of CL&P. I find that this 9.48% ROE should produce operating income sufficient for CL&P to operate successfully and serve its ratepayers, maintain its financial integrity, and compensate its investors for the risk assumed.

#39 million final rate increase (7.8%) RB p.8

BEFORE THE PUBLIC SERVICE COMMISSION
OF
THE STATE OF MISSISSIPPI

12-3-2001

MISSISSIPPI POWER COMPANY DOCKET NO. 01-UN-0548

IN RE: NOTICE OF INTENT OF MISSISSIPPI POWER COMPANY TO CHANGE RATES FOR ELECTRIC SERVICE IN ITS CERTIFICATED AREAS IN THE TWENTY-THREE COUNTIES OF SOUTHEAST MISSISSIPPI

FINAL ORDER

COMES NOW, the Mississippi Public Service Commission (Commission) and issues the following Final Order in this cause.

I. INTRODUCTION

MPCo is a public utility as defined in Section 77-3-3(d)(i) of the *Mississippi Code of 1972, as amended*, and is engaged in the business of generating, transmitting and distributing electric power to and for the public for compensation in twenty-three (23) counties of southeast Mississippi, having its principal place of business at Gulfport, Mississippi. The Company's mailing address is Post Office Box 4079, Gulfport, Mississippi, 39502-4079.

MPCo is the holder of a Certificate of Public Convenience and Necessity issued in Docket No. U-99, as supplemented from time to time, authorizing its operations in specified areas of the twenty-three (23) counties of southeast Mississippi and is rendering electric service in accordance with its service rules and regulations and in accordance with schedules of rates and charges, all of which are a part of its tariff that has been previously approved by order of this Commission.

MPCo is a Mississippi corporation. A copy of its corporate charter, articles of incorporation, the names and addresses of its board of directors and officers, and the name of all persons owning fifteen percent (15%) or more of its stock are on file with this Commission.

MPCo has, since 1986, operated under a Performance Evaluation Plan Rate Schedule designated variously, as revised and amended from time to time, as PEP, PEP-1, PEP-1A and PEP-2. MPCo is authorized under PEP-2 to file a rate proceeding to adjust its rates when there is major construction, purchase, or modification of plant such as occurred with the new Victor J. Daniel Generating Plant Units 3 and 4, the construction of which were authorized by this Commission in Docket No. 97-UA-496. The units were placed in service in May and April of this year, respectively.

II. PROCEDURAL HISTORY

On August 3, 2001, pursuant to PEP-2, Mississippi Power Company, Inc. (MPCo) filed its Notice of Intent ("Notice") to change its rates for electric service, presently on file with the Commission, to be effective with the first billing cycle of January 2002, for bills rendered on and after such date. In its notice, MPCo requested an increase in rates of approximately 9.5% for the average retail customer.

The Commission entered a suspension order in this docket on August 3, 2001, requesting the Public Utilities Staff (Staff) to conduct a full investigation of the lawfulness of the proposed rates and charges contained in MPCo's notice. On August 7, 2001, the Commission issued an order suspending PEP-2 (Docket 93-UA-302) until a final order was issued in the proceeding at hand or until further Order of the Commission.

Notice of the filing was given as required by law and this Commission's Public Utilities Rules of Practice and Procedure ("Rules") to all persons who were parties of record in the

Company's last proceeding in which a major change in rates was sought, to certain other interested persons, and by publication on August 8, 2001, in the *Clarion Ledger* and in the *Sun Herald.*

A Scheduling Order was issued on August 14, 2001, establishing procedures for the timely resolution of this matter within the 120 day period prescribed by Mississippi law, including establishing intervention procedures, discovery procedures, deadlines for the filing of testimony, pre-hearing conferences, and setting his matter for hearing November 7-9, 2001.

The Intervenors in this filing were: Colonial Pipeline Company ("Colonial"); Mississippi Manufacturers Association ("MMA"); Federal Executive Agencies, by and through the Department of the Navy ("NAVY"); Williams Energy Marketing and Trading Company ("Williams"); Mississippi Casino Operators Association d/b/a Gulf Coast Gaming Association ("GCGA"); Mississippi Chapter of the National Federation of Independent Business ("NFIB"); Sierra Club, Mississippi Chapter ("Sierra"); Dynegy, Inc. ("Dynegy"); and Chevron USA, Inc. ("Chevron"). Colonial withdraw its intervention on November 6, 2001. The Staff participated as a party litigant. Each intervenor had a full opportunity for discovery in the period established in the Scheduling Order.

The Commission's Scheduling Order provided that all data requests were to be propounded no later than September 28, 2001. During the discovery phase of this proceeding, various parties propounded to MPCo approximately 420 data requests, which included sub-parts amounting to more than 1000 requests, covering all aspects of MPCo's filing and its operations. The Staff propounded 195 data requests, GCGA propounded 210 data request, MMA propounded 14 data requests and the Navy propounded 1 data request. No motion was filed with

the Commission by any party as to the sufficiency of the responses provided by MPCo or any other party.

MPCo requested a waiver of the requirements of Miss. Code Ann., Section 77-3-37(4) (2000). On August 24, 2001, GCGA filed a Motion in Opposition to MPCo's request for waiver of these requirements. On September 18, 2001, MPCo renewed its request for waiver of the requirements of Miss. Code Ann., 77-3-37(4) (2000). MPCo filed a lead-lag study on September 18, 2001.

A pre-hearing conference, scheduled by order of this Commission, was convened on October 18, 2001, in the hearing room of the Commission. The Honorable Bruce McKinley was designated by the Commission to conduct the hearing. All of the intervenors in this docket, except the Navy and NFIB, appeared and participated in the pre-hearing conference along with the Staff and MPCo. At the pre-hearing conference, discussions and information were exchanged by and among the parties in attendance. At the recommendation of Mr. McKinley and by agreement of the parties in attendance, the pre-hearing conference was recessed until November 6, 2001 at 9:00 a.m. (CST). However, the parties were encouraged by Mr. McKinley as authorized by law to enter into stipulations notwithstanding the fact that the original pre-hearing conference was recessed. On October 26, 2001, the Staff and MPCo entered into a Stipulation. The pre-hearing conference was not reconvened on November 6, 2001, after the parties acknowledged that no additional stipulations had been reached between any other parties.

Sierra pre-filed the direct testimony of Becky Gillete and Aaron Viles on October 18, 2001. the Navy pre-filed the direct testimony of Dr. John B. Legler, MMA pre-filed the direct testimony of R.G. McBride and Roland Woodard, GCGA pre-filed the direct testimony of James

R. Dittmer, and the Staff pre-filed the direct testimony of Dr. Christopher Garbacz on October 22, 2001.

On October 26, 2001, the Staff and MPCo filed a Stipulation in this docket addressing various issues presented in the Company's filing. Among other things, the Staff and Company stipulated that the Company's filing was made pursuant to the authority of PEP-2; that the Company's filing satisfied the filing requirements of Mississippi law and this Commission's Rules; that the Company's jurisdictional cost of service allocations are just and reasonable; that adjustments and/or reductions should be made to the Company's test year rate base and expenses; that the Company's test year capital structure and weighted cost of Debt, Trust Preferred Stock and Preferred Stock portions of cost of capital are appropriate, just and reasonable; that certain changes to PEP-2 are desirable; that the Company's request in this docket, as modified by the Stipulation should be approved; and that the changes to PEP-2 proposed in the Stipulation would result in the performance evaluation plan reflecting and producing rates that are just, reasonable, and in the best interest of the customers and the Company. The particular provisions of the Stipulation related to rate base and expense adjustments, cost of capital, and the refinements to PEP-2, and this Commission's findings with respect to those matters so stipulated are addressed in the Findings and Conclusions section of this Order.

On October 30, 2001, this Commission issued an order, *sua sponte*, which recognized the need for incorporating the findings and conclusions of this docket into PEP-2 and that such incorporation would allow for the orderly transition from rate case back to the normal operation of the PEP-2 rate. The order further authorized and directed the parties of record to submit such additional testimony or evidence as they deemed appropriate to address any issues raised by the

incorporation of the rate case conclusions into PEP-2 and by the re-activation of periodic evaluations under PEP-2. In response to this Commission's October 30 order, GCGA filed a motion asking this Commission to withdraw or modify that order. Oral arguments on GCGA's motion were held on November 6, 2001, at which time counsel for GCGA, MPCo, MMA and MPUS appeared and presented arguments regarding GCGA's motion and this Commission's October 30th order. That motion was overruled by the Commission.

On November 6, 2001, the Commission issued a Procedural Order establishing the procedures, including the order of presentation of witnesses and cross-examination for the upcoming hearings.

On November 6, 2001, the Staff filed supplemental testimony of Dr. Christopher Garbacz and MPCo filed supplemental testimony of Dr. Roger A. Morin, along with rebuttal testimony of H.E. Blakeslee, Frances Turnage and Charles a. Benore in accordance with the Commission's October 30, 2001 Order.

III. JURISDICTION AND SUFFICIENCY OF THE FILING

This Commission has jurisdiction of this matter by virtue of its subject and the authority conferred upon this Commission by the laws of the State of Mississippi.

This Commission finds that the pleadings, testimony, data, documentation and exhibits to this docket filed by MPCo comply with all the statutory filing requirements and the requirements of the Commission's Rules for major changes in rates in excess of $15 million, except the requirements of Miss. Code Ann. 77-3-37(4) (b), (c) and (d) (2000), which this Commission finds inapplicable and hereby waives.

This Commission further finds that the Stipulation entered into between the Staff and the Company and filed with this Commission complies with this Commission's Rules and Mississippi law.

Hearings in his docket were held on November 7-9, 2001 in the hearing room of the Commission.

IV. FINDINGS AND CONCLUSIONS

A. STIPULATION.

As stated previously, on October 26, 2001, the Staff and Company filed a joint Stipulation addressing numerous issues related to the Company's filing, including the incorporation of those agreements into PEP-2. As part of its investigation of this request, the Staff undertook a careful and thorough examination of the Company and its business operations. The Staff propounded and the Company responded to 195 data requests, many of which had multiple subparts. The Staff also reviewed the Company's responses to other parties' data requests. Additionally, the Staff had the benefit of conducting regular audits and reviewing the Company's books and records in connection with PEP and other rate filings. This experience gives the Staff a unique insight into the Company's finances and operations. Based upon the Staff's review, it entered into the Stipulation. The Staff recommended approval of the Company's request subject to several changes. This Commission has carefully reviewed the Stipulation and finds that there is substantial evidence in the record to support the Stipulation. This Commission finds that the Stipulation and the matters contained therein are just and reasonable, will benefit retail customers and will reduce the impacts of the Company's request on such customers. Therefore, this Commission hereby adopts the Stipulation dated October 26, 2001, and incorporates the Stipulation herein by reference. Specific findings regarding certain

Stipulation recommendations will be addressed later in this order, including findings regarding recommendations by intervenors which are contrary to the terms of the Stipulation.

1. **Jurisdictional Allocations.**

As noted in the Stipulation, the Company's proposed change in rates is based upon a jurisdictional cost of service study. This study was offered by Ms. Donna H. Van Loon. After careful review of the study and its allocations, the Staff and MPCo stipulated, and this Commission specifically finds, that the study and its jurisdictional allocations of expenses, revenues and rate base are just and reasonable and shall be used in this proceeding and other proceedings where such allocations must be made.

2. **Rate Base Items.**

The Company's filing also contains information related to the Company's rate base, revenue, and expenses for the historic year, 2000, as well as projections of rate base, revenues, expenses and cost of capital for the pro forma test year, 2002. That information was presented in the pre-filed testimony and exhibits of Ms. Van Loon, Ms. Frances Turnage, and Mr. Charles Benore.

The Company filed and proposed a retail average rate base of $753,184,879, for the pro forma test year. The Staff recommended a reduction of $21,435,744 to the Company's pro forma retail average rate base. With that adjustment, the Staff and Company have stipulated to an adjusted rate base of $731,749,135 for the pro forma test year, which this Commission finds to be just and reasonable and hereby adopts.

The Stipulation made specific recommendations regarding the treatment of certain rate base items:

a. Cash Working Capital: In its original filing, the Company calculated a value for cash working capital by taking one-eighth of its non-fuel operation and maintenance expense. This formula is commonly referred to as the "45-day formula." The 45-day formula resulted in a retail cash working capital calculation of $22,593,980. The Company later filed a lead/lag study that indicated a cash working capital calculation of $14,030,903. PEP-2 includes a cash working capital value of negative $5,500,000. The Staff and Company agreed and stipulated to the use of a $0 (zero) retail cash working capital value. Mr. Dittmer, a witness for GCGA, in his testimony adjusted the Company's lead-lag study to eliminate non-cash items. His calculation indicated that the Company's cash working capital requirements are approximately $638,729. Mr. Dittmer then suggested that cash working capital be set at a negative number, but those suggestions were not based on any substantial evidence. No other intervenor gave a recommendation or opinion on this issue. This Commission recognizes that determining the proper amount of cash working capital is not susceptible to exact measurement, but the preponderance of evidence offered indicates that the Company's cash working capital is greater than zero. Therefore, this Commission finds, based upon the various amounts calculated by the parties, that the stipulated retail cash working capital value of $0 (zero) is appropriate and is adopted for inclusion.

b. Construction Work in Progress: In its original filing, the Company proposed that 100% of the Company's average balance of construction work in progress ("CWIP") be included in rate base. The Company asserts that an on-going construction program is required to meet its customers' needs for reliable service. The Staff and Company have agreed and stipulated that the Company's average CWIP balance for all projects ending within one year of the end of the test period shall be included in rate base with any related allowance for funds used during construction ("AFUDC") accrued by the Company included in operating income. Mr. Dittmer

was the only other witness to address this issue. He testified and proposed that this Commission change its long-standing position on construction work in progress by not allowing any construction work in progress to be included in rate base. Mr. Dittmer suggests that the Company will be compensated appropriately by virtue of its use of AFUDC. However, this Commission finds that an on-going construction program is necessary for Mississippi Power Company to meet the needs of its customers, particularly in light of our emphasis on improving reliability and customer service. Moreover, this Commission agrees with Ms. Turnage that greater use of AFUDC could ultimately lead to higher costs for customers. Therefore, this Commission finds that the Staff's and Company's stipulated position on construction work in progress is appropriate and is adopted for inclusion.

c. Regulatory Asset Over/Under Recovery of Ad Valorem Taxes: For purposes of determining operating income and rate levels in PEP-2, the Company accrues its ad valorem tax expense throughout the year for which the tax assessment is made. A portion of ad valorem tax expense is recovered during that year in base rates. The remainder is collected the following year, after the taxes are paid, through the operation of the ad valorem tax adjustment clause (ATA). Because rate base and assessed property values increase over time and because of the mechanics of ATA, this balance is a growing under-recovery. The deferred amount (ad valorem tax under-recovery) has grown over the years to a projected average balance of over $8 million. This represents a substantial commitment of capital. The Staff and Company have stipulated and this Commission agrees and finds that it is appropriate to include the amount of this under-recovery in the determination of retail average rate base. No intervenor has objected to or proposed an alternate treatment of this regulatory asset.

d. Property Damage Reserve: This Commission has allowed the Company to accrue a storm damage reserve (a.k.a. property damage reserve) to prepare for the damages caused by natural disasters that occasionally affect the Company's facilities. Recently, this Commission issued an order in Docket No. 99-UN-497 that provides the Company with flexibility to adjust its accrual amount as the Company deems appropriate up to $4.5 million. The Company and Staff have agreed and stipulated that, as part of the adjustments to rate base, the Company would modify downward the amount for storm damage reserve expense accrual in its rate calculation for the test period and that the Company should continue to comply with this Commission's storm damage reserve order. This Commission finds that the reduction of the storm damage reserve accrual in the test year and the continued compliance with this Commission's order is just and reasonable.

3. Revenues and Operating Expense Items.

a. Adjustments to Expenses: The Company filed and proposed projected revenues and projected expenses which would result in retail net operating income of $76,034,767 in the 2002 test year. The Staff carefully reviewed and considered the Company's testimony and exhibits as they relate to various expense items. The Staff, as stated in the Stipulation, has carefully considered all of the information provided to the Staff and to other intervenors in response to all data requests in this proceeding, particularly with regard to the information provided on the Company's estimations of expenses for the Company's retail electric operations. The Staff has recommended, and Company has agreed, to a reduction in the Company's projected expenses in 2002 of $865,563, including the effect of income taxes. Mr. Dittmer was the only witness who suggested specific recommendations for adjustments to the Company's expenses, including recommendations to adjust outage expenses, labor expenses, capacity

equalization calculations, and revenues for off-system sales. However, some of the adjustments proposed by Mr. Dittmer were not based upon substantial evidence and others were based on incorrect assumptions. First, Mr. Dittmer recommended that this Commission reduce outage expenses at generating units by approximately $2.2 million in retail expenses in the test year based upon his normalizing those major outage expenses for a five-year average. However, the Company correctly pointed out that Mr. Dittmer's adjustment focuses on only the production component of the Company's total operations and maintenance cost. We are not persuaded by Mr. Dittmer's selective adjustment to the Company's operations and maintenance expenses. This Commission must consider all of the Company's operations and maintenance expenses to determine if the overall expenses are reasonable. When viewed in their totality, the Company's operations and maintenance expenses, as adjusted by the Stipulation, are reasonable.

Second, Mr. Dittmer recommended that this Commission eliminate from the Company's projected expenses the costs of establishing a Regional Transmission Organization ("RTO"). This Commission is well aware of the Federal Energy Regulatory Commission's recent attempts to form RTOs. If Southern Company and its operating companies are required to begin the process of forming an RTO in 2002, which is very likely based upon our own involvement in that process and based upon the testimony of Mr. Blakeslee, the Company's projected $1 million probably understates the actual costs to MPCo's retail operations in 2002.

Third, Mr. Dittmer proposed an adjustment to payroll/labor costs in 2002. The Company's witness, Ms. Turnage, addressed Mr. Dittmer's proposal and demonstrated that the Company's filed labor costs are just and reasonable. Therefore, this Commission rejects Mr. Dittmer's proposal to reduce labor costs.

This Commission has long encouraged the parties to try to resolve all reasonable issues, and for this reason, this Commission requires that pre-hearing conferences be held in these cases. Several witnesses indicated that the adjustment to expenses was a "settlement" of disputed issues related to expenses. This Commission realizes that the Staff and utilities routinely disagree over the treatment of expense items, and finds that the adjustment agreed to in the Stipulation is reasonable in light of the extensive knowledge the Staff has regarding the Company's operations and the overwhelming amount of discovery produced by the Company in this proceeding.

The Staff will again have the opportunity to review the Company's 2002 expenses and to propose adjustments to those expenses in connection with the Company's PEP-2 evaluation for the twelve-month period ending December 31, 2002. This evaluation will review twelve months of historical or actual expense information, which is the same period as the projected period in this filing which was prepared using projected 2002 figures. For the foregoing reasons and based upon this Commission's treatment of the specific adjustments suggested by Mr. Dittmer, this Commission finds that the proposed expenses as adjusted by the Stipulation are just and reasonable and, when considered along with the other findings of this Commission, will result in just and reasonable rates and we hereby adopt same.

b. Adjustments to Revenues: Mr. Dittmer recommends that this Commission make an adjustment to the Company's projected off-system sales revenues for 2002. Mr. Dittmer proposes to increase the projected revenues from off-system sales by approximately $8.1 million. Mr. Dittmer admitted however, that his adjustment was based upon the assumption that the Company should be in a better position to sell capacity off-system in 2002 than it was in 2001. Mr. Dittmer apparently did not consider the fact that the Company had been purchasing significant amounts of capacity and energy prior to the completion of Daniel Units 3 and 4, and

that these purchases were replaced by those units. Mr. Dittmer did not undertake any evaluation of market conditions and prices upon which he could base such an adjustment to the Company's projections. His proposed adjustment to off-system sales is therefore speculative and is not adopted.

Mr. Dittmer also recommends an adjustment to increase the revenues to MPCo associated with capacity equalization payments under the Intercompany Interchange Contract ("IIC"). Again, Mr. Dittmer admits that his recommendation is based upon assumptions (without any factual basis about the IIC capacity reserve sharing calculations.) In the Company's rebuttal testimony, Ms. Turnage demonstrated that Mr. Dittmer's calculations were flawed, that he overstated available capacity and that he gave no weight to the seasonal differences in the value of capacity as provided in the IIC and as shown in response to data requests on this issue. This adjustment is not adopted.

4. **Capital Structure and Cost of Capital.**

This Commission has reviewed the portions of the Stipulation agreeing to the Company's proposed capital structure and the weighted cost of the Debt, Trust Preferred Stock and Preferred Stock. This Commission adopts this portion of the Stipulation and finds that all of the elements of MPCo's proposed cost of capital, except for the Company's proposed rate of return on common stock equity, which will be considered separately, are just and reasonable and should be approved. The only other testimony was the recommendation of Dr. John Legler, the expert witness for the Navy, who testified that an average of the 2000 and 2002 year end equity/debt ratio should be utilized for the test period rather than a year-end equity/debt ratio. While we agree that there may be some merit for using an average capital structure, the average should be developed using the beginning and ending of the projected test period – December 2001 and

December 2002 – and not year end 2000 and 2002. It should also be remembered that year 2000 is prior to the time of the equity infusion for the new units. This Commission is not persuaded by Dr. Legler and finds that the stipulated year-end equity/debt ratio, which is a requirement of PEP-2 previously approved by this Commission, is appropriate for use in this case. Since this filing and its results are to be considered in light of PEP-2 and will become a part of PEP-2, it is important that, where appropriate, the findings of this order should be consistent with PEP-2.

B. RETURN ON COMMON STOCK EQUITY.

This Commission heard a great deal of testimony regarding the Company's return on common stock equity, since a part of the Company's request for rate relief is related to an increase in its cost of capital – specifically, the cost of common stock equity. The Company asserts that the existing formulas for return on equity in PEP do not reflect current conditions in the financial markets and therefore do not produce an adequate return to investors. Three persons offered testimony regarding return on common equity – Mr. Charles Benore, Dr. John Legler, and Dr. Chris Garbacz. It is important to note that each of the three cost of capital witnesses testified to and supported a recommended rate of return, a range of returns which they considered reasonable and certain formulas or models used to develop those values. In each case, the formulas or models used differ from the current formulas in the PEP plan. We have carefully considered all of the information presented, and have spent considerable time and effort evaluating that information. This information should be considered to determine a return on the common stock equity for MPCo that is just and reasonable and consistent with companies of comparable risk; that complies with the Mississippi Public Utility Act and the Rules and Regulations of this Commission; and that complies with the requirements of the United States Supreme Court rulings in *Bluefield Water Works & Development Co. v. Public Service*

Commission of West Virginia, 262 U.S. 679 (1923) and *Federal Power Commission v. Hope Natural Gas Co.*, 320 U.S. 591 (1944).

1. **Benore Testimony.**

Mr. Charles Benore testified for MPCo and recommended a 13.25% return on common equity. Mr. Benore used four models in arriving at a proposed rate of return on common equity for MPCo. Those four models are the Discounted Cash Flow Model ("DCF"), the Equity Risk Premium Model ("ERP"), an average of the standard Capital Asset Pricing Model ("CAPM") and the Empirical Capital Asset Pricing Model ("ECAPM"), and the "Comparable Earnings" Method. Mr. Benore's testimony provides descriptions of the DCF, ERP and CAPM models, as does the testimony of the other witnesses. The results of the first three market models were transformed by Mr. Benore in a process described below. Mr. Benore's fourth model, a "Comparable Earnings" Method, is also discussed below. For his DCF and CAPM models and his "Comparable Earnings" method, Mr. Benore selected comparable companies using nine (9) criteria or tests intended to assure that the companies used in these formulas were comparable to MPCo as to important matters such as risk. Mr. Benore testified that MPCo should be allowed a rate of return on common equity of 13.25%, including Transformation and Comparable Earnings, both of which are discussed below.

Mr. Benore's testimony included a calculation of return on common equity which used the same formulas considered by Dr. Garbacz - the DCF, ERP and CAPM (both standard and empirical averaged). Using these formulas in a manner similar to that used by Dr. Garbacz (without Transformation or the "Comparable Earnings" method), Mr. Benore's formulas on average resulted in a return on common equity of 11.47%.

Mr. Benore also used a fourth model, the "Comparable Earnings" method, which calculates a return on common stock equity for MPCo based on the earnings of comparable companies. This model is likewise described in Mr. Benore's testimony. This comparable earnings test or method was criticized by Dr. Garbacz, who testified that the companies were not truly comparable in his opinion, and further because it compared the retail earnings of MPCo with the total earnings of the other companies, which included wholesale and unregulated earnings. This test determined a return on equity for MPCo of 13.3%.

Mr. Benore further testified that the results of the DCF, ERP and the average of the CAPM models should be adjusted by a process called transformation. Transformation, according to Mr. Benore's direct testimony, "is the process that determines the necessary regulatory book return so that investors have an opportunity to earn their required market return." According to Mr. Benore, the standard models for regulatory book return do not provide the return required by investors when the ratio of market value to book value of common stock is above one (1). This Commission desires that companies under its regulatory control remain healthy and earn a return that allows them to attract the capital needed to provide the quality of service that we and their customers require of them. The argument presented was that transformation has not been accepted in any other regulatory rate proceeding. Since we cannot determine any other commission that has endorsed transformation, we are not able to accept this theory at this time.

2. Legler Testimony.

The second rate of return witness heard by this Commission was Dr. John Legler, on behalf of the Navy. Dr. Legler testified that he found a range between 10.5% and 11.5%, which would produce a just and reasonable return on equity for MPCo. His recommended return was

11.0%. In his rebuttal testimony, Mr. Benore noted several errors in Dr. Legler's calculations: an improper retention growth rate estimate for FPL Group, failure to add 0.5% to the growth rate for each of his comparable companies, and the use of August 31, 2001 prices instead of September 28, 2001 prices. Dr. Legler agreed on cross-examination that he had made errors in his direct testimony and when those errors are corrected and considered, Dr. Legler's Late Filed Exhibit____(JBL-1) Schedule 2 (Revised) indicates that his calculated return on equity would become 11.25% using an average of the models used. In response to questions on cross-examination, Dr. Legler gave an opinion that a range from 10.3% to 12.17% would result in a reasonable return. Dr. Legler used three (3) models to calculate his recommended return - DCF, ERP, and CAPM.

3. **Garbacz Testimony.**

The third rate of return witness testifying before this Commission was Dr. Chris Garbacz, on behalf of the Staff. In his pre-filed direct testimony, Dr. Garbacz determined a recommended rate of return of 11.45% for MPCo's return on common stock equity, using three (3) models -- DCF, ERP and CAPM (both standard and empirical averaged). The models applied by Dr. Garbacz and Mr. Benore were virtually identical. In rebuttal testimony, MPCo's expert witness, Mr. Benore, pointed out three errors in Dr. Garbacz's analysis. These errors were that Dr. Garbacz (1) failed to adjust the dividend to be received by investors to the first holding year as required by the DCF model, (2) failed to adjust the ERP and CAPM for flotation costs and only adjusted the DCF model, and (3) did not use the same time period for interest rates for the Equity Risk Premium and CAPM models as used for stock prices. Dr. Garbacz accepted the first two (2) of the three (3) corrections, which results in increasing his recommended return from 11.45%

to 11.67%. Dr. Garbacz then reduced his recommended return to 11.44% to reflect his claim that MPCo is less risky.

4. **Summary of Rate of Return Witnesses.**

Mr. Benore's range of reasonable returns for MPCo (without transformation or comparable earnings tests) is between 11.4% and 11.5%; Dr. Legler's range, as testified on cross-examination, is between 10.30% and 12.17%; and Dr. Garbacz's range, as corrected is between 11.22% to 11.67%, adjusted under PEP. As Dr. Legler stated on cross-examination, any rate of return selected by this Commission within these ranges would be reasonable. However, it also is obvious from studying these ranges of reasonable returns that the preponderance of the testimony would require a return in the 11.4% to 11.7% range, and that a rate of return in that range would result in just and reasonable rates for MPCo and its customers.

5. **Finding of Rate of Return.**

After considering and carefully analyzing all of the rate of return testimony and considering our experience with rate making, including both conventional and formula-type rate of return plans previously approved by this Commission, we find that a just and reasonable rate of return on common stock equity to be used as part of determining just and reasonable rates for MPCo's customers should be set at 11.5%. This rate of return is based upon the models and the substantial weight of the credible evidence and provides reasonable rates for the customers of MPCo and a fair return for the Company. We find that this rate would be equitable, just and reasonable for use in both a conventional rate case and for use in conjunction with a performance review and analysis under PEP-2.

C. PEP-2 CONSIDERATIONS.

Rate schedule PEP-2 and its predecessors have been the rate approved for setting the revenues of the Company since 1986. At the time PEP was first adopted, this Commission recognized the need to alter the conventional method of rate making to consider and adjust for the Company's performance in meeting the most important needs of its customers. The conventional rate setting process did not take into consideration the Company's performance or set rates based upon that performance. To provide for more emphasis on the needs of utility customers in Mississippi, this Commission in 1985 ordered the Company to develop and file a performance-based rate mechanism. After extensive review and deliberation, the PEP plan was adopted. This plan has allowed the Company the flexibility to balance competing priorities, to access capital necessary to construct and maintain facilities, to provide services needed by customers and, most importantly, to do all of these at rates which have been and are low in comparison to other utilities. Since then, this Commission has ordered most of the larger utilities under its regulatory authority to adopt similar performance-based ratemaking plans.

The history and lawfulness of the Company's performance evaluation plan is well settled under Mississippi law. This Commission agrees with the Staff and Company that PEP-2 constitutes a "formula type rate of return evaluation rate" under the provisions of Miss. Code Ann. 77-3-2 (2000). That section provides this Commission the authority for the adoption of and administration of formula type rate plans and authorizes the periodic calculation, review, and adjustment of revenues, performance, and rates of return.

The Company's retail rate mechanism PEP-2 was in effect at the time of the Company's filing of its notice of intent in this docket. Rate PEP-2 provides the basis for determining the just and reasonable revenue needs of MPCo and for fixing its rates. PEP-2 also includes a section

entitled "Major Plant Addition or Modifications," which provides for changes in rates under PEP-2 when major new plant is added. MPCo's filing herein is pursuant to and authorized by this section of PEP-2.

The Staff and Company also jointly acknowledge, and this Commission concurs, that the construction of the Company's new combined cycle units at Victor J. Daniel Electric Generating Plant Units 3 and 4 constitute a major plant addition as contemplated by PEP-2, and that the Company's filing is authorized under PEP-2.

At the time that the Company filed this rate request under the "Major Plant Additions or Modifications" section of PEP-2, this Commission suspended the regular semiannual evaluations. The Staff and Company have stipulated, and this Commission concurs, that the Company should return to regular periodic PEP-2 evaluations at the end of 2002.

One object of the PEP plan is to promote rate stability. A key provision of PEP-2 limits rate changes resulting from regular semiannual evaluations to 2% of aggregate retail revenue. In order to return to normal operation of PEP and maintain rate stability, it is essential that, in deciding the rate request before us in this docket, the Commission also consider the ongoing operation of PEP-2 and make provision for appropriate integration of this decision with the ongoing operation of the PEP-2 plan.

In recognition of this, on October 30, 2001, this Commission ordered that all parties present such testimony as it deemed appropriate concerning the incorporation of the holding in this docket with and into PEP-2. This was done to recognize and allow for the orderly transition of this case to the normal and continued operations of PEP-2. In order to accomplish the integration of this proceeding with PEP-2 it is necessary for us to:

a. Include into PEP-2 the approved changes in this docket that are necessary to

update and improve PEP-2 and to assure that PEP-2 continues to yield just and reasonable rates, and

b. Provide the means and requirements necessary to integrate the results of this case with the remaining provisions of PEP-2, which continues to be rate making mechanism for determining the Company's rates.

1. **Changes Necessary in PEP-2**

The Staff and the Company have stipulated to the following matters regarding PEP-2:

a. Future rate adjustments under PEP-2 should be determined based upon the middle of the Range of No Change, not on the top or bottom of the Range; and the "sharing" of rate increases and decreases based on price performance should be eliminated. An additional penalty/reward mechanism should be added as per the Stipulation.

b. The cash working capital value used in PEP-2 should be $0 (zero).

c. The CWIP in PEP-2 should include all projects ending within a year of the end of the evaluation period, with any related AFUDC included in operating income.

d. The Company's rate base in PEP-2 should include the regulatory asset Over/Under Recovery of Ad Valorem Taxes.

e. The following language should be added to Rate Schedule, "PEP-2" MPSC Schedule No. 28, page 3 of 28, under the section Filing Procedures:

> In considering any evaluation filed pursuant to this Rate PEP-2, nothing in this Rate shall be construed to prevent the Staff from disputing the accuracy of any investment, revenue or expense; from disputing that any investment, revenue or expense is prudent in amount or purpose or otherwise in accord with the Mississippi law, the Rules and Regulations of the Commission or this Rate PEP-2; or from disputing whether any item investment, revenue or expense is improperly recorded to an account. The Staff may request and the Company shall provide clarification and additional data underlying the entries subjacent to the categories of (1) Investment, (2) Revenues, and (3) Expenses.

f. The Company's initial evaluation under PEP-2, as revised pursuant to this Stipulation in this docket, should be made in February 2003, in accordance with the rate schedule based upon the twelve months ended December 31, 2002.

The Commission finds that the changes to PEP-2 proposed by the Stipulation will produce rates which, when combined with the other findings of this order, will be just, reasonable and in the best interest of the Company's customers and the Company, and we hereby adopt those changes for incorporation in PEP-2.

The Stipulation does not include any agreements regarding the calculation for the cost of common stock equity in PEP-2 (and specifically as to the models included for the calculation of K_{AVG}% therein), which is currently provided in Appendix C of that rate schedule.

There was testimony by some of the parties as to (1) whether the rate of return on common stock equity for a conventional case should become the K_{AVG} in PEP-2 (known previously as the benchmark) and, therefore, should be adjusted – up or down – for MPCo's performance or (2) whether the conventional rate of return should be the allowed return under PEP-2 including performance. This Commission is familiar with PEP-2 and its predecessors. We have never questioned that the conventional return on equity should be the benchmark or starting point (K_{AVG}) with adjustments to be made for performance according to the PEP rate schedule. We agree with witness Dr. Roger Morin that this is what was intended in the initial PEP and all subsequent changes to PEP.

This commission finds, based on the testimony of all the rate of return witnesses, that the present models used in PEP-2 may not currently produce a return on common stock equity (or K_{AVG} as it is referred to in PEP-2) which is just and reasonable.

This Commission is of the opinion that changes to the current models used in PEP-2 should be considered in a separate docket, and that the parties in this proceeding and any new intervenors should be given further opportunity to comment and offer testimony as to changes in the formulas. In order to accomplish this review and to assure that the models provide just and reasonable returns to the Company and likewise just and reasonable rates for MPCo's customers when the semi-annual evaluation under PEP-2 are reinstituted, we are simultaneously with the issuance of this order, issuing a Show Cause Order to MPCo which will establish a new docket to determine the sufficiency of the models which will be used to calculate a just and reasonable return on equity or K_{AVG} for PEP-2.

All of the changes made to PEP-2 by this order, including those adopted from the Stipulation, are subject to change at any time that this Commission finds that they or any other provisions of PEP-2 become unreasonable or cease to result in just and reasonable rates. As we have done in the past, including in this docket, we are not hesitant to call for and make any and all changes which might be necessary.

2. **Integration of the Findings in this Case with PEP-2.**

As this Commission has previously stated, PEP-2 continues to be the rate mechanism under which MPCo's revenue requirements are determined and changes in rates are made. PEP-2 in the Section entitled "Major Plant Additions or Modifications" allows for a change in rates that might be greater than the 2% limitation included in PEP-2, but does not eliminate any of the features of PEP-2. Since no filing under this section of PEP-2 (or any predecessor PEP) has heretofore been made or needed, this Commission feels a need to set forth the requirements and the results of a filing under that section.

The "Major Plant" section of PEP-2 requires that a filing for extraordinary relief due to

the construction of a generating plant must comply with the major case filing requirements provided for by the Public Utility Act and the rules and regulations of this Commission. This requires voluminous financial and other data which would not be filed under an ordinary evaluation under PEP-2. It also requires that a projected test year for determining rates be used instead of the historic test year used in the PEP-2 periodic evaluations. It allows for recovery of an increase in revenues in excess of the 2% of retail revenues, if such is justified.

Neither the "Major Plant" section nor any other section of PEP-2, eliminates the need to perform a calculation of performance to determine whether a change, up or down, should be made so as to reflect MPCo's performance. This is by design. This Commission has since 1985 required that MPCo's rates be adjusted for performance in those areas which most affect the customers -- currently price, reliability and customer satisfaction. We never intended that any rate for MPCo set under PEP-2 or any of its provisions ignore performance.

When this matter was filed, we did not void PEP-2 as the rate method for MPCo, we simply suspended the semi-annual rate evaluation to be made under it. This allowed us to litigate the matters required under the "Major Modification" section and to use the remaining provisions to determine just and reasonable rates for MPCo.

The use of a projected test year, as required here, evaluates MPCo for the year 2002. It would have been counter-productive to evaluate MPCo's need for rates under PEP-2 prior to the end of the 2002 test year. This was the reason we have concluded in accord with the Stipulation, that the semi-annual rate evaluations would only resume based on the historic 12 months ended December 31, 2002. This will also give this Commission a second evaluation, based on actual, historic data of the same period for which rates are to be made here on the projected 2002 year.

The procedure for the calculation of the Company's revenue requirements in this docket, which we find to be consistent with PEP-2, is as follows:

a. The rate base, revenues and expenses, capital structure, and weighted cost of debt, trust preferred stock and preferred stock included in the filing, as modified by the Stipulation and approved herein, shall be used.

b. The return on common equity, as determined herein and adjusted by .25% for flotation costs shall be used as K_{AVG} in the PEP-2 calculation, as PEP-2 is modified by the Stipulation, using the Company's performance as of December 31, 2000, as was used by Dr. Garbacz.

c. Based on this procedure, the Commission finds that the rates determined herein are just and reasonable.

The Company shall determine its revenue requirements for the test year on the basis of this order; shall allocate that revenue requirement to its rate schedules and special contracts; and shall file revised rate schedules reflecting the change.

Although not mentioned in the testimonies of the parties in this docket, the Company included in its test year expenses one-third of the total estimated amount of the costs it expected to incur in this docket. Beginning in 2002, the total costs incurred by MPCo in this docket shall be amortized over a period not to exceed 36 months.

This order shall be effective upon issuance.

Chairman Nielsen Cochran voted Aye; Vice-Chairman Michael Callahan voted Aye; Commissioner Bo Robinson voted Aye.

SO ORDERED by the Commission on this the 3rd day of December, 2001.

MISSISSIPPI PUBLIC SERVICE COMMISSION

Nielsen Cochran, Chairman

Michael Callahan, Vice Chairman

Bo Robinson, Commissioner

Using Analysts' Growth Forecasts to Estimate Shareholder Required Rates of Return

Robert S. Harris

Robert S. Harris is a member of the faculty of the University of North Carolina at Chapel Hill. He is also an Associate Editor of Financial Management.

I. Introduction

Shareholder required rates of return play key roles in establishing economic criteria for resource allocation in many corporate and regulatory decisions. Theory dictates that such returns should be forward-looking return requirements that take into account the risk of the specific equity investment.

Estimation of such returns, however, presents numerous and difficult problems. Although theory clearly calls for a forward-looking required return, investigators, lacking a superior alternative, often resort to averages of historical realizations. One primary example is the determination of equity required return as a "least risk" rate plus a risk premium where an equity risk premium is calculated as an average of past differences between equity returns and returns on debt instruments. The historical studies of Ibbotson *et al.* [9] have been used frequently to implement this approach.[1] Use of such historical risk premia assumes that past realizations are a good surrogate for future expectations and that risk premia are roughly constant over time. Additionally, the choice of a time period over which to average data under such a procedure is essentially arbitrary. Carleton and Lakonishok [3] demonstrate empirically some of the problems with such historical premia when they are disaggregated for different time periods or groups of firms.

Recently Brigham, Shome, and Vinson [2] surveyed work on developing *ex ante* equity risk premia with particular emphasis on regulated utilities. They presented their own risk premia estimates, which make use of financial analysts' forecasts as surrogates for investor expectations.

The current paper follows an approach similar to Brigham *et al.* and derives equity required returns and risk premia using publicly available expectational

Thanks go to Ed Bachmann, Rich Harjes, and Hamid Mehran for computational assistance and to Bill Carleton, Pete Crawford, and Steve Osborn for many discussions. I gratefully acknowledge financial support from the UNC Business Foundation and the Pogue Foundation and thank Bell Atlantic for supplying data for this project. Finally, I thank colleagues at UNC for their helpful comments.

[1] Many leading texts in financial management use such historical risk premia to estimate a market return. See for example, Brealey and Myers [1]. Often a market risk premium is adjusted for the observed relative risk of a stock.

data. The estimation makes use of dividend growth models but incorporates expected rather than historical growth rates. A consensus forecast of financial analysts is used as a proxy for investor expectations. While Brigham *et al.* focus on utility securities, this paper also provides estimates of risk premia for a broad market index. Equity risk premia for both the market and for utilities are shown to vary over time with changes in the perceived riskiness of corporate activity relative to U.S. government bonds. In addition, the estimated risk premia at any given time are shown to vary across groups of stocks. The paper also provides results using the dispersion of analysts' forecasts as an *ex ante* proxy for equity risk.

Section II discusses related literature on financial analysts' forecasts (FAF) and the estimation of required returns using such forecasts. In Section III models and data are discussed. Following a comparison of the results to those of earlier studies (including historical risk premia), the estimates are subjected to economic tests of both their time-series and their cross-sectional characteristics in Section V. Finally, conclusions are offered.

II. Background and Literature Review

In finance, it is often convenient to use the notion of a shareholder's required rate of return. Such a rate (k) is the minimum level of expected return necessary to compensate the investor for bearing risks and receiving dollars in the future rather than in the present. In general, k will depend on returns available on alternative investments (*e.g.*, bonds or other equities) and the riskiness of the stock. To isolate the effects of risk it is often useful (both theoretically and empirically) to work in terms of a risk premium (rp), defined as

$$rp = k - i, \qquad (1)$$

where i = required return for a zero risk investment. Theoretically, i is a risk free rate, though empirically its proxy (*e.g.*, yield to maturity on a government bond) is only a "least risk" alternative that is itself subject to risk.[2] While models such as the capital asset pricing model offer explicit methods for varying risk premia across securities, they provide little practical advice on establishing some benchmark market risk premium. Other models, such as the dividend growth model (hereafter referred to as the discounted cash flow, or DCF, model), can be used to provide direct estimates of k, and hence implied values of rp, but are silent on how rp ought to vary across firms. In this paper DCF models are used to establish risk premia both for the market and for utility stocks. Since the DCF analysis uses a consensus measure of FAF of earnings as a proxy for investor expectations, a brief review of research on FAF is appropriate.

A. Literature on FAF

Much of the burgeoning literature on properties of FAF is surveyed by Givoly and Lakonishok [8]. Of primary importance for this work is the relationship between FAF and investor expectations that determine stock prices. Such forecast data are readily available. That they are used by investors is evidenced by the commercial viability of services that provide such forecasts and by the results of studies of investors' behavior (Touche, Ross and Company [16], Stanley, Lewellen and Schlarbaum [15]). Moreover, a growing body of knowledge shows that analysts' earnings forecasts are indeed reflected in stock prices. Such studies typically employ a consensus measure of FAF calculated as a simple average[3] of forecasts by individual analysts. Elton, Gruber, and Gultekin [5] show that stock prices react more to changes in analysts' forecasts of earnings than they do to changes in earnings themselves, suggesting the usefulness of FAF as a surrogate for market expectations. In an extensive NBER study using analysts' earnings forecasts, Cragg and Malkiel [4, p. 165] conclude "the expectations formed by Wall Street professionals get quickly and thoroughly impounded into the prices of securities. Implicitly, we have found that the evaluations of companies that analysts make are the sorts of ones on which market valuation is based." Updating Cragg and Malkiel's work, Vander Weide and Carleton [17] recently compare consensus FAF of earnings growth to 41 different historical growth measures.[4] They con-

[2]In this development the effects of tax codes and inflation on required returns are ignored.

[3]Mayshar [14] discusses the problems of explaining equilibrium prices of securities when there is divergence of opinion among investors. One issue is whether it is the expectation of the marginal investor or the average investor that determines security prices. Mayshar shows that, in general given divergence of opinion and trading costs, not all investors trade in all assets and that equilibrium prices and the identity of investors trading in each asset are jointly determined. In this sense, equilibrium prices can be considered as "determined simultaneously by the average and marginal investors."

[4]Both Cragg and Malkiel [4] and Vander Weide and Carleton [17] show that an average measure of analysts' forecasts of growth in earnings is powerful in explaining cross-sectional variation in price earnings ratios of stocks.

clude that "there is overwhelming evidence that the consensus analysts' forecast of future growth is superior to historically-oriented growth measures in predicting the firm's stock price . . . consistent with the hypothesis that investors use analysts' forecasts, rather than historically-oriented growth calculations, in making stock buy and sell decisions." [17, p. 15].

B. Use of FAF to Estimate Equity Required Returns

Given the demonstrated relationship of FAF to equity prices and the direct theoretical appeal of expectational data, it is no surprise that FAF have been used in conjunction with DCF models to estimate equity return requirements. Typically such approaches have estimated an *ex ante* risk premium (rp) calculated as the difference between required return and a least risk rate as shown in Equation (1).

Malkiel [13] estimated such risk premia for the Dow Jones Industrial Index using a nonconstant growth version of the DCF model. Initial years of growth were based on Value Line's five-year earnings growth forecasts with subsequent growth approaching a long-run real national growth rate of 4%. More recently, Brigham, Vinson, and Shome [2] used a two stage DCF growth model to estimate *ex ante* risk premia for electric utilities and the Dow Jones Industrial Index. For the period 1966–1984, they report annual risk premia for both Dow Jones Industrial and Electric Indices using Value Line's forecasts. Beginning in 1980 they report monthly risk premia for electric utilities with the source of FAF varying over time; starting with Value Line, adding Merrill Lynch and Salomon Brothers in 1981 and finally, in mid-1983, adding IBES data. IBES (Institutional Broker's Estimate System) is a collection of analysts' forecasts and is discussed in the next section. The resultant risk premia vary over time. In addition, Brigham *et al.* present evidence that their estimated risk premia vary cross-sectionally with a stock's risk (as proxied by bond rating) and over time with the level of interest rates. FAF also have been used in conjunction with DCF models by a number of expert witnesses in rate of return determination for regulated utilities. Recently, the Federal Communications Commission [6] tentatively endorsed the use of consensus FAF in DCF determinations of required return on equity.[5]

This paper adds to earlier work in a number of important respects. First, while Malkiel and Brigham *et al.* focus on electric utilities or the Dow Jones Industrial Index, this paper estimates risk premia for a broadly defined market index — the Standard and Poor's 500. Thus, the results are directly comparable to historical "market" risk premia typically estimated on a similar sample of stocks. Second, the study uses a large sample of FAF (beginning in 1982 when the necessary data first became available). This provides the ability to use a consensus measure of expectations as would be suggested by financial theory. Third, the results show that the derived risk premia change over time and that these changes are related to proxies for risk, which would be expected to be associated with equity risk premia. Although such changes have been noted by earlier studies (*e.g.*, Brigham *et al.*), there is little work explaining the patterns of change. Finally, the paper shows the usefulness of the dispersion of FAF as a proxy for risk. Such a measure is a direct expectational measure of risk and does not rely on assumptions of risk stability over time as do most operational methods of deriving risk surrogates.

III. Models and Data

A. Model for Estimation

The DCF model states that the current market price is the present value of expected future cash flows from ownership. The simplest and most commonly used version estimates shareholders' required rate of return, k, as the sum of dividend yield and expected growth in dividends, or

$$k = (D_1/P_0) + g, \qquad (2)$$

where D_1 = dividend per share expected to be received at time one, P_0 = current price per share (time 0), and g = expected growth rate in dividends per share. The limitations of this model are well known, and it is straightforward to derive expressions for k based on more general specifications of the DCF model.[6] The primary difficulty in using the DCF model is obtaining an estimate of g, since it should reflect market expecta-

[5]In response to the FCC's *Notice of Proposed Rulemaking* [6] to determine authorized rates of return, AT&T used an approach driven by FAF growth estimates from IBES. Also see, for example, W.T. Carleton, *Testimony before the Vermont Public Service Board*, Docket No. 4865 (January 1984) and R.S. Harris, *Testimony filed with the Delaware Public Service Commission*, Docket 84–33 (November 1984). In its *Supplemental Notice* [6], the FCC tentatively endorsed substantial reliance on FAF for use in DCF determination of cost of equity.

[6]As stated, Equation (2) requires expectations of either an infinite horizon of dividend growth at rate g or a finite horizon of dividend growth at rate g and special assumptions about the price of the stock at the end of that horizon. Essentially, the assumption must ensure that the stock price grows at a compound rate of g over the finite horizon.

tions of future performance. Without a ready source for measuring such expectations, application of the DCF model is fraught with difficulties even if the simple version shown in Equation (2) fits the equity investment in question. This paper uses published FAF of long-run growth in earnings as a proxy for g.

B. Data

Many analysts publish forecasts of corporate earnings. Such forecasts are widely disseminated and are the subject of considerable interest both to investors and researchers (see Givoly and Lakonishok [8]). In recent years, this interest has led to a viable market for services that collect and disseminate such FAF. FAF for this research come from IBES (Institutional Broker's Estimate System), which is a product of Lynch, Jones, and Ryan, a major brokerage firm. Data in IBES represent a compilation of earnings per share (EPS) estimates of about 2000 individual analysts from 100 brokerage firms on over 2000 corporations. IBES data are provided to clients in a number of forms, including on-line data bases provided by vendors. The client base, which currently numbers more than 300, includes most large institutional investors such as pension funds, banks, and insurance companies. Representative of industry practice, IBES contains estimates of (i) EPS for the upcoming fiscal year, (ii) EPS for the subsequent year, and (iii) a projected five-year growth rate in EPS. Each item is available at monthly intervals.

IBES collection procedures are designed to obtain timely forecasts made on a consistent basis. IBES requests "normalized" five-year growth rates from analysts. Such normalization is designed to remove short-term distortions that might stem from using an unusually high or low earnings year as a base. These growth and other earnings forecasts are updated when analysts formally change their stated predictions. IBES does, however, verify prior forecasts monthly to make sure that analysts still hold to them. Despite these procedures, there remain potential difficulties in using IBES data to the extent that some analysts fail to normalize growth projections or fail to continually review and revise their earnings estimates. To control for some of these potential difficulties, this analysis uses averages of analysts' forecasts for a wide range of companies over an extended number of months.

In this research, the mean value of individual analyst's forecasts of five-year growth rate in EPS will be used as a proxy for g in the DCF model.[7] The five-year horizon is the longest horizon over which such forecasts are available from IBES and often is the longest horizon used by analysts. One could make alternate assumptions about growth after five years and use a more general version of a DCF model, but unfortunately, there is no source for obtaining market estimates of this expected growth. As a result, the current analysis applies the five-year growth rate as a proxy for g in Equation (2). Given no objective basis for predicting a change in growth (see Footnote 6), this avoids the introduction of *ad hoc* assumptions about future growth. Importantly, however, the approach is applied to portfolios of stocks rather than to individual securities, since future growth patterns may be expected to have drastic changes for some specific securities. Stock prices were obtained from Chase Econometrics and dividend and other firm-specific information from COMPUSTAT. Interest rates (both government and corporate) were gathered from Federal Reserve Bulletins and from Moody's Bond Record. Exhibit 1 describes key variables used in the study. Data collected cover all dividend paying stocks in the Standard and Poor's 500 stock (SP500) index plus approximately

Exhibit 1. Variable Definitions

k	=	equity required rate of return
P_0	=	average daily price per share*
D_1	=	expected dividend per share measured as current indicated annual dividend from COMPUSTAT multiplied by $(1+g)$†
g	=	average financial analysts' forecasts of five-year growth rate in earnings per share (from IBES)
σ_g	=	cross-sectional standard deviation of analysts' forecasts of growth in earnings per share (from IBES)
N_g	=	number of analysts' forecasts of g (from IBES)
i_{20}	=	yield to maturity on 20-year U.S. government obligations. Source: Federal Reserve Bulletin, constant maturity series
i_c	=	yield to maturity on long-term corporate bonds: Moody's average
i_u	=	yield to maturity on long-term public utility bonds: Moody's average
rp	=	equity risk premium calculated as $rp = k - i_{20}$

*In results reported P_0 is the average daily price for a stock from the beginning of the month up to and including the date of publication of monthly IBES data (typically half a month). Almost identical results were found using the average price for the entire month.
†See Footnote 8 at the end of the paper for a discussion of the $(1+g)$ adjustment.

[7]While the model calls for expected growth in dividends, no source of data on such projections is readily available. In addition, in the long run, dividend growth is sustainable only via growth in earnings. As long as payout ratios are not expected to change, the two growth rates will be the same. Vander Weide and Carleton [17] also use the IBES growth rate in earnings per share.

150 additional stocks of regulated companies. Since five-year growth rates were first available from IBES in January 1982, the analysis covers the 36-month period 1982–1984. On average, each company in SP500 had approximately nine individual forecasts of g per month, with some companies having 20 or more forecasts of g. As a result, well over 100,000 FAF (company-months) were employed in the analysis.

IV. Construction of Risk Premia and Required Rates of Return

For each month, a "market" required rate of return was calculated using each dividend paying stock in the SP500 index for which data were available. The DCF model in Equation (2) was applied to each stock and the results weighted by market value of equity to produce the market required return.[8] The return was converted to a risk premium by subtracting i_{20}, the yield to maturity on 20-year U.S. government bonds.[9] The procedure was repeated for the Standard and Poor's Utility Index (SPUT) of 40 stocks. Exhibit 2 reports the results by quarter.

Exhibit 2. Required Rates of Return and Risk Premia

		SP500		SPUT

*i_{20} = Yield on U.S. Treasury obligation, 20 year constant maturity.
†Monthly required return (k) calculated as value weighted average. Quarterly values are simple averages of monthly figures.
‡Risk premium calculated as $k - i_{20}$.

The results appear quite plausible. The estimated risk premia are positive, consistent with equity owners demanding a risk premium over and above returns available on debt securities. Also, as would be expected for less risky stocks, the utility risk premia consistently fall below those estimated for stocks in general. Exhibit 2 shows that estimated risk premia change over time, suggesting changes in the market's perception of the incremental risk of investing in equity rather than debt securities. Such changes will be examined in a subsequent section.

For comparative purposes, Exhibit 3 provides results of related studies. The long-run differential return between stocks and long-term government bonds (Panel A) has been about 6.4% per year (on a geometric basis). It is comforting to note that this is very close to the 6.16% average annual risk premia estimated in Exhibit 2. Note, however, that such risk premia appear to change over time. Panels B and C show some of Brigham *et al.*'s risk premium estimates. Unfortunate-

[8]The construction of D_1 is controversial since dividends are paid quarterly and may be expected to change during the year; whereas, Equation (2), as is typical, is being applied to annual data. Both the quarterly payment of dividends (due to investors' reinvestment income before year's end, see Linke, and Zumwalt [11]) and any growth during the year require an upward adjustment of the current annual rate of dividends to construct D_1. If quarterly dividends grew at a constant rate, both factors could be accommodated straightforwardly by applying Equation (2) to quarterly data (with a quarterly growth rate) and then annualizing the estimated quarterly required return. Unfortunately, with lumpy changes in dividends, the precise nature of the adjustment depends, on both an individual company's pattern of growth during the calendar year and an individual company's required return (and hence reinvestment income in that risk class).

In this work, D_1 is calculated as $D_0(1 + g)$. The full g adjustment is a crude approximation to adjust for both growth and reinvestment income. For example, if one expected dividends to have been raised, on average, six months ago, a "½ g" adjustment would allow for growth, the remaining "½ g" would be justified on the basis of reinvestment income. Any precise accounting for both reinvestment income and growth would require tracking each company's dividend change history and making explicit judgments about the quarter of the next change. Since no organized "market" forecasts of such a detailed nature exist, such a procedure is not possible. To get a feel for the magnitudes involved, the average dividend yield (D_1/P_0) and growth (market value weighted 1982–1984) for the SP500 were 5.8% and 12.5%. Comparable figures for the SP utility index were 10.4% and 6.7%. As a result, a "full g" adjustment on average increases the required return by 60–70 basis points (relative to no g adjustment) for both indices.

[9]Brigham, Shome, and Vinson [2] also use this interest rate to create equity risk premia. The results were robust to changes in weighting. For the SP500, equal weighting (rather than value weighting) increased the 1982–1984 risk premium by two basis points while for the SPUT equal weighting resulted in a 21 basis point increase. As a further test, the SP500 stocks were ranked on g and the upper and lower deciles deleted. The resulting risk premium (1982–84 average) was 5.94%. A similar procedure used to rank dividend yield produced an SP500 risk premium of 6.18%.

ly, their work does not include a broad market index directly comparable to the SP500. Rather, they use the Dow Jones Industrial Index based on 30 large industrial concerns. Though the SPUT includes a broader set of utilities than the electrics covered by Brigham *et al.*, their average risk premium estimates are also in the 4 to 5% range for the early 1980s.

While the estimates in Exhibit 2 are quite plausible, the question still remains as to whether they satisfy economic criteria one would expect of risk premia. In the following section, the estimated risk premia are subjected to a series of tests to see if they vary both cross-sectionally and over time with changes in risk. The tests are ultimately joint tests of the estimates as useful risk premia, the measured proxies for risk and the validity of the economic hypothesis. Nonetheless, if the tests using the risk premia have results conforming to theoretical expectation, the comfort level in using them is increased accordingly.

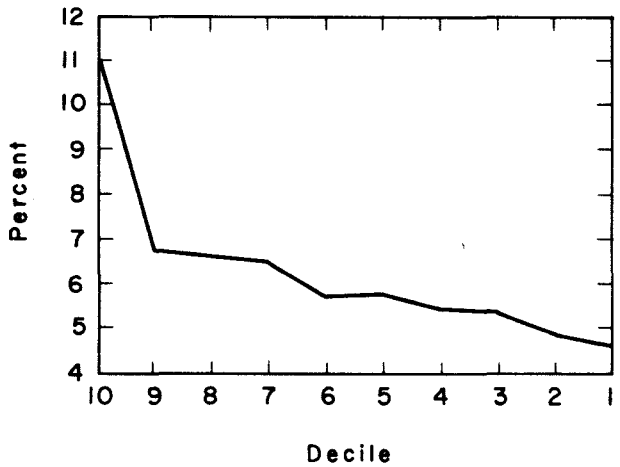
V. Characteristics of Risk Premia

A. Cross-Sectional Tests

Brigham *et al.* show that risk premia (IBES estimates for first half of 1984) for electric utilities are lower the higher the bond rating of the company, confirming the expected tradeoff between risk and return. A similar experiment for electrics, using the current data stretching back to January 1982, confirmed this relationship for a longer time period. Exhibit 4 reports selected results of that analysis. As a contrast, Exhibit 4 also shows the results of using historical growth rates (rather than FAF) in a DCF model. Risk premia derived from historical growth are actually higher for companies with very safe debt, suggesting the clear inferiority of historical to expectational growth rates. With the exception of beta, which is roughly constant across groups, other measures of risk noted in Exhibit 4 confirm the risk differentials associated with bond rating groups.

A further test of the cross-sectional variation in risk premia was performed by dividing the universe of

Exhibit 5. Equity Risk Premia: Deciles Based on Standard Deviation of Financial Analysts Forecasts* (Companies with at least three analysts)



*Risk premia were calculated as equally weighted averages for each decile (10 = highest dispersion) for each of three months: January 1982, December 1982, and September 1983 (approximately 50 companies per decile). These premia were then averaged across deciles. A similar downward pattern was evident in each month.

stocks (industrial plus utility) according to the dispersion of analysts' forecasts, σ_g. This cross-sectional measure of analysts' disagreement should be positively related to the uncertainty of future growth prospects and hence to the riskiness of equity investment. Elsewhere, Malkiel [12] has discussed the rationale and usefulness of such dispersion as an *ex ante* measure of risk. Malkiel argues that σ_g may be a proxy for systematic risk and shows that it bears a closer empirical relationship to expected return than does beta or other risk measures. Most of Malkiel's work is, however, based on data from the 1960s. Exhibit 5 reports risk premia by decile based on σ_g for companies having at least three analysts' forecasts. The three months were chosen as representative. The results show a consistent positive relationship between risk premia and dispersion of analysts' forecasts.

The results in Exhibits 4 and 5 show that the estimated risk premia conform to theoretical relationships between risk and required return that are expected when investors are risk averse. This strengthens the case for using such risk premia, and provides encouragement for further study of their structure.[10]

[10]Such *ex ante* required returns offer a useful alternative to *ex post* data typically used in tests of asset pricing models. See Friend, Westerfield, and Granito [7] for a test of the CAPM using survey data rather than *ex post* holding period returns.

B. Time Series Tests

A potential benefit of using *ex ante* risk premia is the estimation of changes in risk premia over time. Brigham *et al.* [2] note such changes for utility stocks and relate them to changes in interest rates. They conclude that prior to 1980 utility risk premia increased with the level of interest rates, but that this pattern reversed thereafter, resulting in an inverse correlation between risk premia and interest rates. They explain this turnaround as the outcome of changes in bond markets and adaptation of utilities and their regulators to an inflationary environment. Brigham *et al.* do not, however, analyze changing risk premia for stocks in general. Furthermore, they do not provide direct empirical proxies for changes in equity risks that would explain changes in equity risk premia over time.[11]

C. Changes in Risk Premia

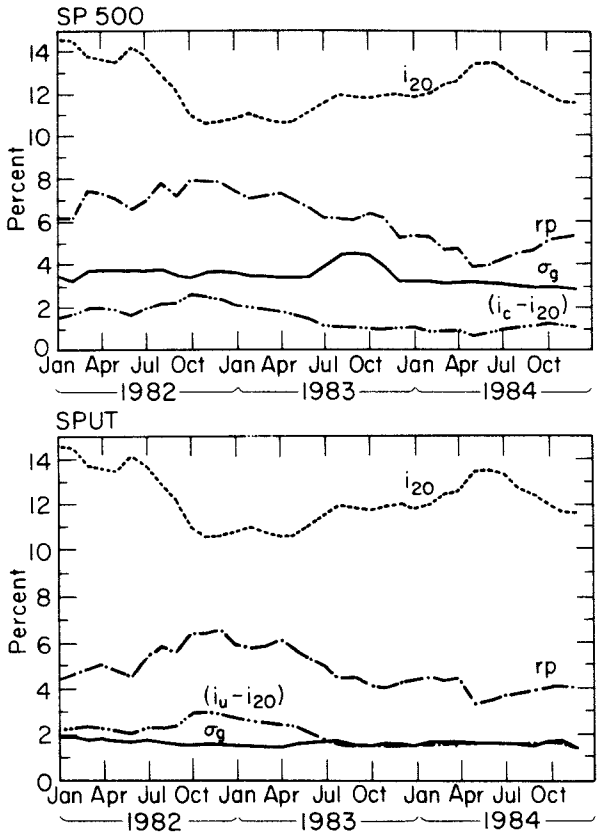
One would expect changes in measured equity risk premia to be related to changes in perceived riskiness. First, with changes in the economy and financial markets, equity investments may be perceived to change in risk. Second, since government bonds are risky investments themselves, their perceived riskiness may change. For example, the large increase in interest rate volatility in the last decade has undoubtedly made fixed income investments more risky holdings than they were in a world of relatively stable rates. Measured equity risk premia (relative to government bonds) could thus be reduced due to increases in perceived riskiness of bonds, even if equities displayed no shifts in risk.

One measure of risk, the standard deviation of FAF, σ_g, was shown previously to be related to cross-sectional differences in risk premia. To test its usefulness as a time series measure of risk, the average value of σ_g was calculated each month for the SP500 index and the SPUT index. The results are graphed in Exhibit 6.[12]

[11]In addition, Brigham *et al.* do not report on their treatment of serial correlation in reported regression results, making it more difficult to interpret their findings. As an example, monthly data are used for the 1980–1984 period in a time series regression of a risk premium on the level of interest rates. Similar regressions using data in this paper (1982–1984 monthly data) showed significant positive autocorrelation with Durbin Watson Statistics well below 1.0.

[12]The average values of σ_g are the market value weighted averages of the σ_g for individual stocks. If one looked at a direct estimate of g made by individual analysts for the index, one would expect to find a lower amount of dispersion because some of the differences on individual securities would cancel out. Such data are not available. One would suspect, however, that the calculated average would move up and down in tandem with this unobservable measure of dispersion.

Exhibit 6. Equity Risk Premia, Interest Rates and Risk



Another possible time series proxy for equity risk is the set of yield spreads between corporate and government bonds. As the perceived riskiness of corporate activity increases, the difference between yields on corporate bonds and government bonds should increase. One would expect the sources of increased riskiness to corporate bonds to also increase risks to shareholders.[13] Exhibit 6 graphs two series of yield spreads. The first is the difference between the yield on Moody's corporate average series and the yield on 20-year U.S. Treasury obligations. This series includes debt of both industrial and utility companies and thus would be appropriate as a risk proxy for a broad market index such as the SP500. The second is the spread between the yields on Moody's public utility series and 20-year U.S. Treasury bonds. This series should reflect relative risks of utility stocks as proxied by SPUT.[14]

Exhibit 7 reports results of analyzing the relationship between risk premia, interest rates, and proxies for risk for both the SP500 and SPUT. All regressions are corrected for serial correlation.[15] For stocks in general, Panel A shows that risk premia are negatively related to the level of interest rates — as proxied by i_{20}. Such a negative relationship may result from increases in the perceived riskiness of investment in government debt at high levels of interest rates. A direct measure of uncertainty about investments in government bonds would be necessary to test this hypothesis directly.

The results also show the significant positive relationship between the two proxies for risk and the estimated risk premia. For example, regression 4 of Panel A shows that the equity premium on the SP500 increases with the dispersion of FAF (σ_g) and the yield spread between corporate and government bonds ($i_c - i_{20}$). Evidently, these two risk measures capture somewhat different dimensions of risk, both of which appear important in explaining risk premia on stocks in general. The simple correlation coefficient between the two risk measures is 0.19 and is insignificantly different from zero. The addition of the yield spread risk proxy also dramatically lowers the magnitude of the coefficient on government bond yields, as can be seen by comparing Equations 1 and 3 of Panel A. Apparently, a large part of the effect of changes in government bond rates on equity risk premia may be explained through the narrowing of the yield spread between corporate and government bonds. This suggests that such increases in government yields may often be associated with a reduction in the *difference* in risk between investment in government bonds and in corporate activity.

Panel B shows that utility risk premia are also inversely related to the level of interest rates as was found by Brigham *et al.* [2]. Unlike the results for stocks in general, however, changes in the dispersion of FAF over time are not significantly related to changes in these utility risk premia. This may be be-

[13]Of course, counterexamples could be constructed but one would expect an overall positive correlation across companies. Additionally, the cross-sectional relationship between bond ratings and equity risk premia reported earlier in the paper supports the link between corporate debt risks and risks on equity.

[14]Note that these two series reflect both changes in the ratings of corporate bonds as well as yield spreads for a given bond rating. The two series proved better in explaining equity risk premia than use of two comparable series for AA-rated debt.

[15]Ordinary least squares regressions showed severe positive autocorrelation in many cases with Durbin Watson Statistics typically below one. Estimation used the Prais-Winsten method. See Johnston [10], pp. 321–325.

*All variables are defined in Exhibit 1 and graphed in Exhibit 6. Regressions were estimated for the 36 month period January 1982–December 1984 and were corrected for serial correlation using the Prais-Winsten method. For purposes of this regression variables are expressed in decimal form, *e.g.*, 14% = 0.14.

†Significantly different from zero at 0.05 level using two-tailed test.

cause of lower variability over time in the dispersion of FAF for utility stocks as compared to equities in general. The yield spread between utility and government bonds is significantly positively related to utility equity risk premia. And, as in the case of stocks in general, introduction of this spread substantially reduces the independent effect of interest rate levels on equity risk premia.

Given the short time series (36 months), tests for the stability of the relationships found in Exhibit 7 present difficulties. As a check, the relationships were reestimated dividing the data into two 18-month periods. For stocks in general (SP500), coefficients on σ_g and $(i_c - i_{20})$ were positive in all regressions and significantly so, except in the case of $(i_c - i_{20})$ for the second 18-month period. The coefficient of i_{20} was significantly negative in both periods. This confirms the general findings for the SP500 in Panel A of Exhibit 7. For utility stocks, results for the subperiods also matched the entire period results. The coefficients of $(i_u - i_{20})$ were significantly positive in both subperiods while those of σ_g were insignificantly different from zero. The level of interest rates (i_{20}) had a significant negative effect in both subperiods.

In summary, the estimated risk premia change over time and the patterns of such change are directly related to changes in proxies for the risks of equity investments. Risk premia for both stocks in general and utilities are inversely related to the level of government interest rates but positively related to the bond yield spreads which proxy for the incremental risk of investing in equities rather than government bonds. For stocks in general, risk premia also increase over time with increases in the general level of disagreement about future corporate performance.

VI. Conclusions

Notions of shareholder required rates of return and risk premia are based in theory on investors' expectations about the future. Research has demonstrated the usefulness of financial analysts' forecasts for such expectations. When such forecasts are used to derive equity risk premia, the results are quite encouraging. In addition to meeting the theoretical requirement of using expectational data, the procedure produces estimates of reasonable magnitude that behave as econom-

ic theory would predict. Both over time and across stocks, the risk premia vary directly with the perceived riskiness of equity investment.

The approach offers a straightforward and powerful aid in establishing required rates of return either for corporate investment decisions or in the regulatory arena. Since data are readily available on a wide range of equities, an investigator can analyze various proxy groups (*e.g.*, portfolios of utility stocks) appropriate for a particular decision. An additional advantage of the estimated risk premia is that they allow analysis of changes in equity return requirements over time. Tracking such changes is important for managers facing changing economic climates.

SUC AT ONEONTA, N. Y.

for flotation and underpricing costs involved in the issuance of additional stock. An allowance of 10 percent is common and would result in an adjusted ratio of 8.3 percent—7.5 percent divided by 0.90.) This ratio implies that if the earnings-price ratio of a company has been running fairly consistently at 7.5 percent, then the stock will continue to sell at approximately its book value if future earnings per share amount to 8.3 percent of this book value.

Dividend-Price Ratio. If a stock has an average market value of $150 and the annual dividend is $9.00, the dividend-price ratio is 6 percent. This ratio thus represents the yield received by the investor at the average market price. Whereas the earnings-price ratio implies that investors are guided on the basis of earnings, the dividend-price ratio implies that investors are guided by dividend yields.[81]

For many years, it was thought that investors bought utility stocks largely on the basis of dividends.[82] More recently, however, studies indicate that the market is valuing utility stocks with reference to total per share earnings, so that the earnings-price ratio has assumed increased emphasis in rate cases.[83] Both ratios must be used with a great deal of caution because they may fail to indicate an adequate rate of return to attract capital. As stated by the California commission in a 1954 decision:

> Earnings-price ratios and dividend-price ratios merely reflect the prospective investors' appraisal of the market value of stock and as such are influenced by prevailing market and economic conditions and the individual requirements of the purchaser. While useful for comparative purposes and of value in presenting background information, they are not conclusive in themselves in the determination of the allowable fair return on investment in operative properties. It is one thing to say that these ratios indicate the terms under which a new investor might devote his money to the business; it is another thing to say that these terms represent or limit the return the applicant is entitled to receive on the capital committed to the service. It seems to us that reliance on ratios of this nature results in a restricted view of the subject of rate-of-return. Obviously, the price at which a security is bought on the market reflects anticipated earnings rather than past results of operations and it by no means follows that the rates at which present market sales prices are related to the past earnings represents the returns the purchasers at those prices are willing to accept in the future.

[81] Both earnings-price and dividend-price ratios "should cover representative periods of operation. Ratios used on a 'spot' basis, for a period of a month, or even a year, might produce very unsatisfactory results. Prices of utility stocks of the most stable type are influenced by short-run considerations—threats of war, tax legislation, changing governmental regulations, strikes, elections—all affect stock prices in one way or another. For dividend yields or earnings-price ratios to be really significant they must be considered over a sufficiently long period of time for the abnormal and unusual pressures to average out." Lionel W. Thatcher, "Cost-of-Capital Techniques Employed in Determining the Rate of Return for Public Utilities," 30 *Land Economics* 85, 92 (1954).

EVALUATING COMMON STOCKS USING VALUE LINE'S PROJECTED CASH FLOWS AND IMPLIED GROWTH RATE

A well-known principle in finance is that the value of a firm must reflect its long-run growth opportunities. In an extensive study, Rappaport [1986] finds that over 60% of the firm's market value is attributable to earnings occurring beyond the immediate five-year horizon. When a firm does not meet analysts' expectations for a given quarter, its long-run potential is often discredited by the investment community. The basic reason for this overreaction is primarily that capital is scarce and, at least for the time being, the opportunity cost is higher somewhere else.

In practice, financial analysts evaluate a firm's growth opportunities by equating its P/E ratio to the growth rate of its earnings.(n1) Thus, the price of the firm's stock follows the volatility of its earnings.

If a firm's earnings are temporarily lower, whether due to seasonality in its business or some other transitory event, but the firm's long-run potential is not impaired, its stock may be called underpriced. This phenomenon is particularly common among semiconductor and other capital equipment companies, which demonstrate fairly frequent boom and bust cycles. In such cases, it is difficult to determine the true growth rate of the firm's earnings, or cash flows, by looking at its historical data.

A preferred way to estimate the firm's long-run growth rate is to deduce it from publicly available data that incorporate expectations concerning the firm's future cash flows. The most widely known source of such data is "Value Line's Investment Survey." Some empirical studies have shown that stock prices react swiftly to Value Line's recommendations.(n2)

The purpose of this article is to demonstrate how investors can use the information from Value Line to assess the long-term, or expected, value of a firm's equity. We follow a simple methodology that is well known in finance and is found in many, basic textbooks. Briefly, we apply the discounted cash flow (DCF) approach to the data supplied by Value Line and compute the price of the firm's common stock, using some reasonable assumptions.

In addition, the study solves for the long-term growth rate implied by the firm's equity cash flows. This rate may be contrasted to various subjective expected rates, or the growth rate for the entire industry, in the form of a sensitivity analysis. If the current price of the stock does not reflect the true long-run rate implied by the firm's cash flows, the stock may be underpriced. Conversely, if the implied rate is greater than the expected growth rate, the stock may be overpriced.

The strategy has several advantages over other security analysis and portfolio selection strategies. It considers forward-looking cash flows, rather than historical information, and

concentrates on the firm's long-term rather than short-term performance.

The methodology is applied to the pricing of MCI's common stock as an example. The results of this simple application are intriguing and promising for investors and analysts, as well as academicians and students of corporate finance.

DISCOUNTED CASH FLOW APPROACH

The discounted cash flow approach (DCF) is the most familiar theoretical method of estimating the firm's value. According to this approach, the value of a firm is the present value of the firm's stream of future expected cash flows discounted at a rate that reflects the riskiness of these cash flows. This approach is widely used by security analysts and financial managers and is consistent with the maximization of shareholder wealth, which is the goal of the management of every corporation. In exploratory research, Copeland, Koller, and Murrin [1996] find a correlation between the market value (actual price per share) and the DCF-based value, using forecasts from the Value, of 0.97.

Although in practice there may be a variety of approaches to valuation of the firm's prospects, the discounted cash flow technique is the most commonly used practical approach to determining a company's value. It is used in capital budgeting decisions to evaluate investment projects or to price entire corporate entities that may be targets for acquisition.

The DCF is expressed as:

(1) [Multiple line equation(s) cannot be represented in ASCII text]

where PV is the present value, n is the number of periods, CF_t are the cash flows that occur in time period t, and r is the relevant discount rate.

If these cash flows were to grow at an annual rate of g%, beginning at year 6, expression (1) becomes:

(2) [Multiple line equation(s) cannot be represented in ASCII text]

The discount factor $1/(1 + r)^5$ is used to discount the collective value of the cash flows at year 6 back to year zero, the present time. The term [(1 + g)/(r - g)] is called the terminal value multiple. It expresses the ratio of the value of the cash flows beyond year 6 to the value of the cash flow of year 5. The price of the firm's stock, P, can then be found by dividing the value of its equity by the number of shares outstanding, N, or P = (PV/N). Of course, if PV represents the present value of the firm's equity and debt, then the value of the firm's debt is first subtracted, and the remaining value is divided by the number of common shares outstanding to obtain the price per

share.

Assuming reliable estimates of the cash flows of the first five years and the discount rate, r, Equation (2) can be applied in conjunction with the firm's value of equity to solve for the implied average growth rate, g, in its distant equity cash flows. This implied growth rate can then be contrasted with various subjective expected rates in the form of a sensitivity analysis. A reasonable choice for the expected growth rate of a firm's equity cash flows would be the one implied by its industry peers, adjusted for opportunities unique to the firm.

In any event, if the implied growth rate is lower than what an investor would have expected, the stock may be underpriced. Conversely, if the implied rate is greater than the expected growth rate, the stock may be overpriced.

CASH FLOWS TO EQUITYHOLDERS

Shareholders' cash flows can be summarized by:

(3) CF_E = EBIT(1- t) - I(1- t) + NCE - Delta WC - CE

where CF_E is cash flow to equity; EBIT is earnings before interest and taxes; T is the corporate tax rate; NCE is non-cash expenses; Delta WC is changes in working capital; and CE is capital expenditures. The cash flows to the debtholders, I_{AT} = I(1- T), imply a tax shield to the common stockholders equal to the firm's marginal tax rate times the interest expense, since I(1- T)= I- IT. This tax shield reduces the firm's cost of debt capital that is used to discount the cash flows to debt in Equation (3). Thus, by discounting the firm's after-tax interest expense by the corresponding after-tax cost of debt, we obtain the value of the firm's debt.

Some authors, including Copeland, Koller, and Murrin [1996], find the present value of the free cash flows to both debt and equity using a weighted average cost of capital and subtract the firm's debt to obtain the market value of its equity. Since the book value of the firm's debt may not be equal to its market value, the preferred approach is to consider only the firm's cash flows to equityholders and discount them by the corresponding cost of equity capital.

Equation (3) can be further simplified as:

(4) CF_E = NI + NCE - Delta WC - CE

where:

(5) NI = EBIT(1- T) - I(1- T)

In order to completely define the variables used in Equation (3), a definition of earnings before interest and taxes is necessary. In general, earnings before interest and taxes is defined as total revenues minus costs and depreciation, or

(6) EBIT = (S + NOI) - (COGS + SGA + R&D) - (Depr)

where S are revenues from the firm's sales; NOI is non-operating income; COGS is cost of goods sold; SGA is selling, general, and administrative expenses; R&D is research and development expenses; and Depr is depreciation. Finally, by substituting Equation (6) into (5) and subsequently into (4) and adjusting for dividend payments to preferred shareholders, denoted by D_p, we obtain Equation (7):

(7) CF_C = (S + NOI - COGS - SGA - R & D - Depr) x (1- T) - I(1-T) + NCE - Delta WC - CE - D_P

where the subscript C denotes cash flows to common equityholders.

VALUE LINE CASH FLOWS

Because of its consistency and broad coverage of stocks, "Value Line Investment Survey" serves as a unique source of information and is widely used by both academicians and practitioners.(n3) This service follows 1,700 companies in over ninety-five industries that represent 94% of the trading volume on all U.S. stock exchanges. It provides subscribers with a detailed one-page overview of each company's past, current, and expected performance for the next four to five years.

In fact, Value Line is the only investment service that provides detailed information for a company's expected short-term performance. Each page offers financial data, trend line growth rates, graphical price history patterns, quarterly sales figures, earnings and dividends, some key financial ratios, and balance sheet information. Value Line also rates companies for timeliness and safety. Furthermore, investors learn, through a summarized text, about the general business and analyst expectations for each company. All data are updated every thirteen weeks on a weekly sequence.

Using the Value Line definition of variables, Equation (7) becomes:

(8) $CF_{C,\,t}$ =(S_t m_t - $Depr_t$- I)(1- T_t) + $Depr_t$ - Delta WC_t - CE_t - $D_{p,\,t}$

where m_t is the operating margin as a percent of sales at year t. Equation 8 constitutes the basis for estimating the cash flows to common equity. Note that if a firm decides to either obtain additional debt or repay part or all of its existing debt, Equation (8) must be modified to reflect

this change in leverage.

Exhibit 1 shows the variables in Equation (7) and the corresponding entries from Value Line expressed in (8).

Value Line's projections refer to the range of the three-year period following the year subsequent to the date of the survey. For example, if the survey's date is October 1997, the projections refer to the period 2000-2002, hence covering a five-year window. We assign the projections for the three-year range to the middle year, which is labeled as year 4. The figures for the years 2 and 3 are geometrically interpolated, while the figures for year 5 are extrapolated using the implied growth rate of the previous four years. For an October 1997 survey date, 1998 is the first year, and 2001, the midpoint of the range 2000-2002, represents the fourth year. The data for the fifth year, 2002, are extrapolated on the basis of the growth rate implied between the years 1998 and 2001. Following this practice, we are able to calculate successive cash flows for the ensuing five years.

Following Equation (2), we then assume that the cash flows for years 6 and beyond will grow at an average constant rate g. If we further assume that the firm's cost of equity capital is given by r, we can then solve for either the PV_0, if we know g, or vice versa.

THE COST OF EQUITY CAPITAL

The rate used to discount the firm's cash flows to its equityholders, also termed the cost of capital, is obtained from the capital asset pricing model (CAPM). According to this model, the expected rate of return for a common stock required by investors, $E(R_{C,i})$, equals the sum of two components: namely, the riskless rate of return, R_f, and a risk premium, $Beta_i[E(R_M) - R_f]$. This relationship is expressed by the equation:

(9) $E(R_{c,i}) = R_f + Beta_i [E(R_M) - R_f]$

where $Beta_i$ is the beta of company i, which reflects its operating and financial risks. Generally, companies in specific industries with cyclical demand, such as real property and electronics, are associated with higher betas. Companies in the utility industry, like telephone and energy, tend to be less sensitive to market movements, and consequently they exhibit lower betas.

The risk-free rate is approximated by the three-month U.S. Treasury bill rate, and the risk premium represents the reward for bearing risk. The term $E(R_M)$ is the expected return on the market portfolio. In theory, the market portfolio incorporates all risky assets. In practice, however, it is unobservable and it is usually represented by a well-diversified index, such as the Chicago Center for Research in Security Prices (CRSP) value-weighted index. Possible alternatives are the NYSE composite index or the Wilshire 5000 equity index.

A common practice in estimating the market risk premium [$E(R_M) - R_f$], is to assume that it approximates the difference between the historical rate of return on stocks and Treasury bills. According to Stocks, Bonds, Bills, and Inflation, the difference is 8.6% (12.3%-3.7%). Thus, even if both equities and Treasury securities drift away from their historical levels, it is assumed that their difference remains constant through time, or at least reverts to its long-term historical average. Following this approach, a stock with a beta of 1.2 would command a cost of equity capital of approximately 14%.

EXAMPLE: VALUATION OF MCI

Beginning in November 1996, MCI has been considering different consolidation proposals from three competitors in the telecommunications industry: British Telecom, GTE, and WorldCom. The offer by WorldCom prevailed over the other two offers, and the shareholders of both firms have approved the proposed merger at an exchange ratio that amounts to $51.00 per MCI share. (n4) This represents a 60% to 100% premium over the 1996 range of prices for MCI shareholders.

The rationale for such a premium may be justified by the synergistic effect of the MCI/ WorldCom merger. In principle, such a synergistic premium exists for many companies, and shareholders need a simple technique to assess it. It is hoped that our methodology will provide such a means and enable investors to take full advantage of the information supplied by Value Line.(n5)

Application of the analysis to MCI is summarized in the four worksheets in Exhibits 2-5.(n6) Exhibit 2 presents the pertinent inputs for the other exhibits. The projected figures refer to a range of two to four years. Exhibit 3 assumes that these figures correspond to the mid-range year, i.e., 2001. The figures for the years 1999 and 2000 are found by interpolation, assuming a geometric growth between the first and the fourth years, i.e., 1998 and 2001. These growth rates are subsequently used to find the 2002 figures, by extrapolating the data of the year 2001. Following this approach we are able to obtain the estimated cash flows to equityholders for the subsequent five years.

Exhibit 4 shows the estimation of the firm's cost of equity capital, using the capital asset pricing model given by Equation (9). These estimates use two variations of the proxy for the risk-free rate: a historical estimate of 3.7%, as calculated by Ibbotson Associates, and the prevailing rate of interest on three-month T-bills. Exhibit 4 provides a series of estimated costs of capital corresponding to a sequence of betas, ranging from 30% below to 30% above the Value Line beta, in increments of 10.%. The worksheet allows the user to input an estimate for the continuing growth rate of the cash flows to equityholders and the increment for higher and lower growth rates.

Finally, Exhibit 5 presents the sensitivity analysis for various expected continuing growth rates and various costs of equity, corresponding to the series of betas considered in Exhibit 4. Assuming that the middle rates represent the investor's best estimates for continuing growth rate and cost of equity, the center cell of the price matrix represents the most likely price for the firm's stock. Given the market price of the stock, the worksheet in Exhibit 5 also calculates the implied continuing growth rate for the firm's cash flows and the "terminal value multiple." For a price of $60.50, the implied continuing growth rate for MCI's cash flows to equity is 5.4%, and the terminal value multiple is 16.

The $51.00 price offered by WorldCom implies a continuing growth rate of 4%. All in all, given that the MCI/WorldCom merger will result in substantial synergistic savings, the $51.00 offer for each MCI share by WorldCom appears to be fair.

CONCLUSIONS AND RECOMMENDATIONS

We have developed a simple yet practical methodology to evaluate common stocks by applying the DCF approach to the data supplied by Value Line to estimate the implied long-term growth rate of a firm's equity cash flows. Given the value of the firm's equity, its annual cash flows, and its cost of equity capital, one may solve for the implied long-term growth rate of the firm's cash flows. This rate can then be compared to various subjective expected rates using sensitivity analysis. If the implied growth rate is lower than investors' expectations, then the stock may be underpriced. Conversely, if the implied rate is greater than the expected growth rate, the stock may be overpriced.

The strategy has several advantages over current security analysis and portfolio selection strategies. It considers forward-looking cash flows, rather than historical information, and concentrates on a firm's long-term rather than short-term performance. It may thus be useful in assessing the equilibrium level of the overall market, especially when it is used in conjunction with other procedures for pinpointing value, such as the P/E ratio. An exploratory application of our methodology to MCI reveals encouraging results.

ENDNOTES

(n1) See Lynch [1989].

(n2) See, for example, Black [1973], Holloway [1981,1983], Copeland and Mayers [1982], Stickel [1985], Huberman and Kandel [1987,1990], Peterson [1987,1995], and Peterson and Peterson [1995]. Philbrick and Ricks [1991] have shown that in determining earnings surprise, Value Line is a better source for actual earnings per share data.

(n3) Lynch [1989] refers to "Value Line Investment Survey" as "the next best thing to having your own private securities analyst" (p. 165).

(n4) The exchange ratio is equal to the quotient of $51.00 divided by the average of the high and low market prices of WorldCom common stock on each of the twenty consecutive trading days ending with the third trading day immediately preceding the effective time of the MCI/ WorldCom merger.

(n5) According to the prospectus, the consultants and the management of the two companies believe that "the MCI/WorldCom merger will create a fully integrated communications company that will be well positioned to take advantage of growth opportunities in global communications."

Estimating Shareholder Risk Premia Using Analysts' Growth Forecasts

Robert S. Harris and Felicia C. Marston

Robert S. Harris is the C. Stewart Sheppard Professor of Business at the Darden Graduate School of Business at the University of Virginia, Charlottesville, Virginia. Felicia C. Marston is an Assistant Professor of Commerce at the McIntire School of Commerce, University of Virginia, Charlottesville, Virginia.

■ One of the most widely used concepts in finance is that shareholders require a risk premium over bond yields to bear the additional risks of equity investments. While models such as the two-parameter capital asset pricing model (CAPM) or arbitrage pricing theory offer explicit methods for varying risk premia across securities, the models are invariably linked to some underlying market (or factor-specific) risk premium. Unfortunately, the theoretical models provide limited practical advice on establishing empirical estimates of such a benchmark market risk premium. As a result, the typical advice to practitioners is to estimate the market risk premium based on historical realizations of share and bond returns (see Brealey and Myers [3]).

In this paper, we present estimates of shareholder required rates of return and risk premia which are derived using forward-looking analysts' growth forecasts. We update, through 1991, earlier work which, due to data availability, was restricted to the period 1982-1984 (Harris [12]). Using stronger tests, we also reexamine the efficacy of using such an expectational approach as an alternative to the use of historical averages. Using the S&P 500 as a proxy for the market portfolio, we find an average market risk premium (1982-1991) of 6.47% above yields on long-term U.S. government bonds and 5.13% above yields on corporate bonds. We also find that required returns for individual stocks vary directly with their risk (as proxied by beta) and that the market risk premium varies over time. In particular, the equity market premium over government bond yields is higher in low interest rate environments and when there is a larger spread between corporate and government bond yields. These findings show that, in addition to fitting the theoretical requirement of being forward-looking, the utilization of analysts' forecasts in estimating return requirements provides reasonable empirical results that can be useful in practical applications.

Section I provides background on the estimation of equity required returns and a brief discussion of related

Thanks go to Ed Bachmann, Bill Carleton, Pete Crawford, and Steve Osborn for their assistance on earlier research in this area. We thank Bell Atlantic for supplying data for this project. literature on financial analysts' forecasts (FAF). In Section II, models and data are discussed. Following a comparison of the results to historical risk premia, the estimates are subjected to economic tests of both their time-series and cross-sectional characteristics in Section III. Finally, conclusions are offered in Section IV.

I. Background and Literature Review

In establishing economic criteria for resource allocation, it is often convenient to use the notion of a shareholder's required rate of return. Such a rate (k) is the minimum level of expected return necessary to compensate the investor for bearing risks and receiving dollars in the future rather than in the present. In general, k will depend on returns available on alternative investments (e.g., bonds or other equities) and the riskiness of the stock. To isolate the effects of risk, it is useful to work in terms of a risk premium (rp), defined as

$$rp = k - i, \tag{1}$$

where i = required return for a zero risk investment.[1]

Lacking a superior alternative, investigators often use averages of historical realizations to estimate a benchmark "market" risk premium which then may be adjusted for the relative risk of individual stocks (e.g., using the CAPM or a variant). The historical studies of Ibbotson Associates [13] have been used frequently to implement this approach.[2] This historical approach requires the assumptions that past realizations are a good surrogate for future expectations and, as typically applied, that risk premia are constant over time. Carleton and Lakonishok [5] demonstrate empirically some of the problems with such historical premia when they are disaggregated for different time periods or groups of firms.

As an alternative to historical estimates, the current paper derives estimates of k, and hence, implied values of rp, using publicly available expectational data. This expectational approach employs the dividend growth model (hereafter referred to as the discounted cash flow or DCF model) in which a consensus measure of financial analysts' forecasts (FAF) of earnings is used as a proxy for investor expectations. Earlier works by Malkiel [17], Brigham, Vinson, and Shome [4], and Harris [12] have used FAF in DCF models, and this approach has been employed in regulatory settings (see Harris [12]) and suggested by consultants as an alternative to use of historical data (e.g., Ibbotson Associates [13, pp. 127, 128]). Unfortunately, the published studies use data extending to 1984 at the latest. Our paper draws on this earlier work but extends it through 1991.[3] Our work is closest to that done by Harris [12], who reviews literature showing a strong link between equity prices and FAF and supporting the use of FAF as a proxy for investor expectations. Using data from 1982 to 1984, Harris' results suggest that this expectational approach to estimating equity risk premia is an encouraging alternative to the use of historical averages. He also demonstrates that such risk premia vary both cross-sectionally with the riskiness of individual stocks and over time with financial market conditions.

II. Models and Data

A. Model for Estimation

The simplest and most commonly used version of the DCF model to estimate shareholders' required rate of return, k, is shown in Equation (2):

$$k = \left(\frac{D_1}{P_0}\right) + g, \tag{2}$$

where D_1 = dividend per share expected to be received at time one, P_0 = current price per share (time 0), and g = expected growth rate in dividends per share. The limitations of this model are well known, and it is straightforward to derive expressions for k based on more general specifications of the DCF model.[4] The primary difficulty in using the DCF model is obtaining an estimate of g, since it should reflect market expectations of future perfor-

[1]Theoretically, i is a risk-free rate, though empirically its proxy (e.g., yield to maturity on a government bond) is only a "least risk" alternative that is itself subject to risk. In this development, the effects of tax codes on required returns are ignored.

[2]Many leading texts in financial management use such historical risk premia to estimate a market return. See, for example, Brealey and Myers [3]. Often a market risk premium is adjusted for the observed relative risk of a stock.

[3]See Harris [12] for a discussion of the earlier work and a detailed discussion of the approach employed here.

[4]As stated, Equation (2) requires expectations of either an infinite horizon of dividend growth at a rate g or a finite horizon of dividend growth at rate g and special assumptions about the price of the stock at the end of that horizon. Essentially, the assumption must ensure that the stock price grows at a compound rate of g over the finite horizon. One could alternatively estimate a nonconstant growth model, although the proxies for multistage growth rates are even more difficult to obtain than single stage growth estimates. Marston, Harris, and Crawford [19] examine publicly available data from 1982-1985 and find that plausible measures of risk are more closely related to expected returns derived from a constant growth model than to those derived from multistage growth models. These findings illustrate empirical difficulties in finding empirical proxies for multistage growth models for large samples.

mance. Without a ready source for measuring such expectations, application of the DCF model is fraught with difficulties. This paper uses published FAF of long-run growth in earnings as a proxy for g.

B. Data

FAF for this research come from IBES (Institutional Broker's Estimate System), which is a product of Lynch, Jones, and Ryan, a major brokerage firm.[5] Representative of industry practice, IBES contains estimates of (*i*) EPS for the upcoming fiscal years (up to five separate years), and (*ii*) a five-year growth rate in EPS. Each item is available at monthly intervals.

The mean value of individual analysts' forecasts of five-year growth rate in EPS will be used as a proxy for g in the DCF model.[6] The five-year horizon is the longest horizon over which such forecasts are available from IBES and often is the longest horizon used by analysts. IBES requests "normalized" five-year growth rates from analysts in order to remove short-term distortions that might stem from using an unusually high or low earnings year as a base.

Dividend and other firm-specific information come from COMPUSTAT. Interest rates (both government and corporate) are gathered from Federal Reserve Bulletins and *Moody's Bond Record*. Exhibit 1 describes key variables used in the study. Data collected cover all dividend paying stocks in the Standard & Poor's 500 stock (S&P 500) index, plus approximately 100 additional stocks of regulated companies. Since five-year growth rates are first available from IBES beginning in 1982, the analysis covers the 113-month period from January 1982 to May 1991.

III. Risk Premia and Required Rates of Return

A. Construction of Risk Premia

For each month, a "market" required rate of return is calculated using each dividend paying stock in the S&P 500 index for which data are available. The DCF model in Equation (2) is applied to each stock and the results weighted by market value of equity to produce the market required return.[7] The return is converted to a risk premium

Exhibit 1. Variable Definitions

k	=	Equity required rate of return.
P_0	=	Average daily price per share.
D_1	=	Expected dividend per share measured as current indicated annual dividend from COMPUSTAT multiplied by $(1 + g)$.[a]
g	=	Average financial analysts' forecast of five-year growth rate in earnings per share (from IBES).
i_{lt}	=	Yield to maturity on long-term U.S. government obligations (source: Federal Reserve Bulletin, constant maturity series).
i_c	=	Yield to maturity on long-term corporate bonds: Moody's average.[b]
rp	=	Equity risk premium calculated as $rp = k - i$.
β	=	beta, calculated from CRSP monthly data over 60 months.

Notes:
[a]See footnote 7 for a discussion of the $(1 + g)$ adjustment.
[b]The average corporate bond yield across bond rating categories as reported by Moody's. See *Moody's Bond Survey* for a brief description and the latest published list of bonds included in the bond rating categories.

[5]Harris [12] provides a discussion of IBES data and its limitations. In more recent years, IBES has begun collecting forecasts for each of the next five years. Since this work was completed, the FAF used here have become available from IBES Inc., now a subsidiary of CitiBank.

[6]While the model calls for expected growth in dividends, no source of data on such projections is readily available. In addition, in the long run, dividend growth is sustainable only via growth in earnings. As long as payout ratios are not expected to change, the two growth rates will be the same.

[7]The construction of D_1 is controversial since dividends are paid quarterly and may be expected to change during the year; whereas, Equation (2), as is typical, is being applied to annual data. Both the quarterly payment of dividends (due to investors' reinvestment income before year's end, see Linke and Zumwalt [15]) and any growth during the year require an upward adjustment of the current annual rate of dividends to construct D_1. If quarterly dividends grow at a constant rate, both factors could be accommodated straightforwardly by applying Equation (2) to quarterly data with a quarterly growth rate and then annualizing the estimated quarterly required return. Unfortunately, with lumpy changes in dividends, the precise nature of the adjustment depends on both an individual company's pattern of growth during the calendar year and an individual company's required return (and hence reinvestment income in the risk class).
In this work, D_1 is calculated as D_0 $(1 + g)$. The full g adjustment is a crude approximation to adjust for both growth and reinvestment income. For example, if one expected dividends to have been raised, on average, six months ago, a "1/2 g" adjustment would allow for growth, and the remaining "1/2 g" would be justified on the basis of reinvestment income. Any precise accounting for both reinvestment income and growth would require tracking each company's dividend change history and making explicit judgments about the quarter of the next change. Since no organized "market" forecast of such a detailed nature exists, such a procedure is not possible. To get a feel for the magnitudes involved, during the sample period the dividend yield (D_1/P_0) and growth (market value weighted) for the S&P 500 were typically 4% to 6% and 11% to 13%, respectively. As a result, a "full g" adjustment on average increases the required return by 60 to 70 basis points (relative to no g adjustment).

Exhibit 2. Bond Market Yields, Equity Required Return, and Equity Risk Premium,[a] 1982-1991

	Bond Market Yields[b]		Equity Market Required Return[c]	Equity Risk Premium	
Year	(1) U.S. Gov't	(2) Moody's Corporates	(3) S&P 500	U.S. Gov't (3) - (1)	Moody's Corporates (3) - (2)
1982	12.92	14.94	20.08	7.16	5.14
1983	11.34	12.78	17.89	6.55	5.11
1984	12.48	13.49	17.26	4.78	3.77
1985	10.97	12.05	16.32	5.37	4.28
1986	7.85	9.71	15.09	7.24	5.38
1987	8.58	9.84	14.71	6.13	4.86
1988	8.96	10.18	15.37	6.41	5.19
1989	8.46	9.66	15.06	6.60	5.40
1990	8.61	9.77	15.69	7.08	5.92
1991[d]	8.21	9.41	15.61	7.40	6.20
Average[e]	9.84	11.18	16.31	6.47	5.13

Notes:
[a]Values are averages of monthly figures in percent.
[b]Yields to maturity.
[c]Required return on value weighted S&P 500 index using Equation (1).
[d]Figures for 1991 are through May.
[e]Months weighted equally.

over government bonds by subtracting i_{lt}, the yield to maturity on long-term government bonds. A risk premium over corporate bond yields is also constructed by subtracting i_c, the yield on long-term corporate bonds. Exhibit 2 reports the results by year (averages of monthly data).

The results are quite consistent with the patterns reported earlier (i.e., Harris [12]). The estimated risk premia in Exhibit 2 are positive, consistent with equity owners demanding additional rewards over and above returns on debt securities. The average expectational risk premium (1982 to 1991) over government bonds is 6.47%, only slightly higher than the 6.16% average for 1982 to 1984 reported earlier (Harris [12]). Furthermore, Exhibit 2 shows the estimated risk premia change over time, suggesting changes in the market's perception of the incremental risk of investing in equity rather than debt securities.

For comparison purposes, Exhibit 3 contains historical returns and risk premia. The average expectational risk premium reported in Exhibit 2 falls roughly midway between the arithmetic (7.5%) and geometric (5.7%) long-term differentials between returns on stocks and long-term government bonds. Note, however, that the expectational risk premia appear to change over time. In the following sections, we examine the estimated risk premia to see if they vary cross-sectionally with the risk of individual stocks and over time with financial market conditions.

B. Cross-Sectional Tests

Earlier, Harris [12] conducted crude tests of whether expectational equity risk premia varied with risk proxied by bond ratings and the dispersion of analysts' forecasts and found that required returns increased with higher risk. Here we examine the link between these premia and beta, perhaps the most commonly used measure of risk for equities.[8] In keeping with traditional work in this area, we adopt the methodology introduced by Fama and Macbeth [9] but replace realized returns with expected returns from Equation (2) as the variable to be explained. For this portion of our tests, we restrict our sample to 1982-1987

[8]For other efforts using expectational data in the context of the two-parameter CAPM, see Friend, Westerfield, and Granito [10], Cragg and Malkiel [7], Marston, Crawford, and Harris [19], Marston and Harris [20], and Linke, Kannan, Whitford, and Zumwalt [16]. For a more complete treatment of the subject, see Marston and Harris [20] from which we draw some of these results. Marston and Harris also investigate the role of unsystematic risk and the difference in estimates found when using expected versus realized returns.

and in any month include firms that have at least three forecasts of earnings growth to reduce measurement error associated with individual forecasts.[9] This restricted sample still consists of, on average, 399 firms for each of the 72 months (or 28,744 company months).

For a given company in a given month, beta is estimated via the market model (using ordinary least squares) on the prior 60 months of return data taken from CRSP. Beta estimates are updated monthly and are calculated against an equally weighted index of all NYSE securities. For each month, we aggregate firms into 20 portfolios (consisting of approximately 20 securities each). The advantage of grouped data is the reduction in potential measurement error inherent in independent variables at the company level. Portfolios are formed based on a ranking of beta estimated from a prior time period (t = -61 to t = -120). Portfolio expected returns and beta are calculated as the simple averages for the individual securities.

Using these data, we estimate the following model for each of the 72 months:

$$R_p = \alpha_0 + \alpha_1 \beta_p + u_p, \quad p = 1...20, \qquad (3)$$

where:

R_p = Expected return for portfolio p in the given month,

β_p = Portfolio beta, estimated over 60 prior months, and

u_p = A random error term with mean zero.

As a result of estimating regression (3) for each month, 72 estimates of each coefficient (α_0 and α_1) are obtained. Using realized returns as the dependent variable, the traditional approach (e.g., Fama and Macbeth [9]) is to assume that realized returns are a fair game. Given this assumption, the mean of the 72 values of each coefficient is an unbiased estimate of the mean over that same time period if one could have actually used expected returns as the dependent variable. Note that if expected returns are used as the dependent variable the fair-game assumption is not required. Making the additional assumption that the true value of the coefficient is constant over the 72 months, a test of whether the mean coefficient is different from zero is performed using a t-statistic where the denominator is the standard error of the 72 values of the coefficient. This is the technique employed by Fama and Macbeth [9]. If one assumes the CAPM is correct, the coefficient α_1 is an empirical estimate of the market risk premium, which should be positive.

To test the sensitivity of the results, we also repeat our procedures using individual security returns rather than portfolios. To account, at least in part, for differences in precision of coefficient estimates in different months we also report results in which monthly parameter estimates are weighted inversely by the standard error of the coefficient estimate rather than being weighted equally (following Chan, Hamao, and Lakonishok [6]).

Exhibit 4 shows that there is a significant positive link between expectational required returns and beta. For instance, in Panel A, the mean coefficient of 2.78 on beta is significantly different from zero at better than the 0.001 level (t = 35.31), and each of the 72 monthly coefficients going into this average is positive (as shown by that 100% positive figure). Using individual stock returns, the significant positive link between beta and expected return remains, though it is smaller in magnitude than for portfolios.[10] Comparison of Panels A and B shows that the results are not sensitive to the weighting of monthly coefficients.

While the findings in Exhibit 4 suggest a strong positive link between beta and risk premia (a result often not supported when realized returns are used as a proxy for expectations; e.g., see Tinic and West [22]), the results do not support the predictions of a simple CAPM. In particular, the intercept is higher than a proxy for the risk-free rate over the sample period and the coefficient of beta is well below estimates of a market risk premium obtained from either expectational (Exhibit 2) or historical data (Exhibit

[9]Firms for which the standard deviation of individual FAF exceeded 20 in any month were excluded since we suspect some of these involve errors in data entry. This screen eliminated very few companies in any month. The 1982-1987 period was chosen due to the availability of data on betas.

[10]The smaller coefficients on beta using individual stock portfolio returns are likely due in part to the higher measurement error in measuring individual stock versus portfolio betas.

Exhibit 4. Mean Values of Monthly Parameter Estimates for the Relationship Between Required Returns and Beta for Both Portfolios and Individual Securities (Figures in Parentheses are *t* Values and Percent Positive), 1982-1987

	Intercept	B	Adjusted R^2 [c]	F[c]
Panel A. Equal Weighting[a]				
Portfolio returns	14.06 (54.02, 100)	2.78 (35.31, 100)	0.503	25.4
Security returns	14.77 (58.10, 100)	1.91 (16.50, 99)	0.080	39.0
Panel B. Weighted by Standard Errors[b]				
Portfolio returns	13.86 (215.6, 100)	2.67 (35.80, 100)	0.503	25.4
Security returns	14.63 (398.9, 100)	1.92 (47.3, 99)	0.080	39.0

[a]Equally weighted average of monthly parameters estimated using cross-sectional data for each of the 72 months, January 1982 - December 1987.
[b]In obtaining the reported means, estimates of the monthly intercept and slope coefficients are weighted inversely by the standard error of the estimate from the cross-sectional regression for that month.
[c]Values are averages for the 72 monthly regressions.

3).[11] Nonetheless, the results show that the estimated risk premia conform to the general theoretical relationship between risk and required return that is expected when investors are risk-averse.

C. Time Series Tests — Changes in Market Risk Premia

A potential benefit of using ex ante risk premia is the estimation of changes in market risk premia over time. With changes in the economy and financial markets, equity investments may be perceived to change in risk. For instance, investor sentiment about future business conditions likely affects attitudes about the riskiness of equity investments compared to investments in the bond markets. Moreover, since bonds are risky investments themselves, equity risk premia (relative to bonds) could change due to changes in perceived riskiness of bonds, even if equities displayed no shifts in risk. For example, during the high interest rate period of the early 1980s, the high level of interest rate volatility made fixed income investments more risky holdings than they were in a world of relatively stable rates.

Studying changes in risk premia for utility stocks, Brigham, et al [4] conclude that, prior to 1980, utility risk premia increased with the level of interest rates, but that this pattern reversed thereafter, resulting in an inverse correlation between risk premia and interest rates. Studying risk premia for both utilities and the equity market generally, Harris [12] also reports that risk premia appear to change over time. Specifically, he finds that equity risk premia decreased with the level of government interest rates, increased with the increases in the spread between corporate and government bond yields, and increased with increases in the dispersion of analysts' forecasts. Harris' study is, however, restricted to the 36-month period, 1982 to 1984.

Exhibit 5 reports results of analyzing the relationship between equity risk premia, interest rates, and yield spreads between corporate and government bonds. Following Harris [12], these bond yield spreads are used as a time series proxy for equity risk. As the perceived riskiness of corporate activity increases, the difference between yields on corporate bonds and government bonds should increase. One would expect the sources of increased riskiness to corporate bonds to also increase risks to shareholders. All regressions in Exhibit 5 are corrected for serial correlation.[12]

[11]Estimation difficulties confound precise interpretation of the intercept as the risk-free rate and the coefficient on beta as the market risk premium (see Miller and Scholes [21], and Black, Jensen, and Scholes [2]). The higher than expected intercept and lower than expected slope coefficient on beta are consistent with the prior studies of Black, Jensen, and Scholes [2], and Fama and MacBeth [9] using historical returns. Such results are consistent with Black's [1] zero beta model, although alternative explanations for these findings exist as well (as noted by Black, Jensen, and Scholes [2]).

[12]Ordinary least squares regressions showed severe positive autocorrelation in many cases, with Durbin Watson statistics typically below one. Estimation used the Prais-Winsten method. See Johnston [14, pp. 321-325].

	(16.23)	(-8.29)		
	0.130	-0.738	0.098	0.68
	(8.71)	(-4.96)	(0.40)	

Note: All variables are defined in Exhibit 1. Regressions were estimated using monthly data and were corrected for serial correlation using the Prais-Winsten method. For purposes of this regression, variables are expressed in decimal form, e.g., 14% = 0.14.

For the entire sample period, Panel A shows that risk premia are negatively related to the level of interest rates — as proxied by yields on government bonds, i_{lt}. This negative relationship is also true for each of the subperiods displayed in Panels B through D. Such a negative relationship may result from increases in the perceived riskiness of investment in government debt at high levels of interest rates. A direct measure of uncertainty about investments in government bonds would be necessary to test this hypothesis directly.

For the entire 1982 to 1991 period, the addition of the yield spread risk proxy to the regressions dramatically lowers the magnitude of the coefficient on government bond yields, as can be seen by comparing Equations 1 and 2 of Panel A. Furthermore, the coefficient of the yield spread (0.666) is itself significantly positive. This pattern suggests that a reduction in the risk differential between investment in government bonds and in corporate activity is translated into a lower equity market risk premium. Further examination of Panels B through D, however, suggests that the yield spread variable is much more important in explaining changes in equity risk premia in the early portion of the 1980s than in the 1988 to 1991 period.

In summary, market equity risk premia change over time and appear inversely related to the level of government interest rates but positively related to the bond yield spread, which proxies for the incremental risk of investing in equities as opposed to government bonds.

IV. Conclusions

Shareholder required rates of return and risk premia are based on theories about investors' expectations for the future. In practice, however, risk premia are often estimated using averages of historical returns. This paper applies an alternate approach to estimating risk premia that employs publicly available expectational data. At least for the decade studied (1982 to 1991), the resultant average market equity risk premium over government bonds is comparable in magnitude to long-term differences (1926 to 1989) in historical returns between stocks and bonds. There is strong evidence, however, that market risk premia change over time and, as a result, use of a constant historical average risk premium is not likely to mirror changes in investor return requirements. The results also show that the expectational risk premia vary cross-sectionally with the relative risk (beta) of individual stocks.

The approach offers a straightforward and powerful aid in establishing required rates of return either for corporate investment decisions or in the regulatory arena. Since data are readily available on a wide range of equities, an investigator can analyze various proxy groups (e.g., portfolios of utility stocks) appropriate for a particular decision as well as analyze changes in equity return requirements over time.

CALL FOR PAPERS
EASTERN FINANCE ASSOCIATION 1993 ANNUAL MEETING
April 14-17, 1993
Richmond, Virginia

Members and friends of the Eastern Finance Association are invited to participate in the 29th Annual Meeting of the EFA in Richmond, Virginia. Research papers covering all major areas of finance will be presented and discussed. Panel sessions and tutorials will also be included in the program. Academicians, practitioners, government specialists, and others with an interest in finance are encouraged to attend and to take part in our meetings.

Those wishing to participate should submit a participation form indicating their desire to present a paper, discuss a paper, chair a session, or organize a special panel or tutorial. Those wishing to present a paper should include *four copies* of the completed paper or detailed abstract. The deadline for receipt of all materials is September 18, 1992.

The EFA will present monetary awards for outstanding research papers in futures and options, investments, corporate finance, and financial institutions. There will also be a special competitive paper session for doctoral students.

For participation forms or other information, please contact:

Investor growth expectations: Analysts vs. history

Analysts' growth forecasts dominate past trends in predicting stock prices.

James H. Vander Weide and Willard T. Carleton

For the purposes of implementing the Discounted Cash Flow (DCF) cost of equity model, the analyst must know which growth estimate is embodied in the firm's stock price. A study by Cragg and Malkiel (1982) suggests that the stock valuation process embodies analysts' forecasts rather than historically based growth figures such as the ten-year historical growth in dividends per share or the five-year growth in book value per share. The Cragg and Malkiel study is based on data for the 1960s, however, a decade that was considerably more stable than the recent past.

As the issue of which growth rate to use in implementing the DCF model is so important to applications of the model, we decided to investigate whether the Cragg and Malkiel conclusions continue to hold in more recent periods. This paper describes the results of our study.

STATISTICAL MODEL

The DCF model suggests that the firm's stock price is equal to the present value of the stream of dividends that investors expect to receive from owning the firm's shares. Under the assumption that investors expect dividends to grow at a constant rate, g, in perpetuity, the stock price is given by the following simple expression:

$$P_s = \frac{D(1+g)}{k-g} \qquad (1)$$

where:

P_s = current price per share of the firm's stock;

D = current annual dividend per share;

g = expected constant dividend growth rate; and

k = required return on the firm's stock.

Dividing both sides of Equation (1) by the firm's current earnings, E, we obtain:

$$\frac{P_s}{E} = \frac{D}{E} \cdot \frac{(1+g)}{k-g} \qquad (2)$$

Thus, the firm's price/earnings (P/E) ratio is a nonlinear function of the firm's dividend payout ratio (D/E), the expected growth in dividends (g), and the required rate of return.

To investigate what growth expectation is embodied in the firm's current stock price, it is more convenient to work with a linear approximation to Equation (2). Thus, we will assume that:

$$P/E = a_0(D/E) + a_1 g + a_2 k. \qquad (3)$$

(Cragg and Malkiel found this assumption to be reasonable throughout their investigation.)

Furthermore, we will assume that the required

rate of return, k, in Equation (3) depends on the values of the risk variables B, Cov, Rsq, and Sa, where B is the firm's Value Line beta; Cov is the firm's pretax interest coverage ratio; Rsq is a measure of the stability of the firm's five-year historical EPS; and Sa is the standard deviation of the consensus analysts' five-year EPS growth forecast for the firm. Finally, as the linear form of the P/E equation is only an approximation to the true P/E equation, and B, Cov, Rsq, and Sa are only proxies for k, we will add an error term, e, that represents the degree of approximation to the true relationship.

With these assumptions, the final form of our P/E equation is as follows:

$$P/E = a_0(D/E) + a_1 g + a_2 B + a_3 Cov + a_4 Rsq + a_5 Sa + e. \quad (4)$$

The purpose of our study is to use more recent data to determine which of the popular approaches for estimating future growth in the Discounted Cash Flow model is embodied in the market price of the firm's shares.

We estimated Equation (4) to determine which estimate of future growth, g, when combined with the payout ratio, D/E, and risk variables B, Cov, Rsq, and Sa, provides the best predictor of the firm's P/E ratio. To paraphrase Cragg and Malkiel, we would expect that growth estimates found in the best-fitting equation more closely approximate the expectation used by investors than those found in poorer-fitting equations.

DESCRIPTION OF DATA

Our data sets include both historically based measures of future growth and the consensus analysts' forecasts of five-year earnings growth supplied by the Institutional Brokers Estimate System of Lynch, Jones & Ryan (IBES). The data also include the firm's dividend payout ratio and various measures of the firm's risk. We include the latter items in the regression, along with earnings growth, to account for other variables that may affect the firm's stock price.

The data include:

Earnings Per Share. Because our goal is to determine which earnings variable is embodied in the firm's market price, we need to define this variable with care. Financial analysts who study a firm's financial results in detail generally prefer to "normalize" the firm's reported earnings for the effect of extraordinary items, such as write-offs of discontinued operations, or mergers and acquisitions. They also attempt, to the extent possible, to state earnings for different firms using a common set of accounting conventions.

We have defined "earnings" as the consensus analyst estimate (as reported by IBES) of the firm's earnings for the forthcoming year.[1] This definition approximates the normalized earnings that investors most likely have in mind when they make stock purchase and sell decisions. It implicitly incorporates the analysts' adjustments for differences in accounting treatment among firms and the effects of the business cycle on each firm's results of operations. Although we thought at first that this earnings estimate might be highly correlated with the analysts' five-year earnings growth forecasts, that was not the case. Thus, we avoided a potential spurious correlation problem.

Price/Earnings Ratio. Corresponding to our definition of "earnings," the price/earnings ratio (P/E) is calculated as the closing stock price for the year divided by the consensus analyst earnings forecast for the forthcoming fiscal year.

Dividends. Dividends per share represent the common dividends declared per share during the calendar year, after adjustment for all stock splits and stock dividends). The firm's dividend payout ratio is then defined as common dividends per share divided by the consensus analyst estimate of the earnings per share for the forthcoming calendar year (D/E). Although this definition has the deficiency that it is obviously biased downward — it divides this year's dividend by next year's earnings — it has the advantage that it implicitly uses a "normalized" figure for earnings. We believe that this advantage outweighs the deficiency, especially when one considers the flaws of the apparent alternatives. Furthermore, we have verified that the results are insensitive to reasonable alternative definitions (see footnote 1).

Growth. In comparing historically based and consensus analysts' forecasts, we calculated forty-one different historical growth measures. These included the following: 1) the past growth rate in EPS as determined by a log-linear least squares regression for the latest year,[2] two years, three years, . . ., and ten years; 2) the past growth rate in DPS for the latest year, two years, three years, . . ., and ten years; 3) the past growth rate in book value per share (computed as the ratio of common equity to the outstanding common equity shares) for the latest year, two years, three years, . . ., and ten years; 4) the past growth rate in cash flow per share (computed as the ratio of pretax income, depreciation, and deferred taxes to the outstanding common equity shares) for the latest year, two years, three years, . . ., and ten years; and 5) plowback growth (computed as the firm's retention ratio for the current year times the firm's latest annual return on common equity).

We also used the five-year forecast of earnings

Reproduced with permission of the copyright owner. Further reproduction prohibited without permission.

per share growth compiled by IBES and reported in mid-January of each year. This number represents the consensus (i.e., mean) forecast produced by analysts from the research departments of leading Wall Street and regional brokerage firms over the preceding three months. IBES selects the contributing brokers "because of the superior quality of their research, professional reputation, and client demand" (IBES *Monthly Summary Book*).

Risk Variables. Although many risk factors could potentially affect the firm's stock price, most of these factors are highly correlated with one another. As shown above in Equation (4), we decided to restrict our attention to four risk measures that have intuitive appeal and are followed by many financial analysts: 1) B, the firm's beta as published by Value Line; 2) Cov, the firm's pretax interest coverage ratio (obtained from Standard & Poor's Compustat); 3) Rsq, the stability of the firm's five-year historical EPS (measured by the R^2 from a log-linear least squares regression); and 4) Sa, the standard deviation of the consensus analysts' five-year EPS growth forecast (mean forecast) as computed by IBES.

After careful analysis of the data used in our study, we felt that we could obtain more meaningful results by imposing six restrictions on the companies included in our study:

1. Because of the need to calculate ten-year historical growth rates, and because we studied three different time periods, 1981, 1982, and 1983, our study requires data for the thirteen-year period 1971-1983. We included only companies with at least a thirteen-year operating history in our study.
2. As our historical growth rate calculations were based on log-linear regressions, and the logarithm of a negative number is not defined, we excluded all companies that experienced negative EPS during any of the years 1971-1983.
3. For similar reasons, we also eliminated companies that did not pay a dividend during any one of the years 1971-1983.
4. To insure comparability of time periods covered by each consensus earnings figure in the P/E ratios, we eliminated all companies that did not have a December 31 fiscal year-end.
5. To eliminate distortions caused by highly unusual events that distort current earnings but not expected future earnings, and thus the firm's price/earnings ratio, we eliminated any firm with a price/earnings ratio greater than 50.
6. As the evaluation of analysts' forecasts is a major part of this study, we eliminated all firms that IBES did not follow.

Our final sample consisted of approximately sixty-five utility firms.[3]

RESULTS

To keep the number of calculations in our study to a reasonable level, we performed the study in two stages. In Stage 1, all forty-one historically oriented approaches for estimating future growth were correlated with each firm's P/E ratio. In Stage 2, the historical growth rate with the highest correlation to the P/E ratio was compared to the consensus analyst growth rate in the multiple regression model described by Equation (4) above. We performed our regressions for each of three recent time periods, because we felt the results of our study might vary over time.

First-Stage Correlation Study

Table 1 gives the results of our first-stage correlation study for each group of companies in each of the years 1981, 1982, and 1983. The values in this table measure the correlation between the historically oriented growth rates for the various time periods and the firm's end-of-year P/E ratio.

The four variables for which historical growth rates were calculated are shown in the left-hand column: EPS indicates historical earnings per share growth, DPS indicates historical dividend per share growth, BVPS indicates historical book value per share growth, and CFPS indicates historical cash flow per share growth. The term "plowback" refers to the product of the firm's retention ratio in the currennt year and its return on book equity for that year. In all, we calculated forty-one historically oriented growth rates for each group of firms in each study period.

The goal of the first-stage correlation analysis was to determine which historically oriented growth rate is most highly correlated with each group's year-end P/E ratio. Eight-year growth in CFPS has the highest correlation with P/E in 1981 and 1982, and ten-year growth in CFPS has the highest correlation with year-end P/E in 1983. In all cases, the plowback estimate of future growth performed poorly, indicating that — contrary to generally held views — plowback is not a factor in investor expectations of future growth.

Second-Stage Regression Study

In the second stage of our regression study, we ran the regression in Equation (4) using two different measures of future growth, g: 1) the best historically oriented growth rate (g_h) from the first-stage correlation study, and 2) the consensus analysts' forecast (g_a) of five-year EPS growth. The regression results, which are shown in Table 2, support at least

two general conclusions regarding the pricing of equity securities.

First, we found overwhelming evidence that the consensus analysts' forecast of future growth is superior to historically oriented growth measures in predicting the firm's stock price. In every case, the R^2 in the regression containing the consensus analysts' forecast is higher than the R^2 in the regression containing the historical growth measure. The regression coefficients in the equation containing the consensus analysts' forecast also are considerably more significant than they are in the alternative regression. These results are consistent with those found by Cragg and Malkiel for data covering the period 1961-1968. Our results also are consistent with the hypothesis that investors use analysts' forecasts, rather than historically oriented growth calculations, in making stock buy–and–sell decisions.

Second, there is some evidence that investors tend to view risk in traditional terms. The interest coverage variable is statistically significant in all but one of our samples, and the stability of the operating income variable is statistically significant in six of the twelve samples we studied. On the other hand, the beta is never statistically significant, and the standard deviation of the analysts' five-year growth forecasts is statistically significant in only two of our twelve samples. This evidence is far from conclusive, however, because, as we demonstrate later, a significant degree of cross-correlation among our four risk variables makes any general inference about risk extremely hazardous.

Possible Misspecification of Risk

The stock valuation theory says nothing about which risk variables are most important to investors. Therefore, we need to consider the possibility that the risk variables of our study are only proxies for the "true" risk variables used by investors. The inclusion of proxy variables may increase the variance of the parameters of most concern, which in this case are the coefficients of the growth variables.[4]

To allow for the possibility that the use of risk proxies has caused us to draw incorrect conclusions concerning the relative importance of analysts' growth forecasts and historical growth extrapolations, we have also estimated Equation (4) with the risk variables excluded. The results of these regressions are shown in Table 3.

Again, there is overwhelming evidence that the consensus analysts' growth forecast is superior to the historically oriented growth measures in predicting the firm's stock price. The R^2 and t-statistics are higher in every case.

CONCLUSION

The relationship between growth expectations and share prices is important in several major areas of finance. The data base of analysts' growth forecasts collected by Lynch, Jones & Ryan provides a unique opportunity to test the hypothesis that investors rely more heavily on analysts' growth forecasts than on historical growth extrapolations in making security buy–and–sell decisions. With the help of this data base, our studies affirm the superiority of analysts' forecasts over simple historical growth extrapolations in the stock price formation process. Indirectly, this finding lends support to the use of valuation models whose input includes expected growth rates.

[1] We also tried several other definitions of "earnings," including the firm's most recent primary earnings per share prior to any extraordinary items or discontinued operations. As our results were insensitive to reasonable alternative definitions of "earnings" we report only the results for the IBES consensus.

[2] For the latest year, we actually employed a point-to-point growth calculation because there were only two available observations.

[3] We use the word "approximately," because the set of available firms varied each year. In any case, the number varied only from zero to three firms on either side of the figures cited here.

INVESTOR GROWTH EXPECTATIONS

Summer 2004

A study done by Vander Weide and Carleton in 1988[1] suggests that consensus analysts' forecast of future growth is superior to historically oriented growth measures in stock valuation process for domestic companies. We worked with one of the original authors of the study, Dr. James H. Vander Weide, and closely followed his suggestions and methodology to investigate whether the results still hold in more recent times (2001- 2003).

We used the following equation to determine which estimate of future growth (g) best predicts the firm's P/E ratio when combined with the dividend payout ratio, D/E, and risk variables, B, Cov, Stb, and Sa.

$$P/E = a_0(D/E) + a_1 g(\text{Growth}) + a_2 B(\text{Beta}) + a_3 \text{Cov}(\text{Interest Coverage Ratio}) + a_4 \text{Stb}(\text{Stability}) + a_5 \text{Sa}(\text{Std Dev}) + e$$

Data Description

Earnings Per Share: IBES consensus analyst estimate of the firm's earnings for the unreported year.

Price/Earnings Ratio: Closing stock price for the year divided by the consensus analyst earnings per share for the forthcoming year.

Dividends: Ratio of common dividends per share to the consensus analyst earnings forecast for the forthcoming fiscal year (D/E).

Historical Growth measures

EPS Growth Rate: Determined by a log-linear least squares regression for the latest year, two years, three years, …, and ten years.

Dividend per Share Growth Rate: Determined by a log-linear least squares regression for the latest year, two years, three years, …, and ten years.

Book Value per Share Growth Rate: Common equity divided by the common shares outstanding. Determined by a log-linear least squares regression for the latest year, two years, three years, …, and ten years.

Cash Flow per Share Growth Rate: Ratio of gross cash flow to common shares outstanding. Determined by a log-linear least squares regression for the latest year, two years, three years, …, and ten years.

Plowback Growth: Firm's retention ratio for the current year times the firm's latest annual return on equity.

3yr Plowback Growth: Firm's three-year average retention ratio times the firm's three-year average return on equity.

Consensus Analysts' Forecasts

Five-Year Earnings Per Share Growth: Mean analysts' forecast compiled by IBES.

[1] Vander Weide, J. H., and W. T. Carleton. "Investor Growth Expectations: Analysts vs. History." *The Journal of Portfolio Management*, Spring 1988, pp. 78-82.

Risk Variables

B: Beta, the firm's beta versus NYSE from Value Line.

Cov: The firm's pretax interest coverage ratio from Compustat.

Stb: Five-year historical earnings per share stability. Average absolute percentage difference between actual reported EPS and a 5yr historical EPS growth trend line from IBES.

Sa: The standard deviation of earnings per share estimate for the fiscal year from IBES.

We set five restrictions on the companies included in the study in order to be consistent with the original study and to obtain more meaningful results.

- Excluded all firms that IBES did not follow.
- Eliminated companies with:
  - Negative EPS during any of the years 1991-2003.
  - No dividend during any one of the years 1991-2003.
  - P/E ratio greater than 60 in years 2001-2003.
  - Less than five years of operating history.

The final universe consisted of 411 US firms, fifty-nine of which are utility companies.

Results

The study was performed in two stages.

Stage 1

In order to determine which historically oriented growth measure is most highly correlated with each firm's end-of-year P/E ratio, we computed spearman (rank) correlations between all forty-two historically oriented future growth measures and P/E.

The result of the stage 1 study is displayed in Table 1. Three-year plowback ratio has the highest correlation with P/E in 2001 and 2002, and five-year EPS growth rate has the highest correlation with P/E in 2003.

We also independently examined utility and non-utility firms. Table 2 shows the result for the fifty-nine utility firms. Two-year growth in EPS has the highest correlation with P/E in 2001, four-year EPS has the highest correlation in 2002, and six-year EPS has the highest correlation in 2003.

Table 3 exhibits the result for the remaining non-utility firms. EPS one-year growth, two-year growth, and five-year growth has the highest correlation with P/E in 2001, 2002, and 2003, respectively.

Stage 2

We compared the multiple regression model of historical growth rate with the highest correlation to the P/E ratio from stage 1 to the five-year earnings per share growth forecast.

$$P/E = a_0(D/E) + a_1 g + a_2 B + a_3 Cov + a_4 Stb + a_5 Sa + e$$

The regression results are displayed in table 4. The results show that the consensus analysts' forecast of future growth better approximates the firm's P/E ratio, which is consistent with the results found by Vander Weide and Carleton. In both regressions, R^2 in the regression with the consensus analysts' forecast is higher than the R^2 in the regression with the historical growth.

Table 4

	2.65	9.48	7.25	3.01	2.45	-0.81	-4.33		

*T-stats below the coefficients in smaller font

For utility companies shown in table 5, consensus analysts' forecast of future growth is superior to historically oriented growth in 2002 and 2003. R^2 is lower in the regression with the consensus analysts' forecast in 2001. For non-utility companies, we found that consensus analysts' forecast of future growth is superior to the alternative in all three years (table 6).

Cost of Capital Estimation

The Risk Premium Approach to Measuring a Utility's Cost of Equity

Eugene F. Brigham, Dilip K. Shome, and Steve R. Vinson

Eugene F. Brigham and Dilip K. Shome are faculty members of the University of Florida and the Virginia Polytechnic Institute and State University, respectively; Steve R. Vinson is affiliated with AT&T Communications.

■ In the mid-1960s, Myron Gordon and others began applying the theory of finance to help estimate utilities' costs of capital. Previously, the standard approach in cost of equity studies was the "comparable earnings method," which involved selecting a sample of unregulated companies whose investment risk was judged to be comparable to that of the utility in question, calculating the average return on book equity (ROE) of these sample companies, and setting the utility's service rates at a level that would permit the utility to achieve the same ROE as comparable companies. This procedure has now been thoroughly discredited (see Robichek [15]), and it has been replaced by three market-oriented (as opposed to accounting-oriented) approaches: (i) the DCF method, (ii) the bond-yield-plus-risk-premium method, and (iii) the CAPM, which is a specific version of the generalized bond-yield-plus-risk-premium approach.

Our purpose in this paper is to discuss the risk-premium approach, including the market risk premium that is used in the CAPM. First, we critique the various procedures that have been used in the past to estimate risk premiums. Second, we present some data on estimated risk premiums since 1965. Third, we examine the relationship between equity risk premiums and the level of interest rates, because it is important, for purposes of estimating the cost of capital, to know just how stable the relationship between risk premiums and interest rates is over time. If stability exists, then one can estimate the cost of equity at any point in time as a function of interest rates as reported in *The Wall Street Journal*, the *Federal Reserve Bulletin*, or some similar source.[1] Fourth, while we do not discuss the CAPM directly, our analysis does have some important implications for selecting a market risk premium for use in that model. Our focus is on utilities, but the methodology is applicable to the estimation of the cost of

[1]For example, the Federal Energy Regulatory Commission's Staff recently proposed that a risk premium be estimated every two years and that, between estimation dates, the last-determined risk premium be added to the current yield on ten-year Treasury bonds to obtain an estimate of the cost of equity to an average utility (Docket RM 80–36). Subsequently, the FCC made a similar proposal ("Notice of Proposed Rulemaking," August 13, 1984, Docket No. 84–800). Obviously, the validity of such procedures depends on (i) the accuracy of the risk premium estimate and (ii) the stability of the relationship between risk premiums and interest rates. Both proposals are still under review.

equity for any publicly traded firm, and also for non-traded firms for which an appropriate risk class can be assessed, including divisions of publicly traded corporations.[2]

Alternative Procedures for Estimating Risk Premiums

In a review of both rate cases and the academic literature, we have identified three basic methods for estimating equity risk premiums: (i) the *ex post,* or historic, yield spread method; (ii) the survey method; and (iii) an *ex ante* yield spread method based on DCF analysis.[3] In this section, we briefly review these three methods.

Historic Risk Premiums

A number of researchers, most notably Ibbotson and Sinquefield [12], have calculated historic holding period returns on different securities and then estimated risk premiums as follows:

$$\text{Historic Risk Premium} = \left(\begin{array}{c}\text{Average of the annual returns on a stock index for a particular past period}\end{array}\right) - \left(\begin{array}{c}\text{Average of the annual returns on a bond index for the same past period}\end{array}\right). \quad (1)$$

Ibbotson and Sinquefield (I&S) calculated both arithmetic and geometric average returns, but most of their risk-premium discussion was in terms of the geometric averages. Also, they used both corporate and Treasury bond indices, as well as a T-bill index, and they analyzed all possible holding periods since 1926. The I&S study has been employed in numerous rate cases in two ways: (i) directly, where the I&S historic risk premium is added to a company's bond yield to obtain an estimate of its cost of equity, and (ii) indirectly, where I&S data are used to estimate the market risk premium in CAPM studies.

There are both conceptual and measurement problems with using I&S data for purposes of estimating the cost of capital. Conceptually, there is no compelling reason to think that investors expect the same relative returns that were earned in the past. Indeed, evidence presented in the following sections indicates that relative expected returns should, and do, vary significantly over time. Empirically, the measured historic premium is sensitive both to the choice of estimation horizon and to the end points. These choices are essentially arbitrary, yet they can result in significant differences in the final outcome. These measurement problems are common to most forecasts based on time series data.

The Survey Approach

One obvious way to estimate equity risk premiums is to poll investors. Charles Benore [1], the senior utility analyst for Paine Webber Mitchell Hutchins, a leading institutional brokerage house, conducts such a survey of major institutional investors annually. His 1983 results are reported in Exhibit 1.

Exhibit 1. Results of Risk Premium Survey, 1983*

Assuming a double A, long-term utility bond currently yields 12½%, the common stock for the same company would be fairly priced relative to the bond if its expected return was as follows:

Total Return	Indicated Risk Premium (basis points)	Percent of Respondents
over 20½%	over 800	
20½%	800	
19½%	700	
18½%	600	10%
17½%	500	8%
16½%	400	29%
15½%	300	35%
14½%	200	16%
13½%	100	0%
under 13½%	under 100	1%
Weighted average	358	100%

*Benore's questionnaire included the first two columns, while his third column provided a space for the respondents to indicate which risk premium they thought applied. We summarized Benore's responses in the frequency distribution given in Column 3. Also, in his questionnaire each year, Benore adjusts the double A bond yield and the total returns (Column 1) to reflect current market conditions. Both the question above and the responses to it were taken from the survey conducted in April 1983.

[2]The FCC is particularly interested in risk-premium methodologies, because (i) only eighteen of the 1,400 telephone companies it regulates have publicly-traded stock, and hence offer the possibility of DCF analysis, and (ii) most of the publicly-traded telephone companies have both regulated and unregulated assets, so a corporate DCF cost might not be applicable to the regulated units of the companies.

[3]In rate cases, some witnesses also have calculated the differential between the yield to maturity (YTM) of a company's bonds and its concurrent ROE, and then called this differential a risk premium. In general, this procedure is unsound, because the YTM on a bond is a *future expected* return on the bond's *market value*, while the ROE is the *past realized* return on the stock's *book value*. Thus, comparing YTMs and ROEs is like comparing apples and oranges.

Benore's results, as measured by the average risk premiums, have varied over the years as follows:

Year	Average RP (basis points)
1978	491
1979	475
1980	423
1981	349
1982	275
1983	358

The survey approach is conceptually sound in that it attempts to measure investors' expectations regarding risk premiums, and the Benore data also seem to be carefully collected and processed. Therefore, the Benore studies do provide one useful basis for estimating risk premiums. However, as with most survey results, the possibility of biased responses and/or biased sampling always exists. For example, if the responding institutions are owners of utility stocks (and many of them are), and if the respondents think that the survey results might be used in a rate case, then they might bias upward their responses to help utilities obtain higher authorized returns. Also, Benore surveys large institutional investors, whereas a high percentage of utility stocks are owned by individuals rather than institutions, so there is a question as to whether his reported risk premiums are really based on the expectations of the "representative" investor. Finally, from a pragmatic standpoint, there is a question as to how to use the Benore data for utilities that are not rated AA. The Benore premiums can be applied as an add-on to the own-company bond yields of any given utility only if it can be assumed that the premiums are constant across bond rating classes. *A priori*, there is no reason to believe that the premiums will be constant.

DCF-Based *Ex Ante* Risk Premiums

In a number of studies, the DCF model has been used to estimate the *ex ante* market risk premium, RP_M. Here, one estimates the average expected future return on equity for a group of stocks, k_M, and then subtracts the concurrent risk-free rate, R_F, as proxied by the yield to maturity on either corporate or Treasury securities:[4]

$$RP_M = k_M - R_F. \tag{2}$$

Conceptually, this procedure is exactly like the I&S approach except that one makes direct estimates of future expected returns on stocks and bonds rather than assuming that investors expect future returns to mirror past returns.

The most difficult task, of course, is to obtain a valid estimate of k_M, the expected rate of return on the market. Several studies have attempted to estimate DCF risk premiums for the utility industry and for other stock market indices. Two of these are summarized next.

Vandell and Kester. In a recently published monograph, Vandell and Kester [18] estimated *ex ante* risk premiums for the period from 1944 to 1978. R_F was measured both by the yield on 90-day T-bills and by the yield on the Standard and Poor's AA Utility Bond Index. They measured k_M as the average expected return on the S&P's 500 Index, with the expected return on individual securities estimated as follows:

$$k_i = \left(\frac{D_1}{P_0}\right)_i + g_i, \tag{3}$$

where,

D_1 = dividend per share expected over the next twelve months,
P_0 = current stock price,
g = estimated long-term constant growth rate, and
i = the i^{th} stock.

To estimate g_i, Vandell and Kester developed fifteen forecasting models based on both exponential smoothing and trend-line forecasts of earnings and dividends, and they used historic data over several estimating horizons. Vandell and Kester themselves acknowledge that, like the Ibbotson-Sinquefield premiums, their analysis is subject to potential errors associated with trying to estimate expected future growth purely from past data. We shall have more to say about this point later.

[4]In this analysis, most people have used yields on long-term bonds rather than short-term money market instruments. It is recognized that long-term bonds, even Treasury bonds, are not risk free, so an RP_M based on these debt instruments is smaller than it would be if there were some better proxy to the long-term riskless rate. People have attempted to use the T-bill rate for R_F, but the T-bill rate embodies a different average inflation premium than stocks, and it is subject to random fluctuations caused by monetary policy, international currency flows, and other factors. Thus, many people believe that for cost of capital purposes, R_F should be based on long-term securities.

We did test to see how debt maturities would affect our calculated risk premiums. If a short-term rate such as the 30-day T-bill rate is used, measured risk premiums jump around widely and, so far as we could tell, randomly. The choice of a maturity in the 10- to 30-year range has little effect, as the yield curve is generally fairly flat in that range.

Malkiel. Malkiel [14] estimated equity risk premiums for the Dow Jones Industrials using the DCF model. Recognizing that the constant dividend growth assumption may not be valid, Malkiel used a nonconstant version of the DCF model. Also, rather than rely exclusively on historic data, he based his growth rates on Value Line's five-year earnings growth forecasts plus the assumption that each company's growth rate would, after an initial five-year period, move toward a long-run real national growth rate of four percent. He also used ten-year maturity government bonds as a proxy for the riskless rate. Malkiel reported that he tested the sensitivity of his results against a number of different types of growth rates, but, in his words, "The results are remarkably robust, and the estimated risk premiums are all very similar." Malkiel's is, to the best of our knowledge, the first risk-premium study that uses analysts' forecasts. A discussion of analysts' forecasts follows.

Security Analysts' Growth Forecasts

Ex ante DCF risk premium estimates can be based either on expected growth rates developed from time series data, such as Vandell and Kester used, or on analysts' forecasts, such as Malkiel used. Although there is nothing inherently wrong with time series-based growth rates, an increasing body of evidence suggests that primary reliance should be placed on analysts' growth rates. First, we note that the observed market price of a stock reflects the consensus view of investors regarding its future growth. Second, we know that most large brokerage houses, the larger institutional investors, and many investment advisory organizations employ security analysts who forecast future EPS and DPS, and, to the extent that investors rely on analysts' forecasts, the consensus of analysts' forecasts is embodied in market prices. Third, there have been literally dozens of academic research papers dealing with the accuracy of analysts' forecasts, as well as with the extent to which investors actually use them. For example, Cragg and Malkiel [7] and Brown and Rozeff [5] determined that security analysts' forecasts are more relevant in valuing common stocks and estimating the cost of capital than are forecasts based solely on historic time series. Stanley, Lewellen, and Schlarbaum [16] and Linke [13] investigated the importance of analysts' forecasts and recommendations to the investment decisions of individual and institutional investors. Both studies indicate that investors rely heavily on analysts' reports and incorporate analysts' forecast information in the formation of their expectations about stock returns. A representative listing of other work supporting the use of analysts' forecasts is included in the References section. Thus, evidence in the current literature indicates that (i) analysts' forecasts are superior to forecasts based solely on time series data, and (ii) investors do rely on analysts' forecasts. Accordingly, we based our cost of equity, and hence risk premium estimates, on analysts' forecast data.[5]

Risk Premium Estimates

For purposes of estimating the cost of capital using the risk premium approach, it is necessary either that the risk premiums be time-invariant or that there exists a predictable relationship between risk premiums and interest rates. If the premiums are constant over time, then the constant premium could be added to the prevailing interest rate. Alternatively, if there exists a stable relationship between risk premiums and interest rates, it could be used to predict the risk premium from the prevailing interest rate.

To test for stability, we obviously need to calculate risk premiums over a fairly long period of time. Prior to 1980, the only consistent set of data we could find came from Value Line, and, because of the work involved, we could develop risk premiums only once a year (on January 1). Beginning in 1980, however, we began collecting and analyzing Value Line data on a monthly basis, and in 1981 we added monthly estimates from Merrill Lynch and Salomon Brothers to our data base. Finally, in mid-1983, we expanded our analysis to include the IBES data.

Annual Data and Results, 1966–1984

Over the period 1966–1984, we used Value Line data to estimate risk premiums both for the electric utility industry and for industrial companies, using the companies included in the Dow Jones Industrial and Utility averages as representative of the two groups. Value Line makes a five-year growth rate forecast, but it also gives data from which one can develop a longer-term forecast. Since DCF theory calls for a truly long-term (infinite horizon) growth rate, we concluded that it was better to develop and use such a forecast than to

[5]Recently, a new type of service that summarizes the key data from most analysts' reports has become available. We are aware of two sources of such services, the Lynch, Jones, and Ryan's Institutional Brokers Estimate System (IBES) and Zack's Icarus Investment Service. IBES and the Icarus Service gather data from both buy-side and sell-side analysts and provide it to subscribers on a monthly basis in both a printed and a computer-readable format.

Exhibit 2. Estimated Annual Risk Premiums, Nonconstant (Value Line) Model, 1966–1984

January 1 of the Year Reported	Dow Jones Electrics			Dow Jones Industrials			
	k_{Avg}	R_F	RP	k_{Avg}	R_F	RP	(3) ÷ (6)
	(1)	(2)	(3)	(4)	(5)	(6)	(7)
1966	8.11%	4.50%	3.61%	9.56%	4.50%	5.06%	0.71
1967	9.00%	4.76%	4.24%	11.57%	4.76%	6.81%	0.62

1969	9.34%	5.88%	3.46%	10.96%	5.88%	5.08%	0.68
1970	11.04%	6.91%	4.13%	12.22%	6.91%	5.31%	0.78
1971	10.80%	6.28%	4.52%	11.23%	6.28%	4.95%	0.91
1972	10.53%	6.00%	4.53%	11.09%	6.00%	5.09%	0.89
1973	11.37%	5.96%	5.41%	11.47%	5.96%	5.51%	0.98
1974	13.85%	7.29%	6.56%	12.38%	7.29%	5.09%	1.29
1975	16.63%	7.91%	8.72%	14.83%	7.91%	6.92%	1.26
1976	13.97%	8.23%	5.74%	13.32%	8.23%	5.09%	1.13
1977	12.96%	7.30%	5.66%	13.63%	7.30%	6.33%	0.89
1978	13.42%	7.87%	5.55%	14.75%	7.87%	6.88%	0.81
1979	14.92%	8.99%	5.93%	15.50%	8.99%	6.51%	0.91
1980	16.39%	10.18%	6.21%	16.53%	10.18%	6.35%	0.98
1981	17.61%	11.99%	5.62%	17.37%	11.99%	5.38%	1.04
1982	17.70%	14.00%	3.70%	19.30%	14.00%	5.30%	0.70
1983	16.30%	10.66%	5.64%	16.53%	10.66%	5.87%	0.96
1984	16.03%	11.97%	4.06%	15.72%	11.97%	3.75%	1.08

use the five-year prediction.[6] Therefore, we obtained data as of January 1 from Value Line for each of the Dow Jones companies and then solved for k, the expected rate of return, in the following equation:

$$P_0 = \sum_{t=1}^{n} \frac{D_t}{(1+k)^t} + \left(\frac{D_n(1+g_n)}{k-g_n}\right)\left(\frac{1}{1+k}\right)^n. \qquad (4)$$

Equation (4) is the standard nonconstant growth DCF model; P_0 is the current stock price; D_t represents the forecasted dividends during the nonconstant growth period; n is the years of nonconstant growth; D_n is the first constant growth dividend; and g_n is the constant, long-run growth rate after year n. Value Line provides D_t values for t = 1 and t = 4, and we interpolated to obtain D_2 and D_3. Value Line also gives estimates for ROE and for the retention rate (b) in the terminal year, n, so we can forecast the long-term growth rate as g_n = b(ROE). With all the values in Equation (4) specified except k, we can solve for k, which is the DCF rate of return that would result if the Value Line forecasts were met, and, hence, the DCF rate of return implied in the Value Line forecast.[7]

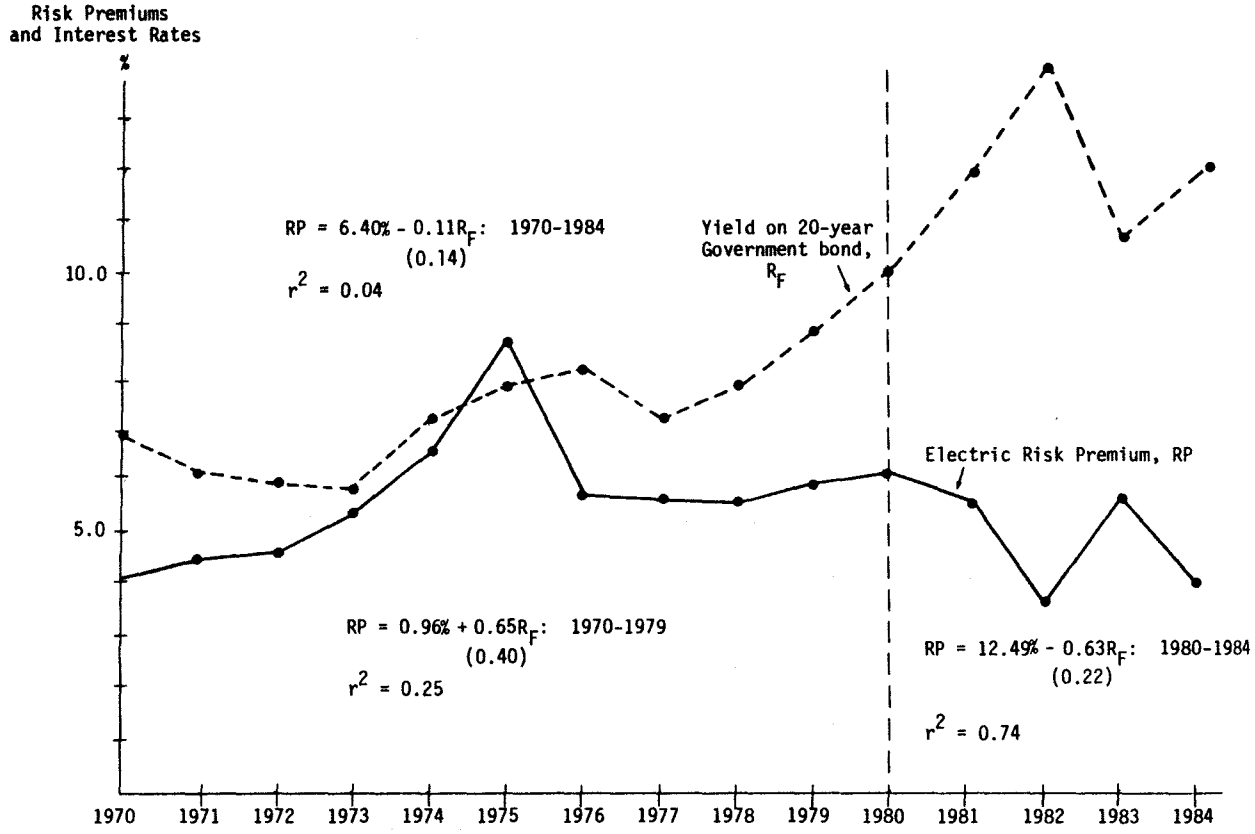
Having estimated a k value for each of the electric and industrial companies, we averaged them (using market-value weights) to obtain a k value for each group, after which we subtracted R_F (taken as the December 31 yield on twenty-year constant maturity Treasury bonds) to obtain the estimated risk premiums shown in Exhibit 2. The premiums for the electrics are plotted in Exhibit 3, along with interest rates. The following points are worthy of note:

1. Risk premiums fluctuate over time. As we shall see in the next section, fluctuations are even wider when measured on a monthly basis.
2. The last column of Exhibit 2 shows that risk premi-

[6]This is a debatable point. Cragg and Malkiel, as well as many practicing analysts, feel that most investors actually focus on five-year forecasts. Others, however, argue that five-year forecasts are too heavily influenced by base-year conditions and/or other nonpermanent conditions for use in the DCF model. We note (i) that most published forecasts do indeed cover five years, (ii) that such forecasts are typically "normalized" in some fashion to alleviate the base-year problem, and (iii) that for relatively stable companies like those in the Dow Jones averages, it generally does not matter greatly if one uses a normalized five-year or a longer-term forecast, because these companies meet the conditions of the constant-growth DCF model rather well.

[7]Value Line actually makes an explicit price forecast for each stock, and one could use this price, along with the forecasted dividends, to develop an expected rate of return. However, Value Line's forecasted stock price builds in a forecasted *change* in k. Therefore, the forecasted price is inappropriate for use in estimating current values of k.

Exhibit 3. Equity Risk Premiums for Electric Utilities and Yields on 20-Year Government Bonds, 1970–1984*



*Standard errors of the coefficients are shown in parentheses below the coefficients.

ums for the utilities increased relative to those for the industrials from the mid-1960s to the mid-1970s. Subsequently, the perceived riskiness of the two groups has, on average, been about the same.

3. Exhibit 3 shows that, from 1970 through 1979, utility risk premiums tended to have a positive association with interest rates: when interest rates rose, so did risk premiums, and vice versa. However, beginning in 1980, an inverse relationship appeared: rising interest rates led to declining risk premiums. We shall discuss this situation further in the next section.

Monthly Data and Results, 1980–1984

In early 1980, we began calculating risk premiums on a monthly basis. At that time, our only source of analysts' forecasts was Value Line, but beginning in 1981 we also obtained Merrill Lynch and Salomon Brothers' data, and then, in mid-1983, we obtained IBES data. Because our focus was on utilities, we restricted our monthly analysis to that group.

Our 1980–1984 monthly risk premium data, along with Treasury bond yields, are shown in Exhibits 4 and 5 and plotted in Exhibits 6, 7, and 8. Here are some comments on these Exhibits:

1. Risk premiums, like interest rates and stock prices, are volatile. Our data indicate that it would not be appropriate to estimate the cost of equity by adding the current cost of debt to a risk premium that had been estimated in the past. Current risk premiums should be matched with current interest rates.
2. Exhibit 6 confirms the 1980–1984 section of Exhibit 3 in that it shows a strong inverse relationship between interest rates and risk premiums; we shall discuss shortly why this relationship holds.
3. Exhibit 7 shows that while risk premiums based on Value Line, Merrill Lynch, and Salomon Brothers

Exhibit 6. Utility Risk Premiums and Interest Rates, 1980–1984

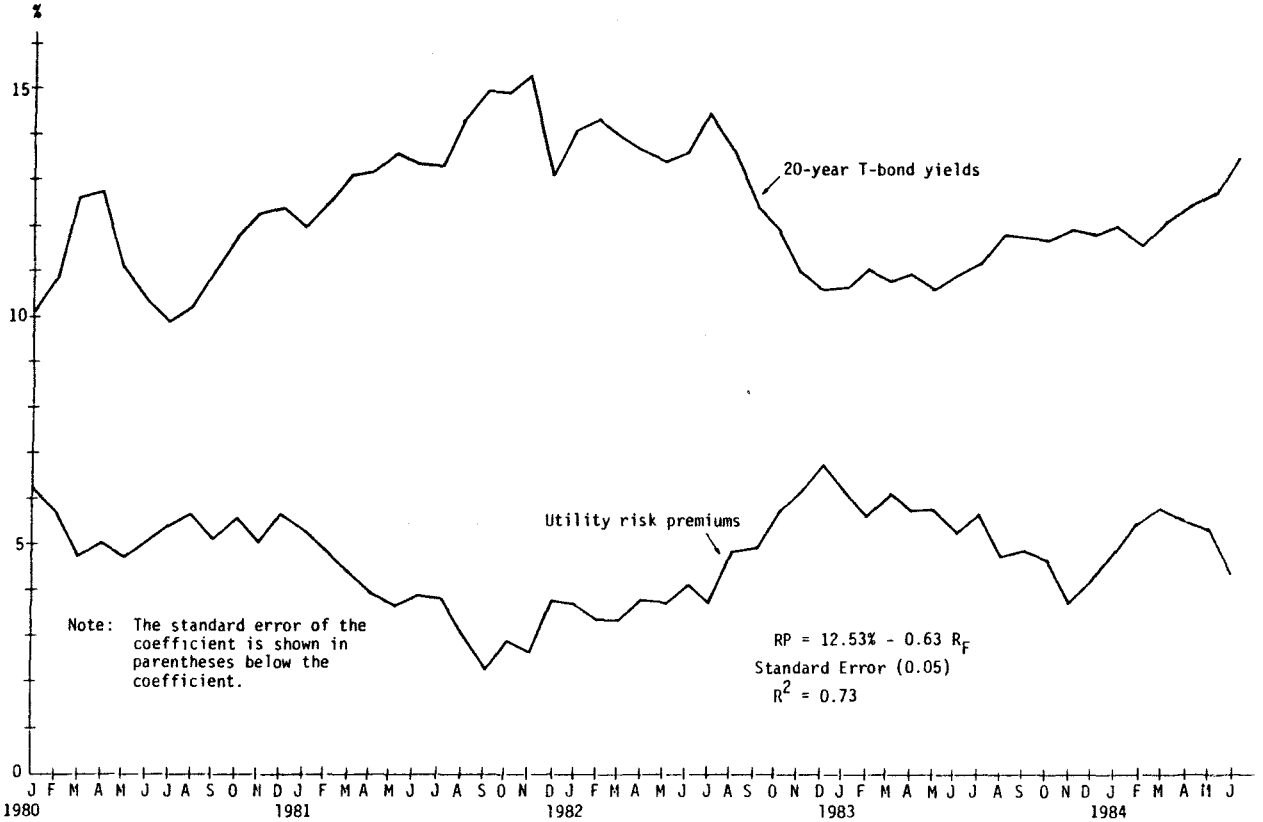

Exhibit 7. Monthly Risk Premiums, Electric Utilities, 1981–1984 (to Date)

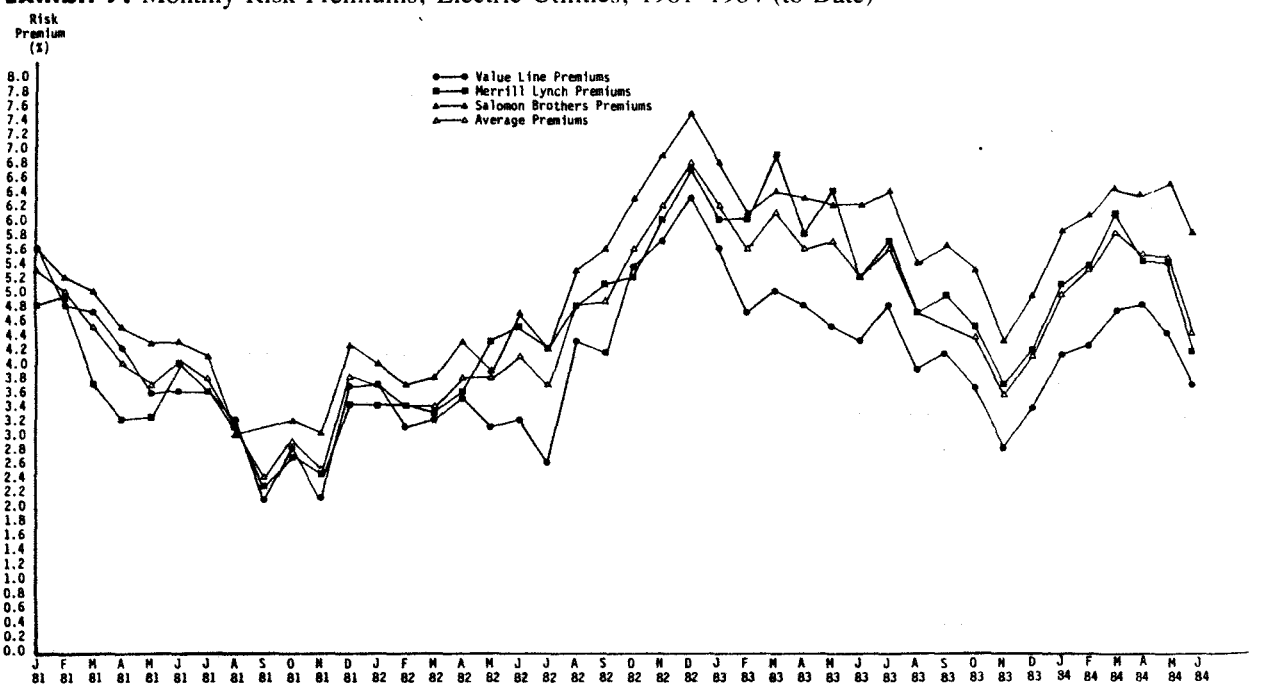

Exhibit 8. Comparative Risk Premium Data

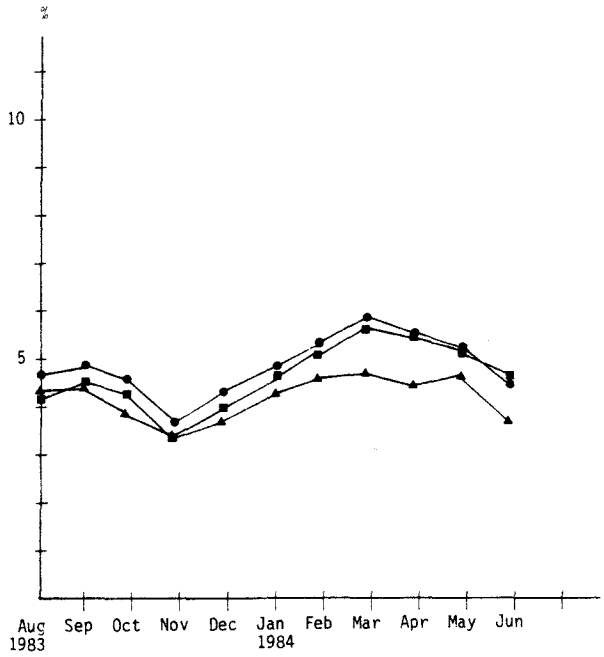

do differ, the differences are not large given the nature of the estimates, and the premiums follow one another closely over time. Since all of the analysts are examining essentially the same data and since utility companies are not competitive with one another, and hence have relatively few secrets, the similarity among the analysts' forecasts is not surprising.

4. The IBES data, presented in Exhibit 5 and plotted in Exhibit 8, contain too few observations to enable us to draw strong conclusions, but (i) the Dow Jones Electrics risk premiums based on our three-analyst data have averaged 27 basis points above premiums based on the larger group of analysts surveyed by IBES and (ii) the premiums on the 11 Dow Jones Electrics have averaged 54 basis points higher than premiums for the entire utility industry followed by IBES. Given the variability in the data, we are, at this point, inclined to attribute these differences to random fluctuations, but as more data become available, it may turn out that the differences are statistically significant. In particular, the 11 electric utilities included in the Dow Jones Utility Index all have large nuclear investments, and this may cause them to be regarded as riskier than the industry average, which includes both nuclear and non-nuclear companies.

Tests of the Reasonableness of the Risk Premium Estimates

So far our claims to the reasonableness of our risk-premium estimates have been based on the reasonableness of our variable measures, particularly the measures of expected dividend growth rates. Essentially, we have argued that since there is strong evidence in the literature in support of analysts' forecasts, risk premiums based on these forecasts are reasonable. In the spirit of positive economics, however, it is also important to demonstrate the reasonableness of our results more directly.

It is theoretically possible to test for the validity of the risk-premium estimates in a CAPM framework. In a cross-sectional estimate of the CAPM equation,

$$(k - R_F)_i = \alpha_0 + \alpha_1\beta_i + u_i, \qquad (5)$$

we would expect

$$\hat{\alpha}_0 = 0 \text{ and } \hat{\alpha}_1 = k_M - R_F = \text{Market risk premium.}$$

This test, of course, would be a joint test of both the CAPM and the reasonableness of our risk-premium estimates. There is a great deal of evidence that questions the empirical validity of the CAPM, especially when applied to regulated utilities. Under these conditions, it is obvious that no unambiguous conclusion can be drawn regarding the efficacy of the premium estimates from such a test.[8]

A simpler and less ambiguous test is to show that the risk premiums are higher for lower rated firms than for higher rated firms. Using 1984 data, we classified the

[8]We carried out the test on a monthly basis for 1984 and found positive but statistically insignificant coefficients. A typical result (for April 1984) follows:

$$(k - R_F)_i = \underset{(0.91)}{3.1675} + \underset{(1.44)}{1.8031}\ \beta_i.$$

The figures in parentheses are standard errors. Utility risk premiums do increase with betas, but the intercept term is not zero as the CAPM would predict, and α_1 is both less than the predicted value and not statistically significant. Again, the observation that the coefficients do not conform to CAPM predictions could be as much a problem with CAPM specification for utilities as with the risk premium estimates.

A similar test was carried out by Friend, Westerfield, and Granito [9]. They tested the CAPM using expectational (survey) data rather than *ex post* holding period returns. They actually found their coefficient of β_i to be negative in all their cross-sectional tests.

Exhibit 9. Relationship between Risk Premiums and Bond Ratings, 1984*

Month	Aaa/AA	AA	Aa/A	A	A/BBB	BBB	Below BBB
January†	—	2.61%	3.06%	3.70%	5.07%	4.90%	9.45%
February	2.98%	3.17%	3.36%	4.03%	5.26%	5.14%	7.97%
March	2.34%	3.46%	3.29%	4.06%	5.43%	5.02%	8.28%
April	2.37%	3.03%	3.29%	3.88%	5.29%	4.97%	6.96%
May	2.00%	2.48%	3.42%	3.72%	4.72%	6.64%	8.81%

Average	2.08%	2.82%	3.15%	3.76%	4.92%	5.28%	7.84%

*The risk premiums are based on IBES data for the electric utilities followed by both IBES and Salomon Brothers. The number of electric utilities followed by both firms varies from month to month. For the period between January and June 1984, the number of electrics followed by both firms ranged from 96 to 99 utilities.
†In January, there were no Aaa/AA companies. Subsequently, four utilities were upgraded to Aaa/AA.

utility industry into risk groups based on bond ratings. For each rating group, we estimated the average risk premium. The results, presented in Exhibit 9, clearly show that the lower the bond rating, the higher the risk premiums. Our premium estimates therefore would appear to pass this simple test of reasonableness.

Risk Premiums and Interest Rates

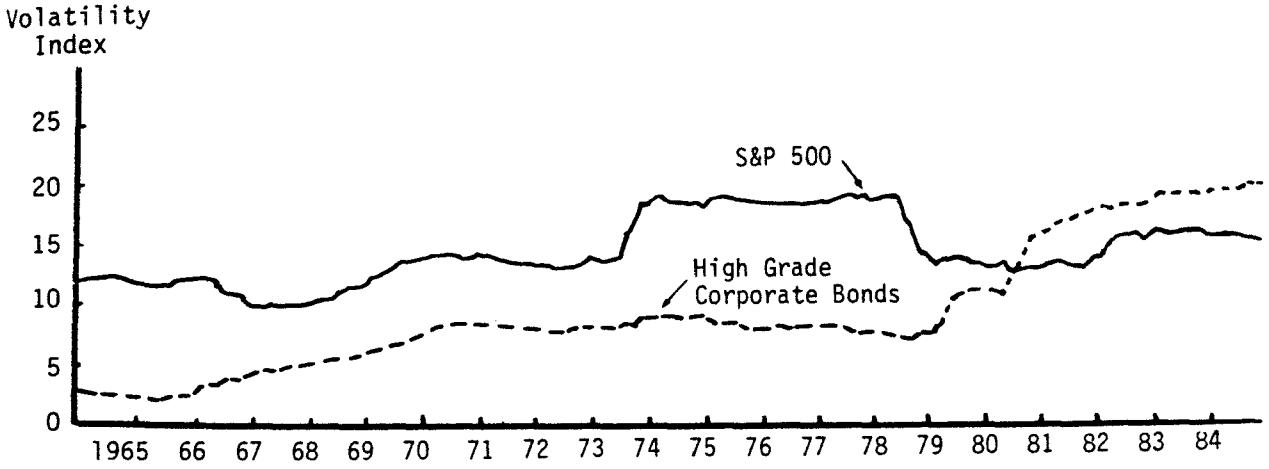
Traditionally, stocks have been regarded as being riskier than bonds because bondholders have a prior claim on earnings and assets. That is, stockholders stand at the end of the line and receive income and/or assets only after the claims of bondholders have been satisfied. However, if interest rates fluctuate, then the holders of long-term bonds can suffer losses (either realized or in an opportunity cost sense) even though they receive all contractually due payments. Therefore, if investors' worries about "interest rate risk" versus "earning power risk" vary over time, then perceived risk differentials between stocks and bonds, and hence risk premiums, will also vary.

Any number of events could occur to cause the perceived riskiness of stocks versus bonds to change, but probably the most pervasive factor, over the 1966–1984 period, is related to inflation. Inflationary expectations are, of course, reflected in interest rates. Therefore, one might expect to find a relationship between risk premiums and interest rates. As we noted in our discussion of Exhibit 3, risk premiums were positively correlated with interest rates from 1966 through 1979, but, beginning in 1980, the relationship turned negative. A possible explanation for this change is given next.

1966–1979 Period. During this period, inflation heated up, fuel prices soared, environmental problems surfaced, and demand for electricity slowed even as expensive new generating units were nearing completion. These cost increases required offsetting rate hikes to maintain profit levels. However, political pressure, combined with administrative procedures that were not designed to deal with a volatile economic environment, led to long periods of "regulatory lag" that caused utilities' earned ROEs to decline in absolute terms and to fall far below the cost of equity. These factors combined to cause utility stockholders to experience huge losses: S&P's Electric Index dropped from a mid-1960s high of 60.90 to a mid-1970s low of 20.41, a decrease of 66.5%. Industrial stocks also suffered losses during this period, but, on average, they were only one third as severe as the utilities' losses. Similarly, investors in long-term bonds had losses, but bond losses were less than half those of utility stocks. Note also that, during this period, (i) bond investors were able to reinvest coupons and maturity payments at rising rates, whereas the earned returns on equity did not rise, and (ii) utilities were providing a rising share of their operating income to debtholders versus stockholders (interest expense/book value of debt was rising, while net income/common equity was declining). This led to a widespread belief that utility commissions would provide enough revenues to keep utilities from going bankrupt (barring a disaster), and hence to protect the bondholders, but that they would not necessarily provide enough revenues either to permit the expected rate of dividend growth to occur or, perhaps, even to allow the dividend to be maintained.

Because of these experiences, investors came to regard inflation as having a more negative effect on utility stocks than on bonds. Therefore, when fears of inflation increased, utilities' measured risk premiums

Exhibit 10. Relative Volatility* of Stocks and Bonds, 1965–1984



*Volatility is measured as the standard deviation of total returns over the last 5 years.
Source: Merrill Lynch, *Quantitative Analysis*, May/June 1984.

also increased. A regression over the period 1966–1979, using our Exhibit 2 data, produced this result:

$$RP = 0.30\% + 0.73\ R_F; \qquad r^2 = 0.48.$$
$$(0.22)$$

This indicates that a one percentage point increase in the Treasury bond rate produced, on average, a 0.73 percentage point increase in the risk premium, and hence a 1.00 + 0.73 = 1.73 percentage point increase in the cost of equity for utilities.

1980–1984 Period. The situation changed dramatically in 1980 and thereafter. Except for a few companies with nuclear construction problems, the utilities' financial situations stabilized in the early 1980s, and then improved significantly from 1982 to 1984. Both the companies and their regulators were learning to live with inflation; many construction programs were completed; regulatory lags were shortened; and in general the situation was much better for utility equity investors. In the meantime, over most of the 1980–1984 period, interest rates and bond prices fluctuated violently, both in an absolute sense and relative to common stocks. Exhibit 10 shows the volatility of corporate bonds very clearly. Over most of the eighteen-year period, stock returns were much more volatile than returns on bonds. However, that situation changed in October 1979, when the Fed began to focus on the money supply rather than on interest rates.[9]

In the 1980–1984 period, an increase in inflationary expectations has had a more adverse effect on bonds than on utility stocks. If the expected rate of inflation increases, then interest rates *will increase* and bond prices *will fall*. Thus, uncertainty about inflation translates directly into risk in the bond markets. The effect of inflation on stocks, including utility stocks, is less clear. If inflation increases, then utilities should, in theory, be able to obtain rate increases that would offset increases in operating costs and also compensate for the higher cost of equity. Thus, with "proper" regulation, utility stocks would provide a better hedge against unanticipated inflation than would bonds. This hedge did not work at all well during the 1966–1979 period, because inflation-induced increases in operating and capital costs were not offset by timely rate increases. However, as noted earlier, both the utilities and their regulators seem to have learned to live better with inflation during the 1980s.

Since inflation is today regarded as a major investment risk, and since utility stocks now seem to provide a better hedge against unanticipated inflation than do

[9]Because the standard deviations in Exhibit 10 are based on the last five years of data, even if bond returns stabilize, as they did beginning in 1982, their reported volatility will remain high for several more years. Thus, Exhibit 10 gives a rough indication of the current relative riskiness of stocks versus bonds, but the measure is by no means precise or necessarily indicative of future expectations.

bonds, the interest-rate risk inherent in bonds offsets, to a greater extent than was true earlier, the higher operating risk that is inherent in equities. Therefore, when inflationary fears rise, the perceived riskiness of bonds rises, helping to push up interest rates. However, since investors are today less concerned about inflation's impact on utility stocks than on bonds, the utilities' cost of equity does not rise as much as that of debt, so the observed risk premium tends to fall.

For the 1980–1984 period, we found the following relationship (see Exhibit 6):

$$RP = 12.53\% - 0.63\ R_F; \qquad r^2 = 0.73.$$
$$(0.05)$$

Thus, a one percentage point increase in the T-bond rate, on average, caused the risk premium to fall by 0.63%, and hence it led to a 1.00 − 0.63 = 0.37 percentage point increase in the cost of equity to an average utility. This contrasts sharply with the pre-1980 period, when a one percentage point increase in interest rates led, on average, to a 1.73 percentage point increase in the cost of equity.

Summary and Implications

We began by reviewing a number of earlier studies. From them, we concluded that, for cost of capital estimation purposes, risk premiums must be based on expectations, not on past realized holding period returns. Next, we noted that expectational risk premiums may be estimated either from surveys, such as the ones Charles Benore has conducted, or by use of DCF techniques. Further, we found that, although growth rates for use in the DCF model can be either developed from time-series data or obtained from security analysts, analysts' growth forecasts are more reflective of investors' views, and, hence, in our opinion are preferable for use in risk-premium studies.

Using analysts' growth rates and the DCF model, we estimated risk premiums over several different periods. From 1966 to 1984, risk premiums for both electric utilities and industrial stocks varied widely from year to year. Also, during the first half of the period, the utilities had smaller risk premiums than the industrials, but after the mid-1970s, the risk premiums for the two groups were, on average, about equal.

The effects of changing interest rates on risk premiums shifted dramatically in 1980, at least for the utilities. From 1965 through 1979, inflation generally had a more severe adverse effect on utility stocks than on bonds, and, as a result, an increase in inflationary expectations, as reflected in interest rates, caused an increase in equity risk premiums. However, in 1980 and thereafter, rising inflation and interest rates increased the perceived riskiness of bonds more than that of utility equities, so the relationship between interest rates and utility risk premiums shifted from positive to negative. Earlier, a 1.00 percentage point increase in interest rates had led, on average, to a 1.73% increase in the utilities' cost of equity, but after 1980 a 1.00 percentage point increase in the cost of debt was associated with an increase of only 0.37% in the cost of equity.

Our study also has implications for the use of the CAPM to estimate the cost of equity for utilities. The CAPM studies that we have seen typically use either Ibbotson-Sinquefield or similar historic holding period returns as the basis for estimating the market risk premium. Such usage implicitly assumes (i) that *ex post* returns data can be used to proxy *ex ante* expectations and (ii) that the market risk premium is relatively stable over time. Our analysis suggests that neither of these assumptions is correct; at least for utility stocks, *ex post* returns data do not appear to be reflective of *ex ante* expectations, and risk premiums are volatile, not stable.

Unstable risk premiums also make us question the FERC and FCC proposals to estimate a risk premium for the utilities every two years and then to add this premium to a current Treasury bond rate to determine a utility's cost of equity. Administratively, this proposal would be easy to handle, but risk premiums are simply too volatile to be left in place for two years.

CALL FOR PAPERS

American Real Estate and Urban Economics Association
1985 Annual Meetings
December 28–30, 1985
New York

Papers are being solicited for presentation at the 1985 AREUEA Meetings held as part of the Allied Social Sciences Associations (ASSA) Meetings in New York. The areas of interest to AREUEA are real estate and urban economics in their broadest sense to include theoretical and applied research on real estate finance, land and housing economics, real estate investment and valuation, real estate and mortgage markets along with government policies related to these markets. Anyone wishing to present a paper should submit a completed manuscript or abstract by no later than May 15, 1985 to the Program Chairman:

Professor George W. Gau
Faculty of Commerce and Business Administration
University of British Columbia
Vancouver, B.C.

"Unusual and Exigent" Conditions Elicit Aggressive Policy Actions

- **Aggressive monetary policy actions involve Fed's balance sheet, not interest rates**
- **Fiscal policy actions make deficit four times the size forecast just two months ago**
- **Even as rates start to increase, they do so very slowly**
- **Long-term outlook just sees modest 2% growth and modest rise in interest rates**

In a 1935 amendment to the Federal Reserve Act of 1913, the Fed was enabled to extend credit to certain parties during "unusual and exigent circumstances." The current period is certainly "unusual." It is also "exigent," meaning, according to Merriam-Webster, that conditions "require immediate aid or action" and that they "require or call for much." In particular, the Fed's usual policy tool, the federal funds rate, was already cut to just above zero by mid-March, so the Federal Open Market Committee can't try to support the economy by lowering that unless they want to reconsider the view against negative interest rates.

Clearly, some policy action was needed. GDP dropped at a 5% annual rate in Q1 and is estimated by the Blue Chip panel to plunge at a 34.0% rate this quarter. A turnaround toward a 15% rate of growth is expected in Q3.

Fed balance sheet already up by $2.94 trillion. So in response to this perceived need for creative policy actions, the Fed has established nine credit-granting facilities reaching out to, as the descriptions all say, "households and businesses." And, as well, to state and local governments. In each case, the Fed is not the actual lender to the actual user of the funds, but it supports, among others, financial institution lenders such as commercial paper issuers (CPFF), money market mutual funds (MMLF) and the well-known Paycheck Protection Program Liquidity Facility (PPPLF) for small businesses. These programs began in late March and most recently have totaled some $130 billion. Since mid-March, the Fed has also bought $1.6 trillion in U.S. Government securities and its total assets have grown from $4.16 trillion to $7.10 trillion.

While the special programs cover just a fraction of the increase in the Fed's assets and a fraction of their legislated totals, they have carried larger announcement effects than the actual dollar amounts might imply. Fed Vice Chair Richard Clarida commented on this in a speech May 21; "just the announcement that these backstop facilities would soon be launched appears to have bolstered confidence in capital markets, allowing many companies to finance themselves privately even before the facilities were up and running."

Fed needs to pair with fiscal policy to give economy effective help. One other clarification on the role of legislation in these Federal Reserve actions. Vice Chair Clarida made a helpful point: ". . . it is important to note that the Fed's statutory authority grants us *lending* powers, not *spending* powers. The Fed is not authorized to grant money to particular beneficiaries, to meet the payroll expenses of small businesses, or to underwrite the unemployment benefits of displaced workers. Programs to support such worthy goals reside squarely in the domain of fiscal policy. The Fed can only make loans to solvent entities with the expectation the loans will be paid back. Direct fiscal support for the economy is thus also essential to sustain economic activity and complement what monetary policy cannot accomplish on its own."

The Blue Chip Financial Forecasts panel believes the Fed's total assets will reach $9.4 trillion at the end of this year, so it would acquire another $2.3 trillion in securities and special facilities loans. At the end of 2021, the panel estimates a balance sheet of $10.2 trillion, with a few of the panelists actually looking for reductions in the Fed's total assets.

Aggressive fiscal policy as well. Fiscal policy actions include the coordination with the Federal Reserve funded programs as well as some other CARES Act benefits, special exemptions on the SNAP food stamps program, more funding for COVID-19 testing, increased funding for certain small business grants and so on. Before all this was enacted during March and April, the March 1st issue of Blue Chip Financial Forecasts included a Special Question asking for panelists' budget deficit estimate for fiscal 2020. They said then that after the $984 billion in fiscal 2019, the fiscal 2020 deficit would be $1.077 trillion. Now the panel is saying $4.0 trillion this fiscal year and $2.5 trillion in fiscal 2021.

As to the more standard interest rate forecasts, the panel expects that the Fed would hold the federal funds rate at its current almost-zero level until the middle of next year, when it would start to raise rates. Even then, the increase in Q3 2021 would still be quite modest, with just a dozen members of the Blue Chip panel seeing the rate higher than it has been recently and most of those by only a token amount. Other interest rates would rise somewhat more over the forecast span to Q3 2021, with ten-year Treasuries moving from their recent yield of 66 basis points to 1.2% by Q3 2021. Thus, the yield curve would steepen somewhat.

Long-term forecasts see growth, inflation and funds rate centering on 2%. This month's Financial Forecasts survey includes the semi-annual look at long-term trends in rates. GDP growth starts this coming decade slightly stronger at 3.2% in 2021 and 2022, and then moderates to 2.0% by 2026. Over the following five years it would average 2.1% a year. Inflation, measured by the CPI, would be 0.2% across this year, Q4 over Q4, then climb to 1.3% next year and 2.1% across the next five years and 2.2% the five years after that.

The fed funds rate would climb gradually toward 2%, reaching that between 2025 and 2026, and then hover just above that level during the following five years. Ten-year Treasury yields would increase from an average of 0.93% this year toward 1.2% next year, with averages of 2.3% and 3.1% during the two succeeding five-year periods. The pattern traced by these projections suggests that the aftermath of the current exigent economic conditions might take at least a couple of years to settle out and only further into the 2020s decade would the economy settle into a more orderly and sustainable situation.

Forecasts for interest rates and the Federal Reserve's Major Currency Index represent averages for the quarter. Forecasts for Real GDP, GDP Price Index and Consumer Price Index are seasonally-adjusted annual rates of change (saar). Individual panel members' forecasts are on pages 4 through 9. Historical data: Treasury rates from the Federal Reserve Board's H.15; AAA-AA and A-BBB corporate bond yields from Bank of America-Merrill Lynch and are 15+ years, yield to maturity; State and local bond yields from Bank of America-Merrill Lynch, A-rated, yield to maturity; Mortgage rates from Freddie Mac, 30-year, fixed; LIBOR quotes from Intercontinental Exchange. All interest rate data are sourced from Haver Analytics. Historical data for Fed's Major Currency Index are from FRSR H.10. Historical data for Real GDP and GDP Chained Price Index are from the Bureau of Economic Analysis (BEA). Consumer Price Index (CPI) history is from the Department of Labor's Bureau of Labor Statistics (BLS).

Forecasts of panel members are on pages 10 and 11. Definitions of variables are as follows: [1]Monetary policy rates. [2]Government bonds are yields to maturity. [3]Foreign exchange rate forecasts for U.K., Australia and the Euro are U.S. dollars per currency unit. For the U.S dollar, forecasts are of the U.S. Federal Reserve Board's AFE Dollar Index.

International Since the middle of March when the coronavirus outbreak turned into a pandemic and large parts of economies were shut down, the Fed has increased its balance sheet by nearly $2.8 trillion, or 65%, to just over $7 trillion. Other major central banks have followed the Fed's aggressive lead. The European Central Bank has also restarted its asset purchase program and created a new one specially to confront the pandemic—the Pandemic Emergency Purchase Program (PEPP), which is scheduled to purchase €750 billion of assets by the end of this year. Since PEPP purchases were initiated at the beginning of April, the ECB has bought €212 billion of securities and has purchased another €107 billion in its APP (restarted in mid-March), increasing the ECB's assets by 18% to 46% of 2020 Q1 euro area GDP. Analysts generally expect the ECB to increase and to extend the PEPP at its June 4 Council meeting.

In mid-March, the Bank of England's Monetary Policy Committee voted unanimously to increase the Bank's holdings of UK government bonds and sterling non-financial investment-grade corporate bonds by £200 billion to a total of £645 billion. Since then, it has purchased nearly £126 billion of new securities. The Bank of England's external forecasters expect the Bank's total holdings to be increased to nearly £700 billion by the second quarter of 2021. The Bank of Japan has also increased its ongoing asset purchase program and created several new lending facilities. The most recent one aimed at increasing credit flow to small and medium-sized business was announced after an emergency meeting on May 22. Since the middle of March, the BoJ's assets have risen ¥43 trillion to 116% of Q1 nominal GDP.

Two central banks that had eschewed quantitative easing during the global financial crisis, the Reserve Bank of Australia and the Bank of Canada, have recently started asset purchase programs and have been quite aggressive. The RBA's program is similar to the Bank of Japan's yield curve control. The RBA intends to buy sufficient government and semi-government bonds to stabilize the yield on the 3-year government bond at 0.25%. Since mid-March, the Bank has increased its assets by 44%, buying A$111 billion of securities. Over this period the 3-year government bond yield has averaged 0.26% versus 0.64% during the first 2-1/2 months of 2020.

At the beginning of April, the Bank of Canada embarked on an asset purchasing campaign in which it intends to buy C$5 billion of Canadian government securities per week "until the economic recovery is well under way." So far, the Bank has purchased nearly C$50 billion of government bonds though its overall balance sheet has increased by much more—C$288 billion, a 187% increase—as repos and purchases of other securities have soared.

As the economic costs of the lockdowns escalate by unprecedented magnitudes, monetary policymakers have appealed for more fiscal support. The US government has legislated more than $2.7 trillion in aid and programs aimed at reducing the economic hit from the pandemic and the House has passed another $3 trillion package. Led by the fiscal authorities in Germany and France, individual euro area governments have also enacted aid programs totaling billions of euros. However, the most significant euro area fiscal policy response would be the €1.85 trillion coronavirus response plan recently proposed by the European Union. The proposal is composed of a €750 billion immediate recovery plan and an additional €1.1 trillion of economic activity-boosting budget over the next seven years. The proposal's largest hurdle is that it must be accepted by all 27 EU members, which at the very least would take some time. But if that can be accomplished, this would be a major step toward increased fiscal union across the bloc. Japan's fiscal policymakers have recently taken a more concrete step. In late May the Cabinet approved a second supplemental budget, which should be legislated sometime in June. This supplemental budget is estimated at slightly more than 6% of GDP on top the 5% of GDP supplemental budget passed in late April. Nearly half of the new supplement is earmarked for support to business.

Second Quarter 2020

Viewpoints:

A Sampling of Views on the Economy, Financial Markets and Government Policy Excerpted from Recent Reports Issued by our Blue Chip Panel Members and Others

Special Questions

1. a. What do you think the peak monthly unemployment rate might be?

20.3%

b. What month would that happen?

May	Jun	Jul	Aug	Oct
61%	24%	6%	6%	3%

c. What do you think the U.S. unemployment rate will be:

at the end of 2020? 11.0%

at the end of 2021? 7.2%

2. The House of Representatives has voted for another $3 trillion in COVID-related federal aid for the economy. Senate passage of this exact bill is, however, open for negotiation.

a. How much more aid do you believe is needed for meaningful support of the economy?

$2.4 trillion

b. The federal government budget deficit was just under $1.0 trillion in fiscal 2019, which was 4.6% of GDP. How large do you see the budget deficit this year and next, and what percentage of GDP would that be?

FY 2020? $4.0 trillion % of GDP 18.9%

FY 2021? $2.5 trillion % of GDP 10.9%

3. The Federal Reserve continues to add substantial amounts to its balance sheet as it seeks to provide credit and/or to support lending by private institutions. By mid-May, its total assets were $6.9 trillion. How large do you estimate the Fed's balance sheet at

Year-end 2020? $9.4 trillion

Year-end 2021? $10.2 trillion

Assessing Credit Losses and Risks to the Banking System

With businesses shuttered and job losses mounting rapidly, there is growing concern over the ability of borrowers to service their debt obligations and the resulting risks to financial stability. We assess the likely scale of economy-wide credit losses, the exposure of creditors to those losses, and the potential risks to financial stability and the banking sector in this edition of the Analyst.

Assessing Credit Losses. We first look at corporate debt. Nonfinancial corporate debt grew by over 60% since 2011 and recently rose to an all-time high as a share of GDP, leading to growing concern even prior to the virus that corporate defaults could rise dramatically in the next downturn. The sharp decline in revenues across many industries has left a large share of companies with negative cash flow, and rising bankruptcy filings and cases suggest the corporate default cycle has started.

A unique feature of this downturn is the wide variation in industry exposure to the virus, with physical constraints on spending, occupational health risks, and geographical variation in the virus outbreak affecting industries differently. Assessing the likely scale of corporate credit losses thus requires a closer look at which industries are most affected and how large they are as share of total corporate debt, as virus-exposure will likely play a large role in determining credit losses alongside traditional cyclical factors.

To assess the impact of the virus across industries, we first look at changes in credit spreads from before the virus to the present for high-yield corporate bonds at the granular industry level. We categorize industries as directly impacted by the virus or only indirectly impacted by the virus, based on a breakdown by our credit strategists and our assessment of which industries have been hardest hit by the virus thus far. Looking across roughly 80 industries, we find that the energy sector and industries directly impacted by the virus have seen significantly larger increases in credit spreads. While translating these numbers to default risk remains challenging given changes in risk premiums, they suggest that default rates will largely be driven by industry exposure to the virus.

The energy sector stands out both in terms of its size and default risks, given the collapse in oil demand, its disproportionately large footprint in the corporate bond market relative to its GDP share, and the heavy amounts of leverage in the sector. We estimate that roughly half of high-yield corporate bonds are in the energy or virus-impacted industries. Overall, our credit strategists estimate that the 12-month trailing high-yield default rate will increase to 13% by the end of 2020, similar to the peak rate reached during the Global Financial Crisis.

Another key area of concern is commercial real estate (CRE), given signs of overheating and overstretched valuations prior to the virus, as well as the unprecedented declines in demand in industries such as lodging, healthcare, and retail. Commercial real estate prices have outpaced single family house prices since the prior downturn, with CRE capitalization rates falling to historically low levels. Late payments on commercial mortgages have picked up sharply in recent months, suggesting mounting pressures.

Once again, the unique nature of this downturn suggests that variation in virus exposure will play a large role in determining the breadth and depth of credit losses in commercial real estate. Delinquencies by property type already show wide dispersion, with virus-exposed property types such as lodging and retail showing much higher delinquency rates

than less exposed property types such as self-storage. This contrasts with the prior real estate bust, when delinquencies were roughly evenly distributed across property types. Overall, our housing strategists expect a deeper contraction of property incomes than during the financial crisis period, given the heavy stresses to rents and occupancy rates facing many properties, and overall losses on commercial mortgages similar to those observed during the financial crisis.

In contrast to corporate debt, consumer debt should see lower default and delinquency rates thanks to strong household balance sheets, expanded unemployment benefits and stimulus payments, and public and private forbearance provisions. Early signs suggest the policy response is helping most consumers stay current on their bills. For these reasons, our housing strategists also expect significantly smaller losses on residential loans than during the prior downturn. Nevertheless, significant downside risks to household debt remain, particularly if unemployment insurance benefits are not extended, and if higher out-of-pocket medical expenses due to loss of employer-based health insurance push more households to default.

Who Bears the Losses? We next look to see where credit losses are most likely to be felt. The Fed's Financial Accounts suggests that the banking system plays a large role in providing credit for commercial real estate and overall corporate borrowing, two areas of greater concern. Household debt is also largely held by banks, particularly residential mortgages, credit card loans, and auto loans, while student debt is largely held by the federal government.

Municipal debt, another area of concern, is largely held by households, mutual funds and pensions funds, and insurance companies, and thus likely poses a smaller threat to financial stability. Lastly, a growing share of corporate lending—especially in riskier categories, such as leveraged loans—is now done by nonbank financial institutions, including collateralized loan obligations (CLOs), asset managers, hedge funds, and private equity companies, and such lending is not well captured in the Fed's Financial Accounts. TIC data provides some evidence that non-bank financial institutions and insurance companies own much of US CLO securities, a growing area of concern. Crucially, CLOs do not generally permit early redemptions and are thus less susceptible to runs, and our credit strategists do not see CLOs posing a major risk to financial stability, despite the likely significant pickup in defaults on leveraged loans.

Banks are highly exposed to many areas of credit, while households, mutual funds, and pensions are largely more exposed to equities. Insurance companies are somewhere in between, and hold a significant amount of exposure to corporate debt, including CLOs.

Given the large size of the banking system, its importance in credit provision, and its outsized role in amplifying the economic shocks of the last downturn, we next turn to assessing the risks of the credit downturn to the banking system.

Risks to the Banking System. The Fed's Financial Stability Report warned that financial sector vulnerabilities, including for the banking sector, are likely to be significant in the near term, while the April FOMC minutes indicated concern that banks could come under greater stress, particularly if more adverse economic scenarios were realized. The Fed's Senior Loan Officer Opinion Survey (SLOOS) indicated that lending standards tightened significantly, particularly for commercial and industrial (C&I) and CRE loans, with most banks citing a less favorable or more uncertain economic outlook, as well as a reduced tolerance for risk, as reasons for tightening lending standards. Loan loss provisions across banks have increased significantly in preparation for the rise in defaults and delinquencies.

While further losses are likely to come, there are several reasons why banks may prove more resilient than during the financial crisis. The banking system is much better capitalized, with capital ratios comfortably above their required minimum levels. Only a modest percentage of banks cited a deterioration in their capital position as playing a role in tightening lending standards in the first quarter. In addition, residential real estate remains the largest category of lending in the banking system by a significant margin. Given that this downturn was not precipitated by a housing crisis, losses on this particularly large category will likely be smaller than during the GFC.

One potential worry is that certain industries are heavily exposed to the virus, which may lead to larger risks to the banking system if the lending of particular banks, or the banking system as a whole, is highly concentrated in these industries. Disclosures on industry exposure provided by relatively large banks suggest that the exposure of the banking system to at-risk industries appears manageable. Moreover, most individual large banks are not heavily concentrated in at-risk industries, although smaller banks may be more geographically constrained and thus concentrated in particular industries.

We next assess the vulnerability of bank balance sheets as of 2019Q4, using comprehensive balance sheet data across all FDIC-insured institutions. We estimate the losses on total bank equity from losses across asset categories, based on projections from our bank and credit analysts and our economic projections. We assume similar losses on C&I and CRE lending as in the 2008 crisis, but a smaller hit on residential mortgages and consumer loans. Crucially, we do not build in large effects from the fiscal stimulus package, which should ease the burden of losses for the private sector, especially for household and small business loans.

We calculate the estimated losses as a percent of total bank equity capital, using our outlined assumptions. We estimate that losses on C&I, CRE, consumer, and residential real estate loans would amount to roughly 15% of total bank equity, compared to around 30% of total bank equity at risk heading into the Global Financial Crisis, using ex-post realized losses across the same categories. Two main reasons account for this difference: first, losses on the large residential real estate category are likely to be smaller, and second, bank equity levels are higher today than before the crisis.

We next look at lending exposure of the largest banks individually, using bank-specific details from regulatory data covering all large banks operating in the US. Bank-level data can reveal differences across banks and highlight whether there are a significant number of banks with large exposures to at-risk categories. We again compare the largest banks' exposure across major loan categories today to their exposure across these categories in 2007. Where available, we use bank-level disclosures on exposures to high-risk industries, applying a higher loss rate for banks with higher exposures.

We find that while there is dispersion among the largest banks in their exposure to losses, almost all of the largest banks today are less vulnerable than the median large bank was prior to the financial crisis. Again, our finding is driven by both the smaller losses in the large real estate category and by banks' higher equity capital levels today.

While financial stability concerns appear manageable, significant downside risks remain. A slower than expected recovery and a prolonged downturn would likely stress the banking system further, and a growing share of riskier lending is now done by less regulated nonbank financial institutions, where risks are harder to assess. Should a more adverse scenario arise, Fed officials have indicated the willingness to further help facilitate the provision of credit by the financial system.

David Choi (Goldman Sachs)

Long-Range Survey:

The table below contains the results of our twice-annual long-range CONSENSUS survey. There are also Top 10 and Bottom 10 averages for each variable. Shown are consensus estimates for the years 2021 through 2026 and averages for the five-year periods 2022-2026 and 2027-2031. Apply these projections cautiously. Few if any economic, demographic and political forces can be evaluated accurately over such long time spans.

Chapter 6
Alternative Asset Pricing Models

6.1 Empirical Validity of the CAPM

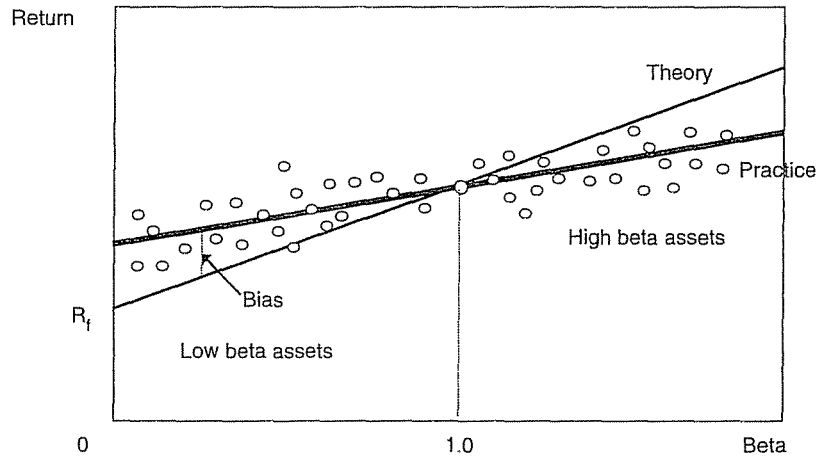
The last chapter showed that the practical difficulties of implementing the CAPM approach are surmountable. Conceptual and empirical problems remain, however.

At the conceptual level, the CAPM has been submitted to criticisms by academicians and practitioners. Contrary to the core assumption of the CAPM, investors may choose not to diversify, and bear company-specific risk if abnormal returns are expected. A substantial percentage of individual investors are indeed inadequately diversified. Short selling is somewhat restricted, in violation of CAPM assumptions. Factors other than market risk (beta) may also influence investor behavior, such as taxation, firm size, and restrictions on borrowing.

At the empirical level, there have been countless tests of the CAPM to determine to what extent security returns and betas are related in the manner predicted by the CAPM. The results of the tests support the idea that beta is related to security returns, that the risk-return tradeoff is positive, and that the relationship is linear. The contradictory finding is that the risk-return tradeoff is not as steeply sloped as predicted by the CAPM. With few exceptions, the empirical studies agree that the implied intercept term exceeds the risk-free rate and the slope term is less than predicted by the CAPM. That is, low-beta securities earn returns somewhat higher than the CAPM would predict, and high-beta securities earn less than predicted. This is shown pictorially in Figure 6-1. A CAPM-based estimate of cost of capital underestimates the return required from low-beta securities and overstates the return required from high-beta securities, based on the empirical evidence. Brealey, Myers, and Allen (2006), among many others,[1] provide recent empirical evidence very similar to the relationship depicted in Figure 6-1. This is one of the most

[1] For a summary of the empirical evidence on the CAPM, see Jensen (1972) and Ross (1978). The major empirical tests of the CAPM were published by Friend and Blume (1975), Black, Jensen, and Scholes (1972), Miller and Scholes (1972), Blume and Friend (1973), Blume and Husic (1973), Fama and Macbeth (1972), Basu (1977), Reinganum (1981B), Litzenberger and Ramaswamy (1979), Banz (1981), Gibbons (1982), Stambaugh (1982), Shanken (1985), Black (1993), and Brealey, Myers, and Allen (2006). Evidence in the Canadian context is available in Morin (1980, 1981).

FIGURE 6-1
PREDICTED VS. OBSERVED CAPM RETURN ESTIMATES



well-known results in finance. This result is particularly pertinent for public utilities whose betas are typically less than 1.00. Based on the evidence, as shown in Figure 6-1, a CAPM-based estimate of the cost of capital underestimates the return required from such securities.

The empirical evidence also demonstrates that the SML is highly unstable over short periods and differs significantly from the long-run relationship. This evidence underscores the potential for error in cost of capital estimates that apply the CAPM using historical data over short time periods. The evidence[2] also shows that the addition of specific company risk, as measured by standard deviation, adds explanatory power to the risk-return relationship.

In short, the currently available empirical evidence indicates that the simple version of the CAPM does not provide a perfectly accurate description of the process determining security returns. Explanations for this shortcoming include some or all of the following:

1. The CAPM excludes other important variables that are important in determining security returns, such as size, skewness, and taxes.
2. The market index used in the tests excludes important classes of securities, such as bonds, mortgages, and business investments. There is a further argument that the CAPM can never be really tested and that such a test is infeasible. This is because the market index proxy used

[2] See Friend, Westerfield, and Granito (1978) and Morin (1980).

The model is analogous to the standard CAPM, but with the return on a minimum risk portfolio that is unrelated to market returns, R_Z, replacing the risk-free rate, R_F. The model has been empirically tested by Black, Jensen, and Scholes (1972), who find a flatter than predicted SML, consistent with the model and other researchers' findings. An updated version of the Black-Jensen-Scholes study is available in Brealey, Myers, and Allen (2006) and reaches similar conclusions.

The zero-beta CAPM cannot be literally employed to estimate the cost of capital, since the zero-beta portfolio is a statistical construct difficult to replicate. Attempts to estimate the model are formally equivalent to estimating the constants, a and b, in Equation 6-2. A practical alternative is to employ the Empirical CAPM, to which we now turn.

6.3 Empirical CAPM

As discussed in the previous section, several finance scholars have developed refined and expanded versions of the standard CAPM by relaxing the constraints imposed on the CAPM, such as dividend yield, size, and skewness effects. These enhanced CAPMs typically produce a risk-return relationship that is flatter than the CAPM prediction in keeping with the actual observed risk-return relationship. The ECAPM makes use of these empirical findings. The ECAPM estimates the cost of capital with the equation:

$$K = R_F + \acute{\alpha} + \beta \times (MRP - \acute{\alpha}) \qquad (6\text{-}5)$$

where $\acute{\alpha}$ is the "alpha" of the risk-return line, a constant, and the other symbols are defined as before. All the potential vagaries of the CAPM are telescoped into the constant $\acute{\alpha}$, which must be estimated econometrically from market data. Table 6-2 summarizes[10] the empirical evidence on the magnitude of alpha.[11]

[10] The technique is formally applied by Litzenberger, Ramaswamy, and Sosin (1980) to public utilities in order to rectify the CAPM's basic shortcomings. Not only do they summarize the criticisms of the CAPM insofar as they affect public utilities, but they also describe the econometric intricacies involved and the methods of circumventing the statistical problems. Essentially, the average monthly returns over a lengthy time period on a large cross-section of securities grouped into portfolios are related to their corresponding betas by statistical regression techniques; that is, Equation 6-5 is estimated from market data. The utility's beta value is substituted into the equation to produce the cost of equity figure. Their own results demonstrate how the standard CAPM underestimates the cost of equity capital of public utilities because of utilities' high dividend yield and return skewness.

[11] Adapted from Vilbert (2004).

TABLE 6-2
EMPIRICAL EVIDENCE ON THE ALPHA FACTOR

Author	Range of alpha
Fischer (1993)	−3.6% to 3.6%
Fischer, Jensen and Scholes (1972)	−9.61% to 12.24%
Fama and McBeth (1972)	4.08% to 9.36%
Fama and French (1992)	10.08% to 13.56%
Litzenberger and Ramaswamy (1979)	5.32% to 8.17%
Litzenberger, Ramaswamy and Sosin (1980)	1.63% to 5.04%
Pettengill, Sundaram and Mathur (1995)	4.6%
Morin (1989)	2.0%

For an alpha in the range of 1%–2% and for reasonable values of the market risk premium and the risk-free rate, Equation 6-5 reduces to the following more pragmatic form:

$$K = R_F + 0.25\,(R_M - R_F) + 0.75\,\beta(R_M - R_F) \qquad (6\text{-}6)$$

Over reasonable values of the risk-free rate and the market risk premium, Equation 6-6 produces results that are indistinguishable from the ECAPM of Equation 6-5.[12]

An alpha range of 1%–2% is somewhat lower than that estimated empirically. The use of a lower value for alpha leads to a lower estimate of the cost of capital for low-beta stocks such as regulated utilities. This is because the use of a long-term risk-free rate rather than a short-term risk-free rate already incorporates some of the desired effect of using the ECAPM. That is, the

[12] Typical of the empirical evidence on the validity of the CAPM is a study by Morin (1989) who found that the relationship between the expected return on a security and beta over the period 1926–1984 was given by:

$$\text{Return} = 0.0829 + 0.0520\,\beta$$

Given that the risk-free rate over the estimation period was approximately 6% and that the market risk premium was 8% during the period of study, the intercept of the observed relationship between return and beta exceeds the risk-free rate by about 2%, or 1/4 of 8%, and that the slope of the relationship is close to 3/4 of 8%. Therefore, the empirical evidence suggests that the expected return on a security is related to its risk by the following approximation:

$$K = R_F + x(R_M - R_F) + (1 - x)\beta(R_M - R_F)$$

where x is a fraction to be determined empirically. The value of x that best explains the observed relationship Return $= 0.0829 + 0.0520\,\beta$ is between 0.25 and 0.30. If $x = 0.25$, the equation becomes:

$$K = R_F + 0.25(R_M - R_F) + 0.75\beta(R_M - R_F)$$

long-term risk-free rate version of the CAPM has a higher intercept and a flatter slope than the short-term risk-free version which has been tested. Thus, it is reasonable to apply a conservative alpha adjustment. Moreover, the lowering of the tax burden on capital gains and dividend income enacted in 2002 may have decreased the required return for taxable investors, steepening the slope of the ECAPM risk-return trade-off and bring it closer to the CAPM predicted returns.[13]

To illustrate the application of the ECAPM, assume a risk-free rate of 5%, a market risk premium of 7%, and a beta of 0.80. The Empirical CAPM equation (6-6) above yields a cost of equity estimate of 11.0% as follows:

$$K = 5\% + 0.25\,(12\% - 5\%) + 0.75 \times 0.80\,(12\% - 5\%)$$
$$= 5.0\% + 1.8\% + 4.2\%$$
$$= 11.0\%$$

As an alternative to specifying alpha, see Example 6-1.

Some have argued that the use of the ECAPM is inconsistent with the use of adjusted betas, such as those supplied by Value Line and Bloomberg. This is because the reason for using the ECAPM is to allow for the tendency of betas to regress toward the mean value of 1.00 over time, and, since Value Line betas are already adjusted for such trend, an ECAPM analysis results in double-counting. This argument is erroneous. Fundamentally, the ECAPM is not an adjustment, increase or decrease, in beta. This is obvious from the fact that the expected return on high beta securities is actually lower than that produced by the CAPM estimate. The ECAPM is a formal recognition that the observed risk-return tradeoff is flatter than predicted by the CAPM based on myriad empirical evidence. The ECAPM and the use of adjusted betas comprised two separate features of asset pricing. Even if a company's beta is estimated accurately, the CAPM still understates the return for low-beta stocks. Even if the ECAPM is used, the return for low-beta securities is understated if the betas are understated. Referring back to Figure 6-1, the ECAPM is a return (vertical axis) adjustment and not a beta (horizontal axis) adjustment. Both adjustments are necessary. Moreover, recall from Chapter 3 that the use of adjusted betas compensates for interest rate sensitivity of utility stocks not captured by unadjusted betas.

[13] The lowering of the tax burden on capital gains and dividend income has no impact as far as non-taxable institutional investors (pension funds, 401K, and mutual funds) are concerned, and such investors engage in very large amounts of trading on security markets. It is quite plausible that taxable retail investors are relatively inactive traders and that large non-taxable investors have a substantial influence on capital markets.

The Capital Asset Pricing Model: Theory and Evidence

Eugene F. Fama and Kenneth R. French

The capital asset pricing model (CAPM) of William Sharpe (1964) and John Lintner (1965) marks the birth of asset pricing theory (resulting in a Nobel Prize for Sharpe in 1990). Four decades later, the CAPM is still widely used in applications, such as estimating the cost of capital for firms and evaluating the performance of managed portfolios. It is the centerpiece of MBA investment courses. Indeed, it is often the only asset pricing model taught in these courses.[1]

The attraction of the CAPM is that it offers powerful and intuitively pleasing predictions about how to measure risk and the relation between expected return and risk. Unfortunately, the empirical record of the model is poor—poor enough to invalidate the way it is used in applications. The CAPM's empirical problems may reflect theoretical failings, the result of many simplifying assumptions. But they may also be caused by difficulties in implementing valid tests of the model. For example, the CAPM says that the risk of a stock should be measured relative to a comprehensive "market portfolio" that in principle can include not just traded financial assets, but also consumer durables, real estate and human capital. Even if we take a narrow view of the model and limit its purview to traded financial assets, is it

[1] Although every asset pricing model is a capital asset pricing model, the finance profession reserves the acronym CAPM for the specific model of Sharpe (1964), Lintner (1965) and Black (1972) discussed here. Thus, throughout the paper we refer to the Sharpe-Lintner-Black model as the CAPM.

legitimate to limit further the market portfolio to U.S. common stocks (a typical choice), or should the market be expanded to include bonds, and other financial assets, perhaps around the world? In the end, we argue that whether the model's problems reflect weaknesses in the theory or in its empirical implementation, the failure of the CAPM in empirical tests implies that most applications of the model are invalid.

We begin by outlining the logic of the CAPM, focusing on its predictions about risk and expected return. We then review the history of empirical work and what it says about shortcomings of the CAPM that pose challenges to be explained by alternative models.

The Logic of the CAPM

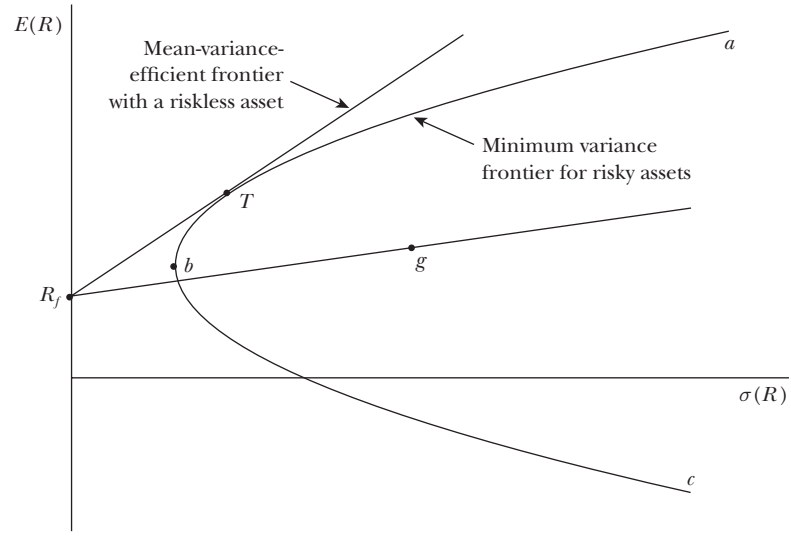
The CAPM builds on the model of portfolio choice developed by Harry Markowitz (1959). In Markowitz's model, an investor selects a portfolio at time $t - 1$ that produces a stochastic return at t. The model assumes investors are risk averse and, when choosing among portfolios, they care only about the mean and variance of their one-period investment return. As a result, investors choose "mean-variance-efficient" portfolios, in the sense that the portfolios 1) minimize the variance of portfolio return, given expected return, and 2) maximize expected return, given variance. Thus, the Markowitz approach is often called a "mean-variance model."

The portfolio model provides an algebraic condition on asset weights in mean-variance-efficient portfolios. The CAPM turns this algebraic statement into a testable prediction about the relation between risk and expected return by identifying a portfolio that must be efficient if asset prices are to clear the market of all assets.

Sharpe (1964) and Lintner (1965) add two key assumptions to the Markowitz model to identify a portfolio that must be mean-variance-efficient. The first assumption is *complete agreement*: given market clearing asset prices at $t - 1$, investors agree on the joint distribution of asset returns from $t - 1$ to t. And this distribution is the true one—that is, it is the distribution from which the returns we use to test the model are drawn. The second assumption is that there is *borrowing and lending at a risk-free rate*, which is the same for all investors and does not depend on the amount borrowed or lent.

Figure 1 describes portfolio opportunities and tells the CAPM story. The horizontal axis shows portfolio risk, measured by the standard deviation of portfolio return; the vertical axis shows expected return. The curve *abc*, which is called the minimum variance frontier, traces combinations of expected return and risk for portfolios of risky assets that minimize return variance at different levels of expected return. (These portfolios do not include risk-free borrowing and lending.) The tradeoff between risk and expected return for minimum variance portfolios is apparent. For example, an investor who wants a high expected return, perhaps at point a, must accept high volatility. At point T, the investor can have an interme-

Figure 1
Investment Opportunities



diate expected return with lower volatility. If there is no risk-free borrowing or lending, only portfolios above *b* along *abc* are mean-variance-efficient, since these portfolios also maximize expected return, given their return variances.

Adding risk-free borrowing and lending turns the efficient set into a straight line. Consider a portfolio that invests the proportion x of portfolio funds in a risk-free security and $1 - x$ in some portfolio g. If all funds are invested in the risk-free security—that is, they are loaned at the risk-free rate of interest—the result is the point R_f in Figure 1, a portfolio with zero variance and a risk-free rate of return. Combinations of risk-free lending and positive investment in g plot on the straight line between R_f and g. Points to the right of g on the line represent borrowing at the risk-free rate, with the proceeds from the borrowing used to increase investment in portfolio g. In short, portfolios that combine risk-free lending or borrowing with some risky portfolio g plot along a straight line from R_f through g in Figure 1.[2]

[2] Formally, the return, expected return and standard deviation of return on portfolios of the risk-free asset f and a risky portfolio g vary with x, the proportion of portfolio funds invested in f, as

$$R_p = xR_f + (1 - x)R_g,$$

$$E(R_p) = xR_f + (1 - x)E(R_g),$$

$$\sigma(R_p) = (1 - x)\sigma(R_g),\ x \leq 1.0,$$

which together imply that the portfolios plot along the line from R_f through g in Figure 1.

To obtain the mean-variance-efficient portfolios available with risk-free borrowing and lending, one swings a line from R_f in Figure 1 up and to the left as far as possible, to the tangency portfolio T. We can then see that all efficient portfolios are combinations of the risk-free asset (either risk-free borrowing or lending) and a single risky tangency portfolio, T. This key result is Tobin's (1958) "separation theorem."

The punch line of the CAPM is now straightforward. With complete agreement about distributions of returns, all investors see the same opportunity set (Figure 1), and they combine the same risky tangency portfolio T with risk-free lending or borrowing. Since all investors hold the same portfolio T of risky assets, it must be the value-weight market portfolio of risky assets. Specifically, each risky asset's weight in the tangency portfolio, which we now call M (for the "market"), must be the total market value of all outstanding units of the asset divided by the total market value of all risky assets. In addition, the risk-free rate must be set (along with the prices of risky assets) to clear the market for risk-free borrowing and lending.

In short, the CAPM assumptions imply that the market portfolio M must be on the minimum variance frontier if the asset market is to clear. This means that the algebraic relation that holds for any minimum variance portfolio must hold for the market portfolio. Specifically, if there are N risky assets,

$$\text{(Minimum Variance Condition for } M) \quad E(R_i) = E(R_{ZM}) + [E(R_M) - E(R_{ZM})]\beta_{iM},\ i = 1, \ldots, N.$$

In this equation, $E(R_i)$ is the expected return on asset i, and β_{iM}, the market beta of asset i, is the covariance of its return with the market return divided by the variance of the market return,

$$\text{(Market Beta)} \quad \beta_{iM} = \frac{\text{cov}(R_i, R_M)}{\sigma^2(R_M)}.$$

The first term on the right-hand side of the minimum variance condition, $E(R_{ZM})$, is the expected return on assets that have market betas equal to zero, which means their returns are uncorrelated with the market return. The second term is a risk premium—the market beta of asset i, β_{iM}, times the premium per unit of beta, which is the expected market return, $E(R_M)$, minus $E(R_{ZM})$.

Since the market beta of asset i is also the slope in the regression of its return on the market return, a common (and correct) interpretation of beta is that it measures the sensitivity of the asset's return to variation in the market return. But there is another interpretation of beta more in line with the spirit of the portfolio model that underlies the CAPM. The risk of the market portfolio, as measured by the variance of its return (the denominator of β_{iM}), is a weighted average of the covariance risks of the assets in M (the numerators of β_{iM} for different assets).

Thus, β_{iM} is the covariance risk of asset i in M measured relative to the average covariance risk of assets, which is just the variance of the market return.[3] In economic terms, β_{iM} is proportional to the risk each dollar invested in asset i contributes to the market portfolio.

The last step in the development of the Sharpe-Lintner model is to use the assumption of risk-free borrowing and lending to nail down $E(R_{ZM})$, the expected return on zero-beta assets. A risky asset's return is uncorrelated with the market return—its beta is zero—when the average of the asset's covariances with the returns on other assets just offsets the variance of the asset's return. Such a risky asset is riskless in the market portfolio in the sense that it contributes nothing to the variance of the market return.

When there is risk-free borrowing and lending, the expected return on assets that are uncorrelated with the market return, $E(R_{ZM})$, must equal the risk-free rate, R_f. The relation between expected return and beta then becomes the familiar Sharpe-Lintner CAPM equation,

$$\text{(Sharpe-Lintner CAPM)} \quad E(R_i) = R_f + [E(R_M) - R_f]\beta_{iM},\ i = 1, \ldots, N.$$

In words, the expected return on any asset i is the risk-free interest rate, R_f, plus a risk premium, which is the asset's market beta, β_{iM}, times the premium per unit of beta risk, $E(R_M) - R_f$.

Unrestricted risk-free borrowing and lending is an unrealistic assumption. Fischer Black (1972) develops a version of the CAPM without risk-free borrowing or lending. He shows that the CAPM's key result—that the market portfolio is mean-variance-efficient—can be obtained by instead allowing unrestricted short sales of risky assets. In brief, back in Figure 1, if there is no risk-free asset, investors select portfolios from along the mean-variance-efficient frontier from a to b. Market clearing prices imply that when one weights the efficient portfolios chosen by investors by their (positive) shares of aggregate invested wealth, the resulting portfolio is the market portfolio. The market portfolio is thus a portfolio of the efficient portfolios chosen by investors. With unrestricted short selling of risky assets, portfolios made up of efficient portfolios are themselves efficient. Thus, the market portfolio is efficient, which means that the minimum variance condition for M given above holds, and it is the expected return-risk relation of the Black CAPM.

The relations between expected return and market beta of the Black and Sharpe-Lintner versions of the CAPM differ only in terms of what each says about $E(R_{ZM})$, the expected return on assets uncorrelated with the market. The Black version says only that $E(R_{ZM})$ must be less than the expected market return, so the

[3] Formally, if x_{iM} is the weight of asset i in the market portfolio, then the variance of the portfolio's return is

$$\sigma^2(R_M) = Cov(R_M, R_M) = Cov\left(\sum_{i=1}^{N} x_{iM}R_i, R_M\right) = \sum_{i=1}^{N} x_{iM}Cov(R_i, R_M).$$

premium for beta is positive. In contrast, in the Sharpe-Lintner version of the model, $E(R_{ZM})$ must be the risk-free interest rate, R_f, and the premium per unit of beta risk is $E(R_M) - R_f$.

The assumption that short selling is unrestricted is as unrealistic as unrestricted risk-free borrowing and lending. If there is no risk-free asset and short sales of risky assets are not allowed, mean-variance investors still choose efficient portfolios—points above *b* on the *abc* curve in Figure 1. But when there is no short selling of risky assets and no risk-free asset, the algebra of portfolio efficiency says that portfolios made up of efficient portfolios are not typically efficient. This means that the market portfolio, which is a portfolio of the efficient portfolios chosen by investors, is not typically efficient. And the CAPM relation between expected return and market beta is lost. This does not rule out predictions about expected return and betas with respect to other efficient portfolios—if theory can specify portfolios that must be efficient if the market is to clear. But so far this has proven impossible.

In short, the familiar CAPM equation relating expected asset returns to their market betas is just an application to the market portfolio of the relation between expected return and portfolio beta that holds in any mean-variance-efficient portfolio. The efficiency of the market portfolio is based on many unrealistic assumptions, including complete agreement and either unrestricted risk-free borrowing and lending or unrestricted short selling of risky assets. But all interesting models involve unrealistic simplifications, which is why they must be tested against data.

Early Empirical Tests

Tests of the CAPM are based on three implications of the relation between expected return and market beta implied by the model. First, expected returns on all assets are linearly related to their betas, and no other variable has marginal explanatory power. Second, the beta premium is positive, meaning that the expected return on the market portfolio exceeds the expected return on assets whose returns are uncorrelated with the market return. Third, in the Sharpe-Lintner version of the model, assets uncorrelated with the market have expected returns equal to the risk-free interest rate, and the beta premium is the expected market return minus the risk-free rate. Most tests of these predictions use either cross-section or time-series regressions. Both approaches date to early tests of the model.

Tests on Risk Premiums

The early cross-section regression tests focus on the Sharpe-Lintner model's predictions about the intercept and slope in the relation between expected return and market beta. The approach is to regress a cross-section of average asset returns on estimates of asset betas. The model predicts that the intercept in these regressions is the risk-free interest rate, R_f, and the coefficient on beta is the expected return on the market in excess of the risk-free rate, $E(R_M) - R_f$.

Two problems in these tests quickly became apparent. First, estimates of beta

for individual assets are imprecise, creating a measurement error problem when they are used to explain average returns. Second, the regression residuals have common sources of variation, such as industry effects in average returns. Positive correlation in the residuals produces downward bias in the usual ordinary least squares estimates of the standard errors of the cross-section regression slopes.

To improve the precision of estimated betas, researchers such as Blume (1970), Friend and Blume (1970) and Black, Jensen and Scholes (1972) work with portfolios, rather than individual securities. Since expected returns and market betas combine in the same way in portfolios, if the CAPM explains security returns it also explains portfolio returns.[4] Estimates of beta for diversified portfolios are more precise than estimates for individual securities. Thus, using portfolios in cross-section regressions of average returns on betas reduces the critical errors in variables problem. Grouping, however, shrinks the range of betas and reduces statistical power. To mitigate this problem, researchers sort securities on beta when forming portfolios; the first portfolio contains securities with the lowest betas, and so on, up to the last portfolio with the highest beta assets. This sorting procedure is now standard in empirical tests.

Fama and MacBeth (1973) propose a method for addressing the inference problem caused by correlation of the residuals in cross-section regressions. Instead of estimating a single cross-section regression of average monthly returns on betas, they estimate month-by-month cross-section regressions of monthly returns on betas. The times-series means of the monthly slopes and intercepts, along with the standard errors of the means, are then used to test whether the average premium for beta is positive and whether the average return on assets uncorrelated with the market is equal to the average risk-free interest rate. In this approach, the standard errors of the average intercept and slope are determined by the month-to-month variation in the regression coefficients, which fully captures the effects of residual correlation on variation in the regression coefficients, but sidesteps the problem of actually estimating the correlations. The residual correlations are, in effect, captured via repeated sampling of the regression coefficients. This approach also becomes standard in the literature.

Jensen (1968) was the first to note that the Sharpe-Lintner version of the

[4] Formally, if x_{ip}, $i = 1, \ldots, N$, are the weights for assets in some portfolio p, the expected return and market beta for the portfolio are related to the expected returns and betas of assets as

$$E(R_p) = \sum_{i=1}^{N} x_{ip}E(R_i), \text{ and } \beta_{pM} = \sum_{i=1}^{N} x_{ip}\beta_{pM}.$$

Thus, the CAPM relation between expected return and beta,

$$E(R_i) = E(R_f) + [E(R_M) - E(R_f)]\beta_{iM},$$

holds when asset i is a portfolio, as well as when i is an individual security.

relation between expected return and market beta also implies a time-series regression test. The Sharpe-Lintner CAPM says that the expected value of an asset's excess return (the asset's return minus the risk-free interest rate, $R_{it} - R_{ft}$) is completely explained by its expected CAPM risk premium (its beta times the expected value of $R_{Mt} - R_{ft}$). This implies that "Jensen's alpha," the intercept term in the time-series regression,

$$\text{(Time-Series Regression)} \quad R_{it} - R_{ft} = \alpha_i + \beta_{iM}(R_{Mt} - R_{ft}) + \varepsilon_{it},$$

is zero for each asset.

The early tests firmly reject the Sharpe-Lintner version of the CAPM. There is a positive relation between beta and average return, but it is too "flat." Recall that, in cross-section regressions, the Sharpe-Lintner model predicts that the intercept is the risk-free rate and the coefficient on beta is the expected market return in excess of the risk-free rate, $E(R_M) - R_f$. The regressions consistently find that the intercept is greater than the average risk-free rate (typically proxied as the return on a one-month Treasury bill), and the coefficient on beta is less than the average excess market return (proxied as the average return on a portfolio of U.S. common stocks minus the Treasury bill rate). This is true in the early tests, such as Douglas (1968), Black, Jensen and Scholes (1972), Miller and Scholes (1972), Blume and Friend (1973) and Fama and MacBeth (1973), as well as in more recent cross-section regression tests, like Fama and French (1992).

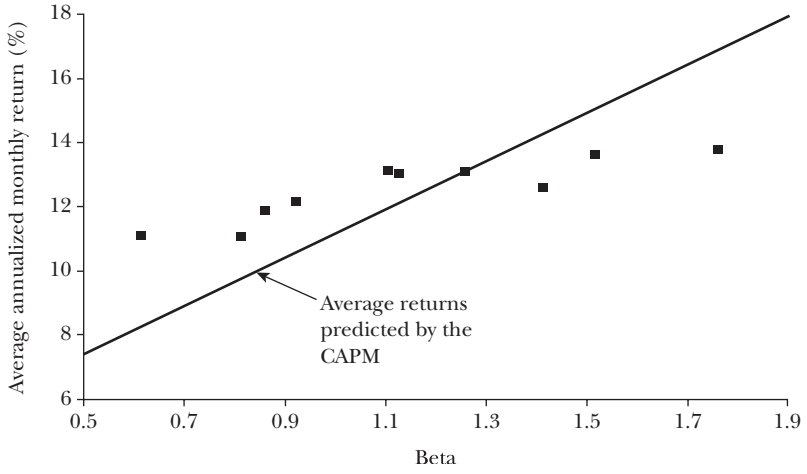
The evidence that the relation between beta and average return is too flat is confirmed in time-series tests, such as Friend and Blume (1970), Black, Jensen and Scholes (1972) and Stambaugh (1982). The intercepts in time-series regressions of excess asset returns on the excess market return are positive for assets with low betas and negative for assets with high betas.

Figure 2 provides an updated example of the evidence. In December of each year, we estimate a preranking beta for every NYSE (1928–2003), AMEX (1963–2003) and NASDAQ (1972–2003) stock in the CRSP (Center for Research in Security Prices of the University of Chicago) database, using two to five years (as available) of prior monthly returns.[5] We then form ten value-weight portfolios based on these preranking betas and compute their returns for the next twelve months. We repeat this process for each year from 1928 to 2003. The result is 912 monthly returns on ten beta-sorted portfolios. Figure 2 plots each portfolio's average return against its postranking beta, estimated by regressing its monthly returns for 1928–2003 on the return on the CRSP value-weight portfolio of U.S. common stocks.

The Sharpe-Lintner CAPM predicts that the portfolios plot along a straight

[5] To be included in the sample for year t, a security must have market equity data (price times shares outstanding) for December of $t - 1$, and CRSP must classify it as ordinary common equity. Thus, we exclude securities such as American Depository Receipts (ADRs) and Real Estate Investment Trusts (REITs).

Figure 2
Average Annualized Monthly Return versus Beta for Value Weight Portfolios Formed on Prior Beta, 1928–2003



line, with an intercept equal to the risk-free rate, R_f, and a slope equal to the expected excess return on the market, $E(R_M) - R_f$. We use the average one-month Treasury bill rate and the average excess CRSP market return for 1928–2003 to estimate the predicted line in Figure 2. Confirming earlier evidence, the relation between beta and average return for the ten portfolios is much flatter than the Sharpe-Lintner CAPM predicts. The returns on the low beta portfolios are too high, and the returns on the high beta portfolios are too low. For example, the predicted return on the portfolio with the lowest beta is 8.3 percent per year; the actual return is 11.1 percent. The predicted return on the portfolio with the highest beta is 16.8 percent per year; the actual is 13.7 percent.

Although the observed premium per unit of beta is lower than the Sharpe-Lintner model predicts, the relation between average return and beta in Figure 2 is roughly linear. This is consistent with the Black version of the CAPM, which predicts only that the beta premium is positive. Even this less restrictive model, however, eventually succumbs to the data.

Testing Whether Market Betas Explain Expected Returns

The Sharpe-Lintner and Black versions of the CAPM share the prediction that the market portfolio is mean-variance-efficient. This implies that differences in expected return across securities and portfolios are entirely explained by differences in market beta; other variables should add nothing to the explanation of expected return. This prediction plays a prominent role in tests of the CAPM. In the early work, the weapon of choice is cross-section regressions.

In the framework of Fama and MacBeth (1973), one simply adds predetermined explanatory variables to the month-by-month cross-section regressions of

returns on beta. If all differences in expected return are explained by beta, the average slopes on the additional variables should not be reliably different from zero. Clearly, the trick in the cross-section regression approach is to choose specific additional variables likely to expose any problems of the CAPM prediction that, because the market portfolio is efficient, market betas suffice to explain expected asset returns.

For example, in Fama and MacBeth (1973) the additional variables are squared market betas (to test the prediction that the relation between expected return and beta is linear) and residual variances from regressions of returns on the market return (to test the prediction that market beta is the only measure of risk needed to explain expected returns). These variables do not add to the explanation of average returns provided by beta. Thus, the results of Fama and MacBeth (1973) are consistent with the hypothesis that their market proxy—an equal-weight portfolio of NYSE stocks—is on the minimum variance frontier.

The hypothesis that market betas completely explain expected returns can also be tested using time-series regressions. In the time-series regression described above (the excess return on asset i regressed on the excess market return), the intercept is the difference between the asset's average excess return and the excess return predicted by the Sharpe-Lintner model, that is, beta times the average excess market return. If the model holds, there is no way to group assets into portfolios whose intercepts are reliably different from zero. For example, the intercepts for a portfolio of stocks with high ratios of earnings to price and a portfolio of stocks with low earning-price ratios should both be zero. Thus, to test the hypothesis that market betas suffice to explain expected returns, one estimates the time-series regression for a set of assets (or portfolios) and then jointly tests the vector of regression intercepts against zero. The trick in this approach is to choose the left-hand-side assets (or portfolios) in a way likely to expose any shortcoming of the CAPM prediction that market betas suffice to explain expected asset returns.

In early applications, researchers use a variety of tests to determine whether the intercepts in a set of time-series regressions are all zero. The tests have the same asymptotic properties, but there is controversy about which has the best small sample properties. Gibbons, Ross and Shanken (1989) settle the debate by providing an F-test on the intercepts that has exact small-sample properties. They also show that the test has a simple economic interpretation. In effect, the test constructs a candidate for the tangency portfolio T in Figure 1 by optimally combining the market proxy and the left-hand-side assets of the time-series regressions. The estimator then tests whether the efficient set provided by the combination of this tangency portfolio and the risk-free asset is reliably superior to the one obtained by combining the risk-free asset with the market proxy alone. In other words, the Gibbons, Ross and Shanken statistic tests whether the market proxy is the tangency portfolio in the set of portfolios that can be constructed by combining the market portfolio with the specific assets used as dependent variables in the time-series regressions.

Enlightened by this insight of Gibbons, Ross and Shanken (1989), one can see

a similar interpretation of the cross-section regression test of whether market betas suffice to explain expected returns. In this case, the test is whether the additional explanatory variables in a cross-section regression identify patterns in the returns on the left-hand-side assets that are not explained by the assets' market betas. This amounts to testing whether the market proxy is on the minimum variance frontier that can be constructed using the market proxy and the left-hand-side assets included in the tests.

An important lesson from this discussion is that time-series and cross-section regressions do not, strictly speaking, test the CAPM. What is literally tested is whether a specific proxy for the market portfolio (typically a portfolio of U.S. common stocks) is efficient in the set of portfolios that can be constructed from it and the left-hand-side assets used in the test. One might conclude from this that the CAPM has never been tested, and prospects for testing it are not good because 1) the set of left-hand-side assets does not include all marketable assets, and 2) data for the true market portfolio of all assets are likely beyond reach (Roll, 1977; more on this later). But this criticism can be leveled at tests of any economic model when the tests are less than exhaustive or when they use proxies for the variables called for by the model.

The bottom line from the early cross-section regression tests of the CAPM, such as Fama and MacBeth (1973), and the early time-series regression tests, like Gibbons (1982) and Stambaugh (1982), is that standard market proxies seem to be on the minimum variance frontier. That is, the central predictions of the Black version of the CAPM, that market betas suffice to explain expected returns and that the risk premium for beta is positive, seem to hold. But the more specific prediction of the Sharpe-Lintner CAPM that the premium per unit of beta is the expected market return minus the risk-free interest rate is consistently rejected.

The success of the Black version of the CAPM in early tests produced a consensus that the model is a good description of expected returns. These early results, coupled with the model's simplicity and intuitive appeal, pushed the CAPM to the forefront of finance.

Recent Tests

Starting in the late 1970s, empirical work appears that challenges even the Black version of the CAPM. Specifically, evidence mounts that much of the variation in expected return is unrelated to market beta.

The first blow is Basu's (1977) evidence that when common stocks are sorted on earnings-price ratios, future returns on high E/P stocks are higher than predicted by the CAPM. Banz (1981) documents a size effect: when stocks are sorted on market capitalization (price times shares outstanding), average returns on small stocks are higher than predicted by the CAPM. Bhandari (1988) finds that high debt-equity ratios (book value of debt over the market value of equity, a measure of leverage) are associated with returns that are too high relative to their market betas.

Finally, Statman (1980) and Rosenberg, Reid and Lanstein (1985) document that stocks with high book-to-market equity ratios (B/M, the ratio of the book value of a common stock to its market value) have high average returns that are not captured by their betas.

There is a theme in the contradictions of the CAPM summarized above. Ratios involving stock prices have information about expected returns missed by market betas. On reflection, this is not surprising. A stock's price depends not only on the expected cash flows it will provide, but also on the expected returns that discount expected cash flows back to the present. Thus, in principle, the cross-section of prices has information about the cross-section of expected returns. (A high expected return implies a high discount rate and a low price.) The cross-section of stock prices is, however, arbitrarily affected by differences in scale (or units). But with a judicious choice of scaling variable X, the ratio X/P can reveal differences in the cross-section of expected stock returns. Such ratios are thus prime candidates to expose shortcomings of asset pricing models—in the case of the CAPM, shortcomings of the prediction that market betas suffice to explain expected returns (Ball, 1978). The contradictions of the CAPM summarized above suggest that earnings-price, debt-equity and book-to-market ratios indeed play this role.

Fama and French (1992) update and synthesize the evidence on the empirical failures of the CAPM. Using the cross-section regression approach, they confirm that size, earnings-price, debt-equity and book-to-market ratios add to the explanation of expected stock returns provided by market beta. Fama and French (1996) reach the same conclusion using the time-series regression approach applied to portfolios of stocks sorted on price ratios. They also find that different price ratios have much the same information about expected returns. This is not surprising given that price is the common driving force in the price ratios, and the numerators are just scaling variables used to extract the information in price about expected returns.

Fama and French (1992) also confirm the evidence (Reinganum, 1981; Stambaugh, 1982; Lakonishok and Shapiro, 1986) that the relation between average return and beta for common stocks is even flatter after the sample periods used in the early empirical work on the CAPM. The estimate of the beta premium is, however, clouded by statistical uncertainty (a large standard error). Kothari, Shanken and Sloan (1995) try to resuscitate the Sharpe-Lintner CAPM by arguing that the weak relation between average return and beta is just a chance result. But the strong evidence that other variables capture variation in expected return missed by beta makes this argument irrelevant. If betas do not suffice to explain expected returns, the market portfolio is not efficient, and the CAPM is dead in its tracks. Evidence on the size of the market premium can neither save the model nor further doom it.

The synthesis of the evidence on the empirical problems of the CAPM provided by Fama and French (1992) serves as a catalyst, marking the point when it is generally acknowledged that the CAPM has potentially fatal problems. Research then turns to explanations.

One possibility is that the CAPM's problems are spurious, the result of data dredging—publication-hungry researchers scouring the data and unearthing contradictions that occur in specific samples as a result of chance. A standard response to this concern is to test for similar findings in other samples. Chan, Hamao and Lakonishok (1991) find a strong relation between book-to-market equity (B/M) and average return for Japanese stocks. Capaul, Rowley and Sharpe (1993) observe a similar B/M effect in four European stock markets and in Japan. Fama and French (1998) find that the price ratios that produce problems for the CAPM in U.S. data show up in the same way in the stock returns of twelve non-U.S. major markets, and they are present in emerging market returns. This evidence suggests that the contradictions of the CAPM associated with price ratios are not sample specific.

Explanations: Irrational Pricing or Risk

Among those who conclude that the empirical failures of the CAPM are fatal, two stories emerge. On one side are the behavioralists. Their view is based on evidence that stocks with high ratios of book value to market price are typically firms that have fallen on bad times, while low B/M is associated with growth firms (Lakonishok, Shleifer and Vishny, 1994; Fama and French, 1995). The behavioralists argue that sorting firms on book-to-market ratios exposes investor overreaction to good and bad times. Investors overextrapolate past performance, resulting in stock prices that are too high for growth (low B/M) firms and too low for distressed (high B/M, so-called value) firms. When the overreaction is eventually corrected, the result is high returns for value stocks and low returns for growth stocks. Proponents of this view include DeBondt and Thaler (1987), Lakonishok, Shleifer and Vishny (1994) and Haugen (1995).

The second story for explaining the empirical contradictions of the CAPM is that they point to the need for a more complicated asset pricing model. The CAPM is based on many unrealistic assumptions. For example, the assumption that investors care only about the mean and variance of one-period portfolio returns is extreme. It is reasonable that investors also care about how their portfolio return covaries with labor income and future investment opportunities, so a portfolio's return variance misses important dimensions of risk. If so, market beta is not a complete description of an asset's risk, and we should not be surprised to find that differences in expected return are not completely explained by differences in beta. In this view, the search should turn to asset pricing models that do a better job explaining average returns.

Merton's (1973) intertemporal capital asset pricing model (ICAPM) is a natural extension of the CAPM. The ICAPM begins with a different assumption about investor objectives. In the CAPM, investors care only about the wealth their portfolio produces at the end of the current period. In the ICAPM, investors are concerned not only with their end-of-period payoff, but also with the opportunities

they will have to consume or invest the payoff. Thus, when choosing a portfolio at time $t - 1$, ICAPM investors consider how their wealth at t might vary with future *state variables*, including labor income, the prices of consumption goods and the nature of portfolio opportunities at t, and expectations about the labor income, consumption and investment opportunities to be available after t.

Like CAPM investors, ICAPM investors prefer high expected return and low return variance. But ICAPM investors are also concerned with the covariances of portfolio returns with state variables. As a result, optimal portfolios are "multifactor efficient," which means they have the largest possible expected returns, given their return variances and the covariances of their returns with the relevant state variables.

Fama (1996) shows that the ICAPM generalizes the logic of the CAPM. That is, if there is risk-free borrowing and lending or if short sales of risky assets are allowed, market clearing prices imply that the market portfolio is multifactor efficient. Moreover, multifactor efficiency implies a relation between expected return and beta risks, but it requires additional betas, along with a market beta, to explain expected returns.

An ideal implementation of the ICAPM would specify the state variables that affect expected returns. Fama and French (1993) take a more indirect approach, perhaps more in the spirit of Ross's (1976) arbitrage pricing theory. They argue that though size and book-to-market equity are not themselves state variables, the higher average returns on small stocks and high book-to-market stocks reflect unidentified state variables that produce undiversifiable risks (covariances) in returns that are not captured by the market return and are priced separately from market betas. In support of this claim, they show that the returns on the stocks of small firms covary more with one another than with returns on the stocks of large firms, and returns on high book-to-market (value) stocks covary more with one another than with returns on low book-to-market (growth) stocks. Fama and French (1995) show that there are similar size and book-to-market patterns in the covariation of fundamentals like earnings and sales.

Based on this evidence, Fama and French (1993, 1996) propose a three-factor model for expected returns,

$$\text{(Three-Factor Model)} \quad E(R_{it}) - R_{ft} = \beta_{iM}[E(R_{Mt}) - R_{ft}] + \beta_{is}E(SMB_t) + \beta_{ih}E(HML_t).$$

In this equation, SMB_t (small minus big) is the difference between the returns on diversified portfolios of small and big stocks, HML_t (high minus low) is the difference between the returns on diversified portfolios of high and low B/M stocks, and the betas are slopes in the multiple regression of $R_{it} - R_{ft}$ on $R_{Mt} - R_{ft}$, SMB_t and HML_t.

For perspective, the average value of the market premium $R_{Mt} - R_{ft}$ for 1927–2003 is 8.3 percent per year, which is 3.5 standard errors from zero. The

average values of SMB_t, and HML_t are 3.6 percent and 5.0 percent per year, and they are 2.1 and 3.1 standard errors from zero. All three premiums are volatile, with annual standard deviations of 21.0 percent ($R_{Mt} - R_{ft}$), 14.6 percent (SMB_t) and 14.2 percent (HML_t) per year. Although the average values of the premiums are large, high volatility implies substantial uncertainty about the true expected premiums.

One implication of the expected return equation of the three-factor model is that the intercept α_i in the time-series regression,

$$R_{it} - R_{ft} = \alpha_i + \beta_{iM}(R_{Mt} - R_{ft}) + \beta_{is}SMB_t + \beta_{ih}HML_t + \varepsilon_{it},$$

is zero for all assets i. Using this criterion, Fama and French (1993, 1996) find that the model captures much of the variation in average return for portfolios formed on size, book-to-market equity and other price ratios that cause problems for the CAPM. Fama and French (1998) show that an international version of the model performs better than an international CAPM in describing average returns on portfolios formed on scaled price variables for stocks in 13 major markets.

The three-factor model is now widely used in empirical research that requires a model of expected returns. Estimates of α_i from the time-series regression above are used to calibrate how rapidly stock prices respond to new information (for example, Loughran and Ritter, 1995; Mitchell and Stafford, 2000). They are also used to measure the special information of portfolio managers, for example, in Carhart's (1997) study of mutual fund performance. Among practitioners like Ibbotson Associates, the model is offered as an alternative to the CAPM for estimating the cost of equity capital.

From a theoretical perspective, the main shortcoming of the three-factor model is its empirical motivation. The small-minus-big (SMB) and high-minus-low (HML) explanatory returns are not motivated by predictions about state variables of concern to investors. Instead they are brute force constructs meant to capture the patterns uncovered by previous work on how average stock returns vary with size and the book-to-market equity ratio.

But this concern is not fatal. The ICAPM does not require that the additional portfolios used along with the market portfolio to explain expected returns "mimic" the relevant state variables. In both the ICAPM and the arbitrage pricing theory, it suffices that the additional portfolios are well diversified (in the terminology of Fama, 1996, they are multifactor minimum variance) and that they are sufficiently different from the market portfolio to capture covariation in returns and variation in expected returns missed by the market portfolio. Thus, adding diversified portfolios that capture covariation in returns and variation in average returns left unexplained by the market is in the spirit of both the ICAPM and the Ross's arbitrage pricing theory.

The behavioralists are not impressed by the evidence for a risk-based explanation of the failures of the CAPM. They typically concede that the three-factor model captures covariation in returns missed by the market return and that it picks

up much of the size and value effects in average returns left unexplained by the CAPM. But their view is that the average return premium associated with the model's book-to-market factor—which does the heavy lifting in the improvements to the CAPM—is itself the result of investor overreaction that happens to be correlated across firms in a way that just looks like a risk story. In short, in the behavioral view, the market tries to set CAPM prices, and violations of the CAPM are due to mispricing.

The conflict between the behavioral irrational pricing story and the rational risk story for the empirical failures of the CAPM leaves us at a timeworn impasse. Fama (1970) emphasizes that the hypothesis that prices properly reflect available information must be tested in the context of a model of expected returns, like the CAPM. Intuitively, to test whether prices are rational, one must take a stand on what the market is trying to do in setting prices—that is, what is risk and what is the relation between expected return and risk? When tests reject the CAPM, one cannot say whether the problem is its assumption that prices are rational (the behavioral view) or violations of other assumptions that are also necessary to produce the CAPM (our position).

Fortunately, for some applications, the way one uses the three-factor model does not depend on one's view about whether its average return premiums are the rational result of underlying state variable risks, the result of irrational investor behavior or sample specific results of chance. For example, when measuring the response of stock prices to new information or when evaluating the performance of managed portfolios, one wants to account for known patterns in returns and average returns for the period examined, whatever their source. Similarly, when estimating the cost of equity capital, one might be unconcerned with whether expected return premiums are rational or irrational since they are in either case part of the opportunity cost of equity capital (Stein, 1996). But the cost of capital is forward looking, so if the premiums are sample specific they are irrelevant.

The three-factor model is hardly a panacea. Its most serious problem is the momentum effect of Jegadeesh and Titman (1993). Stocks that do well relative to the market over the last three to twelve months tend to continue to do well for the next few months, and stocks that do poorly continue to do poorly. This momentum effect is distinct from the value effect captured by book-to-market equity and other price ratios. Moreover, the momentum effect is left unexplained by the three-factor model, as well as by the CAPM. Following Carhart (1997), one response is to add a momentum factor (the difference between the returns on diversified portfolios of short-term winners and losers) to the three-factor model. This step is again legitimate in applications where the goal is to abstract from known patterns in average returns to uncover information-specific or manager-specific effects. But since the momentum effect is short-lived, it is largely irrelevant for estimates of the cost of equity capital.

Another strand of research points to problems in both the three-factor model and the CAPM. Frankel and Lee (1998), Dechow, Hutton and Sloan (1999), Piotroski (2000) and others show that in portfolios formed on price ratios like

book-to-market equity, stocks with higher expected cash flows have higher average returns that are not captured by the three-factor model or the CAPM. The authors interpret their results as evidence that stock prices are irrational, in the sense that they do not reflect available information about expected profitability.

In truth, however, one can't tell whether the problem is bad pricing or a bad asset pricing model. A stock's price can always be expressed as the present value of expected future cash flows discounted at the expected return on the stock (Campbell and Shiller, 1989; Vuolteenaho, 2002). It follows that if two stocks have the same price, the one with higher expected cash flows must have a higher expected return. This holds true whether pricing is rational or irrational. Thus, when one observes a positive relation between expected cash flows and expected returns that is left unexplained by the CAPM or the three-factor model, one can't tell whether it is the result of irrational pricing or a misspecified asset pricing model.

The Market Proxy Problem

Roll (1977) argues that the CAPM has never been tested and probably never will be. The problem is that the market portfolio at the heart of the model is theoretically and empirically elusive. It is not theoretically clear which assets (for example, human capital) can legitimately be excluded from the market portfolio, and data availability substantially limits the assets that are included. As a result, tests of the CAPM are forced to use proxies for the market portfolio, in effect testing whether the proxies are on the minimum variance frontier. Roll argues that because the tests use proxies, not the true market portfolio, we learn nothing about the CAPM.

We are more pragmatic. The relation between expected return and market beta of the CAPM is just the minimum variance condition that holds in any efficient portfolio, applied to the market portfolio. Thus, if we can find a market proxy that is on the minimum variance frontier, it can be used to describe differences in expected returns, and we would be happy to use it for this purpose. The strong rejections of the CAPM described above, however, say that researchers have not uncovered a reasonable market proxy that is close to the minimum variance frontier. If researchers are constrained to reasonable proxies, we doubt they ever will.

Our pessimism is fueled by several empirical results. Stambaugh (1982) tests the CAPM using a range of market portfolios that include, in addition to U.S. common stocks, corporate and government bonds, preferred stocks, real estate and other consumer durables. He finds that tests of the CAPM are not sensitive to expanding the market proxy beyond common stocks, basically because the volatility of expanded market returns is dominated by the volatility of stock returns.

One need not be convinced by Stambaugh's (1982) results since his market proxies are limited to U.S. assets. If international capital markets are open and asset prices conform to an international version of the CAPM, the market portfolio

should include international assets. Fama and French (1998) find, however, that betas for a global stock market portfolio cannot explain the high average returns observed around the world on stocks with high book-to-market or high earnings-price ratios.

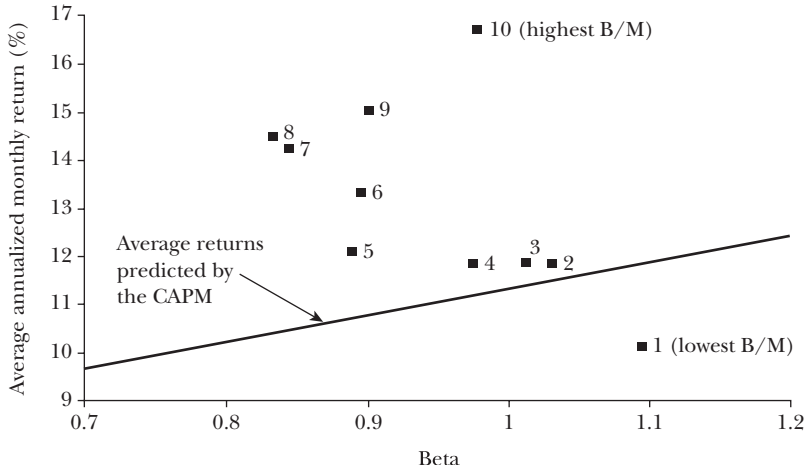
A major problem for the CAPM is that portfolios formed by sorting stocks on price ratios produce a wide range of average returns, but the average returns are not positively related to market betas (Lakonishok, Shleifer and Vishny, 1994; Fama and French, 1996, 1998). The problem is illustrated in Figure 3, which shows average returns and betas (calculated with respect to the CRSP value-weight portfolio of NYSE, AMEX and NASDAQ stocks) for July 1963 to December 2003 for ten portfolios of U.S. stocks formed annually on sorted values of the book-to-market equity ratio (B/M).[6]

Average returns on the B/M portfolios increase almost monotonically, from 10.1 percent per year for the lowest B/M group (portfolio 1) to an impressive 16.7 percent for the highest (portfolio 10). But the positive relation between beta and average return predicted by the CAPM is notably absent. For example, the portfolio with the lowest book-to-market ratio has the highest beta but the lowest average return. The estimated beta for the portfolio with the highest book-to-market ratio and the highest average return is only 0.98. With an average annualized value of the riskfree interest rate, R_f, of 5.8 percent and an average annualized market premium, $R_M - R_f$, of 11.3 percent, the Sharpe-Lintner CAPM predicts an average return of 11.8 percent for the lowest B/M portfolio and 11.2 percent for the highest, far from the observed values, 10.1 and 16.7 percent. For the Sharpe-Lintner model to "work" on these portfolios, their market betas must change dramatically, from 1.09 to 0.78 for the lowest B/M portfolio and from 0.98 to 1.98 for the highest. We judge it unlikely that alternative proxies for the market portfolio will produce betas and a market premium that can explain the average returns on these portfolios.

It is always possible that researchers will redeem the CAPM by finding a reasonable proxy for the market portfolio that is on the minimum variance frontier. We emphasize, however, that this possibility cannot be used to justify the way the CAPM is currently applied. The problem is that applications typically use the same

[6] Stock return data are from CRSP, and book equity data are from Compustat and the Moody's Industrials, Transportation, Utilities and Financials manuals. Stocks are allocated to ten portfolios at the end of June of each year t (1963 to 2003) using the ratio of book equity for the fiscal year ending in calendar year $t - 1$, divided by market equity at the end of December of $t - 1$. Book equity is the book value of stockholders' equity, plus balance sheet deferred taxes and investment tax credit (if available), minus the book value of preferred stock. Depending on availability, we use the redemption, liquidation or par value (in that order) to estimate the book value of preferred stock. Stockholders' equity is the value reported by Moody's or Compustat, if it is available. If not, we measure stockholders' equity as the book value of common equity plus the par value of preferred stock or the book value of assets minus total liabilities (in that order). The portfolios for year t include NYSE (1963–2003), AMEX (1963–2003) and NASDAQ (1972–2003) stocks with positive book equity in $t - 1$ and market equity (from CRSP) for December of $t - 1$ and June of t. The portfolios exclude securities CRSP does not classify as ordinary common equity. The breakpoints for year t use only securities that are on the NYSE in June of year t.

Figure 3
Average Annualized Monthly Return versus Beta for Value Weight Portfolios Formed on B/M, 1963–2003



market proxies, like the value-weight portfolio of U.S. stocks, that lead to rejections of the model in empirical tests. The contradictions of the CAPM observed when such proxies are used in tests of the model show up as bad estimates of expected returns in applications; for example, estimates of the cost of equity capital that are too low (relative to historical average returns) for small stocks and for stocks with high book-to-market equity ratios. In short, if a market proxy does not work in tests of the CAPM, it does not work in applications.

Conclusions

The version of the CAPM developed by Sharpe (1964) and Lintner (1965) has never been an empirical success. In the early empirical work, the Black (1972) version of the model, which can accommodate a flatter tradeoff of average return for market beta, has some success. But in the late 1970s, research begins to uncover variables like size, various price ratios and momentum that add to the explanation of average returns provided by beta. The problems are serious enough to invalidate most applications of the CAPM.

For example, finance textbooks often recommend using the Sharpe-Lintner CAPM risk-return relation to estimate the cost of equity capital. The prescription is to estimate a stock's market beta and combine it with the risk-free interest rate and the average market risk premium to produce an estimate of the cost of equity. The typical market portfolio in these exercises includes just U.S. common stocks. But empirical work, old and new, tells us that the relation between beta and average return is flatter than predicted by the Sharpe-Lintner version of the CAPM. As a

result, CAPM estimates of the cost of equity for high beta stocks are too high (relative to historical average returns) and estimates for low beta stocks are too low (Friend and Blume, 1970). Similarly, if the high average returns on value stocks (with high book-to-market ratios) imply high expected returns, CAPM cost of equity estimates for such stocks are too low.[7]

The CAPM is also often used to measure the performance of mutual funds and other managed portfolios. The approach, dating to Jensen (1968), is to estimate the CAPM time-series regression for a portfolio and use the intercept (Jensen's alpha) to measure abnormal performance. The problem is that, because of the empirical failings of the CAPM, even passively managed stock portfolios produce abnormal returns if their investment strategies involve tilts toward CAPM problems (Elton, Gruber, Das and Hlavka, 1993). For example, funds that concentrate on low beta stocks, small stocks or value stocks will tend to produce positive abnormal returns relative to the predictions of the Sharpe-Lintner CAPM, even when the fund managers have no special talent for picking winners.

The CAPM, like Markowitz's (1952, 1959) portfolio model on which it is built, is nevertheless a theoretical tour de force. We continue to teach the CAPM as an introduction to the fundamental concepts of portfolio theory and asset pricing, to be built on by more complicated models like Merton's (1973) ICAPM. But we also warn students that despite its seductive simplicity, the CAPM's empirical problems probably invalidate its use in applications.

■ *We gratefully acknowledge the comments of John Cochrane, George Constantinides, Richard Leftwich, Andrei Shleifer, René Stulz and Timothy Taylor.*

[7] The problems are compounded by the large standard errors of estimates of the market premium and of betas for individual stocks, which probably suffice to make CAPM estimates of the cost of equity rather meaningless, even if the CAPM holds (Fama and French, 1997; Pastor and Stambaugh, 1999). For example, using the U.S. Treasury bill rate as the risk-free interest rate and the CRSP value-weight portfolio of publicly traded U.S. common stocks, the average value of the equity premium $R_{Mt} - R_{ft}$ for 1927–2003 is 8.3 percent per year, with a standard error of 2.4 percent. The two standard error range thus runs from 3.5 percent to 13.1 percent, which is sufficient to make most projects appear either profitable or unprofitable. This problem is, however, hardly special to the CAPM. For example, expected returns in all versions of Merton's (1973) ICAPM include a market beta and the expected market premium. Also, as noted earlier the expected values of the size and book-to-market premiums in the Fama-French three-factor model are also estimated with substantial error.

Prior to 1979, there were no formal announcements of business cycle turning points.

The NBER does not define a recession in terms of two consecutive quarters of decline in real GDP. Rather, a recession is a significant decline in economic activity spread across the economy, lasting more than a few months, normally visible in real GDP, real income, employment, industrial production, and wholesale-retail sales. For more information, see the latest announcement from the NBER's Business Cycle Dating Committee, dated 9/20/10.

An Empirical Study of Ex Ante Risk Premiums for the Electric Utility Industry

Farris M. Maddox, Donna T. Pippert, and Rodney N. Sullivan

Farris M. Maddox is Principal Financial Analyst. Donna T. Pippert is Manager of Finance. Both are in the Division of Economics and Finance at the Virginia State Corporation Commission, Richmond, VA. Rodney N. Sullivan is Manager of Inventory and Productivity at Circuit City Stores, Inc., Richmond, VA.

This study examines the relationship between interest rates and utility equity risk premiums. We found that an inverse relationship exists, with the equity risk premium changing by 37 basis points for each 100 basis-point change in the 30-year Treasury bond yield. The inverse relationship is stable; however, changes in the relative risk of debt and equity securities produce shifts in the level of risk premiums, regardless of the behavior of Treasury bond yields. We also found that the equity risk premiums were consistently positive over the study period, which conforms to the basic risk/return tenet of finance.

■ Several studies published in recent years support an inverse relationship between utility equity risk premiums and interest rates during the first half of the 1980s. Our study provides a more current examination of this relationship. Our findings support the conclusion that equity risk premiums for utility stocks continue to vary inversely with interest rates. Further, the inverse relationship between interest rates and risk premiums appears stable over the sample period; however, market behavior at certain points in the sample period appears to reflect changes in the market's evaluation of the relative risk of Treasury bonds and utility stocks. For instance, significant differences in the level of the risk premium were observed during certain periods, irrespective of the level of interest rates. Considering the dynamic nature of risk premiums, we discuss how the study may be applicable for estimating the cost of equity for utilities.

Section I provides background information and a literature review. Section II describes the research methodology and the data. Section III provides the empirical results. Section IV furnishes an example to illustrate the model's usefulness. Section V furnishes conclusions.

We would like to thank the Editors and an anonymous referee for their helpful comments. The findings, views, and opinions expressed by the authors do not necessarily represent those of their respective employers.

I. Background and Literature Review

The determination of an appropriate cost of equity is a controversial issue in utility rate proceedings. Bond yields provide a readily observable, definitive measure of the market's required return on that investment; however, such a measure is not readily available for stocks. The indefinite life and uncertainty of a firm's future earnings make it necessary to employ theoretical models to arrive at an estimate of the cost of equity. All theoretical models have strengths and weaknesses, and the focus in utility rate proceedings is often on what is wrong with a particular approach rather than what is right. However, the nebulous nature of the true cost of equity provides no definitive way to assess the superiority of one method's results over another's. Consequently, several cost of equity models are typically used to develop a final estimate.

The risk premium method is an alternative approach to the prevalent discounted cash flow (DCF) model in estimating the cost of equity. A fundamental tenet of financial theory is that riskier investments should command a higher expected return than less risky investments. The risk premium may be defined as the difference, or spread, between expected returns on alternative investments. Financial textbooks usually illustrate risk premiums based on a theoretical risk-free rate and the rate for alternative-risk investments along the security market line.
